7. The improved electric railway having a conductor and a series of non-magnetic plates, and armatures interposed therebetween and adapted to connect the same when influenced by a magnet of a car, substantially as and for the purposes set forth.

399,092. ELECTRIC CAR. HARRY W. SMITH, Newark, N. J. Filed Oct. 26, 1888. Serial No. 289,230. (No model.)

Claim.—1. The improved electric car combining with the body of a car a magnet-holder, magnets, and a plate of non-magnetic metal arranged between the magnet and railway when the car is in operation, substantially as and for the purposes set forth.

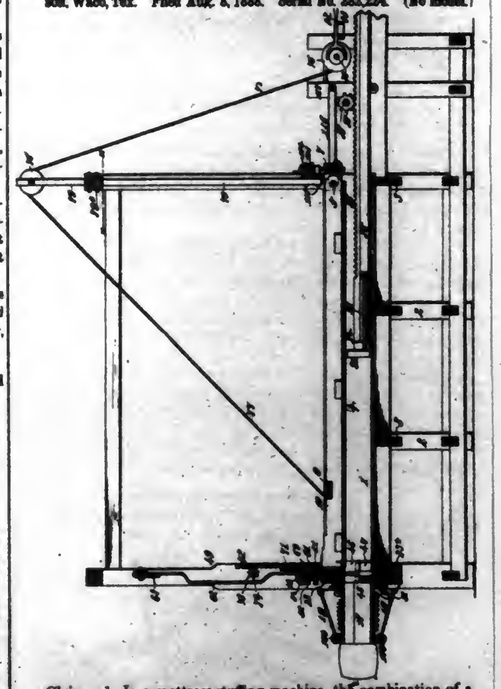
2. The improved electric car combining with the car-body a magnet-holder consisting of boards or plates *d d*, provided with feeders at the ends and covered top and bottom with non-magnetic material and magnets arranged in said holders, substantially as and for the purposes set forth.

3. The improved electric car or vehicle combining with the car-body a magnet-holder arranged beneath the body of the car, and a series of magnets, including both electro-magnets and permanent magnets, substantially as and for the purposes set forth.

4. The improved electric car combining with the car-body axles *b b*, a magnet-holder movably arranged on said axles, and magnets, substantially as and for the purposes set forth.

5. The improved electric car combining with the car-body an adjustable magnet-holder suspended from the axles thereof, and magnets, substantially as and for the purposes set forth.

6. The improved electric car combining with the car-body an electric motor and magnets, a magnet-holder inclosing said magnets, and a brush or brushes extending through said holder to engage the track or way, substantially as and for the purposes set forth.



7. The improved electric car combining with the car-body a series of inclosed magnets arranged beneath the body of the car to attract armatures in the railway, substantially as and for the purposes set forth.

8. In combination, in a car having an electromotor, plates *d d*, cover *h*, and partitions *m' m'*, forming brush-passages, brushes arranged in said passages and adapted to engage a conductor in the railway and transmit the current therefrom and connected with said motor, substantially as and for the purposes set forth.

9. The improved electric car combining with the car-body a magnet-holder, brushes adjustably arranged with relation to said holder, and springs secured on said holder and to said brushes, substantially as set forth.

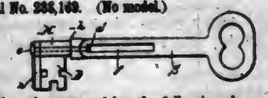
10. The improved electric car combining therein a magnet-holder and magnets, and brushes arranged on said holder to engage the conducting agents on the road or way, said brushes being carried by springs to allow an automatic adjustment relative to said way, substantially as and for the purposes set forth.

399,093. MATTRESS-STUFFING MACHINE. EDWIN H. STEPHENSON, Waco, Tex. Filed Aug. 8, 1888. Serial No. 282,224. (No model.)

Claim.—1. In a mattress-stuffing machine, the combination of a laterally-expansible press-box, a vertically-adjustable and laterally-expansible box-cover, a spout connected with the discharge-mouth of the press-box, composed of two upper sections movable vertically and laterally adjustable, and two lower sections laterally adjustable and loosely connected with the upper sections, substantially as described.

2. In a mattress-stuffing machine, the combination, with a laterally-expansible press-box, of a cover composed in part of separable sections, said cover hinged upon a vertically-adjustable end bar, means for raising and lowering the same, a spout formed in four overlapping sections adjustable one upon the other in a horizontal and vertical direction, and means, substantially as described, for closing the spaces between the press-box and the mouth of the spout, substantially as described.

3. In a mattress-stuffing machine, the combination, with a press-box expansible laterally, and a vertically-adjustable box-cover, of a four-part spout located at the end of said press-box and composed of two upper and two lower sections lapped upon each other, the two upper sections being movable vertically, and one upper and one lower section being movable laterally in unison with the laterally-adjustable side of the press-box, and means for so adjusting the spout-sections, substantially as described.



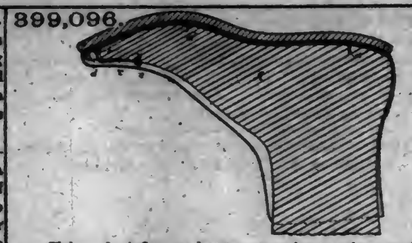
4. In a mattress-stuffing machine, the combination, with a press-box having a laterally-movable side, of a hinged cover composed in part of separable sections, one or more of which may be united with the integral portion of said cover, the movable side being provided with rack-bars meshing with pinions giving lateral movement, and a rest-bar being connected to said movable side near one end, extended outward and supported by the end of one or more of said rack-bars to support the ends of the separable sections above the teeth of the racks, substantially as described.

5. In a mattress-stuffing machine, the combination, with a press-box having a laterally-movable side, of a cover hinged upon a vertically-adjustable end bar, said cover composed in part of separable sections, and the screws mounted in fixed supports and engaging said end bar, said screws being rotated by a horizontal shaft carrying miter-gears which mesh with similar miters on the screws, substantially as described.

6. In a mattress-stuffing machine, the combination, with a press-box capable of lateral expansion and a vertically-adjustable box-cover, of a spout composed of four sections overlapping and sliding upon each other, the two lower sections having at their outer ends upwardly-turned double plates between which the downwardly-bent ends of the upper sections lie, and removable pins passing through an opening in the double plates and through one of a series of openings in the downwardly-turned ends of the upper sections, substantially as described.

7. In a mattress-stuffing machine, the combination, with a press-box having one side wall adjustable laterally, and a vertically-movable box-cover comprising removable and replaceable sections to vary its width, of a spout located at the discharge-mouth of the press-box and comprising two upper sections movable vertically and laterally adjustable, and two lower sections laterally adjustable and loosely connected with the upper sections, substantially as described.

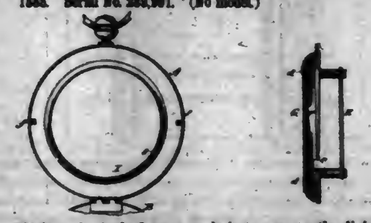
399,094. KEY. OSCAR STODDARD, Detroit, Mich. Filed Oct. 15, 1888. Serial No. 288,169. (No model.)



Claim.—A door-key comprising the following elements: the shank having the opening therein, the head having the annular shoulder and and wing, said parts formed integral, the hole passing through the head and communicating with the opening in the shank, the auxiliary wing, its form in cross-section coinciding with the head and wing of the key and having the hole therein, and the rivet passing through the head and the auxiliary wing, its outer end being upset, as and for the purposes specified.

399,095. SPOOL-HOLDER FOR SEWING-MACHINES. CHARLES L. THOMAS, York, Pa. Filed June 14, 1888. Serial No. 277,066. (No model.)

Claim.—As a new article of manufacture, the herein-described spool-holder, comprising the base-plate provided with the apertures *a a*, the face-plate having a concavely-curved upper edge, and provided with the curved slot D, parallel with its upper edge, and the ends F, substantially as specified.



399,096. ATTACHMENT FOR LASTS. AUGUSTUS S. TROWBRIDGE, Milford, Mass., assignor of two-thirds to Charles W. Shippee, same place, and William H. Dunbar, Boston, Mass. Filed Sept. 15, 1888. Serial No. 285,473. (No model.)

Claim.—1. A form or last to enter a boot or shoe provided at its toe with a spring-catch and in its heel and ball portions with catches, holders, or points to support the sock-lining or cover for the inner sole while a boot or shoe is being applied to the form or last, and is pressed or forced into contact with the adhesive surface of the said lining or cover and onto the form to give shape to the sole thereof, the toe-catch having its point inclined forward, all as set forth and represented.

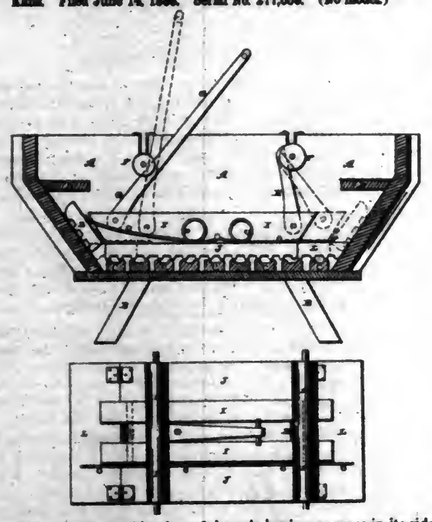
2. In combination with a form or last to enter a boot or shoe, the spring toe catch or holder *b*, having its point inclined forward, and the heel and ball holders or points *a a'*, for supporting a sock-lining or inner-sole cover while being applied and secured to the inner sole of a boot or shoe, substantially as shown and set forth.

399,097. CLOCK-CASE. ALFRED D. TERRELL, New Haven, Conn., assignor to the New Haven Clock Company, same place. Filed Nov. 5, 1888. Serial No. 289,991. (No model.)

Claim.—1. A clock-case made in two parts, the division being in a plane at right angles to the axis of the case, one of the parts of the case constructed with radially-projecting studs *f* upon its inside, combined with a movement having its front plate provided with a flange corresponding to the shape of the interior of the case, the edge of the flange adapted to rest against the inner surface of the case, the said flange constructed with notches *e*, corresponding in position to the studs *f* of the case, and the edge of the flange from the recesses inclined to the plane of movement, substantially as described, and whereby the said notches permit the flange of the movement to pass into the case beyond the studs, and then by a partial rotation of the movement to bring the inclined edges of the flange under said studs.

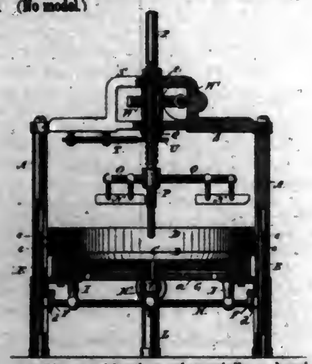
2. A circular clock-case made from sheet metal in two parts, the division being in a plane at right angles to the axis of the case, the one part, A, being the front and the other part, B, the rear part, the front part provided with a glass, I, and a border, H, resting upon the inside of the glass, combined with a movement constructed with a circular flange, F, corresponding in shape to and so as to rest against the interior of the front portion of the case, the said flange constructed with two or more notches, *e*, through its edge, and the edge of the case from the notches inclined to the plane of movement, the said front portion of the case provided with studs *f*, corresponding to the notches *e* in the flange of the movement, and whereby the said movement and its flange are removably secured in the case, and also serve to secure the glass and its holding in place, substantially as and for the purpose described.

399,098. ATTACHMENT FOR GRATES. JOHN H. WAIT, Portsmouth, Ohio. Filed Sept. 8, 1888. Serial No. 284,905. (No model.)



Claim.—1. An attachment for grates, comprising a flat plate having a series of grooves in its upper surface and a number of openings, G, the front central opening being of proper size to be engaged by a

lifter, and feet or prongs depending from the under side of the plate at the rear end of the same, as specified.



2. An attachment for grates, consisting of a flat plate having on its under side at its rear end the lugs K and notches M, and the depending feet N, provided with the prongs O O at their lower ends, substantially as and for the purpose specified.

399,099. WASHING-MACHINE. JOSEPH A. WALKER, Meivern, Kans. Filed June 14, 1888. Serial No. 277,058. (No model.)

Claim.—The combination of the tub, having recesses in its sides and the ribs C upon its bottom, with the cross-pieces F, the hanger H, secured to one of the cross-pieces, the lever G, secured to the other, the wash-board J, the cleats I, secured to the top of the board and between which the lower ends of the lever and hanger are secured, the hinged end pieces, L, attached to opposite ends of the wash-board, and the springs O, for keeping the end pieces pressed downward, substantially as shown and described.

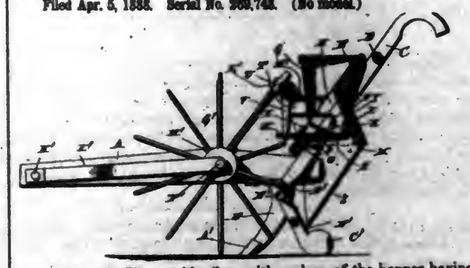
399,100. SUGAR CREAMING AND MIXING MACHINE. WILLIAM WALTHER, New York, N. Y. Filed Aug. 27, 1888. Serial No. 283,854. (No model.)

Claim.—1. The combination, substantially as herein set forth, in a machine for cooling and creaming sugar, of a double-bottomed pan inclosing a hollow space to contain a cooling medium and having inlet and outlet apertures to promote a circulation therein, a rotating and longitudinally-moving spindle mounted axially above the pan and having a screw formed thereon, a nut engaging said screw, having a ratchet upon its periphery and revolving loosely in a stationary bearing, a pawl engaging said ratchet-scrapers carried by the spindle, a low stationary wall encircling the pan, an outer movable concentric rim encircling said wall, whereby the depth of the pan may be increased or diminished, and mechanism, substantially as described, for actuating said rim.

2. The combination, with the vertical rotating spindle in a sugar-creaming machine, the scraping-blades carried thereby, and means, substantially as described, for rotating the spindle, of a screw formed upon said spindle, a nut encircling and engaging said screw and revolving loosely in a stationary bearing, a ratchet encircling the periphery of said nut, and a spring-actuated pawl engaging said ratchet, substantially in the manner and for the purpose herein set forth.

3. The combination, substantially as set forth, with the rotating spindle in a sugar-creaming machine, scraping-blades carried thereby, and the pan in which said blades revolve, of a fixed low encircling rim, a concentric movable extension-rim telescoping with said fixed rim, and means, substantially as described, for raising and lowering said extension-rim, substantially in the manner and for the purpose herein set forth.

4. The combination, with the movable rim encircling the pan in a sugar-creaming machine, of the vertical standards, the guide-rods playing in said standards and attached to the rim, the horizontal rock-shaft mounted in bearings under the pan, the lifting-arms projecting from said rock-shaft and linked to the guide-rods, the main arm projecting from the rock-shaft at an angle with said lifting-arms, the nut pivoted to said main arm, and the horizontal screw-shaft rotating in bearings under the pan and engaging said nut, all substantially in the manner and for the purpose herein set forth.



399,101. STEAM-ENGINE. JACOB WEST, Bolivar, Pa. Filed Nov. 17, 1888. Serial No. 291,110. (No model.)

Claim.—1. The combination, substantially as described, of the cylinder or casing having a conical chamber, lateral ingress and egress ports communicating, respectively, with the larger and smaller ends of said chamber, a head to close the larger end of said chamber, and a conical piston provided with spiral grooves terminating near the larger end of the piston.

2. The combination, substantially as described, of a cylinder or casing provided with a conical chamber, an eduction-port opening laterally from the smaller end of the chamber, a circular steam-passage surrounding the larger end of the chamber and communicating therewith through one or more radial openings, an ingress-port opening into said circular chamber, a removable head to close the larger end of the chamber, and a conical spirally-grooved piston mounted in the chamber with its shaft journaled in the heads of the cylinder and provided at its larger end beyond the ingress-ports with a peripheral plain surface.

399,102. CORN-PLANTER. MOSES A. WESTBROOK, Carthage, Miss. Filed Apr. 5, 1888. Serial No. 269,743. (No model.)

Claim.—1. The combination, with a plow, of the hopper having the inclined rear side board, E, detachably secured to the plow-handles, the seed-slide arranged in the bottom of the hopper, the rock-shaft journaled in supports projecting from the hopper and having the arm V engaging the seed-slide, the operating-arm L', and the driving-wheel journaled on one side of the plow-beam and having the tappet-arms H' engaging the arm L', substantially as described.

2. The combination, with a plow, of the hopper having the inclined rear side board, E, detachably secured to the plow-handles, and having the opening H, the spout I, depending from said board and fitted between the handles, the reciprocating seed-slide in the lower portion of the hopper and projecting forward through an opening in the board E, the rock-shaft journaled in supports on the hopper and having the arm engaging the seed-slide, and means, substantially as set forth, to oscillate said rock-shaft.

399,103. BRAKE-SHOE. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed Nov. 15, 1888. Serial No. 290,914. (No model.)

Claim.—1. A brake-shoe having those parts of its face which operate on the portions of the wheel-tread normally in contact with the rail recessed at one or more points and the other portions thereof solid with reference to securing by different areas of wearing-surfaces in different parts of the brake-shoe a uniform or practically uniform wear of the wheel against which it operates, substantially as set forth

2. A brake-shoe having in combination the continuous bearing portions 6 and 7 and the sectional bearing-faces 5, arranged to operate on that portion of a car-wheel normally bearing upon the rail, substantially as set forth.

399,104. GAS-BURNER. FERNANDO WHITE, Pittsburg, Pa., assignor of one-half to William Yagle & Co., (Limited,) same place. Filed Mar. 15, 1883. Serial No. 267,949. (No model.)

Claim.—1. In a gas-burner, the combination of the body *a*, the gas-supply pipe *d*, extending into the same, said pipe having outlets *e* therein and having its upper end threaded, the cover-plate *g*, screwing onto the end of said pipe and resting against the top of the body *a*, and a cap or plug, *h*, closing the end of the pipe *d*, substantially as and for the purposes set forth.

2. In a gas-burner, the combination of the body *a*, having the outlets *f*, the pipe *d*, extending up through the body and having outlets *e* therein, the cover-plate *g*, screwing onto said pipe and resting on said body, and the regulating-sleeve *j*, screwing onto said pipe and having an enlarged portion inclosing said outlet *e* and extending up toward said cover-plate, substantially as and for the purpose set forth.

399,105. TRUSSED SUSPENSION-BRIDGE. GEORGE M. WILSON, Melvern, Kans. Filed Nov. 22, 1888. Serial No. 291,560. (No model.)

Claim.—1. The combination, in a suspension-bridge, of the cables, the chords or stringers, the plates or castings on the cables and under the stringers, the vertical tie-rods connecting the plates or castings, and the truss-rods, also secured to and connecting the said plates, the said truss-rods being crossed in the spaces between the tie-rods, substantially as described.

2. The plates or castings L, having the concaved grooves on their lower sides to adapt them to fit on the cables and having the ears M and the ears S, in combination with the tie-rods secured to the ears M, and the truss-rods secured to the ears S, substantially as described.

3. The combination, with the stringers or chords arranged in pairs and apart from each other, the plates or castings O, arranged under the stringers and having the transverse arms N and the longitudinal arms R, the tie-rods secured to the arms N, and the truss-rods secured to the arms R, substantially as described.

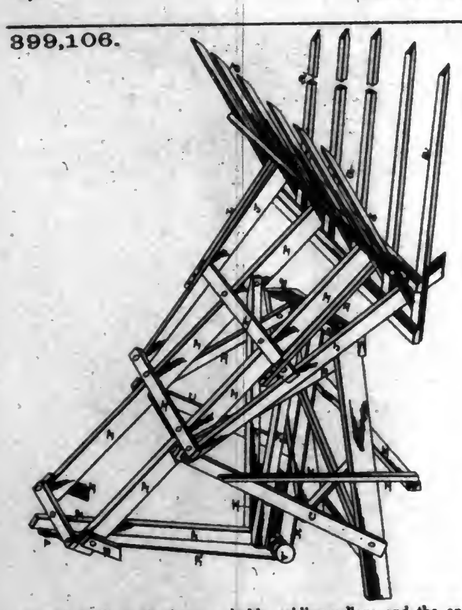
4. The combination, in a suspension-bridge, of the cables, the chords or stringers, the tie-rods depending from the cables and supporting the chords, the truss-rods also connecting the cable and chords, the deck-beams arranged on the chords or stringers, the floor-boards supported on the deck-beams, and the hub-boards X, secured to the tie-rods, substantially as described.

5. In a bridge, the piers B, the chords or stringers A, slightly arched and supported by the piers, the ends of the chords or stringers projecting beyond the piers for a suitable distance and resting on the banks or approaches, the posts C, arranged in pairs on opposite sides of the bridge, and having their lower ends passed between the stringers or chords and supported by the piers, the saddles or caps D at the upper ends of the posts C, and the cables H, supported by the posts C by bearing on the saddles D, and having their ends secured at a suitable distance beyond the piers of the stream by suitable anchoring devices, as set forth.

6. The posts C, arranged in pairs on opposite sides of the bridge, and having the caps or saddles D provided with ears or flanges E, the said caps or saddles being connected by the cross-bar F, combined with the cables H, supported by the posts C, bearing upon the saddle-plates D between the flanges thereof, and having their ends secured at a suitable distance beyond the piers by suitable anchoring devices, I, as set forth.

7. In a suspension-bridge, the cables, the plates or castings L on the cables, the V-shaped truss-rods V, having their upper ends connected to the plates or castings L, the chords or stringers A, and the plates or castings O below the chords or stringers and connected to the truss-rods V, as set forth.

8. In a suspension-bridge, the chords or stringers A, the cables H, the V-shaped truss-rods V, depending from the cables and passing under the chords or stringers, and the tie-rods K, also depending from the cables, having the shape of an inverted U, and passing down and connected to the chords or stringers, and the truss-rods V, crossing each other midway between the tie-rods K, as set forth.



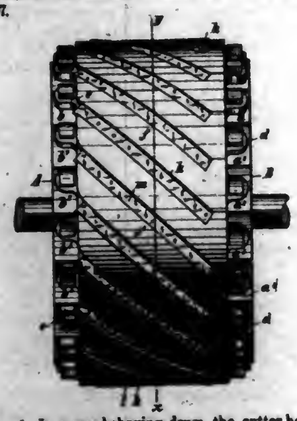
9. In a suspension-bridge, the cables H, the chords or stringers A, and the truss-rods V, having the shape of the letter V, the central portion of the truss-rods passing under the chords or stringers, and the upper ends being secured to the cables, the said truss-rods crossing each other, as set forth.

10. In a suspension-bridge, the cables H, the chords or stringers A, the plates L on the cables, the plates O below the chords or stringers, and the V-shaped truss-rods V, having their central portions passed through the plates O, to hold the same against the chords or stringers, and their upper ends connected to alternate plates L, the said truss-rods crossing each other, as set forth.

399,106. HAY-STACKER. JULIUS E. WILL and HENRY WILL, Bethel, Mo., assignors of one-third to Philip Steinbach, Sr., same place. Filed Oct. 2, 1888. Serial No. 287,092. (No model.)

Claim.—1. The combination of a suitable supporting-frame, the lovers F, the fork composed of two sets of teeth placed at a suitable angle to each other, the braces N P, secured to the levers, a weight

399,106.

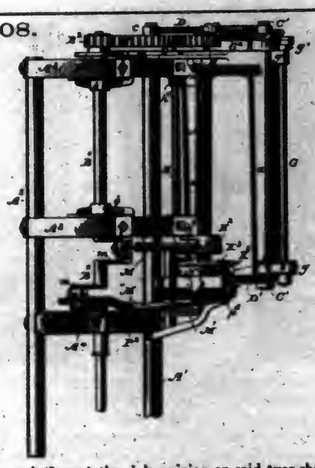


secured rigidly to the brace, suitable guiding-pulleys, and the operating-rope, substantially as described.

2. In a hay-stacker, the combination of the levers F, pivoted upon a suitable supporting-frame, the braces J, cross-pieces K, and the adjustable braces L, with the hay-fork consisting of a stationary set of teeth and a pivoted shorter set of teeth, which are adapted to be held at different angles to the stationary set by means of said braces L, substantially as set forth.

3. The combination of the frame A, the braces B C, secured together at their upper ends by the cross-bolt D, the levers F, having the fork G secured to their front ends, the stops E, secured to the rear ends of the levers, the braces N P, the weight secured to the braces, the guiding-pulleys, and the operating-rope, substantially as specified.

399,107. MACHINE FOR CUTTING WOOD INTO CHIPS. OTTO A. WEITZE, Barzehnde, Prussia, Germany. Filed May 28, 1888. Serial No. 275,271. (No model.) Patented in Germany Mar. 24, 1887, No. 42,187.



Claim.—1. In a wood-shaving drum, the cutter head or drum having a series of diagonal slots in its periphery, the helicoidal staves, and the series of knives, substantially as set forth.

2. In a wood-shaving drum, the combination, with the cutter head or drum and the polygonal bottom pieces, A and B, of the helicoidal staves *f* and the knives *h*, substantially as set forth.

399,108. GRAIN-BINDER. CHARLES B. WITHERSTON, Janesville, Wis. Filed Apr. 26, 1887. Serial No. 236,977. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the trip-pinion on the packer-shaft, the trip-latch, the main gear, with which said pinion directly meshes, the delay-flange on its

399,108.

side, the tyer-shaft, and the delay-pinion on said tyer-shaft directly meshing with the main gear.

2. The combination, substantially as hereinbefore set forth, of the trip-pinion on the packer-shaft, the main gear meshing directly therewith, the binder-arm mounted on an overhead shaft, the pitman connecting the main gear with an arm on said shaft, the parallel compressor-shaft, the delay-pinion on the tyer-shaft directly meshing with the main gear, and the link connecting said delay-pinion with an arm from the compressor-shaft.

3. The combination, substantially as hereinbefore set forth, of the trip-pinion on the packer-shaft, the trip-latch, the main gear, with which said trip-pinion directly meshes, the tyer-shaft, the delay-pinion on said tyer-shaft, having a shoe engaging a delay-flange on the main gear and itself meshing directly with the teeth of said main gear, the binder-arm shaft, and a pitman connecting the wrist-pin on the main gear with an arm from said shaft.

4. The combination, substantially as hereinbefore set forth, with the delay-pinion and its shoe having lateral channels in its toes, of a driving-gear having a delay-flange provided with supporting-pins at the center of the cut-away spaces therein, projecting to about half the thickness of the shoe to support it after it has passed through said cut-away spaces.

5. The combination, substantially as hereinbefore set forth, with the trip-pinion, trip-clutch, and pivoted trip-latch, and with a wheel in the train driven by said pinion and between said pinion and the band applying and uniting devices, of the locking-dog independently pivoted to the frame and taking into a notch in said wheel, and an arm from said locking-dog projecting into the path of the independent trip-latch, whereby it will be lifted when the trip-latch is moved to release the driving-dog.

6. The combination, substantially as hereinbefore set forth, with the trip-clutch and trip-latch, of the rock-shaft upon which said trip-latch is secured, the spring pressing the trip-latch normally away from the path of the trip-dog, the arm from the inner end of the trip-shaft resting adjacent to the periphery of the shaft, which is carried in the subtending arm of the binder-frame, and a finger normally resting under said arm to hold the latch into engagement and partaking of the motions of said subtending shaft, whereby after disengagement it is brought up again beneath the heel of said arm and again resets the trip-latch.

7. The combination, substantially as hereinbefore set forth, with the trip-latch, the trip-shaft, and the spring which urges said trip-latch out of the path of the trip-dog, of the arm at the inner end of the trip-shaft, the trip-lever mounted upon a support sleeved about the shaft carried in the subtending arm of the binder-frame, the finger projecting laterally from said support under the arm from the trip-shaft, means whereby said sleeve is permitted a limited play about its supporting-shaft, and a spring holding it resistingly against such play, that as the grain is packed against the trip-finger it may yield and overcome the spring, carrying the lateral arm or finger out from beneath the arm from the trip-shaft, and then be taken around to come up on the other side of said arm in the ensuing revolution of its supporting-shaft.

8. The combination, substantially as hereinbefore set forth, with the trip-finger carried upon the inner end of the shaft in the subtending arm of the binder-frame, the trip-shaft extending alongside and parallel with said subtending frame-arm to the inner end of the shaft which the latter carries, the arm from the inner end of said trip-shaft, and the sleeve encircling the inner end of the subtending shaft where

it projects from the frame-arm and carrying the trip-finger, of the discharge-arm projecting rigidly from the other side of said sleeve, whereby as the trip-lever is carried around after starting the binder the discharge-arm is brought up into its place to eject the bound sheaf, and then returns beneath the binder as the trip-lever comes up to its initial position.

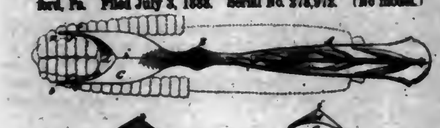
9. The combination, substantially as hereinbefore set forth, with the driving-dog, trip-latch, trip-shaft, and its arm, and with the subtending shaft of the binder, of the sleeve K, tangential supporting-bar K^3, the trip-lever K^2, supported upon and adjustable along said tangential supporting-bar, the spring L, and a device for adjusting the stress of said spring.

10. The combination, substantially as hereinbefore set forth, with the tyer-shaft, of a knotter-stock fixed thereto to revolve therewith, a tying-bill carried by said stock, and means whereby said bill is rotated upon its own axis during a portion of the revolution of the stock.

11. The combination, substantially as hereinbefore set forth, with the tyer-shaft and with the revolving knotter-stock carried thereby, of the tyer-spindle set obliquely in said stock, the pinion and delay-shoe on one end of said spindle, a segment-gear and delay-flange so cared to the binder-frame, with which said pinion and shoe engage, the tying-bill at the head of said spindle, and a cam carried by the revolving stock, with which the heel of the pivoted jaw engages as the bill is rotated to open said jaw.

12. The combination, substantially as hereinbefore set forth, with the tyer-shaft and the revolving stock mounted thereon, of the tyer-spindle, the tying-bill at the head thereof, the stationary holder, and means whereby the tyer-spindle is rotated to form the knot as it is approaching the holder, and stopped in its individual rotation with the jaws trending toward the holder immediately after it passes thereby to strip and tighten the knot as the stock continues to revolve.

13. The combination, substantially as hereinbefore set forth, with the tyer shaft and the revolving stock mounted thereon, of the obliquely-set tyer-spindle, the tying-bill at the head thereof, the stationary holder, and means whereby the tyer-spindle is rotated to form the knot as it is approaching the holder, and stopped in its individual rotation with the jaws trending toward the holder immediately after it passes thereby to strip and tighten the knot as the stock continues to revolve.

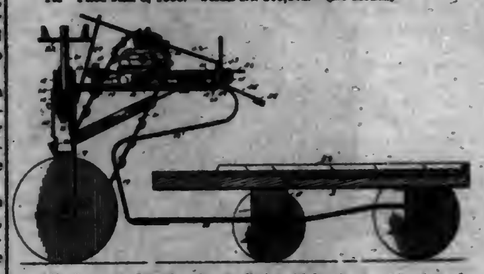


14. The combination, substantially as hereinbefore set forth, of the tyer-shaft, the revolving tyer-stock carried thereby, the tying-bill mounted in said stock, the stationary holder comprising a notched disk and shoe, the Geneva stop-pinion upon the holder-spindle, and the delay-flange and tooth upon the revolving knotter-stock engaging with said pinion to actuate the holder.

15. The combination, substantially as hereinbefore set forth, with the revolving knotter-stock and the tying-bill carried thereby, of the stationary holder and the cord-stop between said holder and the knotter, whereby the cord-strands are retained in position to pass between the open jaws of the tying-bill as it approaches the holder.

16. The combination, substantially as hereinbefore set forth, with the revolving knotter-stock and tying-bill carried thereby, of the knife mounted upon said stock above the crown of the tying-bill, projecting across the plane in which the cord is laid by the binder-arm, and serving to retain the cord-strands prior to the knotting movement.

17. The combination, substantially as hereinbefore set forth, with the tying-bill, the revolving stock in which it is mounted, and the stationary holder, of the knife carried by said stock above the crown of the tying-bill and projecting across the plane in which the cord is laid by the binder-arm, and having a notch in its shank to receive the spool-strand as it passes the holder and deflect it into position to spring beneath the chin of the knotter.



399,109. TABLE-KNIFE FOR GREEN CORN. JESSE F. WYNKOOP, Brooklyn, N. Y., assignor of one-half to Alonzo I. Wilcox, Bradford, Pa. Filed July 3, 1888. Serial No. 278,972. (No model.)

Claim.—1. The table-knife for green corn, consisting of the handle A and the body C, the body being concave on its under side and having at its end the forwardly-extending tines *a b* and the continuous cutting-edges *d f*, substantially as shown and described.

2. The table-knife for green corn, consisting of the handle A and body C, the latter having the concave under surface and oppositely-beveled upper surface, and having also at its end the forwardly-extending tines *a b* and cutting-edges *d e f*, substantially as shown and described.

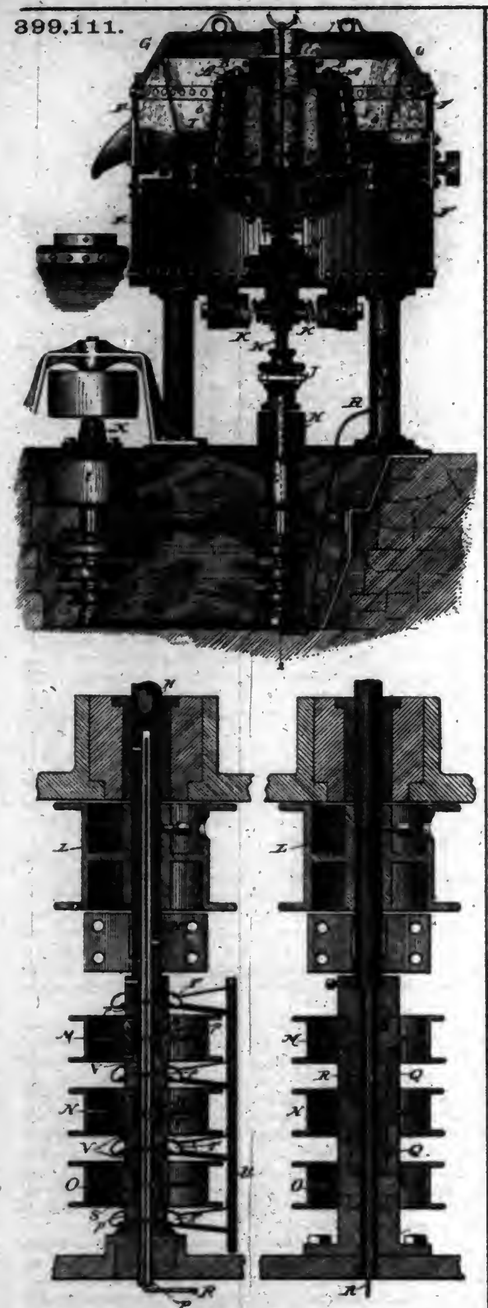
399,110. HAND-PROPELLED VEHICLE. CYRUS YINGST, Annville, Pa. Filed Jan. 2, 1889. Serial No. 295,172. (No model.)

Claim.—1. In a hand-propelled vehicle, the combination of a vertical fork carrying a steering-wheel, a supplemental frame secured rigidly to the fork, a hanger pivotally connected to the fork and rigidly connected to a pivoted front axle, a bed, devices for detachably locking the supplemental frame to the hanger, and a driving-shaft journaled in the supplemental frame and connected to the axle of the steering-wheel, substantially as and for the purpose described.

2. In a hand-propelled vehicle, the combination of a bed having a pivoted front axle, a vertical fork having a rigid cross-head at its upper end and a steering-wheel journaled in its lower end, a supplemental frame rigidly secured to the cross-head, a hanger secured at one end to the front axle of the bed and having a horizontal arm arranged beneath the supplemental frame and pivoted to the cross-head, a device for adjustably and detachably locking the supplemental frame to the arm of the hanger, and a power-shaft journaled in the supplemental frame and gearing to the axle of the steering-wheel, substantially as and for the purpose described.

3. In a hand-propelled vehicle, the combination of a bed having a pivoted front axle, a vertical fork carrying a steering-wheel, a cross-head rigidly secured to the upper end of the fork, a hanger rigidly secured to the front axle of the bed and having a horizontal perforated arm pivoted to the cross-head, a supplemental frame rigidly secured to the cross-head and provided with a notched rear bar, which rests on the horizontal arm of the hanger, a latch pivoted to the arm of the hanger and having a prong adapted to enter one of the notches and the aperture of the supplemental frame and hanger-arm, respectively, and a power-shaft journaled in the supplemental frame and geared to the shaft of the steering-wheel, substantially as and for the purpose described.

4. In a hand-propelled vehicle, the combination of a bed having a front axle, a vertical fork carrying a steering-wheel and a cross-head, a hanger pivoted to the cross-head and rigidly secured to the front axle, a supplemental frame secured to the cross-head, a horizontal plate secured to the rear end of the supplemental frame and having the sockets for the reception of the knees of the occupant of the vehicle, and a locking device for detachably connecting said supplemental frame to the hanger, substantially as and for the purpose described.



5. In a hand-propelled vehicle, the combination of a bed having a pivoted front axle, a vertical fork carrying a cross-head, a steering-wheel rotatively mounted in the lower end of the fork and having gear-wheels provided on its extended ends, a supplemental frame rigidly secured to the cross-head, a transverse bar secured to the fork above the axle of the steering-wheel, inclined braces secured to the ends of said transverse bar and the rear end of the frame, a power-shaft journaled in the supplemental frame and having gear-wheels at its ends, which are connected with the similar wheels on the shaft of the steering-wheel by intermediate chains, and a hanger rigidly secured to the front axle and pivoted to the cross-head, substantially as and for the purpose described.

6. In a hand-propelled vehicle, the combination, with an adjustable swinging frame carrying the driving mechanism, of a table arranged above said frame and the devices supported thereon, and vertical standards secured to the swinging frame and the front end of the table for supporting the latter in an inclined position.

399,111. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMUS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Nov. 24, 1886. Serial No. 201,594. (No model.)

Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revolubie receiving-vessel adapted to receive molten material to be treated, comprising a surrounding shell or case and a lining of an exterior size and shape to fit the interior of the surrounding shell or case, and provided with a neck or mouth separable from the main portion of the lining and removable from the surrounding

399,111.

shell or case, and means for revolving said vessel, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination, of a revoluble receiving-vessel adapted to receive molten material to be treated, comprising a surrounding shell or case and a lining of an exterior size and shape to fit the interior of the surrounding shell or case, and provided with channels, grooves, or indentations to diminish the surface-contact between the lining and the shell or case, and provided with a neck or mouth separable from the main portion of the lining and removable from the surrounding shell or case, and means for revolving said vessel, substantially as described.

3. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, an incasing cover or envelope of wire wrapped or coiled around said vessel, and means for revolving said vessel, substantially as described.

4. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated and separable in the plane of its largest diameter, an incasing cover or envelope of wire wrapped or coiled around said vessel, and means for rotating said vessel, substantially as described.

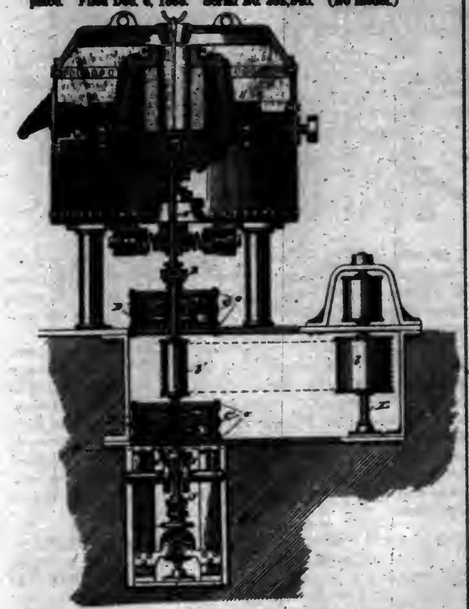
5. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, comprising a surrounding shell or case provided with an incasing cover or envelope of wire wrapped or coiled around said shell or case, and a lining of an exterior size and shape to fit the interior of the surrounding shell or case, and means for revolving said vessel, substantially as described.

6. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated and separable in the plane of its largest diameter, comprising a surrounding shell or case provided with an incasing cover or envelope of wire wrapped or coiled around said shell or case, and a lining of an exterior size and shape to fit the interior of the surrounding shell or case, and means for revolving said vessel, substantially as described.

7. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, comprising a surrounding shell or case provided with an incasing cover or envelope of wire wrapped or coiled around said shell or case, and a lining of an exterior size and shape to fit the interior of the surrounding shell or case, and provided with channels, grooves, or indentations to diminish the surface-contact between the lining and the shell or case, substantially as described.

8. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated and separable in the plane of its largest diameter, comprising a surrounding shell or case provided with an incasing cover or envelope of wire wrapped or coiled around said shell or case, and a lining of an exterior size and shape to fit the interior of the surrounding shell or case, and provided with channels, grooves, or indentations to diminish the surface-contact between the lining and the shell or case, and means for revolving said vessel, substantially as described.

9. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive the molten material to be treated, comprising a surrounding shell or case having an incasing cover or envelope of wire wrapped or coiled around said shell or case, and a lining of an exterior size and shape to fit the interior of the surrounding shell or case, and provided with a neck or mouth separable from the main portion of the lining and removable from the shell or case, and means for revolving said vessel, substantially as described.



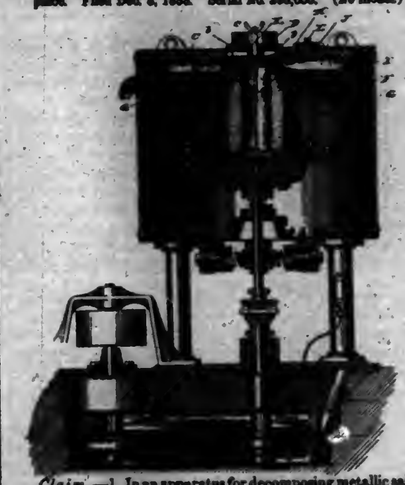
10. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive the molten material to be treated, a bottom in said vessel composed of refractory material or material capable of withstanding great heat in that spot where the molten material falls, a removable ring or collar forming the outer rim of the bottom and extending from the central portion of refractory material to the sides of the receiving-vessel and separable therefrom, and means for revolving said vessel, substantially as described.

11. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive the molten material to be treated and a surrounding curb having an incasing cover or envelope of wire wrapped or coiled around said curb, substantially as described.

12. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive the molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a divided bearing for the lower end or portion of the actuating-shaft, comprising a stationary section and a number of sections respectively rotatable in the direction of the rotation of the actuating-shaft, such sections being provided with sockets and hubs, the hubs fitting and rotating in the sockets, whereby the various sections are maintained in their vertical position, and means for rotating the actuating-shaft, substantially as described.

13. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive the molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves and having a hollow perforated lower extension diminished in diameter, a divided bearing for the lower end or portion of the actuating-shaft, comprising a number of sections with a hole through them receiving the hollow lower diminished extension of the actuating-shaft and being respectively rotatable in the direction of the rotation of the actuating-shaft, a pipe entering said hollow diminished extension and introducing oil therein, and means for rotating the actuating-shaft, substantially as described.

399,112. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMUS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Dec. 6, 1883. Serial No. 302,840. (No model.)



Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a divided bearing for supporting the actuating-shaft and its superimposed load, comprising two sets of vertical wheels arranged in suitable bearings, and two horizontal disks arranged on the actuating-shaft and rotating as it revolves, and resting upon the upper peripheries of the vertical wheels and rotating them, and means for rotating the actuating-shaft, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a divided bearing for supporting the actuating-shaft and its superimposed load, comprising two sets of vertical wheels arranged in suitable bearings, and two horizontal disks arranged on the actuating-shaft and rotating as it revolves, and resting upon the upper peripheries of the vertical wheels and rotating them, a spring arranged on the actuating-shaft above the second disk, with its upper end against a collar or stop, and the second disk movable vertically, and means for rotating the actuating-shaft, substantially as described.

3. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, one or more journal-boxes maintaining the actuating-shaft in a vertical position, containing wheels or rollers which bear against the surface of the actuating-shaft and rotate with it, a divided bearing for supporting the actuating-shaft and its superimposed load, comprising two sets of vertical wheels arranged in suitable bearings and two horizontal disks arranged on the actuating-shaft and rotating as it revolves, and resting upon the upper peripheries of the vertical wheels and rotating them, a spring arranged on the actuating-shaft above the second disk, with its upper end against a collar or stop, and the second disk movable vertically, and means for rotating the actuating-shaft, substantially as described.

4. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, and comprising a flexible or laterally-vibratable upper portion and a rigidly-journaled lower portion, a laterally-yieldable journal for maintaining a flexible or laterally-vibratable upper portion of the actuating-shaft in a vertical position, one or more journal-boxes for maintaining the rigidly-journaled lower portion of the actuating-shaft in a vertical position, containing wheels or rollers which bear against the surface of the actuating-shaft and rotate with it, a divided bearing for supporting the actuating-shaft and its superimposed load, comprising two sets of vertical wheels arranged in suitable bearings, and two horizontal disks arranged on the actuating-shaft and rotating as it revolves, and resting upon the upper peripheries of the vertical wheels and rotating them, a spring arranged on the actuating-shaft above the second disk, with its upper end against a collar or stop, and the second disk movable vertically, and means for rotating the actuating-shaft, substantially as described.

399,113. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMUS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Dec. 8, 1883. Serial No. 303,055. (No model.)

Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, having its contracted neck or mouth lined with refractory material capable of withstanding great heat, a cover for the neck or mouth of the receiving-vessel, with space between the cover and the neck or mouth to permit the discharging material to escape therefrom, and means for rotating the receiving-vessel, substantially as described.

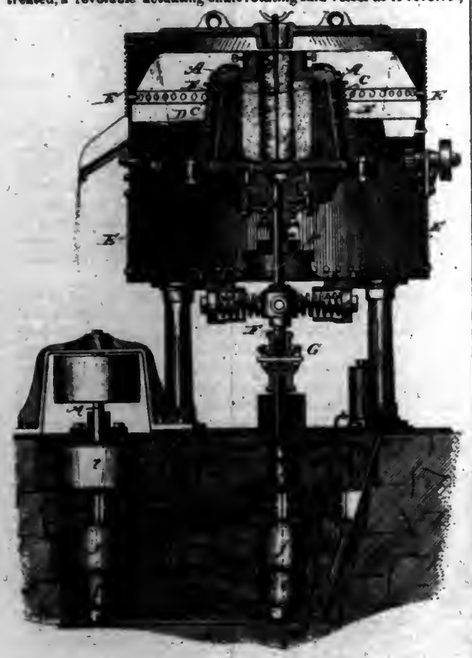
2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, having its contracted neck or mouth lined with refractory material capable of withstanding great heat, a cover over the neck or mouth of the receiving-vessel, adjustable up or down to increase or diminish the space between the cover and the neck or mouth, through which the material is discharged, and means for rotating the receiving-vessel, substantially as described.

3. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a cover over the neck or mouth of the receiving-vessel, with space between the cover and the neck or mouth to permit the discharging material to escape therefrom, a removable spout directing the molten material, preferably, into the center of the neck or mouth of the receiving-vessel, and means for rotating the receiving-vessel, substantially as described.

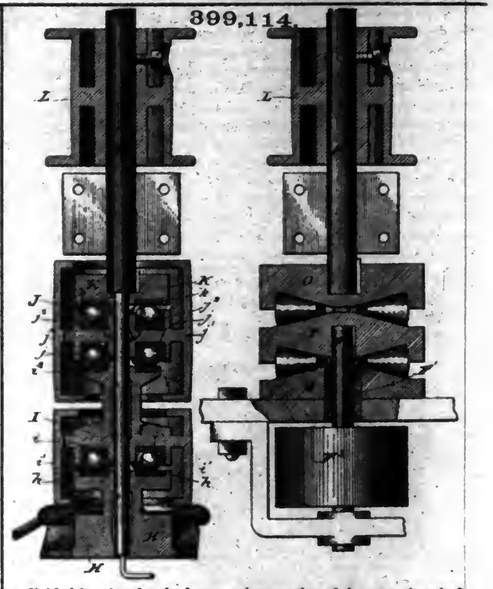
4. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be

treated, a cover over the neck or mouth of the receiving-vessel, with space between the cover and the neck or mouth to permit the discharging material to escape therefrom, a removable spout directing the molten material, preferably, into the center of the neck or mouth of the receiving-vessel, a bowl surrounding the removable spout, and means for rotating the receiving-vessel, substantially as described.

5. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a removable annular tub surrounding the same and adapted to receive molten material discharged from the mouth of the receiving-vessel, and means for rotating the receiving-vessel, substantially as described.



6. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a removable annular tub surrounding the same and adapted to receive the molten material discharged from the mouth of the receiving-vessel, and provided with a space in its walling, into and through which a blast or current of air may be passed and heated by the molten material discharged into the tub, and means for rotating the receiving-vessel, substantially as described.

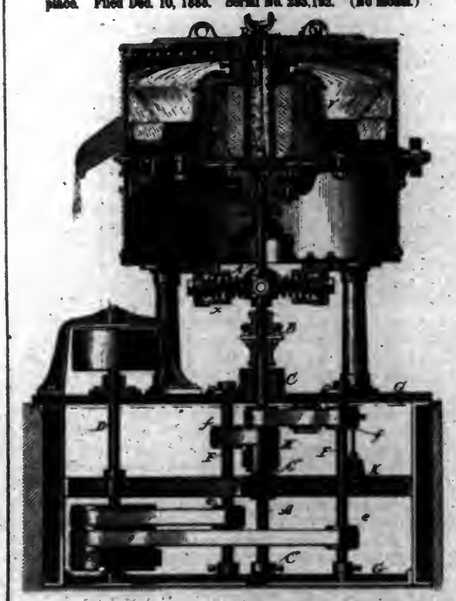


7. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a series of pipes arranged over the same and in proximity to the molten material discharged from the mouth of the receiving-vessel, and means for rotating the receiving-vessel, substantially as described.

399,114. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Nov. 26, 1888. Serial No. 293,191. (No model.)

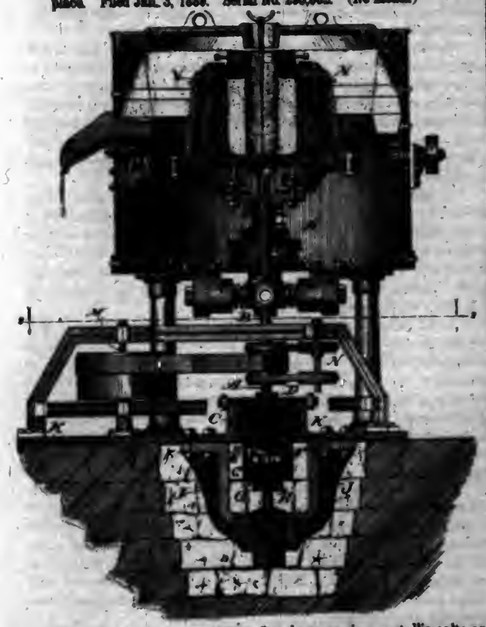
Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, comprising a surrounding shell or case provided with an incasing cover or envelope of wire wrapped or coiled around the same, and a lining having an exterior of a size and shape to admit it to the interior of the surrounding shell or case, and a non-heat-conducting packing interposed between the lining and the surrounding shell or case, and means for rotating the receiving-vessel, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves,



a divided bearing for the lower end or portion of the actuating-shaft, comprising a number of sections respectively rotatable in the direction of the rotation of the actuating-shaft, with balls or rollers interposed between the sections of the bearing, and means for rotating the actuating-shaft, substantially as described.

3. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a divided bearing for the lower end or portion of the actuating-shaft, comprising a number of sections respectively rotatable in the direction of the rotation of the actuating-shaft, with balls or rollers interposed between the sections of the bearing, and means for rotating the actuating-shaft and the rotatable sections of the bearing, substantially as described.



399,115. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Dec. 10, 1888. Serial No. 293,192. (No model.)

Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft carrying said vessel and its superimposed load and rotating them as it revolves, one or more counter-shafts with belts drawing against the actuating-shaft from different lateral directions and maintaining it in a vertical position while carrying and rotating the receiving-vessel and its superimposed load, and means for rotating one or more of said shafts, whereby all are rotated, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft carrying said vessel and its superimposed load and rotating them as it revolves, one or more counter-shafts, with belts drawing against the actuating-shaft from different lateral directions and maintaining it in a vertical position while carrying and rotating the receiving-vessel and its superimposed load, means for severally tightening and maintaining the tension of the connecting-belts, and means for rotating one or more of said shafts, whereby all are rotated, substantially as described.

399,116. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,962. (No model.)

Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a flexible journal for the lower portion of the actuating-shaft conforming to the lateral vibrations of the shaft, a vibratable bed supporting the weight of the actuating-shaft and its superimposed load, balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating vibratable bed, and means for rotating the actuating-shaft, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a flexible journal for the lower portion of the actuating-shaft conforming to the lateral vibrations of the shaft, a box or frame depending from the flexible journal and vibrating in unison therewith, a vibratable bed in the lower end of such box or frame supporting the weight of the actuating-shaft and its superimposed load, balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating vibratable bed, and means for rotating the actuating-shaft, substantially as described.

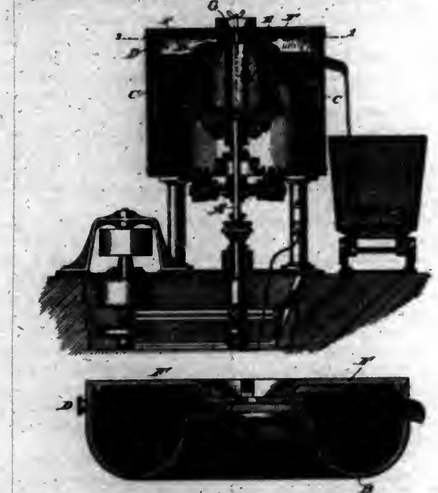
3. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a flexible journal for the lower portion of the actuating-shaft conforming to the lateral vibrations of the shaft, a vibratable bed supporting the weight of the actuating-shaft and its superimposed load and vibrating in unison with the vibrations of the flexible journal, balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating vibratable bed, a center or stud arranged beneath the vibratable bed, wholly or partially sustaining it, a stationary bed supporting the center or stud, and means for rotating the actuating-shaft, substantially as described.

4. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a flexible journal for the lower portion of the actuating-shaft conforming to the lateral vibrations of the shaft, a vibratable bed supporting the weight of the actuating-shaft and its superimposed load and vibrating in unison with the vibrations of the flexible journal, balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating vibratable bed, a center or stud arranged beneath the vibratable bed, wholly or partially sustaining it, a stationary vertically-adjustable bed supporting the center or stud, and means for rotating the actuating-shaft, substantially as described.

5. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a flexible journal for the lower portion of the actuating-shaft conforming to the lateral vibrations of the shaft, a vibratable bed supporting the weight of the actuating-shaft and its superimposed load and vibrating in unison with the vibrations of the flexible journal, balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating vibratable bed, a center or stud arranged beneath the vibratable bed, wholly or partially sustaining it, a stationary vertically-adjustable bed supporting the center or stud, and means for rotating the actuating-shaft, substantially as described.

6. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a flexible journal for the lower portion of the actuating-shaft conforming to the lateral vibrations of the shaft, a vibratable bed supporting the weight of the actuating-shaft and its superimposed load and vibrating in unison with the vibrations of the flexible journal, balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating vibratable bed, a center or stud arranged beneath the vibratable bed, wholly or partially sustaining it, a stationary vertically-adjustable bed supporting the center or stud, and means for rotating the actuating-shaft, substantially as described.

7. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a flexible journal for the lower portion of the actuating-shaft conforming to the lateral vibrations of the actuating-shaft, a vibratable bed supporting the weight of the actuating-shaft and its superimposed load, sets of balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating vibratable bed, with a rotatable block interposed between the sets of balls or rollers, and means for rotating the actuating-shaft, substantially as described.



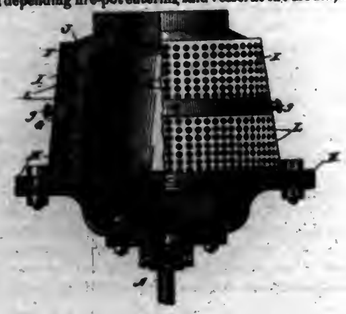
8. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a divided bearing for the lower end of the actuating-shaft comprising sets of balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating bed, with a loose rotatable block interposed between the sets of balls or rollers, and means for rotating the actuating-shaft, substantially as described.

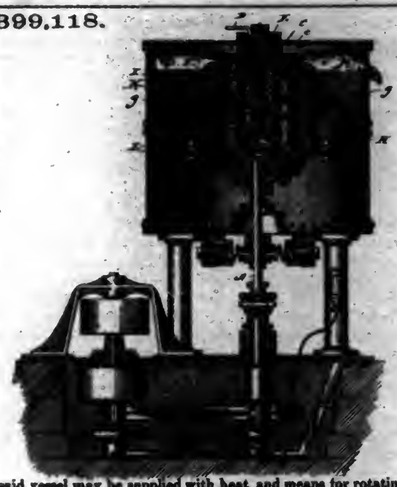
9. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a vibratable bed supporting the weight of the actuating-shaft and its superimposed load, a divided bearing for the lower end of the actuating-shaft comprising sets of balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating bed, with a rotatable block interposed between the sets of balls or rollers, and means for rotating the actuating-shaft, substantially as described.

10. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revolable receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a divided bearing for the lower end of the actuating-shaft comprising sets of balls or rollers interposed between the rotating head of the actuating-shaft and their non-rotating bed, with a rotatable block

interposed between the sets of balls or rollers, a power-shaft and one or more counter-shafts whose belts connect with the actuating-shaft and draw against it from different lateral directions, and means for rotating the actuating-shaft, substantially as described.

399,117. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,363. (No model.)





Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, an annular tub surrounding the same and adapted to receive the molten material discharged from the mouth of the receiving-vessel, a removable cover for such tub to retain the heat of the molten material therein, a revoluble actuating-shaft rotating the receiving-vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revolable receiving-vessel adapted to receive molten material to be treated, an annular tub surrounding the same and adapted to receive the molten material discharged from the mouth of the receiving-vessel, a removable cover for such tub to retain the heat of the molten material therein having a depressed central portion forming a cover over the neck or mouth of the receiving-vessel, with space between the cover and the neck or mouth to permit the discharging material to escape therefrom, whereby the heat in the receiving-vessel is largely retained, a revoluble actuating-shaft rotating the receiving-vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

399,118. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,364. (No model.)

Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a depending fire-pot entering said vessel at the mouth, whereby

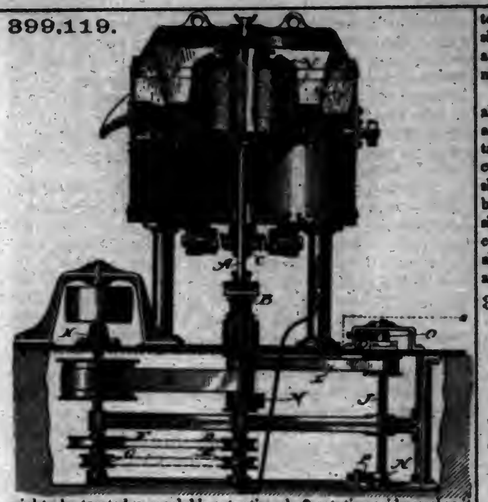
said vessel may be supplied with heat, and means for rotating the actuating-shaft, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a depending fire-pot entering said vessel at the mouth and provided with a hole or opening through it for the admission of molten material to said vessel, and means for rotating the actuating-shaft, substantially as described.

3. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a cover or envelope of wire wrapped or coiled around said vessel, a covering or jacket protecting the wire, a revoluble actuating-shaft rotating said vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

4. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a cover or envelope of wire wrapped or coiled around said vessel, a covering or jacket protecting the wire and provided with holes or perforations to admit air to the wire and permit the cooling of the exterior of the receiving-vessel, a revoluble actuating-shaft rotating said vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

5. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a ring or shoulder around the receiving-vessel affording a stop for the upper coils of wire, a cover or envelope of wire wrapped or coiled around said vessel, a revoluble actuating-shaft rotating said vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

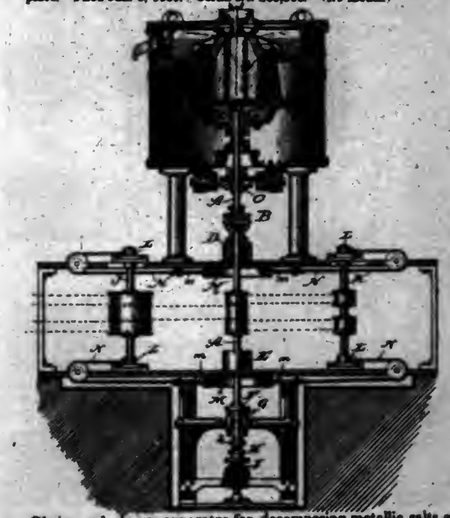


6. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a band or hoop around the receiving-vessel enabling it to be removed or handled, a cover or envelope of wire wrapped or coiled around said vessel, a revoluble actuating-shaft rotating said vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

7. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, said vessel being specially re-enforced or strengthened at the base or angle of its shell or case, a cover or envelope of wire wrapped or coiled around said vessel, a revoluble actuating-shaft rotating said vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

399,119. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,365. (No model.)

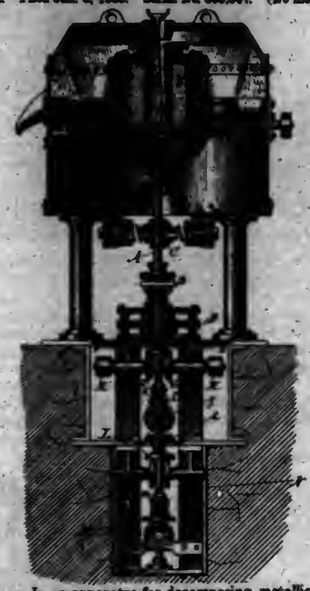
Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten mate-



399,119.

rial to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a bearing for the lower end or portion of the actuating-shaft, a counter-shaft adjustable toward or from the actuating-shaft to regulate the tension of its belt, and with its belt drawing against the actuating-shaft in opposition to the power-shaft to counteract or counterbalance lateral strain, and means for rotating the actuating-shaft and the sections of its bearing, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a bearing for the lower end or portion of the actuating-shaft, comprising a number of sections respectively rotatable in the direction of the rotation of the actuating-shaft, a counter-shaft adjustable toward or from the actuating-shaft to regulate the tension of its belt, with yieldable means for adjusting and sustaining it in proper position, and with its belt drawing against the actuating-shaft in opposition to the power-shaft to counteract or counterbalance lateral strain, and means for rotating the actuating-shaft and the sections of its bearing, substantially as described.

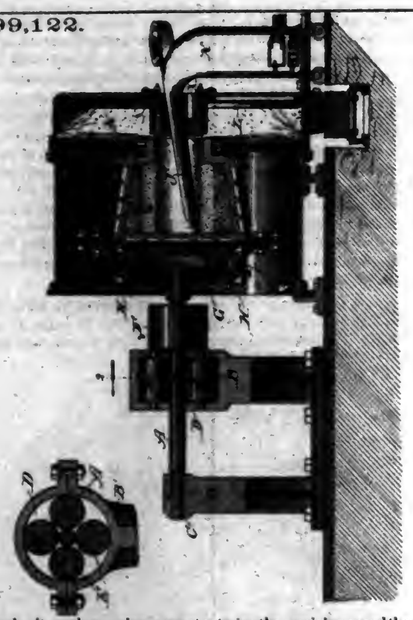


399,120. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,366. (No model.)

Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating in a loose journal-box and rotating said vessel as it revolves, one or more counter-shafts with their belts drawing against the actuating-shaft in opposition to the power-shaft to counteract or counterbalance lateral strain and to maintain the actuating-shaft vertical in its loose journal, and means for rotating the actuating-shaft, substantially as described.

2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, counter and power shafts adjustable toward and from the actuating-shaft to regulate and equalize the tension of their belts, and with the belt of the counter-shaft drawing against the actuating-shaft in opposition to the power-shaft, means for effecting the adjustment of the counter and power shafts, consisting of a connection holding them apart against the strain of their belts, and means for rotating the actuating-shaft, substantially as described.

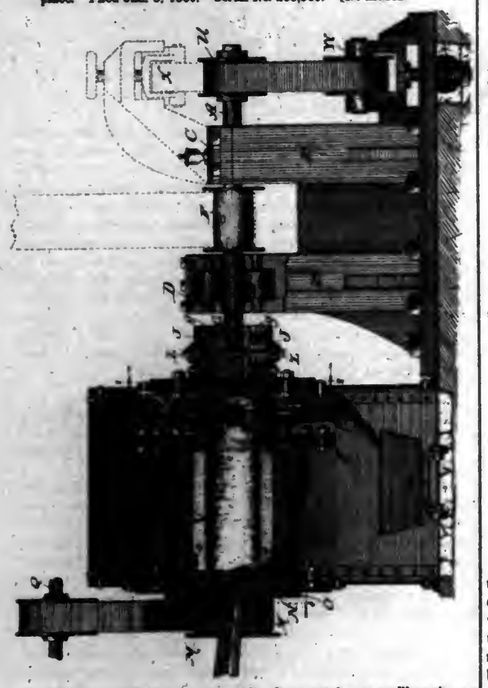
399,121. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,367. (No model.)



Claim.—In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a revoluble receiving-vessel adapted to receive molten material to be treated, a revoluble actuating-shaft rotating said vessel as it revolves, a bearing for supporting the actuating-shaft and its superimposed load, comprising vertical wheels arranged in suitable bearings and a horizontal disk arranged on the actuating-shaft and rotating as it revolves and resting upon the upper peripheries of the vertical wheels, a spring arranged on the actuating-shaft above the disk, with its upper end against a vertically-adjustable collar or stop, whereby the tension of the spring may be increased or diminished, and means for rotating the actuating-shaft, comprising a rotating frictional surface bearing against the frictional surface on the actuating-shaft and rotating it, substantially as described.

399,122. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,368. (No model.)

Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a horizontal revoluble receiving-vessel adapted to receive molten material to be treated, a horizontal revoluble actuating-shaft rotating said vessel as it revolves, a pipe or spout entering the receiving-vessel through its mouth and discharging the molten material to be treated into the receiving-vessel at or near its farther end, means for supplying heat to the interior of the receiving-vessel, and means for rotating the actuating shaft, substantially as described.

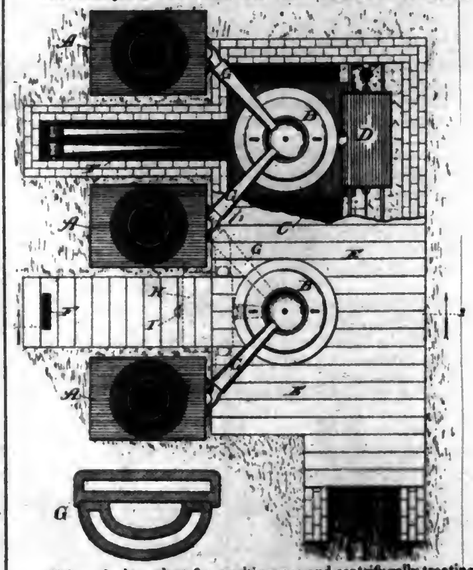


2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a horizontal revoluble receiving-vessel adapted to receive molten material to be treated, a horizontal revoluble actuating-shaft rotating said

399,122.

vessel as it revolves, a pipe or spout entering the receiving-vessel through its mouth and discharging the molten material to be treated into the receiving-vessel at or near its farther end, a plate or cover before the mouth of the receiving-vessel, with space between the plate or cover and the mouth of the receiving-vessel for the discharge of the molten material thrown off by the action of centrifugal force, and means for rotating the actuating-shaft, substantially as described.

399,123. APPARATUS FOR USE IN DECOMPOSING METALLIC SALTS AND DESULPHURIZING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,369. (No model.)



Claim.—1. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a horizontal revoluble receiving-vessel adapted to receive molten material to be treated, and having a mouth at one end through which the molten material is introduced and an annular extension at the other, having its interior of less diameter than the interior of the receiving-vessel, containing one or more openings in its walls through which the material thrown off by the action of centrifugal force is discharged, a horizontal revoluble actuating-shaft rotating said vessel as it revolves, and means for rotating the actuating-shaft, substantially as described.

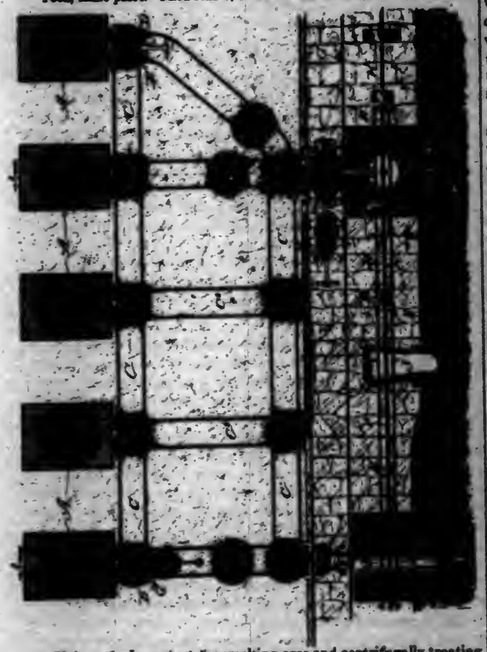
2. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a horizontal revoluble receiving-vessel adapted to receive molten material to be treated, and having a mouth at one end through which the molten material is introduced and an annular extension at the other, having its interior of less diameter than the interior of the receiving-vessel, closed at its outer end, and containing one or more openings in its walls through which the material thrown off by the action of centrifugal force is discharged, a horizontal revoluble actuating-shaft rotating said vessel as it revolves, a yieldable connection between the actuating-shaft and the receiving-vessel to accommodate the vibrations of the latter, and means for rotating the actuating-shaft, substantially as described.

3. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a horizontal revoluble receiving-vessel adapted to receive molten material to be treated and having a mouth at one end through which the molten material is introduced, a horizontal revoluble actuating-shaft rotating said vessel as it revolves, a counter-balance device to counterbalance the weight of the receiving-vessel and its load, and means for rotating the actuating-shaft, substantially as described.

4. In an apparatus for decomposing metallic salts or salts of metals and desulphurizing ores when in a molten state, the combination of a horizontal revoluble receiving-vessel adapted to receive molten material to be treated and having a mouth at one end through which the molten material is introduced, a horizontal revoluble actuating-shaft rotating said vessel as it revolves, a bearing for the actuating-shaft, comprising a number of wheels or rollers bearing against the actuating-shaft and rotating as it rotates, a counter-balance device to counterbalance the weight of the receiving-vessel and its load, and means for rotating the actuating-shaft, substantially as described.

399,124. PLANT FOR USE IN SMELTING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,370. (No model.)

Claim.—1. In a plant for smelting ores and centrifugally treating the resulting materials, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, pipes, spouts, or conduits connecting the smelting-furnace with the receiving-vessel, through which the molten material to be treated may be flowed into the same, and means for rotating such receiving-vessel, substantially as described.



2. In a plant for smelting ores and centrifugally treating the resulting materials, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, pipes, spouts, or conduits connecting the smelting-furnace with the receiving-vessel, through which the molten material to be treated may be flowed into the same, a precipitating-receiver intermediate the smelting-furnace and the receiving-vessel, into which the heaviest particles of the molten material may settle, and means for rotating the receiving-vessel, substantially as described.

3. In a plant for smelting ores and centrifugally treating the resulting materials, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and arranged in an excavation bringing the mouth of the receiving-vessel below the tapping-point of the smelting-furnace, pipes, spouts, or conduits connecting the smelting-furnace with the receiving-vessel, through which the molten material to be treated may be flowed into the same, and means for rotating such receiving-vessel, substantially as described.

4. In a plant for smelting ores and centrifugally treating the resulting materials, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and arranged in an excavation, bringing the mouth of the receiving-vessel below the tapping-point of the smelting-furnace, a passage to the excavation containing the centrifugal apparatus, a floor or covering over such passage, pipes, spouts, or conduits connecting the smelting-furnace with the receiving-vessel, through which the molten material to be treated may be flowed into the same, and means for rotating such receiving-vessel, substantially as described.

5. In a plant for smelting ores and centrifugally treating the resulting materials, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and arranged in an excavation, bringing the mouth of the receiving-vessel below the tapping-point of the smelting-furnace, branch excavations or conduits affording facilities for the introduction of the means for rotating vessel, pipes, spouts, or conduits connecting the smelting-furnace with the receiving-vessel, through which the molten material to be treated may be flowed into the same, and means for rotating such receiving-vessel, substantially as described.

399,125. PLANT FOR USE IN SMELTING ORES. PHINEAS H. ADAMS, Jr., and ORSEMAS T. X. ADAMS, Chicago, Ill., assignors to Melinda Peck, same place. Filed Jan. 3, 1889. Serial No. 295,371. (No model.)

Claim.—1. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, a car or conveyer for carrying the molten material to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

2. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, a car or conveyer for carrying the molten material to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

3. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, an intermediate precipitating-vessel to catch and retain the heaviest particles of the material treated, a car or conveyer for carrying the molten material to the centrifugal apparatus, and means for rotating the receiving-vessels, substantially as described.

4. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, an intermediate precipitating-vessel to catch and retain the heaviest particles of the material treated, a car or conveyer for carrying the molten material to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

5. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, an intermediate storage-vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

6. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, an intermediate storage-vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

7. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, an intermediate vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, said vessel being arranged on a plane intermediate that of the smelting-furnace and the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

8. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, an intermediate vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, said vessel being arranged on a plane intermediate that of the smelting-furnace and the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

9. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, a track or way leading from the smelting-furnace to the centrifugal apparatus, a car or conveyer for conveying the molten material along the track or way to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

10. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated,

the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, a track or way leading from the smelting-furnace to the centrifugal apparatus, a car or conveyer for conveying the molten material along the track or way to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

11. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, a track or way leading from the smelting-furnace to the centrifugal apparatus, a turn-table arranged in the track or way to facilitate the turning of a car or conveyer or transferring it from the track, a car or conveyer for carrying the molten material along the track or way to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

12. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, a track or way leading from the smelting-furnace to the centrifugal apparatus, a turn-table arranged in the track or way to facilitate the turning of a car or conveyer or transferring it from the track, a car or conveyer for carrying the molten material along the track or way to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

13. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, an intermediate storage-vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, a car for receiving and carrying away the material discharged from the receiving-vessel by the action of centrifugal force, and means for rotating the receiving-vessel, substantially as described.

14. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, an intermediate storage-vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, a car for receiving and carrying away the material discharged from the receiving-vessel by the action of centrifugal force, and means for rotating the receiving-vessel, substantially as described.

15. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated, tracks or ways communicating with the smelting-furnaces and the centrifugal apparatuses permitting cars or conveyers carrying molten material to be run from the smelting-furnaces to the centrifugal apparatuses, cars or conveyers carrying the molten material along the tracks or ways to the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

16. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the material treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated and located on a lower plane than the smelting-furnaces, tracks or ways communicating with the smelting-furnaces and the centrifugal apparatuses permitting cars or conveyers carrying molten material to be run from the smelting-furnaces to the centrifugal apparatuses, cars or conveyers carrying the molten material along the tracks or ways to the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

17. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated the combination of a number of smelting-furnaces for reducing ore to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated, tracks or ways communicating with the smelting-furnaces and the centrifugal apparatuses, permitting cars or conveyers carrying molten material to be run from the smelting-furnaces to the centrifugal apparatuses, cars or conveyers carrying the molten material along the tracks or ways to the centrifugal apparatuses, a track or way arranged between the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatus to operate in connection therewith, and means for rotating the receiving-vessels, substantially as described.

18. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated and located on a lower plane than the smelting-furnaces tracks or ways communicating with the smelting-furnaces and the centrifugal apparatuses, permitting cars or conveyers carrying molten material to be run from the smelting-furnaces to the centrifugal apparatus, cars or conveyers carrying the molten material along the tracks or ways to the centrifugal apparatuses, a track or way arranged between the centrifugal apparatuses on a plane intermediate that of the smelting-furnaces and the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatus to operate in connection therewith, and means for rotating the receiving-vessels, substantially as described.

19. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated, tracks or ways communicating with the smelting-furnaces and the centrifugal apparatuses, permitting cars or conveyers carrying molten material to be run from the smelting-furnaces to the centrifugal apparatuses, cars or conveyers carrying the molten material along the tracks or ways to the centrifugal apparatuses, a track or way arranged between the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatus to operate in connection therewith, a car for receiving, carrying away, and disposing of the material treated by the action of centrifugal force, a track or way along which such car can move and communicate with the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

20. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated and located on a lower plane than the smelting-furnaces, tracks or ways communicating with the smelting-furnaces and the centrifugal apparatuses, permitting cars or conveyers carrying molten material to be run from the smelting-furnaces to the centrifugal apparatuses, cars or conveyers carrying the molten material along the tracks or ways to the centrifugal apparatuses, a track or way arranged between the centrifugal apparatuses on a plane intermediate that of the smelting-furnaces and the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatus to operate in connection therewith, a car for receiving, carrying away, and disposing of the material treated by the action of centrifugal force, a track or way along which such car can move and communicate with the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

21. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated, cars or conveyers for carrying the molten material to the centrifugal apparatuses, a track or way communicating with each of the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatus to operate in connection therewith, and means for rotating the receiving-vessels, substantially as described.

22. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated and located on a lower plane than the smelting-furnaces, cars or conveyers for carrying the molten material to the centrifugal apparatuses, a track or way communicating with each of the centrifugal apparatuses on a plane intermediate that of the smelting-furnaces and the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatus to operate in connection therewith, and means for rotating the receiving-vessels, substantially as described.

23. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated, cars or conveyers for carrying the molten material to the centrifugal apparatuses, a track or way communicating with each of the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatus to operate in connection therewith, a car for receiving, carrying away, and disposing of the material treated by the action of centrifugal force, a track or way along which such car can move and communicate with the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

24. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnaces, cars or conveyers for carrying the molten material to the centrifugal apparatuses, a track or way communicating with each of the centrifugal apparatuses on a plane intermediate that of the smelting-furnaces and the centrifugal apparatuses, a storage or precipitating vessel arranged on such track or way and movable thereon to any desired centrifugal apparatuses to operate in connection therewith, a car for receiving, carrying away, and disposing of the material treated by the action of centrifugal force, a track or way along which such car can move and communicate with the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

25. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, a car or conveyer for carrying the molten material to the centrifugal apparatus, a tramway overhanging the centrifugal apparatus, a derrick or tackle car movable along such tramway and adapted to raise and carrying the receiving-vessel to the place for emptying its contents, and means for rotating the receiving-vessel, substantially as described.

26. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated and located on a lower plane than the smelting-furnace, a car or conveyer for carrying the molten material to the centrifugal apparatus, a tramway overhanging the centrifugal apparatus, a derrick or tackle car movable along such tramway and adapted to raise and carry the receiving-vessel to the place for emptying its contents, and means for rotating the receiving-vessel, substantially as described.

27. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated, cars or conveyers for carrying the molten material to the centrifugal apparatuses, a tramway overhanging the centrifugal apparatus, a derrick or tackle car movable along such tramway and adapted to raise and carry the receiving-vessel to the place for emptying its contents, a car for receiving, carrying away, and disposing of the material treated by the action of centrifugal force, a track or way along which such car can move and communicate with the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

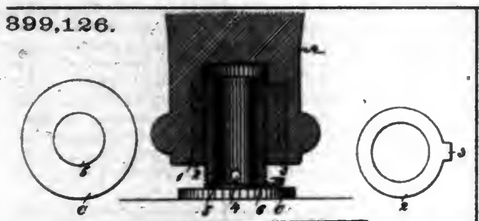
28. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a number of smelting-furnaces for reducing ores to a molten condition, a number of centrifugal apparatuses provided with revoluble receiving-vessels adapted to receive molten material to be treated and located on a lower plane than the smelting-furnaces, cars or conveyers for carrying the molten material to the centrifugal apparatuses, a tramway overhanging the centrifugal apparatus, a derrick or tackle car movable along such tramway and adapted to raise and carry the receiving-vessel to the place for emptying its contents, a car for receiving, carrying away, and disposing of the materials treated by the action of centrifugal force, a track or way along which such car can move and communicate with the centrifugal apparatuses, and means for rotating the receiving-vessels, substantially as described.

29. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and located in a trench, excavation, or depression, which wholly or partially receives it and which is provided with sufficient covering to afford a surface to permit operations over or about the top of the apparatus, a car or conveyer for carrying the molten material to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

30. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and located in a trench, excavation, or depression, which wholly or partially receives it and which is provided with sufficient covering to afford a surface to permit operations over or about the top of the apparatus, an intermediate precipitating-vessel to catch and retain the heaviest particles of the material treated, a car or conveyer for carrying the molten material to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

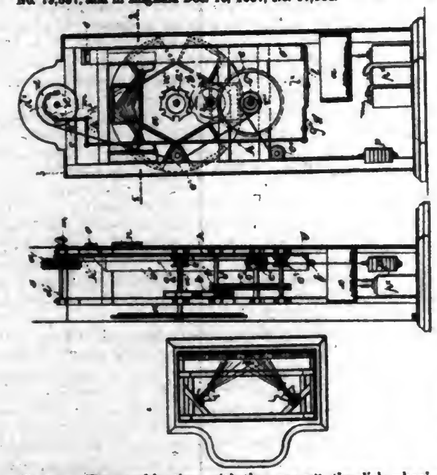
31. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and located in a trench, excavation, or depression, which wholly or partially receives it and which is provided with sufficient covering to afford a surface to permit operations over or about the top of the apparatus, an intermediate storage-vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.

32. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and located in a trench, excavation, or depression, which wholly or partially receives it and which is provided with sufficient covering to afford a surface to permit operations over or about the top of the apparatus, an intermediate vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, said vessel being arranged on a plane intermediate that of the smelting-furnace and the centrifugal apparatus, and means for rotating the receiving-vessel, substantially as described.



33. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and located in a trench, excavation, or depression, which wholly or partially receives it and which is provided with sufficient covering to afford a surface to permit operations over or about the top of the apparatus, an intermediate storage-vessel in which the molten material may be emptied or dumped in quantity and from which it may flow in a desired stream to the centrifugal apparatus, a car for receiving and carrying away the material discharged from the receiving-vessel by the action of centrifugal force, and means for rotating the receiving-vessel, substantially as described.

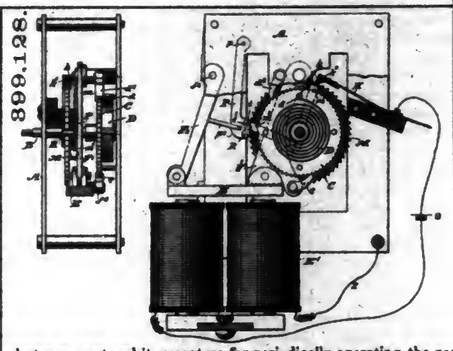
34. In a plant for smelting ores and centrifugally treating the resulting materials and handling and disposing of the materials treated, the combination of a smelting-furnace for reducing ores to a molten condition, a centrifugal apparatus provided with a revoluble receiving-vessel adapted to receive molten material to be treated, and located in a trench or excavation, which wholly or partially receives it and which is provided with sufficient covering to afford a surface to permit operations over or about the top of the apparatus, a car or conveyer for carrying the molten material to the centrifugal apparatus, a tramway overhanging the centrifugal apparatus, a derrick or tackle car movable along such tramway and adapted to raise and carry the receiving-vessel to the place for emptying its contents, and means for rotating the receiving-vessel, substantially as described.



399,126. DEVICE FOR LEVELING BILLIARD-TABLES. HENRY C. HENRY, Philadelphia, Pa. Filed Aug. 7, 1888. Serial No. 282,194. (No model.)

Claim.—A table-leveling device consisting of an interiorly-threaded bushing with vertical shoulder on the side thereof, a base-plate with shoulder on its upper face, and a screw-threaded stem having a recess on its lower edge and side openings, the latter for insertion of handles, said parts being combined substantially as described.

399,126.



399,127. **DEVICE FOR EXHIBITING PICTURES.** VICTOR BONNET, HIPPOLYTE LEMAGARAY, ARMAND RICHARD, and ALFRED RICHARD, Paris, France. Filed May 1, 1888. Serial No. 272,468. (No model.) Patented in France Dec. 10, 1887, No. 18,752; in Belgium Dec. 13, 1887, No. 79,897, and in England Dec. 16, 1887, No. 17,611.

Claim.—The combination, with the case $a^{\times}$, the disk-wheel a, mounted upon a shaft, a'', journaled within said case, the slotted wheel a', mounted upon the same shaft, the one-toothed wheel b, mounted on a shaft, b'', journaled within said case and engaging the slotted wheel a', the wheel b', mounted upon the same shaft with the wheel b and meshing into the wheel c, the wheel c, mounted upon a shaft, c'', journaled within said case and meshing into the wheel b', the wheel c', mounted upon the same shaft with the wheel c, the shaft d'', journaled within said case, the wheel d, mounted upon the shaft d'', the cord e, wrapped upon said wheel d, extending over the guide-wheel e', journaled in bearings in said case, the pulley e' and the guide-wheel e', journaled on bearings in said case and finally attached to the weight p, and the weight p, attached to the cord e within said case, of the conduit c' within said case, the lever i, pivoted at $i^{\times}$ within said case extending with one end under the conduit c' to receive coins falling therefrom and engaging the lever g' with its other end, the lever g, pivoted at $g^{\times}$ within said case, engaging said lever l, and pivotally attached to the rod h, the rod h, attached to said lever g and the bell-crank h', the bell-crank h', pivoted to $h^{\times}$ within said case and attached to the rod h and the said wheel d, and the knob m, attached to the wheel d and moving in a slot, $d^{\times}$, in said frame $a^{\times}$, all substantially as and for the purpose set forth.

399,128. **SELF-WINDING ELECTRIC CLOCK.** FRANK W. BRAINERD, Chicago, Ill. Filed May 25, 1888. Serial No. 275,043. (No model.)

399,128.

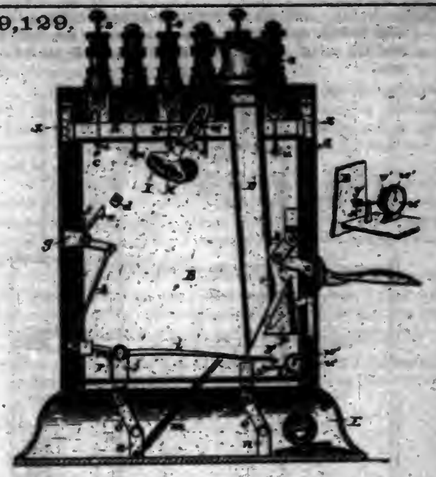
Claim.—1. The combination, with a clock-movement, of an electro-magnet and its armature for winding the same, a pawl carried by the armature giving a step-by-step movement to the winding mechanism, a toothed wheel operated by the clock-train, a circuit-closing device operated by the toothed wheel, and a circuit-interrupting device operated by the armature-lever at the limit of its forward movement.

2. The combination of a clock-movement, an electro-magnet, its armature for winding the driving-spring of the clock step by step, a contact-arm loosely mounted upon the minute-hand arbor of the movement, a circuit-closing spring operated by a wheel moving with the minute-hand arbor to make contact with the contact-arm, and thus periodically complete the connections through the winding-magnet, and an arm movable with the armature for moving said contact-arm out of contact with the circuit-closing spring.

3. The combination of a clock-movement, a spring having one end attached to the central arbor, a wheel surrounding said arbor, to which the other end is attached, a pawl for driving the wheel, an electro-magnet and its armature for periodically operating the pawl, a wheel or cam moving with the clock-train, and mechanical connections therewith for forcing the armature away from its electro-magnet after each forward movement as the clock unwinds, substantially as described.

4. In a self-winding clock-movement, the combination of an electro-magnet and its armature, the pivoted contact-arm m, the circuit-closing spring K, a wheel moving with the clock-train for operating the circuit-closing spring, and a system of levers engaging the contact-arm and moving it out of contact with said spring by the forward movement of the armature, substantially as described.

5. In a self-winding electric clock, an electro-magnet and its armature for giving a step-by-step movement to the winding mechanism, a toothed wheel advanced by the forward movement of the clock-train, a pawl engaging the teeth of the wheel, and a lever operated by the pawl and engaging the support of said armature and gradually forcing the latter away from the poles of its magnet as a tooth of the wheel passes under said pawl.



6. In a self-winding electric clock, the combination, with the electro-magnet E' and its armature E, and a pawl carried by the armature, of the loosely-mounted lever P, the links supporting the armature, one of which is engaged by said lever P, the wheel M, moving with the clock-movement, and the pawl carried by the lever P and engaged by the teeth of said wheel.

7. In a self-winding electric clock, the combination of the electro-magnet E' and its armature E, a pawl, e, moving with the armature, the loosely-mounted lever P, the links supporting the armature, one of which is engaged by said lever P, the wheel M, moving with the clock-movement, the pawl carried by the lever P and engaged by the teeth of said wheel, the loosely-mounted contact-arm m, the circuit-closing spring applied to the contact-arm and controlled by said wheel, and a link-connection between said contact-arm and the lever P for removing the arm from the contact with the spring.

399,129. **COIN-OPERATED CALCULATING-MACHINE.** FRANKLIN W. BROOKS, New York, N. Y. Filed Nov. 17, 1888. Serial No. 291,079. (No model.)

399,129.

Claim.—1. The combination, with the casing having the vertically-elongated openings a, of the movable plate located in said casing, and having columns of figures thereon adapted to align with said openings, and also having the lug d, and a pivoted bell-crank lever engaging said lug when the plate is in its downward position, substantially as described.

2. The combination, with the box or casing having the vertically-elongated openings, a, the movable plate located in said casing and having columns of figures thereon adapted to align with said openings, and the spring m, connecting the lower edge of said plate with the bottom of the casing and tending to draw the plate diagonally downward, substantially as described.

3. The combination, with the box or casing having the vertically-elongated openings a, of the movable plate B, having columns of figures thereon adapted to align with said openings, a hand-lever having its fulcrum in one side of the casing, and a link connecting said lever and plate, whereby when the lever is depressed the plate will be caused to move slightly to one side and then upwardly, substantially as shown, and for the purpose set forth.

4. The combination, with the box or casing having the vertically-elongated openings a, of the movable plate B, having thereon columns of figures adapted to align with said openings, and also provided with the lug d, the pivoted bell-crank lever engaging said lug when the plate is down, and the spring m, connecting the lower edge of said plate with the bottom of the casing at diagonally-opposite points, substantially as described.

5. The combination, with the box or casing having the vertically-elongated openings a, of the movable plate located in said casing, and having thereon columns of figures adapted to align with said openings, and also provided with lug d, the pivoted bell-crank lever engaging said lug when the plate is down, the spring m, connecting the lower edge of the plate with the bottom of the casing, the hand-lever having its fulcrum in one side of the casing, and a link connecting said lever and plate, substantially as shown, and for the purpose described.

6. The combination, with the box or casing having the vertical openings a, of a movable plate located in said casing, and having thereon columns of figures adapted to align with said openings, a spring tending to draw said plate diagonally downward, a lock for maintaining the plate in such downward position, and a hand-lever and link-connection for operating said plate, substantially as described.

7. The combination, with the box or casing having the vertically-elongated openings a, of the movable plate B, having the lug d, and provided with columns of figures adapted to align with said openings, a pivoted bell-crank lever for engaging said lug when the plate is drawn downwardly, a rod connected to said lever, and a weighted rocking lever connected to said rod, substantially as described.

8. The combination, with the weighted rocking lever i, mounted in V-shaped bearings, of the metal strip r, formed to overlap the lever and retain it in its bearing, and having a portion turned under said lever to act as a stop therefor, substantially as shown and described.

9. The combination, with the casing having in its bottom the posts s s, of the movable plate B and the links o o, connecting said plate to said posts, substantially as described.

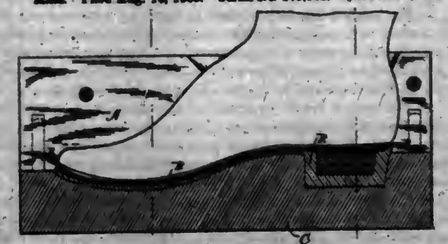
10. The coin chute or conduit D, constructed in two parts, the line of separation beginning a suitable distance from the bottom at one of the sides, and extending diagonally downward to or near to the lower edge at the opposite side, substantially as described.

11. The combination, with the box or casing A and the movable plate B, of the coin-chute D, constructed of two parts, the lower part, p, of which is connected to said plate, by which to be carried therewith when the same is moved, substantially as described.

12. The combination, with the casing A and movable plate B, having the stud or projection y', and spring m, drawing the plate downward diagonally, of pawl x', operated by said stud, and the indicator and ratchet-wheel, substantially as described.

13. The combination, with the casing A, having the upper openings, b, and the movable plate provided with the series of lugs or teats c, of the spring-bolts e, provided with spring-catches for engaging said lugs or teats when the plate is up and said bolts are depressed, the same being also provided with the plates t, having numbers thereon for registering with said openings b, substantially as described.

14. The combination, with the box or casing A, having the vertical openings a and the upper openings, b, of the movable plate B, provided with columns of figures adapted to align with said vertical openings having the series of teats c, the spring-bolts e, having the spring-catches u and numbered plates t, and a hand-lever and link for moving said plate upwardly, substantially as described.



15. The combination, with the box or casing having the vertical openings a and upper openings, b, of the movable plate B, having the lug d, and the series of teats c, and also provided with columns of figures adapted to align with said vertical openings, the spring-bolts having the spring-catches and numbered plate, a hand-lever and link for moving the plate upwardly, and a lever for engaging lug d, to maintain the plate locked in its downward position, substantially as described.

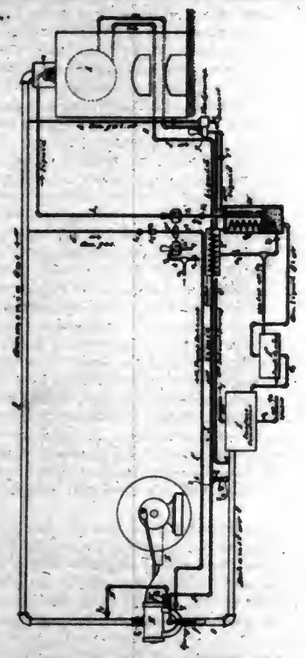
16. The combination, with the movable plate B, having lug d, of the lever f, engaging said lug, the rod h, and the weighted rocking lever i, connected to the rod and adapted to release said lever f from lug d when depressed, substantially as shown and described.

17. The combination, with the spring-bolts e, having the plates t, of the movable locking-strip v, having the projections w, which rest beneath the lower ends of said plates when the parts are in their normal positions, substantially as shown, and for the purpose described.

18. The combination, with the casing having strip z, provided with slot y, and the spring-bolts having the plates t, of the movable plate B, the strip v, having projections w, and provided with pin x, and the sector G, formed with slot a', working on pin x, and secured to the movable plate, substantially as shown and described.

399,130. **BOOT OR SHOE.** GEORGE F. BUTTERFIELD, Stoneham, Mass. Filed Aug. 10, 1885. Serial No. 173,972. (No model.)

Claim.—1. The described process of forming rubber-soled boots or shoes, consisting in first making the boot or shoe and securing its leather sole to it in any usual way, then applying to the bottom of such leather sole a coating of rubber cement and an outsole of raw-rubber compound, and subsequently curing the rubber sole and permanently affixing it to the leather-sole bottom by vulcanization, substantially as set forth.



2. A boot or shoe having a leather sole sewed, pegged, or nailed to the upper thereof, and provided with a rubber outer sole secured by cement and vulcanization directly upon the bottom of the leather sole, so as to conceal said sole and its fastenings, substantially as set forth.

399,131. **METHOD OF UTILIZING AQUA-AMMONIA AS A MOTIVE POWER IN ENGINES.** JOSEPH H. CAMPBELL, New York, N. Y. Filed Sept. 18, 1887. Renewed July 24, 1888. Serial No. 280,917. (No model.)

Claim.—1. The method herein described of relieving the boiler of an aqua-ammonia engine from an excess of pressure, which consists in drawing off a portion of the solution or liquid from the boiler through an aperture additional to the exhaust-absorbing jet, cooling said solution, and returning it to the boiler, as set forth.

2. The method herein described of relieving the boiler of an aqua-ammonia engine from an excess of pressure, which consists in drawing off a portion of the solution or liquid from the boiler through an aperture additional to the exhaust-absorbing jet, cooling said solution,

899,181.

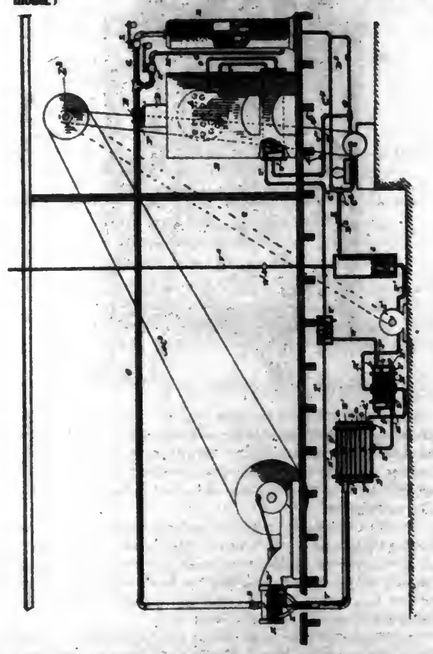
and returning it to the vapor-space of the boiler, where it is brought in contact with the vapor in the boiler, as set forth.

3. The method herein described of relieving the boiler of an aqua-ammonia engine from an excess of pressure, which consists in causing the pressure of vapor in the boiler to automatically start and operate a pump to transfer cool solution to the boiler, whereby the pressure is reduced by the introduction of the cooled solution or fluid into the boiler, as set forth.

4. The method herein described of operating a vapor-pump, in combination with an aqua-ammonia engine, which consists in driving a pump directly by vapor of aqua-ammonia and absorbing the exhaust-vapor of said pump by a continuous stream of absorbing-liquid designed to absorb the exhaust of the engine, substantially as set forth.

5. The method herein described of operating a vapor-pump, in combination with an aqua-ammonia engine, the same consisting in driving a pump directly by vapor of aqua-ammonia and absorbing the exhaust-vapor of said pump by the absorbing-liquid designed to absorb the exhaust of the engine, substantially as set forth.

6. The method herein described of utilizing a single-spray jet for absorbing the exhaust-vapor from an engine and a pump, the same consisting in bringing the exhaust-pipes of said engine and pump into one common exhaust-pipe which is provided with an absorbing-jet, substantially as set forth.



7. The method herein described of relieving the boiler of an aqua-ammonia engine from an excess of pressure, which consists in transferring the vapor from the boiler directly to the absorbers and well without passing it through the engine and bringing said vapor in contact with a continuous stream under boiler-pressure of cooled weak solution or fluid while in transit to the absorbers, as set forth.

8. The method herein described of relieving the boiler of an aqua-ammonia engine from an excess of pressure, which consists in transferring the vapor from the boiler directly to the exhaust-pipe of the cylinder of the engine without passing it through the engine and bringing such vapor in contact with a continuous stream of the cooled weak solution, as set forth.

9. The method herein described of reducing the pressure in the boiler of an aqua-ammonia engine, which consists in conveying the vapor from the pipe leading from the boiler to the cylinder of the engine directly to the exhaust-pipe of the cylinder and absorbing said vapor, together with exhaust-vapor from the cylinder, by a continuous stream of the cooled solution, as set forth.

10. The method herein described of relieving the boiler of an aqua-ammonia engine of excessive pressure, which consists in withdrawing liquid from the boiler, cooling it by cooling-water, and returning the liquid to the boiler, part of said cooling-water being supplied by a pump started and operated by such excessive pressure, substantially as set forth.

899,182. METHOD OF UTILIZING AQUA-AMMONIA AS A MOTIVE POWER IN ENGINES. JOSEPH H. CAMPBELL, New York, N. Y. Filed Aug. 6, 1887. Renewed July 24, 1888. Serial No. 280,918. (No model.)

Claim.—1. The method herein described of absorbing vapor of ammonia, which consists in bringing said vapor in contact with cooled liquid from the boiler and then subjecting such solution and the unabsorbed vapor to successive simultaneous coolings and absorptions, alternating with the evolutions of heat produced by the successive absorptions, substantially as set forth.

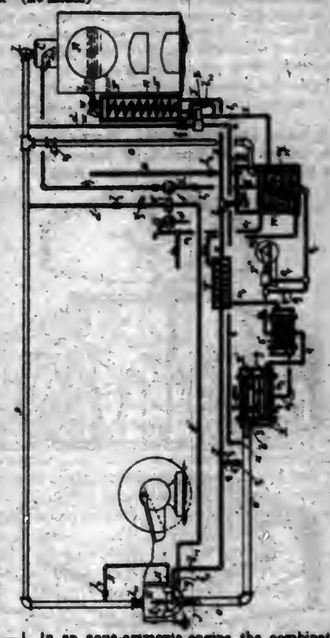
2. The method herein described of absorbing vapor of ammonia, which consists in bringing said vapor in contact with a continuous stream of cooled liquid from the boiler, then subjecting such solution and the unabsorbed vapor to successive simultaneous coolings and absorptions, alternating with the evolutions of heat produced by the successive absorptions, and discharging the solution into a well below its liquid-line, substantially as set forth.

3. The method herein described of absorbing vapor of ammonia, which consists in passing such vapor with cooled liquid from the boiler into the upper end of a surface condenser or absorber provided with lateral tubes and vertical pockets, so as to drain the liquid contents from such surface condenser by gravity, substantially as set forth.

4. The method herein described of operating an aqua-ammonia engine, which consists in propelling the engine with vapor of ammonia, bringing the exhaust-vapor in contact with cooled liquid from the boiler, subjecting the solution and the unabsorbed vapor to successive simultaneous coolings and absorptions, alternating with the evolutions of heat produced by the successive absorptions, and returning the combined liquid and exhaust-vapor to the boiler, substantially as set forth.

5. The method herein described of operating an aqua-ammonia engine, which consists in propelling the engine with vapor of ammonia, bringing the exhaust-vapor in contact with a continuous stream of liquid from the boiler under boiler-pressure, subjecting the solution and the unabsorbed vapor to successive simultaneous coolings and absorptions, alternating with the evolutions of heat produced by the successive absorptions, and returning the combined exhaust-vapor and liquid to the boiler, substantially as set forth.

6. The method herein described of operating an aqua-ammonia engine, which consists in propelling the engine with vapor of ammonia, passing such vapor with cooled liquid from the boiler into the upper end of a surface condenser or absorber provided with lateral tubes and vertical pockets, so as to drain the liquid contents from such surface condenser by gravity into a suitable well, entering it below the liquid-line, and returning the contents of said well to the boiler, substantially as set forth.



7. In a vapor-engine, the method herein described of indicating a deficiency of liquid in the boiler, which consists in placing the spray-pipe at the low-water point and extending it into the exhaust-pipe of the cylinder, whereby when the solution in the boiler falls too low the vapor will rush over to the exhaust-pipe and cause a back-pressure on the piston to check the engine.

8. In ammonia-engines, the method herein described of drawing off from the cylinder the unabsorbed exhaust-vapor by producing a vacuum on the piston and creating a pressure in the well to aid absorption by means of a pump operating between the absorbers and well, as set forth.

9. The method herein described of purging the apparatus of air, which consists in carrying the air into a well, together with absorbing liquid and ammonia-vapor, absorbing the vapor under pressure produced by a pump, and forcing the air out of the well through an escape-pipe, substantially as set forth.

10. The method herein described of relieving the boiler of excessive pressure, which consists in discharging the excess of vapor into a reservoir containing absorbing-liquid below its liquid-line, said excessive pressure operating a safety-valve, substantially as set forth.

899,183. AMMONIA-VAPOR ENGINE. JOSEPH H. CAMPBELL, New York, N. Y. Filed Dec. 30, 1887. Renewed July 24, 1888. Serial No. 280,919. (No model.)

Claim.—1. In an aqua-ammonia engine, the combination, with the cylinder thereof, of a pipe carrying spraying or absorbing liquid from the boiler to the exhaust-pipe, and a horizontal surface-condenser, substantially as set forth.

2. In an aqua-ammonia engine, the combination, with the cylinder thereof, of a pipe carrying spraying or absorbing liquid from the boiler to the exhaust-pipe, a horizontal surface-condenser, and a secondary absorber into which the fluid enters below the liquid-line, substantially as set forth.

3. In an aqua-ammonia engine, the combination, with the cylinder thereof, of a pipe carrying spraying-fluid from the boiler to the exhaust-pipe and an absorber provided with vertical chambers and horizontal tubes, substantially as set forth.

4. In an aqua-ammonia engine, the combination, with the cylinder thereof, of a pipe carrying spraying-fluid from the boiler to the exhaust-pipe, and an absorber provided with vertical chambers and horizontal tubes and partitions, and a secondary absorber into which the fluid passes underneath the liquid-line for the purpose of entrapping gas carried along by adhesion, substantially as set forth.

5. In an aqua-ammonia engine, the combination, with the boiler of a reservoir containing liquid of greater absorptive power than that contained in the boiler, and a pipe provided with a valve constructed to admit automatically, in case of excessive pressure in the boiler, vapor from the boiler into the liquid contained in the well, substantially as set forth.

6. In an aqua-ammonia engine, the combination, with the boiler, of a reservoir containing solution of greater absorptive power than that contained in the boiler, a pipe with suitable valve leading from the vapor-space of the boiler into the liquid-space of the reservoir, and a pump for forcing the solution from the reservoir back into the boiler, substantially as set forth.

7. In an aqua-ammonia engine, the combination, with the boiler, of a reservoir containing solution of greater absorptive power than that contained in the boiler, and a pipe provided with a valve for admitting vapor from the boiler to the well, that part of said pipe within the fluid in the well being provided with a series of perforations, substantially as set forth.

8. In an engine of the character described, the spray-pipe J, leading from the boiler to the exhaust-pipe of the cylinder, provided with the branch pipe J', leading into the cylinder, and having the cock P, whereby a jet of the solution may be injected into the cylinder to lubricate the same prior to starting the engine, substantially as set forth.

9. In an engine of the character described, the combination of an apparatus for reabsorbing the exhaust-vapor, and the pump P', for increasing the vacuum on the piston and creating a pressure in the well, substantially as set forth.

10. In an engine of the character described, the combination of an apparatus for reabsorbing the exhaust-vapor, the pump P', placed between the absorbers and the well W, and a by-pass around said pump with suitable valve, substantially as set forth.

11. In an engine of the character described, the combination, with the well W, partly filled with aqua-ammonia for receiving the combined spraying-liquid and exhaust-vapor, of the pump P', for discharging absorbing-liquid into said well, and the pipe M, with cock P, for purging the apparatus of air, substantially as specified.

12. In an engine of the character described, the combination, with the well W, of a pipe for filling said well with solution, the cock P, for closing the outlet of said well, and the pipe M, with cock l, for purging the apparatus of air, substantially as set forth.

13. In an engine of the character described, in combination with the boiler and the spray-pipe J, the strainer w, substantially as set forth.

14. In an engine of the character described, the combination, with the boiler and the spray-pipe J, of the casing U, with detachable bottom and containing the strainer w, substantially as set forth.

15. In an engine of the character described, the combination, with the boiler and the spray-pipe, of the strainer w and cock P^{11}, substantially as specified.

16. In an engine of the character described, the combination, with the boiler and the spray-pipe, of the cock P^{10} in said spray-pipe, substantially as set forth.

17. In an aqua-ammonia engine, the combination, with a spray-pipe for conveying the fluid or solution from the boiler to the exhaust-pipe of the engine, of an additional pipe provided with a suitable valve or cock connecting the spray-pipe with the exhaust-pipe, whereby the amount of solution or fluid admitted from the boiler to the exhaust-pipe can be increased, as set forth.

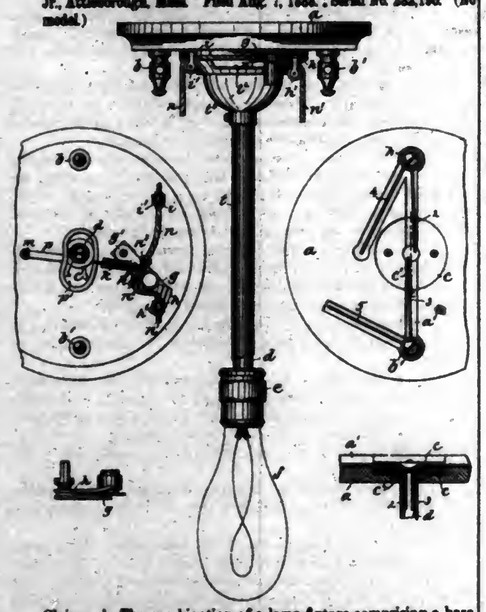
18. In an aqua-ammonia engine, the combination of a pipe for conveying spraying-fluid from the boiler to the exhaust-pipe of the engine, an additional pipe provided with a suitable valve or cock connecting the spray-pipe with a cooling apparatus, and a pump for forcing the cooled fluid or solution into the vapor-space of the boiler, as set forth.

19. In an aqua-ammonia engine, the combination of a pipe for conveying spraying-fluid from the boiler to the exhaust-pipe of the engine, an additional pipe provided with a self-acting or automatic valve connecting the spray-pipe with the exhaust-pipe and cooling apparatus, and a pump for forcing the cooled fluid or solution into the vapor-space of the boiler, as set forth.

20. In an aqua-ammonia engine, the combination of a pipe for conveying spraying-fluid from the boiler to the exhaust-pipe of the engine, an additional pipe provided with a self-acting or automatic valve connecting the spray-pipe with the exhaust-pipe and cooling apparatus, and a pump for forcing the cooled solution or fluid into the vapor-space of the boiler, said pump being arranged and adjusted to operate automatically under an increased pressure in the boiler, as set forth.

21. In an aqua-ammonia engine, the combination, with the boiler and engine-cylinder, of the pipe N N, provided with a cock or valve, for conveying vapor directly (and without passing it through the cylinder) to the absorbing-jet j, discharging liquid under boiler-pressure for the purpose of relieving the boiler, substantially as specified.

22. In an aqua-ammonia engine, the combination of a boiler and pipe leading from the vapor-space of the boiler to the cylinder of the engine, with a pump adapted to be operated by the vapor from the boiler, and a pipe leading from the exhaust of the pump to the exhaust-pipe of the engine, as set forth.



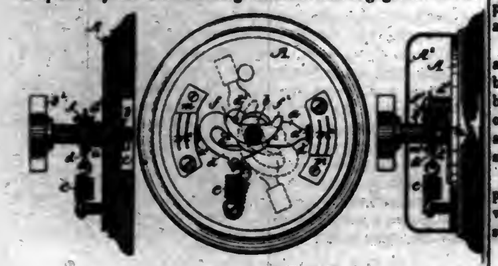
23. In an aqua-ammonia engine, a boiler for generating the vapor, and a pipe leading from the vapor-space of the boiler to the cylinder of the engine, a pump adapted to be operated by the vapor from the boiler, and a pipe leading from the exhaust of the pump to the exhaust-

pipe of the engine, in combination with a spray of the cooled solution or fluid, whereby the exhaust from the cylinders of the pump and engine are absorbed, as set forth.

24. In an aqua-ammonia engine, the combination of the boiler, a system of circulating-pipes for conveying cooling-water to the absorbers, and a pump adjusted to automatically increase the amount of such cooling-water in case of excessive pressure in the boiler, substantially as set forth.

25. In an aqua-ammonia engine, the combination, with the boiler and absorbers for absorbing the exhaust-vapor, of an air-pump, a receiving-well, and a feed-pump, said well being placed between said pumps, substantially as set forth.

399,184. ELECTRIC-LAMP FIXTURE AND SWITCH. LOUIS W. DILLON, North Attleborough, assignor of one-half to Homer M. Daggett, Jr., Attleborough, Mass. Filed Aug. 7, 1888. Serial No. 282,190. (No model.)



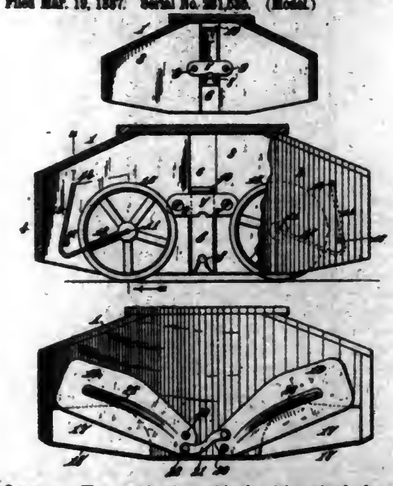
Claim.—1. The combination of a lamp-fixture comprising a base and lamp-supporting shank fastened thereon, with a switch pivoted on said base and provided with stops, limiting its movement in either direction, a spring connected at one end with said switch in advance of its pivot, and the arm connected with the other end of said spring and pivoted on said base at the other side of the shank from the switch-pivot, and provided with an opening through which said shank passes, and operating-cords connected with said switch, and pulleys therefor on the base of the lamp-fixture, substantially as described.

2. The combination of the base and lamp-supporting shank extending therefrom, with a switch pivoted on said base at one side of said shank, a spring connected with said switch in advance of its pivot, and the arm connected with said spring pivoted on said base at the other side of the shank from the switch-pivot, and provided with an opening through which the said shank passes, substantially as and for the purpose described.

399,185. ELECTRIC SWITCH. LOUIS W. DILLON, North Attleborough, assignor of one-half to Homer M. Daggett, Jr., Attleborough, Mass. Filed Oct. 3, 1888. Serial No. 287,045. (No model.)

Claim.—1. The combination of the pivoted switch-arm with an independently-movable actuating cam-lever that engages the switch-

399,185.



arm at each side of its pivot and a projection or abutment co-operating with the cam-surface and constituting the fulcrum of said cam-lever, by which cam-surface and abutment the said cam-lever is retained wholly disengaged from the said switch-arm during its movement from one to the other side of the pivot thereof, substantially as described.

2. The combination of the switch-arm and arbor constituting the pivot or fulcrum therefor with an independently-movable actuating shifting cam-lever and spring, said lever having a cam-surface co-operating with said arbor, which constitutes the fulcrum for said lever in both positions of the latter, and arms connected with said arbor for shifting the cam-lever relative thereto, substantially as described.

3. The combination of the pivoted switch-arm having contact-surfaces at each end insulated from said switch-arm with a pair of stationary contacts co-operating with the contacts at each end of said switch-arm, and a movable cam-lever that engages the said switch-arm at each side of its pivot, the cam-surface of said lever constituting the guide that determines its path of movement when shifted with relation to the pivot of said switch-arm, substantially as described.

399,186. CARPET-SWEEPER. WALTER J. DREW, Grand Rapids, Mich., assignor to The Bissell Carpet Sweeper Company, same place. Filed Mar. 19, 1887. Serial No. 231,536. (Model.)

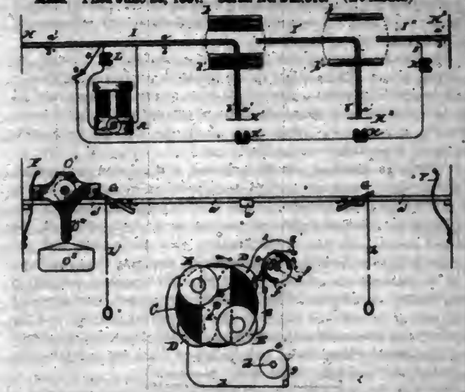
Claim.—1. The combination, with the drive-wheel of a carpet-sweeper, of a wheel-holder composed of a single continuous piece of spring-wire bent to form an axle, on which the wheel revolves, and continued at both ends of the axle into two side supports extending along opposite sides of the wheel to free the latter from side draft, both side supports having their extremities secured to parts of the sweeper-casing, substantially as described.

2. The combination, with the drive-wheel of a carpet-sweeper, of a wheel-holder composed of a single continuous piece of spring-wire bent to form an axle, on which the wheel revolves, and continued at both ends of the axle into two side supports extending along the opposite sides of the wheel to free the latter from side draft, both of said side supports having their extremities turned laterally into pivots which are pivoted to parts of the sweeper-casing, substantially as described.

3. The combination, with the drive-wheel of a carpet sweeper, of a wheel-holder composed of a single continuous piece of spring-wire bent to form an axle, on which the wheel revolves, and continued at both ends of the axle into two supporting-arms extending along the opposite sides of the wheel beyond the periphery thereof, and bent at an angle to the said side supporting-arms and pivotally supported substantially as described.

4. The combination, with a carpet-sweeper casing, of a sliding plate having a seat for the journal of a brush-shaft and free to slide vertically at all times for the insertion and removal of the brush-shaft substantially as described.

5. The combination, with a carpet-sweeper casing, of a vertically



sliding plate having a seat at its lower end for the journal of a brush shaft, a cross-bar behind which the plate slides, and screws for connecting the cross-bar with the casing and causing friction on the sliding plate, substantially as described.

6. The combination, with a carpet-sweeper casing having its end wall provided with a channel, of a vertically-sliding plate in said channel, having at its upper end a lug and at its lower end a seat for the journal of a brush-shaft, and a cross-bar extending over the plate, secured to the casing, and confining the plate in the channel, substantially as described.

7. The combination, with a carpet-sweeper casing having discharge-openings, of movable gates and a link-connection between the gates, substantially as described.

8. The combination, with a carpet-sweeper casing having dust-pans and discharge-openings therefor, of pivoted gates and a link pivotally connected with the gates, said link having its pivots alternating with the pivots of the gates, substantially as described.

399,187. ELECTRICAL STORE-SERVICE APPARATUS. RICHARD M. DYER, East Orange, N. J., assignor to William S. Lamson, Lowell, Mass. Filed June 20, 1887. Serial No. 242,218. (No model.)

Claim.—1. In electrical store-service apparatus, the combination, with the way formed of two parallel tracks placed close together in the same horizontal plane and connected with opposite sides of the circuit, of a carrier having wheels in the same horizontal plane riding upon both of said tracks, an electric motor mounted upon said carrier and receiving current through said wheels, and a receptacle-supporting bail depending from the carrier on one side of the way, substantially as set forth.

2. In electrical store-service apparatus, the combination, with a way formed of two parallel tracks connected with opposite sides of the circuit and arranged close together, and insulating-supports at intervals connecting the tracks to form a single structure and projecting laterally in one direction, of a carrier having wheels riding upon both of said tracks, an electric motor mounted upon said carrier and receiving current through said wheels, and a receptacle-supporting bail depending from the carrier and hanging down on one side of the way, substantially as set forth.

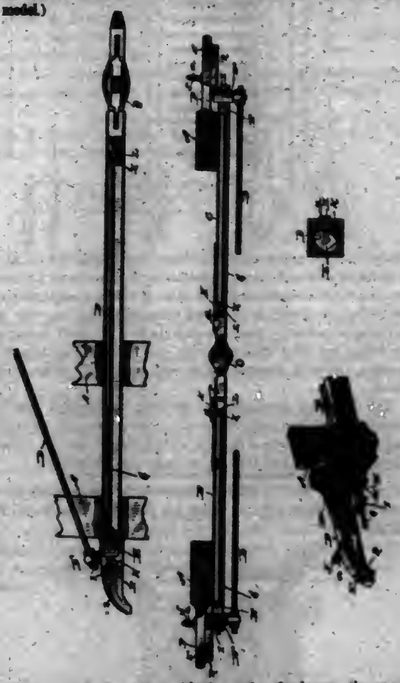
3. In electrical store-service apparatus, the combination, with a carrier having two driving-wheels riding on the way, of two revolving soft-iron armatures with their central longitudinal lines in the same plane, two electro-magnets located at right angles to each other and arranged so that the armatures revolve across their poles, and a commutator for directing the current to the magnets alternately, substantially as set forth.

4. In electrical store-service apparatus, the combination, with a way forming the circuit, of a carrier having an electric motor riding on said way, a section at the end of the way disconnected from the circuit and forming a continuation of the main body of the way and in line therewith and in the same horizontal plane, a latch for holding the car, and a starting device for starting the car on its return-trip, substantially as set forth.

5. In electrical store-service apparatus, the combination of a carrier, an electric motor thereon, and a shifting commutator which is shifted by the friction of the spring or springs thereon in starting the carrier, substantially as set forth.

6. In electrical store-service apparatus, the combination of a carrier, an electric motor thereon, a commutator mounted loosely on a shaft of the carrier and connected therewith by a slot and pin, and one or more springs bearing on said commutator and causing it to shift by friction thereon, substantially as set forth.

7. In electrical store-service apparatus, the combination, with the way formed of two tracks connected with opposite sides of the electric circuit, of breaks in said way and parallel switching-plates bridging such breaks and also connected with the circuit, substantially as set forth.



8. In electrical store-service apparatus, the combination, with the way formed of two tracks connected with opposite sides of the electric circuit, of switching-plates, also connected with said circuit, and carriers having switching-wheels on the driving-shafts of the carriers, substantially as set forth.

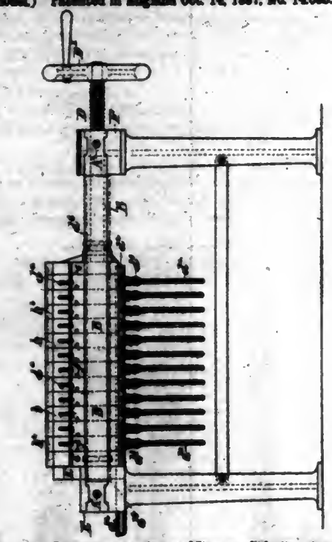
9. In electrical store-service apparatus, the combination, with the way formed of two tracks connected with opposite sides of the electric circuit, of switching-plates, also connected with said circuit and carriers having switching-wheels on the driving-shafts of the carriers, said switching-wheels being smaller than the main wheels of the carriers, substantially as set forth.

10. In store-service apparatus, the combination, with a way and carriers traveling thereon, of latches holding the carriers at their stations and electro-magnets locking such latches, substantially as set forth.

11. In store-service apparatus, the combination, with a way and carriers traveling thereon, of latches holding the carriers at their stations, electro-magnets locking such latches, and a switch at one end of the way controlling the circuit to such electro-magnets, substantially as set forth.

399,188. POSITIVE SHUTTLE-MOTION FOR LOOMS. JOHN W. EISENHART, York, Pa. Filed July 20, 1888. Serial No. 280,542. (No model.)

Claim.—1. In a positive shuttle-motion for looms, the combination, with a reciprocating shuttle-operating arm, of a latch for engaging the shuttle and carried by the arm, a rock-shaft also carried by the arm and provided with a cam or equivalent device for moving the latch, and means, substantially as described, for operating the shaft.



2. In a positive shuttle-motion for looms, the combination, with a reciprocating arm, of a latch on the arm for engaging the shuttle, a rock-shaft carried by the arm and provided at one end with a cam or equivalent device and at the other end with a finger, and a dog arranged in the path of the said finger to operate the said shaft, substantially as described.

3. The combination of a frame, the reciprocating tubular carrier-arms mounted in this frame, spring-latches upon the inner ends of these arms for engaging the shuttle, rock-shafts journaled inside of these tubular arms and provided with cams on their inner ends for operating the shuttle-latches, adjustable fingers on the outer ends of the said rock-shafts, means for adjusting these fingers, and pivoted dogs for operating the said rock-shafts and fingers, substantially as described.

4. The combination of a frame, reciprocating carrier-arms, spring-latches carried by these arms, rock-shafts carried by these carrier-

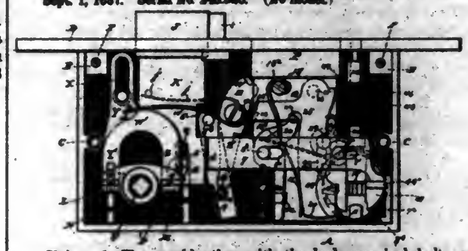
arms and provided on their inner ends with cams for operating the said spring-latches, fingers on the outer ends of these rock-shafts curved dogs R, pivoted to the said frame in line with the said fingers and springs for keeping these dogs normally pressed downward, substantially as described.

399,139. APPARATUS FOR THE MANUFACTURE OF NAPHTHALINE. HENRY J. PHIPSON, Brookehelme, St. John's Park, Blackheath, County of Kent, and GEORGE H. PERKIN, 33 Hillsboro Road, Dulwich, County of Surrey, England. Filed Aug. 21, 1888. Serial No. 283,343. (No model.) Patented in England Oct. 14, 1887, No. 14,085.

Claim.—1. In apparatus for molding naphthaline for use as set forth, a series of separable mold-plates having in their faces a number of recesses or cavities registering with those of the next adjacent plate, these plates being ranged on edge and clamped tightly together, the recesses communicating by small channels made in the mold, the structure also being provided with receiving and guiding channels, with cooling-pipes, and with chambers *d* in each part mold, substantially as set forth.

2. The described apparatus for forming naphthaline into ball forms, consisting of the combination of a receiving-trough, the molds *b*, having cooling-chambers *d* therein, distributing-channel *b'*, channel *c*, and mold-recesses *c'*, substantially as shown and described.

399,140. HAY-CARRIER. HENRY L. PERKIN, Harvard, Ill., assignor to Hunt, Heim & Ferris. Filed Oct. 10, 1888. Serial No. 287,756. (No model.)



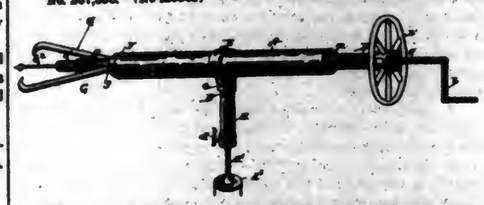
Claim.—1. In a hay-carrier, a carrier-frame provided with wheels adapted to engage or rest upon opposite sides of the supporting-track, the wheels of one side being mounted upon arms pivoted to said frame, substantially as set forth.

2. The combination, with the two-part carrier-frame A A', having integrally-formed arms on part A', said arms bearing supporting-wheels C" C", of the integrally-formed arms B, pivoted on the part A of said frame and bearing the wheels C C, substantially as set forth.

3. The combination, with the two-part carrier-frame A A', one part of which is provided with integrally-formed wheel-bearing arms B', of the integrally-formed arms B, pivoted to the other part of said frame, said arms B having the flange H and said frame part A having the hook G, adapted to engage said flange, substantially as and for the purpose set forth.

4. The combination, with the frame A A', provided with wheel-bearing arms B', formed integrally with the part A', of arms B, formed integrally with each other and pivoted to the part A, and wheels C C, mounted upon the arms B, respectively, said arms B having the flange H and the lip I, and said frame part A having the hook G, adapted to engage said flange, substantially as and for the purpose set forth.

399,141. LOCK. WILLIAM S. PIERCE, Brooklyn, N. Y., assignor to the Hopkins & Dickinson Manufacturing Company, same place. Filed Sept. 1, 1887. Serial No. 248,590. (No model.)



Claim.—1. The combination, with the lock-case, lock-bolt and latch-bolt, and operating-cylinder, of the slotted sliding fence connecting said lock-bolt and latch-bolt and governing the movements thereof, whereby said bolts are operated simultaneously as well as independently, substantially as specified.

2. The combination, with the lock-case provided with a stud, 30, engaging a lock-bolt having a spring-actuated notched angle-lever, a latch-bolt provided with a slot or guideway, and a shouldered stud, R, on the lock-case, of a slotted sliding fence adapted to engage a recess of the latch-bolt, and a cylinder-lock mechanism for rotating the sliding fence, substantially as specified.

3. The combination, with the lock-case, of the slotted and notched lock-bolt, the pivoted and notched angle-lever resting against the stem of the lock-bolt, the spring-actuated lever having the rounded dog engaging the notched angle-lever on the stem of the lock-bolt, the pivoted slotted lever having the flange or stop at its inner end, the latch-bolt having the slotted branched stem engaging the shouldered stud on the inner one of the parallel ribs, the branched and slotted slide resting on the stem of the latch-bolt, the pivoted lever provided with pins at its ends and engaging the notched angle-lever, and the pivoted lever connected with flanged and slotted stop-lever, the slotted and shouldered sliding fence, and the armed hubs for operating the latch-bolt and lock-bolt, substantially as specified.

399,142. DRILL. ROBERT L. PRATT, Sweet Valley, Pa., assignor of one-half to F. M. Raggio, same place. Filed Mar. 20, 1888. Serial No. 267,890. (No model.)

Claim.—1. As an improvement in drills, the combination, with the drill-shaft and the barrel or cylinder, of the telescoping rods, one of which has a lower forked end and the other a set-screw bearing against said rod, the hoop or band encircling said barrel or cylinder, and the bolt passed through lower parallel ends of said hoop or band, substantially as shown and described.

2. In a drill, the combination, with the barrel or cylinder having the apertured cheeks at its forward end, of the grappling-forks pivotally secured to said cheeks, substantially as shown and described.

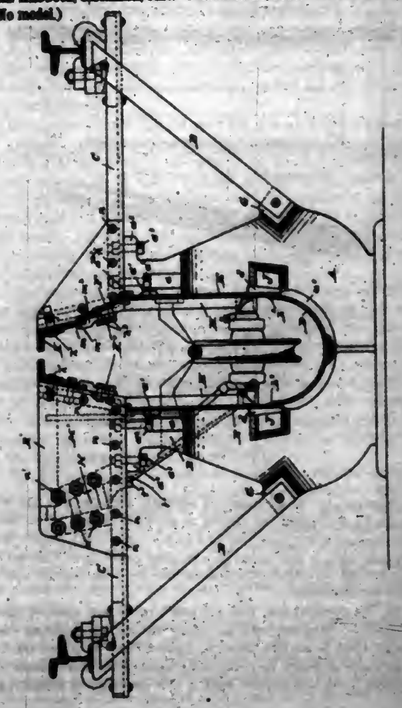
399,143. HAND PLOW AND WEEDER. GERSHAM GIDDEN, Buchanan, Mich., assignor to Elliott Eugene Gidden, same place. Filed Sept. 10, 1888. Serial No. 285,068. (No model.)

Claim.—In a hand-plow, the combination of the inclined standard, a shovel secured at its lower end, an adjustable curved frame secured to the said standard, a traction-wheel journaled therein, sleeves secured to the said curved frame, and a curved standard working in the said sleeves and carrying a cutting implement, and means for securing the same in position, substantially as described.

399,144. LUMINOUS SIGHT FOR FIRE-ARMS. HERBERT H. GRESHILL, Newcastle-upon-Tyne, County of Northumberland, England, assignor to W. G. Armstrong, Mitchell & Co., (Limited,) same place. Filed Oct. 22, 1888. Serial No. 288,842. (No model.) Patented in England Apr. 2, 1886, No. 4,653.

Claim.—1. The combination, substantially as hereinbefore set forth, of the sight-piece, the luminous body below the sight-piece, and the case hiding the luminous body from view, but having an opening at the top through which light is transmitted to the sight-piece.

2. The combination, substantially as hereinbefore set forth, of the transparent sight-piece, the luminous body, and the case hiding the luminous body from view, but having an opening through which light is transmitted to the sight-piece.



3. The combination, substantially as hereinbefore set forth, of the transparent sight-piece, the socket-piece in which it is mounted, the electric lamp and the case hiding the electric lamp from view, but having an opening through which light is transmitted to the sight-piece, and the circuit-connections of the electric lamp supported in the socket-piece.

4. The combination, substantially as hereinbefore set forth, of the transparent sight-piece, the socket-piece or support in which it is mounted, the electric lamp contained within the socket-piece incased thereby and hidden from view, but having an opening through which light is transmitted to the sight-piece, and the clamp for removably securing the socket piece to a gun.

5. The combination, substantially as hereinbefore set forth, of the transparent sight-piece, the socket-piece or support on which it is mounted, and the electric lamp and its circuit-connections removably secured to the socket-piece.

6. The combination, substantially as hereinbefore set forth, of the front and rear sight-sights for guns, each consisting of a transparent sight-piece, a luminous body, and a case hiding the luminous body from view, but having an opening through which light is transmitted to the transparent sight-piece.

399,145. CABLE-RAILWAY-CONDUIT CONSTRUCTION. WILLIAM THE HADDOCK, Cincinnati, Ohio. Filed June 22, 1888. Serial No. 277,914. (No model.)

Claim.—1. In a cable-railway-conduit construction, bottom plate, D, recessed at each end, in combination with lug *b'* on the yoke, substantially as set forth.

2. In a cable-railway-conduit construction, side plates, as D, having feet b^3, said plates suitably wedged into position, substantially as set forth.

3. In a cable-railway-conduit construction, side plates, F, in combination with a rib, as L, substantially as set forth.

4. In a cable-railway-conduit construction, yokes and bottom, side, and top plates, as set forth, in combination with lugs, as J, and suitable wedges, substantially as set forth.

5. In a cable-railway-conduit construction, the combination, with suitable frame-work, substantially as set forth, of the man-hole pocket R, having a flange, r^3, to rest on a ledge on the bar N, substantially as set forth.

6. In a cable-railway-conduit construction, T-headed bar N, bolted to the gusset-plates M', and the cross-bars P, said bars having the rabbeted edge *t*, substantially as set forth.

7. In a cable-railway-conduit construction, a side plate, as E, having cast with it a man-hole pocket, substantially as set forth.

8. In a cable-railway-conduit construction, a short pipe, R^2, cast with the bottom plate of the conduit, in combination with lugs *w*, forming T-slots *w'*, bolts w^4, collar w^5, and sewer-pipe S, substantially as set forth.

9. In a cable-railway-conduit construction, the combination, with yoke and bottom, side, and top plates, of lugs, as J, and suitable wedges, and wedges, as *d'*, substantially as set forth.

10. In a cable-railway-conduit construction, a yoke having flanges, as J, substantially as set forth.

11. In a cable-railway-conduit construction, side plates, substantially as set forth, suitably wedged into position, substantially as set forth.

399,146. PUZZLE. MAURICE JACOBS, New York, N. Y. Filed Dec. 12, 1888. Serial No. 293,407. (Model.)

Claim.—1. In a puzzle of the class described, an open link consisting of a rod bent at its middle to form a plane U, and having both its branches bent back into a plane parallel to the body of the U, the two branches being at their ends only at a distance from each other less than the diameter of the rod itself.

2. The combination, with the U-shaped link having both its branches bent back into a plane parallel to the body of the U and converged toward their free ends, of a second link similar to and engaging the first, and having its body or rod of a diameter greater than the distance between the converged ends of the first, substantially as set forth.

399,147. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. JAMES F. KIRTLEY, Terre Haute, Ind., assignor of three-fourths to Joseph H. Briggs, same place. Filed Oct. 20, 1888. Serial No. 289,412. (No model.)

Claim.—1. A dynamo-regulator comprising adjustable commutator-brushes, an electro-magnetic device to shift the same, a normally-

open regulating-circuit including the electro-magnetic device, a circuit-controller, and a speed-governor carried by a rotating part of the machine and connected with the circuit-controller, as set forth.

2. In a regulator for an electric motor or generator, the combination of a movable brush-holder for the commutator-brushes, an electro-magnet to shift the brush-holder and change the line of commutation, a regulating-circuit including the electro-magnet, a circuit-controller in the circuit, and a speed-governor attached to a rotating part of the machine for operating the circuit-controller when the machine reaches a certain speed, as described.

3. In a regulator for an electric motor or generator, the combination of a movable brush-holder, an electro-magnet to shift said brush-holder, a regulating-circuit including the magnet and part of the field-magnet coil, a circuit-controller in the circuit, and a centrifugal governor attached to a rotating part of the machine for operating the circuit-controller when the machine reaches a certain speed, substantially as described.

4. A dynamo-regulator comprising adjustable commutator-brushes, an electro-magnetic device to adjust the same, a regulating-circuit including a source of electricity and the electro-magnetic device, and a speed-governor carried by a rotating part of the machine to close the regulating-circuit when a predetermined speed is reached and actuate the electro-magnetic device to adjust the commutator-brushes.

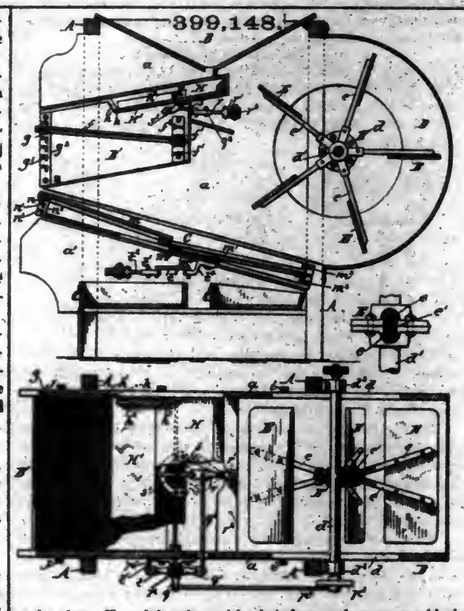
5. A dynamo-regulator comprising shifting commutator-brushes, an electro-magnetic device to adjust the same, a normally-open regulating-circuit including a source of current and the electro-magnetic device, and a centrifugal circuit-controller to close the circuit and actuate the electro-magnetic device to adjust the brushes.

6. A dynamo-current regulator comprising shifting commutator-brushes, an electro-magnetic device to adjust the same, a regulating-circuit including a portion of the field-magnet and the electro-magnetic device, a circuit-controller in the circuit, and a speed-regulator carried by the armature-shaft and connected with the controller to close the circuit and thereby shift the commutators when a predetermined speed is attained.

7. A dynamo-regulator comprising a movable brush-holder provided with stops to limit its movements, a spring secured to one end of the same to yieldingly hold that end depressed, an extension upon the opposite end of the holder, an electro-magnet located below the extension which forms the armature of the magnet, a normally-open regulating-circuit including the magnet, and a centrifugal circuit-controller to close the circuit and actuate the magnet to move the brush-holder.

8. In a regulator, the combination of an armature-shaft extension, a circuit-closer carried by the same, a centrifugal governor to operate the circuit-closer, collars on the extension connected with the closer, brushes bearing upon the collars, and a regulating-circuit including the closer, collars, and brushes, substantially as described.

399,148. GRAIN-SEPARATOR. JOHN A. KRAKE, Buffalo, N. Y., assignor of one-half to Joseph Burk, same place. Filed July 20, 1888. Serial No. 280,491. (No model.)

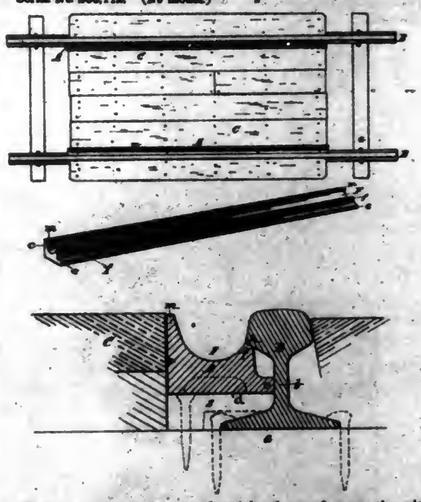


Claim.—1. The combination, with the fan-shaft d' and fan-blades E, of the hub E', mounted on said shaft and provided with sockets e', and the outwardly-diverging arms e, secured with their inner ends in said sockets and with their outer ends to the fan-blades, substantially as set forth.

2. The combination, with the upper shaking-shoe, provided in its sides with notches h', of the feed-board H, secured to said shaking-shoe, and a removable extension, H', having pins h engaging in the notches h', and provided with a supporting-bar, h^3, overlapping the end of the feed-board H, substantially as set forth.

3. The combination, with the shaking-shoe B', provided in its sides with inclined notches h', and the feed-board H, provided with a deflector, h^3, of the removable extension H', having pins h engaging in the notches h', and provided with a supporting-bar, h^3, overlapping the outer end of the feed-board and forming a continuation of the deflector h^3, substantially as set forth.

4. The combination, with the lower shoe, C, provided at its upper end with a plate having a series of undercut notches, n', and at its lower end with a series of notches, m^2, of the lower screen, m', provided at its lower end with supporting-pins engaging in the notches m^2, and having an upper cross-bar engaging with a cross-piece, m^4, secured to the frame of the shoe, and an upper screen, m, abutting with its lower end against the lower screen, m', and provided at its upper end with supporting-pins engaging in the undercut notches n', substantially as set forth.

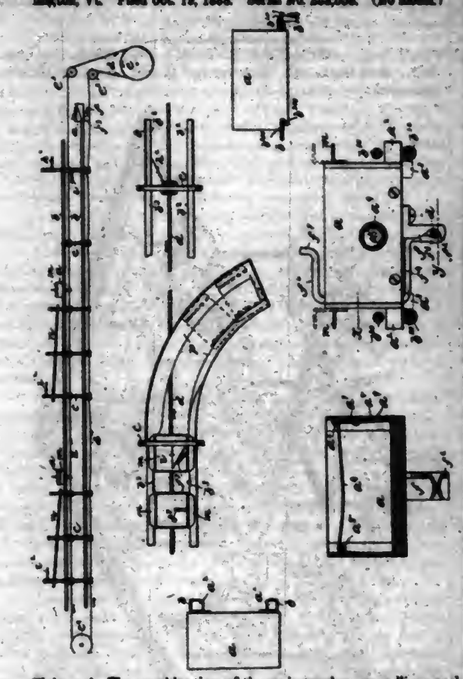


5. The combination, with the stationary frame and shaking-shoe, of adjustable hangers J, pivoted at one end to the shoe and provided at their opposite ends with pins j, plates K, having an opening or slot in which the upper portions of the hangers are arranged, and with a series of notches, k k' k^3, for receiving said pins, and plates L, hinged

to the plates K and bearing with their lower edges upon said pins, substantially as set forth.

6. The combination, with the stationary frame and a longitudinally-vibrating shoe, of longitudinal toggle-links connecting the shoe with the stationary frame, a transverse driving-shaft having a crank-disk, an upright rock-shaft having two actuating-arms arranged about at right angles to each other, a rod connecting one of said arms with said crank-disk, and a rod connecting the other arm of the upright shaft with said toggle-links at or near the joint thereof, substantially as set forth.

399,149. FLANGEWAY-RAIL FOR RAILROAD CROSSINGS AND BRIDGES. WILLIAM LAWRENCE, Worcester, Mass. Filed Oct. 15, 1888. Serial No. 288,112. (No model.)



Claim.—1. As an improved article of manufacture, the within-described rolled metal rail shaped as shown, with the lateral flange c at its forward lower part, the lip f at the upper front corner, the upright rear edge, c, and upwardly-extended guard-lip m, and the channel F, having the hollow rounded contour between the said lips, all as shown and described.

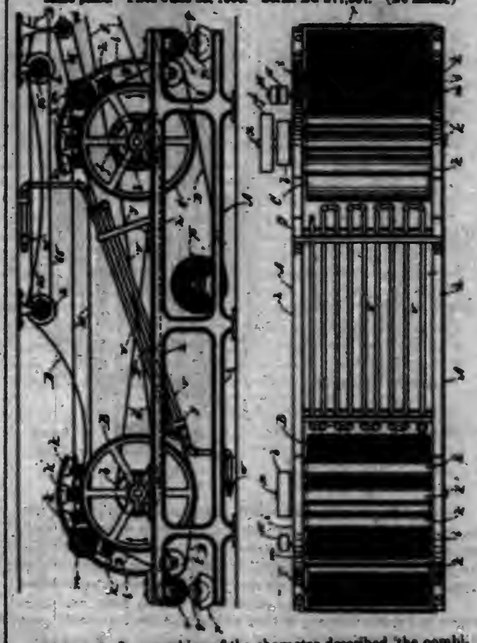
2. The combination, with the track-rail B and crossing-plank C, of the rolled flangeway-rail A, having the lateral projecting flange c at its forward lower part abutting against the web of the track-rail, the upwardly-directed lip f, matching against the lower corner of the track-rail head, the upright back c, and guard-lip m, sustaining the

crossing-plank, and the rounded channel F between said lips f and m, all as shown and described.

399,150. CONVEYING APPARATUS. JOSEPH C. MARTIN, Burlington, Vt. Filed Oct. 19, 1888. Serial No. 288,568. (No model.)

Claim.—1. The combination of the main track, a propelling-cord moved parallel thereto, an auxiliary or delivering track inclined to the line of the main track, the carrier supported and guided on the main track and provided with flanges distinct and separate from those of its parts which engage the main track, and which are adapted to engage said auxiliary track and to support and guide it thereon, a cord-engaging clutch attached to the carrier, and a clutch-tripper arranged and operating to release the clutch from the cord after the carrier has left the main track and has traveled a predetermined distance on the auxiliary track, substantially as and for the purposes hereinbefore set forth.

2. The combination of the carrier with a main track composed of two opposite rails, each having upper and under guide-surfaces that engage corresponding guide-surfaces on the carrier above and below, portions of one of said rail-guide surfaces being removed at stations or points on the track where the carrier is to be applied thereto and removed therefrom to permit the carrier to be lowered onto and raised up from the said track, the remaining portion of said rail-guide surfaces at such points serving to support and guide the carrier, substantially as described.



3. The combination of the carrier, a main track composed of two opposite rails, each having upper and under guide-surfaces that engage corresponding guide-surfaces on the carrier above and below, portions of one of said rail-guide surfaces being removed at the station or point on the track where the carrier is to be removed therefrom, and an auxiliary or delivering track at said station, inclined to the line of the main track, composed of two opposite rails adapted to engage lateral longitudinal flanges on the said carrier distinct from those parts of the carrier which engage the main track, substantially as and for the purposes hereinbefore set forth.

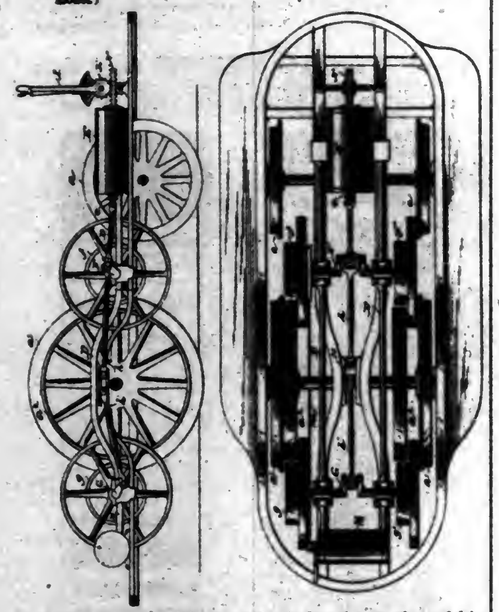
4. The combination of a track and propelling-cord moved parallel thereto, with carriers movable on said track, provided with a cord-engaging clutch composed of a cord-receiving member consisting of an arm attached to the carrier, and a movable member consisting of a finger supported on an arm connected with the rock-shaft, and a cam on said rock-shaft and spring co-operating therewith to retain the said clutch in its open and closed positions, substantially as described.

5. The combination of the main track and the propelling-cord moving substantially parallel therewith, with the carrier moving on said track, provided with a cord-engaging clutch having a cord-receiving member consisting of an arm attached to the body of the carrier and provided at its extremity with a laterally-projecting finger, and a member movable toward and from said cord-receiving member in an arc substantially tangential to the line of movement of said cord, substantially as set forth.

6. The combination of the main track and propelling-cord moving substantially parallel therewith, with a carrier movable on said track, provided with a cord-engaging clutch having a cord-receiving member consisting of an arm attached to the body of the carrier and provided near its extremity with an inclined cord-engaging recess, and a member movable toward and from said cord-receiving member in an arc substantially tangential to the movement of said cord, substantially as set forth.

399,151. MACHINE FOR COATING PAPER. JAMES M. MCCAMLAND, Pepperell, Mass., assignor of one-fourth to Albert McCausland, same place. Filed June 22, 1888. Serial No. 277,867. (No model.)

Claim.—1. In a machine of the character described, the combination of a frame, two cylinders journaled in said frame, two coils of steam-pipe disposed between said cylinders in an inclined plane, impinging the top surface of one cylinder and the bottom surface of the other cylinder, said coils forming a straight passage between them through which the paper passes to be dried, troughs for containing the coating material, provided with a feed-roll and secured, respectively, at each end of said frame, a coating-brush journaled in said frame in contact with said feed-roll, and a guide-roll for the paper journaled near each of said coating-brushes in such a manner that the paper will receive a coating from said brushes on opposite surfaces as it passes over said rolls and cylinders, substantially as set forth.



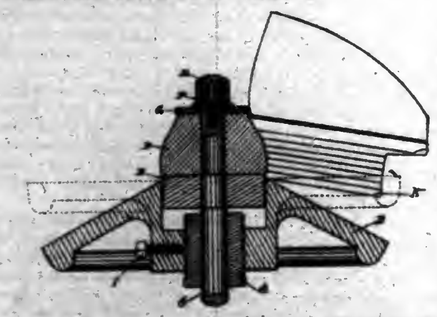
2. In a machine of the character described, the combination of a frame, two cylinders journaled in said frame and revolving in opposite directions, a trough for containing the coating material, provided with a feed-roll and secured at each end of said frame, a revolving coating-brush journaled in each end of said frame in contact with said feed-rolls, guide-rolls for the paper journaled, respectively, in said frame nearly in contact with said coating-brushes, a series of laterally-arranged straight brushes and a revolving brush for distributing the coating as the paper passes over said cylinders, and diagonally-arranged coils of steam-pipe for drying the coated surface of the paper as it leaves one cylinder, whereby it is adapted to be brought in contact with the second cylinder to permit the opposite surface to be coated, substantially as specified.

3. In a machine of the character described, the combination of the frame A, the revolving cylinders B C, journaled in said frame, brushes for depositing the coating material upon opposite surfaces of the paper as it respectively passes over said cylinders, and the steam-coils v, secured between said cylinders for drying the paper as it leaves the cylinder C, and thereby preventing it from adhering to the cylinder B, substantially as set forth.

4. In a machine of the character described, the combination of the frame A, the cylinders B C, journaled in said frame, the troughs p, secured to said frame and provided with feed-rolls q, the revolving

coating-brushes *r*, journaled in said frame, the guide-rolls *t*, the finishing-brushes *k m*, supported above said cylinders, and the steam-pipes *v*, adapted to dry the paper as it passes between the cylinders, substantially as specified.

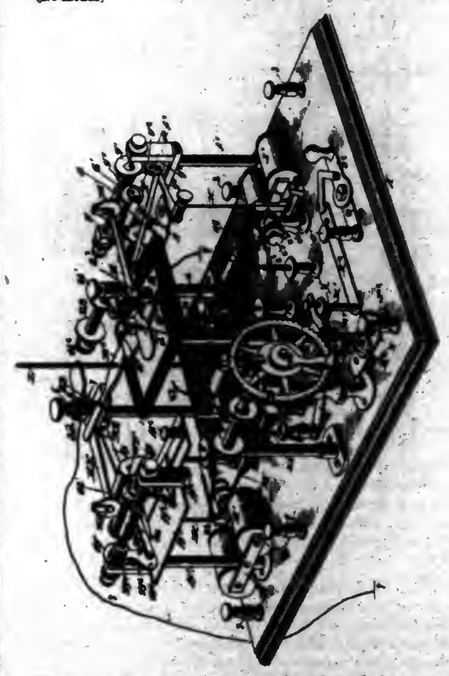
399,152. DRIVING MECHANISM FOR STREET-CARS. JAMES MCLEAN, Pueblo, Colo., assignor to the McLean Rapid Transit Machine Company, of Colorado. Filed Apr. 25, 1888. Serial No. 271,796. (No model.)



Claim.—1. In combination with a body and supporting and driving wheels, a sliding frame carrying friction-wheels, with crank-shafts and piston-connections to an engine, all mounted on the said frame, the friction-wheels being arranged to shift their contact with friction-wheels on the axle to reverse the movement, substantially as described.

2. In combination with a car-body, a moving frame carrying a motor, two shafts carrying friction-wheels, said friction-wheels being in line with friction-wheels on the driving-axle, but on opposite sides thereof at a distance asunder greater than the diameter of the friction-wheels on the driving-axle, and connections between the two shafts on the moving frame and the motor, all substantially as described.

3. In combination with the sliding frame carrying the engine, crank-shafts journaled thereon and their friction-wheels arranged on both sides of friction-wheels on the axle of the driving-wheels, the connection between one crank-shaft and the piston-rod of the engine, and connection between the two crank-shafts through the sliding head moving on ways in the frame.



399,153. HEEL-TRIMMER. OSCAR L. HOGLE, Boston, Mass. Filed Mar. 12, 1888. Serial No. 266,163. (No model.)

Claim.—1. The improved heel-trimming machine above described, consisting of table B, cutter D, top-lift guide E, and collar G, the surface of the table being inclined to the axis of the cutter-arbor C, the table being recessed to receive the top-lift guide E, and the collar G being held by means substantially such as are shown, substantially as described, and for the purpose set forth.

2. In a heel-trimming machine, the table B, with its surface inclined to the axis of the cutter, in combination with the cutter D and the top-lift guide E, the table B being recessed to receive the top-lift guide, substantially as and for the purpose set forth.

399,154. AUTOMATIC TELEGRAPHY. JOHN O'NEIL, New York, N. Y. Filed July 6, 1886. Renewed July 23, 1888. Serial No. 280,836. (No model.)

Claim.—1. In an automatic multiplex-telegraph instrument, a continuously-energized electro-magnet interposed in the main-line circuit and independent intermittently-energized electro-magnets in alternate circuit with said main line, in combination with styluses vibrated by said continuously-energized magnet and independent electrodes in intermittent circuit with said main-line circuit, substantially as described.

2. In an automatic multiplex-telegraph system, a combined transmitting and receiving instrument, each having supports to receive material on which the message is written or is to be recorded, a single electro-magnet interposed in the main-line circuit, continuously-vibrating separate styluses or electrodes connected to a vibrating armature pivoted in the field of said electro-magnet, and mechanism, substantially as described, to intermittently throw said electrodes into and out of said main-line circuit, as and for the purpose set forth.

3. A continuously-energized electro-magnet interposed in the main-line circuit, a vibrating armature therefor, and independent electro-magnets in intermittent circuit with said main line and provided with armatures positively connected together, in combination with styluses, connections between said styluses and the armature of the continuously-energized magnet, electrodes carried by said styluses, message-fillets in normal contact with said electrodes, feed mechanism for said fillets, and connections between the armatures of said independent magnets and said feed mechanism, substantially as described.

4. In an automatic multiplex-telegraph instrument, a message-fillet, a support therefor, and feed mechanism to move said fillet in forward direction, a stylus having an electrode in normal contact with said fillet, an armature to vibrate said stylus, a continuously-energized electro-magnet included in the main-line circuit to actuate said armature, and independent intermittently-energized electro-magnets, substantially as described, armatures therefor, and connections between said armatures and said electrode to automatically throw said electrode into and out of the main-line circuit and into and out of contact with the message-fillet, as and for the purpose specified.

5. In an automatic multiplex-telegraph system, a combined transmitting and receiving instrument having supports to receive material on which the message is written or is to be recorded, means, substantially as described, to move said material in forward direction, separate styluses or electrodes connected together and to an armature pivoted in the field of an electro-magnet, which is continuously closed to the main-line circuit, and mechanism, substantially as described, to intermittently throw said electrodes into and out of circuit with the main line, as and for the purpose specified.

6. In an automatic multiplex-telegraph system, a transmitter and a receiver placed in juxtaposition and provided with supports to receive strips on which messages are written and are to be recorded, means to move said strips consecutively in forward direction, separate styluses connected together and to a vibrating armature pivoted in the field of a single electro-magnet, which is interposed in the main-line circuit, whereby the said styluses are vibrated over the surface of said material, and means, substantially as described, for throwing said styluses alternately out of contact with said material and out of circuit with the main line, as and for the purpose set forth.

7. A transmitting-instrument and a receiving-instrument in juxtaposition, each having a message-fillet, a support and feed mechanism for the same, and a stylus or electrode in normal contact with said fillet, a connection between said styluses or electrodes, an armature to vibrate said electrodes simultaneously, a continuously-energized electro-magnet to actuate said armature, and intermittently-actuated electro-magnets independent of said continuously-energized magnet, to actuate said feed mechanism and to intermittently throw said electrodes into and out of circuit with the main line, substantially as described.

8. A multiplex-telegraph instrument provided with a transmitting-instrument and a receiving-instrument in juxtaposition, each having a message-fillet, a support and feed mechanism for said fillet, and a stylus or electrode in normal contact with said fillet, connections between said styluses or electrodes, a continuously-energized magnet interposed in the main-line circuit to simultaneously vibrate said electrodes, in combination with devices to positively move said electrodes out of contact with said fillets, intermittently-energized electro-magnets interposed in the circuits of said transmitting and receiving instruments, and connections between said magnets, feed mechanism, and contact-breaking devices, substantially as described.

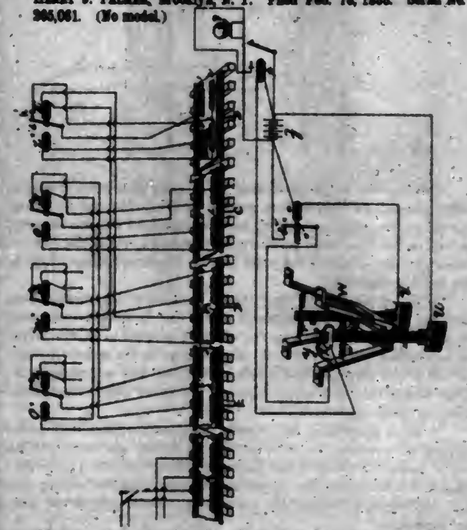
9. An automatic multiplex-telegraph instrument having a transmitting and a receiving device provided with styluses intermittently in circuit with the main line, connected together and to the vibrating armature of an electro-magnet interposed in the main-line circuit, electro-magnets interposed in the circuits of said transmitter and said receiver and alternately energized by message-impulses over said main line, and means, substantially as described, connected to said magnets to feed the message sending and receiving material in forward direction, and to automatically and intermittently throw the transmitting and receiving instruments into and out of the main-line circuit, as and for the purpose set forth.

10. In a combined transmitting and receiving instrument, styluses, which are intermittently thrown into and out of the main-line circuit are connected together and to a vibrating armature pivoted in the field of and operated by the intermittently-reversed polarity of a single electro-magnet interposed in the main-line circuit, supports to receive material on which the message is written or is to be recorded, feed mechanism to move said material in forward direction, mechanism to move said styluses out of contact with said material, and intermittently-operating electro-magnets interposed in the circuit of each of said instruments and connected to said feed mechanism and to the mechanism by which the styluses are thrown out of contact with said message sending and receiving material, as and for the purpose specified.

11. A transmitting-instrument and a receiving-instrument placed in juxtaposition and provided with message-fillets, feed mechanism therefor, and with connected styluses having electrodes in normal contact with said fillets, a continuously-energized electro-magnet to vibrate said styluses, an intermittently-energized electro-magnet included in the circuit of each of said magnets and provided with armatures, positive connections between said armatures, and stops to limit the movement thereof, connections between said armatures and feed mechanism, devices to move said electrodes out of contact with said fillets, and connections between said devices and the armatures of said intermittently-energized magnets, substantially as described.

12. In an automatic multiplex-telegraph system, a transmitting and a receiving instrument having metallic rollers F FF to receive strips of material on which messages are written or are to be recorded, styluses or electrodes E EE in contact with said material and attached to vibrating arms E EE, which are connected together and operated by a vibrating armature pivoted in the field of an electro-magnet which is interposed in the main-line circuit and adapted to be intermittently energized by oppositely-moving message-impulses over said main-line circuit, intermittently-operating electro-magnets interposed in the circuits of said instruments and connected to feed mechanism to move said material in forward direction, and mechanism to throw said arms E EE and electrodes E' EE' out of contact with said material, as and for the purpose set forth.

13. A transmitting and a receiving instrument placed in juxtaposition and provided with electro-magnets I' and II' interposed in the circuits of said instruments, respectively, and having armatures I and II, positively connected together and provided with binding-posts *k* and *kk*, which are insulated from said armatures, rods or bars H HH, and connecting-rods from said bars to operate feed mechanism arranged to move message sending and receiving material in forward direction and to move electrodes which are normally in contact with said material out of contact therewith, substantially as described.



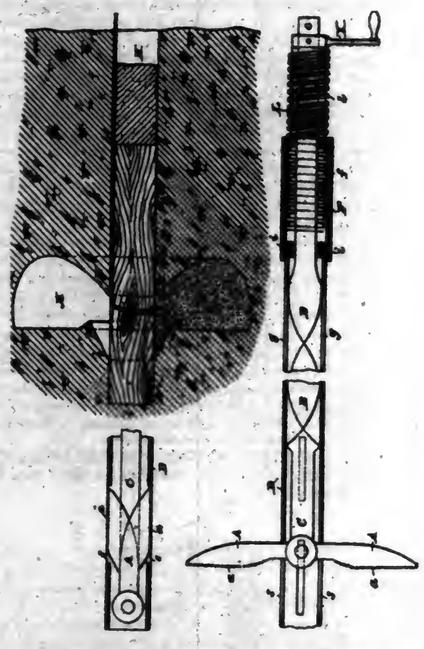
14. In an automatic multiplex-telegraph system, the combination of a transmitting and a receiving instrument provided with vibrating stylus-carrying arms E EE, metallic rollers F FF, to receive strips or fillets of proper material on which messages are written or are to be recorded, and means, substantially as described, to operate said arms and rollers, with pivoted props R RR and arms S SS, connecting said props with feed mechanism, as and for the purpose specified.

15. The combination of the vibrating stylus-carrying arms E EE, metallic rollers F FF, feed-rollers G GG, having feed ratchet-wheels and pendent arms provided with spring-pressed pawls, and means, substantially as described, to operate said feed-rollers, with material on which messages are written or to be recorded, and pivoted props R RR and connecting-rods S SS, substantially as described.

16. The combination, in a multiplex-telegraph instrument and with the message receiving and transmitting fillet thereof, of a fluid-receptacle, 13, having rollers 14 and 15 arranged therein and upon opposite sides of said fillet, contact-rollers F and FF, and feed-rollers having intermittent rotary motion, substantially as described.

17. The combination, with the message receiving and transmitting fillet of a receiving or transmitting instrument, of intermittently-rotating feed-rollers and a fillet-dampening device comprising a fluid-receptacle, a vulcanite roller, 14, and a metallic roller, 15, operating therein, and a spring, 16, connected to hold said rollers in contact with the opposite sides, respectively, of said fillet, substantially as described.

399,155. ELECTRICAL RAILWAY SIGNALING APPARATUS. HENRY J. PALMER, Brooklyn, N. Y. Filed Feb. 18, 1888. Serial No. 265,081. (No model.)



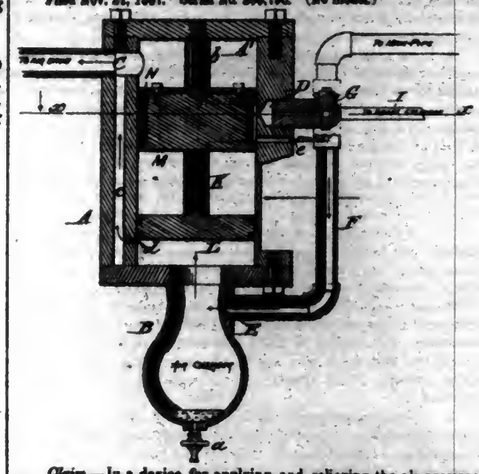
Claim.—1. In an electric railway signaling system, track-terminals and a partial electric circuit connected therewith, corresponding train-terminals and a partial circuit connected therewith and passing to a battery on the train through an electro-magnet, in combination with a separate circuit controlling a signaling apparatus through the armature and back stop of the said magnet, the said separate circuit being normally open between two points, but closed at those points when the contact devices on the train are upon the road-terminals, whereby, if the external circuit be found closed, a signal upon the locomotive will be prevented, and if found open a signal will be sounded, as and for the purpose set forth.

2. The combination, with conducting-rails along a railway-track, of corresponding contact devices upon a train, the said devices being attached to one or more movable or tilting supports, and a circuit-controller operated directly by the movement of said tilting supports to close a circuit upon the train, as and for the purpose set forth.

3. The combination, with the contact-brushes and the supporting-frame in which they are pivoted, of the battery Z, the partial circuit containing the magnet *e*, and the secondary circuit controlled by the said-magnet and having as its terminals the head X and the spring Y, as and for the purpose set forth.

399,156. REAMER FOR FORMING BLAST-HOLES. LEOPOLD PLOM, Retinne, and JULIEN D'ANDRIMONT, Liege, Belgium. Filed Oct. 31, 1888. Serial No. 289,563. (No model.) Patented in Belgium Dec. 23, 1886, No. 5,616; in France Jan. 3, 1887, No. 167,287; in Luxemburg Jan. 3, 1887, No. 783, and in England Jan. 4, 1887, No. 139.

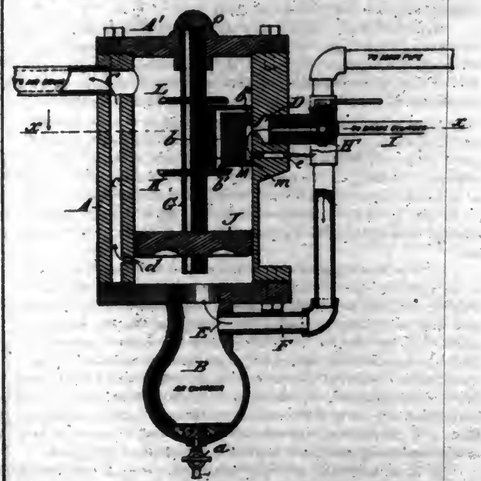
Claim.—1. In an instrument for forming blast-holes in coal or other mineral, the combination, with an inclosing-tube and a drill-rod having an extensible and folding within said rod, of a sleeve screwing on one end of the above members and secured to the other, so as to rotate thereon, whereby the latter may be withdrawn substantially in the manner explained.



2. In an instrument for forming blast-holes, the combination, with the tube D, having apertures *s*, of a rod, C, located within said open-ended tube and having the wings A pivoted to it, said wings being inclined outward, whereby they engage in the apertures when moved in one direction and fold upon the rod, and are brought entirely within the tube when moved in the other direction, substantially as herein explained.

3. In an instrument for forming blast-holes, substantially as described, the combination, with the tube D, having apertures *g*, of the rod C, carried by the tube and having a cutting end, and a spiral portion, B, for conveying the pulverized material from the cutting end and discharging it through the apertures *g*, substantially in the manner explained.

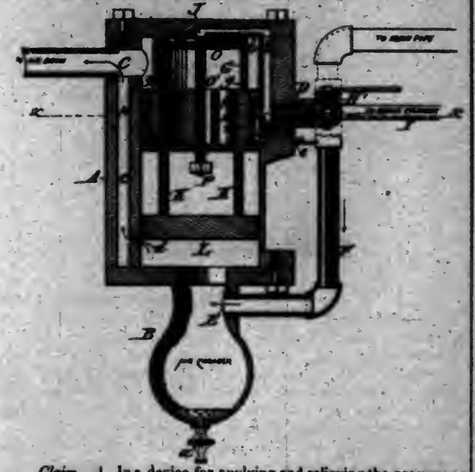
4. In an instrument for forming blast-holes, substantially as described, the combination, with the tube D, having sleeve F, keyed by a lug and annular slot thereon, of a rod, C, having wings A bent outward in opposite directions, whereby they engage an edge on the tube and a head, L, said sleeve and head having corresponding screw-threads, whereby upon rotation of the sleeve the rod is moved relatively to the tube D and the wings A extended, as fully explained.



5. In an instrument for forming blast-holes, substantially as described, the combination, with the tube D, stem C, and wings A, mounted on the stem, said tube having the apertures *s g*, and the sleeve F, keyed thereon so as to be rotatable, of a rod having the conveyer B and head L and crank X, said head and sleeve F being correspondingly screw-threaded, whereby they engage, and upon rotation of the sleeve the rod is moved relatively to the tube to extend the wings and convey the fine material to discharge it through the apertures *g*, the whole instrument being rotated substantially in the manner herein set forth.

399,157. AUTOMATIC PISTON FOR AIR-BRAKES. NATHANIEL J. PRITCHARD and JAMES S. TREPLOW, Milton, assignors, by direct and mesne assignments, to the Pritchard Brake Company, Roanoke, Va. Filed Nov. 21, 1887. Serial No. 256,790. (No model.)

Claim.—In a device for applying and relieving the air-pressure on railway-brakes, the combination of the inclosing-case A, whose top plate, A', has a downward projection, *b*, said case having port C, leading to the air-drum, port D, leading to the brake-cylinder, port E, where the main pipe enters, the exhaust-port *c* in the side wall of the cylinder near port D, the vertical passage *e* and port *d* between it and the interior chamber of the case, the T-shaped pipe connected to the casing at port D, and having a plug-valve, G, located at the intersection of its members, the piston K within said interior chamber of the casing, having heads L and M, the loosely-placed ring N, surrounding head M, and having a recessed face adapted to connect port D and exhaust-port *c*, all of said parts being arranged to operate substantially in the manner and for the purpose described.



399,158. AIR-BRAKE. NATHANIEL J. PRITCHARD and JAMES S. TREPLOW, Milton, assignors, by direct and mesne assignments, to the Pritchard Brake Company, Roanoke, Va. Filed Apr. 13, 1888. Serial No. 270,568. (No model.)

Claim.—1. In a device for applying and relieving the pressure on pneumatic railway-brakes, the combination of the inclosing-case having ports leading to the air-drum, main pipe, and brake-cylinder, an exhaust-port, and a vertical passage extending upward through the wall of the cylinder to the port that leads to the air-drum, said passage having communication near the bottom of the cylinder by a port with the interior of the cylinder, the cap-plate for the cylinder provided with a downwardly-extending tubular box, the piston and its piston-rod, the upper end of which is received into said tubular box, the two flat circular plates or disks secured upon said piston-rod, the valve located between said plates, and consisting of a semi-cylindrical piece of metal having a port in the bottom and a port in the side, which ports are connected by an air-passage, the opening to the lower or bottom port being controlled by the flat plate beneath it, all the parts being arranged to operate substantially as and for the purpose herein described.

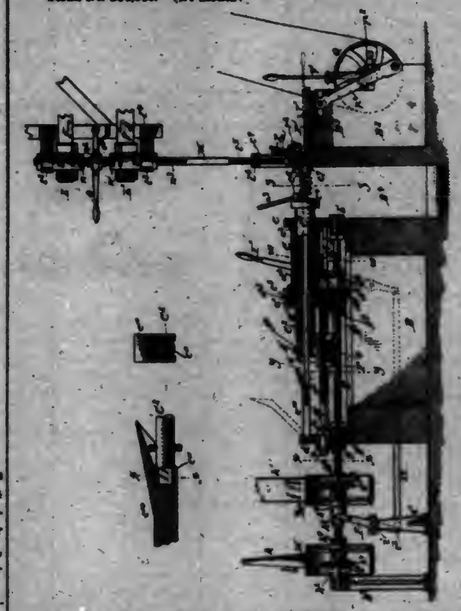
2. In a device for applying and relieving pneumatic pressure on railway-brakes, the combination of the main cylindrical case A, having the port C, leading to the air-drum, port D, leading to the brake-cylinder, port E, leading to the main air-supply pipe, an exhaust-port, *c*, and a vertical passage, *e*, extending upward through the wall of the cylinder to the port C, said passage *e* communicating by port *d* with the interior of cylinder A, the cap-plate A' for the main body A, provided with a downwardly-projecting tubular box, *o*, the piston J and its piston-rod G, whose upper end enters the tubular box *o*, the two flat circular plates K and L, secured upon the piston-rod, the valve M, located between said plates or disks, and having a bottom port, *b'*, a lateral port, *b³*, and a connecting-passage, *b*, between said ports, the port *b'* being adapted to be closed or opened by the disk or plate K, all the parts being arranged for joint operation, substantially as described, and for the purpose specified.

399,159. DEVICE FOR APPLYING PRESSURE TO RAILWAY-BRAKES. NATHANIEL J. PRITCHARD and JAMES S. TREPLOW, Milton, assignors, by direct and mesne assignments, to the Pritchard Brake Company, Roanoke, Va. Filed Mar. 5, 1888. Renewed Jan. 18, 1889. Serial No. 296,794. (No model.)

Claim.—1. In a device for applying and relieving the pressure on railway-brakes, the combination of the inclosing-case having ports leading to the air-drum, main pipe, and brake-cylinder, the double-ended piston located within said case, the valve surrounding the upper end of the piston, in the manner specified, and the graduating-piston, all the parts being combined and arranged for joint operation, substantially as described.

2. In a device for applying and relieving the air-pressure to pneumatic railway-brakes, the combination of the cylindrical inclosing-case having ports leading to the air-drum, main pipe, and brake-cylinder, suitable air-passages, as specified, and also an exhaust-port, the cap-plate for said inclosing-case having a downwardly-projecting cylindrical extension provided with a port and apertures, the main double-ended piston operating within the inclosing-case, and the graduating-piston working within the cylindrical extension on the cap-plate, all substantially as described, and for the purpose set forth.

3. In a device for applying and relieving the air-pressure to air-brakes, the inclosing-case provided with properly-arranged ports, as specified, in combination with the main double-ended piston, its surrounding valve, and the graduating-piston having its piston-rod connected to and actuated by the main piston, substantially in the manner and for the purpose set forth.



4. The combination of the inclosing-case having ports leading to the air-drum, main pipe, and brake-cylinder, together with connecting-passages and exhaust-ports, the cap-plate for said case having a downwardly-projecting cylindrical extension furnished with a small port and other apertures, the main double-ended piston carrying a valve arranged relatively thereto, as described, the graduating-piston working in the cylindrical extension on the cap-plate and having its piston-rod connected to and adapted to be actuated by the main piston, all substantially in the manner and for the purposes hereinbefore described.

5. The combination, with the inclosing-case having ports C D E and exhaust *c*, the cap-plate A', having the cylindrical extension G, provided with port *b*, and an aperture or apertures, *g*, said case and cap-plate having also suitable air-passages, of a main piston operating within the central chamber, and a graduating-piston operating within the cylindrical extension on the cap-plate to accomplish the result specified, substantially as set forth.

6. The combination of the cylindrical case A, having ports C D E and exhaust *c*, the cap-plate A', having the extension G, provided with small port *b*, and an aperture or apertures, *g*, the main piston having suitably-connected heads L and M, said head M being peripherally flanged at top and bottom to form an annular recess, the valve N, located within said annular recess, and the piston O, working within the extension G and having a piston-rod, O', projected through the head M and furnished with a nut, P, all the parts being arranged substantially as and for the purpose described.

7. In combination with an inclosing-case constructed substantially as described, a main piston having heads L and M, said head M being annularly recessed, the valve N, recessed at *n* and located within the said annular recess of head M, but being shorter in vertical length than the recess, for the purpose indicated, and the piston O, having rod O', extending through head M and furnished with nut P, all substantially as described.

399,160. SPRING-BENDING MACHINE. JAMES M. RICE, Pittston, Pa., assignor to William T. Haydock, St. Louis, Mo. Filed Sept. 25, 1888. Serial No. 286,213. (No model.)

Claim.—1. The combination, with the clamping-dies, whereby one end of the spring-bar is held, of a winding-cylinder, a removable mandrel arranged within the winding-cylinder, a rotating drum surrounding the winding-cylinder and connected therewith by a groove and feather to rotate the same, and feed mechanism whereby the winding-cylinder is moved longitudinally in the drum, substantially as set forth.

2. The combination, with the clamping-dies, whereby a portion of the spring-bar is held, of the winding mechanism whereby the spring-bar is coiled, and a ram whereby the end of the spring-bar is bent, substantially as set forth.

3. The combination, with the clamping-dies, of the winding-cylinder, a mandrel arranged in the bore of the winding-cylinder, and a locking-arm whereby the mandrel is held against longitudinal movement, substantially as set forth.

4. The combination with the clamping-dies, the winding-cylinder, and the mandrel provided with a flat-sided end, of a locking-lever provided with a flat-sided recess engaging with the flat-sided end, of the mandrel, whereby the mandrel is held against rotary movement, substantially as set forth.

5. The combination, with the hollow drum provided with driving-gear whereby it is rotated, of a winding-cylinder arranged in said drum and connected therewith by a groove and feather, a cross-head provided with a screw-nut and connected with said winding-cylinder, and a feed-screw engaging with said screw-nut, substantially as set forth.

6. The combination, with the hollow drum provided with a gear-rim, of a winding-cylinder arranged in said drum and connected therewith by a groove and feather, a feed-screw connecting said winding-cylinder, a driving-shaft provided with mechanism whereby it can be rotated in either direction, gears connecting said driving-shaft with the feed-screw, and a gear-pinion and clutch whereby the drum can be rotated from said driving-shaft, substantially as set forth.

7. The combination, with the lower die provided in its face with a recess, of a mandrel having an inclined end seated in said recess and a winding-cylinder surrounding said mandrel, substantially as set forth.

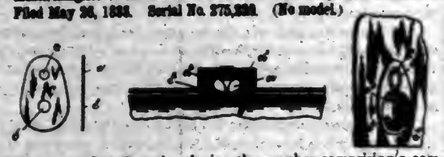
8. The combination, with the clamping-dies, of a winding-cylinder and a feed-screw whereby the cylinder is moved toward the clamping-dies, thereby bending the body of the bar preparatory to winding the same, substantially as set forth.

9. The combination, with the winding mechanism, of an upper movable die and a lower stationary die provided in its upper face with a depression, and having on its front side a slotted flange opening upwardly and projecting upwardly beyond the face of the die, and having inclined deflecting-faces to form in connection with the winding mechanism the initial bend of the spiral, substantially as set forth.

10. The combination, with the winding mechanism, of a lower stationary die, an upper movable die provided on its rear side with a former-plate, a pivoted ram, and mechanism whereby an oscillating motion is imparted to the ram, substantially as set forth.

11. The combination, with the winding mechanism, the clamping-dies, and the ram whereby the end of the spring-bar is bent, of a locking-lever which is engaged with the spring-bar and whereby the latter is held in position during the operation of winding, substantially as set forth.

899,161. GLOVE-FASTENER. WILLIAM S. RICHARDSON, Boston, Mass., assignor to the Ball and Socket Fastener Company, Nashua, N. H. Filed May 26, 1888. Serial No. 275,228. (No model.)



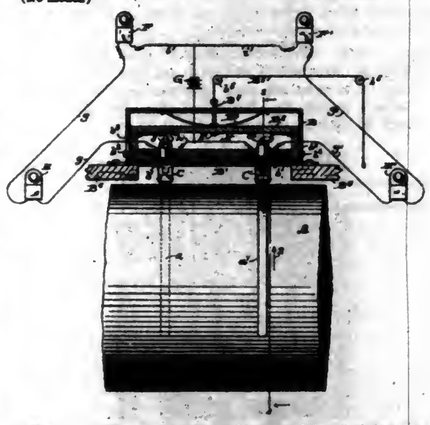
Claim.—1. The ball member of a fastening, comprising the ball a, applied to one surface of the material upon which it is used, the cap a', applied upon the opposite surface of said material and having a cavity to receive the material and ball, and a washer or flange between the ball and material, the said ball being secured to the cap with the material to bring the principal part of its body within the edge of the material determined by the edge of the cap, substantially as described.

2. A socket member of a fastening, comprising a flat plate having at one end an ear, b^2, affording means by which the member of the fastening is secured to the material, and at the other end the continuous flange b^3, and the yielding or spring jaws b^5, rising from the inner edge thereof and having an opening to receive the ball member of the fastening, substantially as described.

3. The combination, in a fastening for gloves and other articles, of the flat plate b^2, the jaws b^5, extending upward therefrom, and the slit or slits b^4, and an extension, b^3, of the plate b^2, for receiving a fastening for securing the member to the material with the ball, post, or stud member, substantially as described.

4. The combination, in a fastening for gloves and other articles, of a ball member comprising a ball, a, secured within a cavity formed in one surface of the material, and a cap located upon the other surface of the material, and a washer, the ball and washer being secured to the cap, and the washer and cap determining said cavity in the material, with a socket member having upwardly-extending yielding jaws b^5, provided with an opening to receive the ball, substantially as described.

899,162. GLOVE-FASTENING. WILLIAM S. RICHARDSON, Boston, Mass., assignor to the Ball and Socket Fastener Company, Nashua, N. H. Filed May 26, 1888. Serial No. 275,229. (No model.)



Claim.—1. In a fastening device, the member comprising a compressible ball adapted to be placed upon one surface of the material of the glove or other article to which it is attached, and a cap upon the opposite surface of said material, the ball being secured to the cap and held in its cavity by a fastening extending from the ball through the material to the cap, substantially as described.

2. The combination of the member of a fastening, consisting of a compressible ball, a, a cap, a', held or secured to the material, as described, with the ball-receiving device comprising a plate, C, having a sleeve, c^2, provided with the opening c^3, of less size than the size of the ball when expanded, substantially as described.

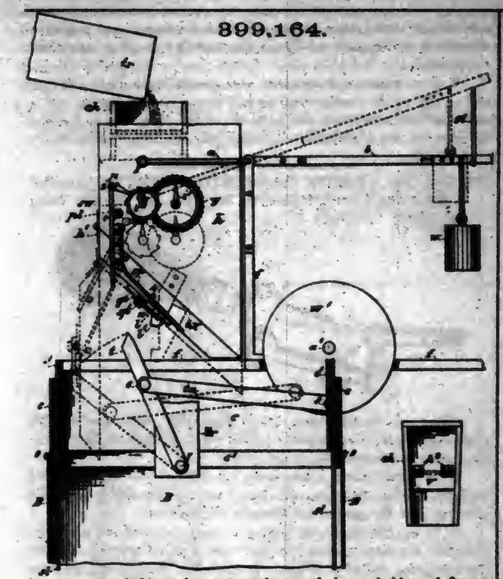
3. The member of a fastening device for receiving and holding an expansible ball, comprising the plate C, the sleeve c^2, extending therefrom and having the opening c^3, of less size than the expanded ball which it receives, and the ear c^4, by which it is secured to the material, substantially as described.

4. The combination of the compressible ball a, the cap a', the crowned washer a^2, and a stud or eyelet connecting the ball and washer with the cap, substantially as described.

899,168. ELECTRIC SIGNAL FOR ENGINE-SHAFTS. JAMES G. RICKETSON, Milwaukee, Wis. Filed Oct. 4, 1882. Serial No. 267,161. (No model.)

Claim.—1. The combination, with a revolving shaft having cams attached thereto, as described, each cam having one inclined and one blunt end, of a pair of push-rods suspended in housings above said shaft, hangers hinged to said push-rods and capable of turning on their hinge-joints in one direction only and normally located in the paths of motion of said cams, contact-strips attached to the housings of the push-rods in the path of motion of the latter, and a pair of distant signals electrically connected to said contact-strips, whereby the inclined edge of one cam will pass under the hanger of one of the push-rods and raise it, closing a circuit and actuating the distant signal in said circuit, while the blunt edge of the other cam will strike the hanger of the other push-rod and swing it out of the way on its hinge-joint, substantially as set forth.

2. The combination, with a revolving shaft having cams attached thereto, as described, of a frame supported above said shaft, a movable block sliding vertically in said frame and carrying push-rods having hangers hinged thereto in the paths of motion of said cams, a spring within the said frame bearing against said block, a rod connected to the latter, and a cord connected to said rod, whereby the hangers may be withdrawn from possibility of contact with the said cams by drawing upon said cord and on releasing the cord automatically restored to place, substantially as set forth.



899,164. AUTOMATIC GRAIN WEIGHER AND MEASURER. WILLIAM S. SCOTT, Rentsonce, Ind. Filed Feb. 13, 1888. Serial No. 263,930. (No model.)

Claim.—1. In an automatic grain weighing and measuring machine, a frame-work, a hopper suspended therefrom, a scale-beam connected to the hopper and carrying a weight, a bottom hinged to such hopper, a spring connected thereto for closing and a latch for securing the same, and a trip for unlatching connected to a wheel driven by suitable power, such trip operating to release the latch when the loaded hopper falls, all combined substantially as shown and described.

2. A grain-weighing machine comprising a hopper having a hinged bottom suspended by a bail from a frame, a scale-beam connected to the hopper-bail, and a chute connected above the hopper, having a valve in its bottom adapted to be lifted when the chute falls by contact with a projection, whereby the grain is held in the chute and prevented from falling into the hopper until the latter rises, substantially as described.

3. A grain-weighing machine comprising, in combination, a frame-work, a hopper having a hinged bottom, a bail connected to such

899,164.

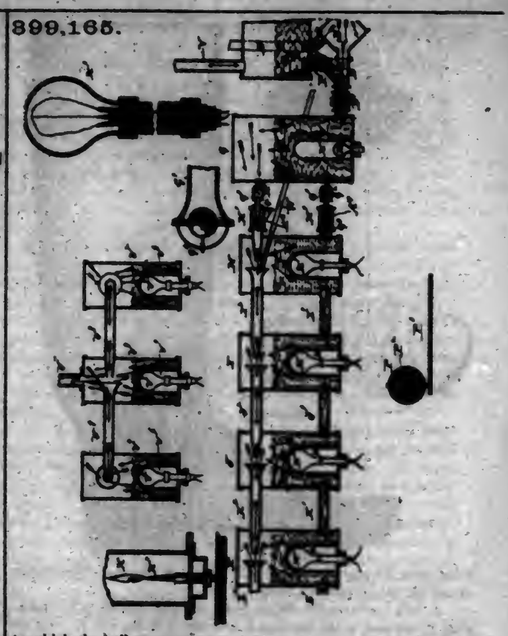
hopper suspended in such frame-work, an axle journaled in such frame a driving-wheel mounted thereon, a tripping mechanism connected to such driving-wheel at one end and at the other, and a trip which engages with a latch secured to the hinged bottom of such hopper, whereby the latch is freed by the descent of the load, substantially as shown and described.

4. A grain-weighing machine comprising a hopper suspended by its bail from the frame and carrying above it a chute provided with a valve located in line and in combination with a projection from the frame, whereby the descent of the loaded hopper closes the valve and retains the grain in the chute until the hopper again rises, substantially as described.

5. In a grain-weighing machine, the chute ch, the projection pr, connected to the frame-work below, and valve v, hinged to the bottom of such chute and opening upward in the line of such projection, all combined substantially as described.

6. In an automatic grain weighing and measuring machine, a frame-work, a hopper having a hinged bottom suspended by a bail therefrom, a pressure-spring connected to such hopper for closing the hinged bottom when the load is discharged, an axle journaled in the frame-work, a driving-wheel mounted thereon, a tripping mechanism connected to such driving-wheel at one end and at the other with a trip which engages with a latch secured to the hinged bottom of such hopper, and a registering mechanism which is actuated by the opening of the hopper-bottom, all combined substantially as shown and described.

7. In an automatic grain-weighing machine, a frame-work, f, hopper h, having a hinged bottom, hx, bail a; the latter having bearings in such frame-work, driving-wheel w', revolving in bearings upon such frame, and the trip-arm tx, connected to such driving-wheel at one end and at the other end to the trip t, pivoted at 7 to the crombar of the frame and adapted to engage with a latch, l, which secures the hinged bottom in place, substantially as shown and described.



8. In an automatic grain weighing and measuring machine, the frame-work f, hopper h, suspended by a bail therefrom and provided with a hinged bottom, hx, closable by a pressure-spring, sp, registering mechanism comprising a pawl-lever, pl, pivoted to the hopper, pawl p, ratchet-wheel sw, gear-wheel gw, and indexes ii upon such wheels, all secured to the side of the hopper, such registering mechanism actuated by the back-pressure of the hinged bottom of the hopper through the pin 3 upon the pawl-lever, all combined as shown and described.

9. In an automatic grain weighing and registering mechanism, a hopper h, suspended by a bail, a, in frame-work f, a chute, ch, having a valve, v, connected to such hopper, a scale-beam, b, carrying a weight, w, and projection pr, connected to the frame for closing the valve in the chute, all combined and operating substantially as shown and described.

899,165. STEAM-GENERATOR. DANIEL W. SMITH, St. Louis, Mo., assignor of one-half to Joseph C. Addington, same place. Filed Nov. 26, 1887. Serial No. 256,265. (No model.)

Claim.—1. In combination with a number of boilers and a receiver

899,165.

to which the boilers are connected, pipes connecting the boilers and having flared ends and injector-nozzles adapted to inject therein arranged above the water-level, and burners for heating the water in the boilers, substantially as set forth.

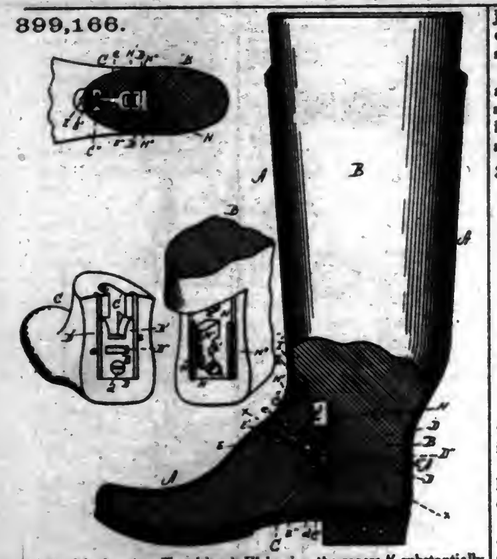
2. The combination, with a number of boilers and a receiver to which said boilers are connected, of pipes connecting said boilers, each having a flared mouth and an injector-nozzle, and said mouths and nozzles being arranged opposite each other and above the water-level within said boilers, water-pipes connecting the boilers at their lower parts, and burners for heating the water in said boilers, substantially as set forth.

3. In combination with a number of boilers provided with burners and a receiver to which the boilers are connected, injector-pipes connecting the boilers near their upper parts, pipes connecting the boilers near their lower parts, one of which is provided with automatic valves, and the steam-exhaust pipes for discharging steam into the boilers, substantially as and for the purpose set forth.

4. In combination with a number of boilers provided with burners and a receiver to which the boilers are connected, injector-pipes connecting the boilers together near their upper parts, pipes connecting the boilers near their lower parts, exhaust-pipe provided with an automatic valve discharging steam into the tanks, and a water-tank provided with automatic valve and connected with the exhaust-steam pipe, substantially as shown and described.

5. In combination with a number of boilers provided with burners and a receiver to which the boilers are connected, injector-pipes connecting the boilers near their upper parts, pipes connecting the boilers near their lower parts, and exhaust-steam pipe discharging steam into the boilers and pipes, substantially as and for the purpose set forth.

6. In combination with a lower series of boilers provided with burners and a receiver to which said boilers are connected, an upper series of boilers connected to the receiver and provided with injector-pipes, substantially as and for the purpose set forth.



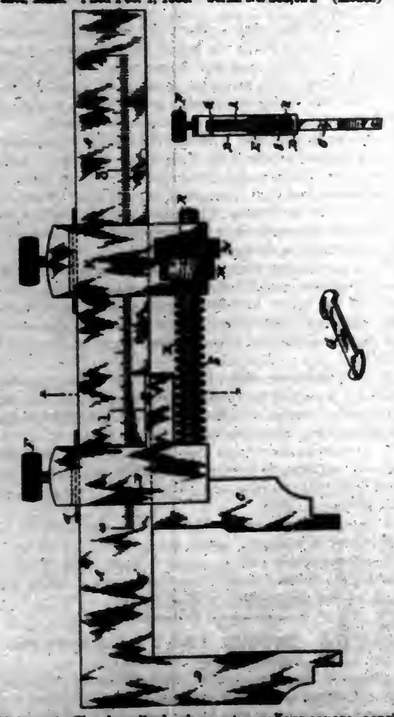
7. In combination with an upper and lower series of boilers provided with heaters and a receiver to which said boilers are connected, a kettle arranged in the receiver, substantially as shown and described, for the purpose set forth.

8. In combination with a series of boilers provided with heaters and a receiver to which the boilers are connected, an exhaust-steam pipe discharging steam into the boilers through a pipe, B, and pipe E, connecting the exhaust-steam pipe to the respective boilers, substantially as and for the purpose set forth.

899,166. BOOT-TREE. JOSEPH D. BULLER, Malden, Mass. Filed Jan. 7, 1888. Serial No. 260,676. (No model.)

Claim.—1. In a boot-tree for rubber boots, the combination of the foot C, recessed at C', provided with the plate D, slotted at D', the spring-rod E, adapted to play in the passage C', and the leg B, pro-

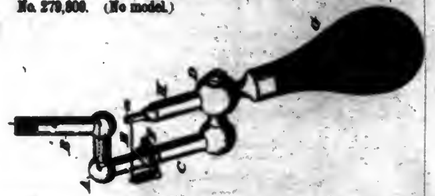
399,166.



vided with the plate H and hook H', having the recess *h'*, substantially as and for the purpose set forth.

2. In a boot-tree for rubber boots, the combination of the hook-plate H, secured to the leg B and provided with the ribs H", with the plate D and foot C, the latter provided with the grooves *c c* next the sides of said plate, substantially as and for the purpose above set forth.

3. In a boot-tree for rubber boots, the combination of the foot portion C, provided with a locking-bolt, the leg portion B, provided with a catch for engaging said bolt, and a spring, as I, set into said leg portion and bearing against the foot portion, substantially as and for the purpose set forth.

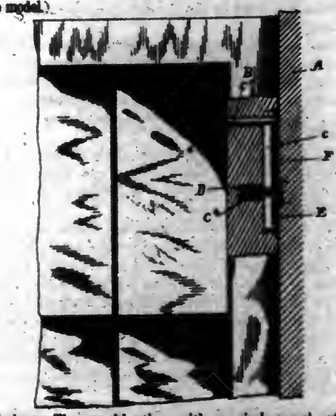


399,167. MICROMETER CALIPER-SQUARE. LAROY S. STARRETT, Athol, Mass. Filed Feb. 1, 1888. Serial No. 262,634. (Model.)

Claim.—1. The described micrometer caliper-square, consisting of a graduated blade or beam, A, with a fixed jaw, B, and movable jaw C D E, in combination with an adjustable binding-clasp, K, micrometer-nut M N, threaded rod R, and surrounding spring S, substantially as set forth.

2. In a measuring-instrument, a graduated blade, a movable jaw, and an adjustable binding-clasp on said blade, in combination with a screw-rod extending from the jaw to the clasp, a spiral spring embracing such rod, and a micrometer-nut engaging such screw, substantially as set forth.

399,168. ELECTRIC CIGAR-LIGHTING DEVICE. WILLIAM TAG and SANFORD C. SMITH, Philadelphia, Pa. Filed July 13, 1888. Serial No. 279,809. (No model.)



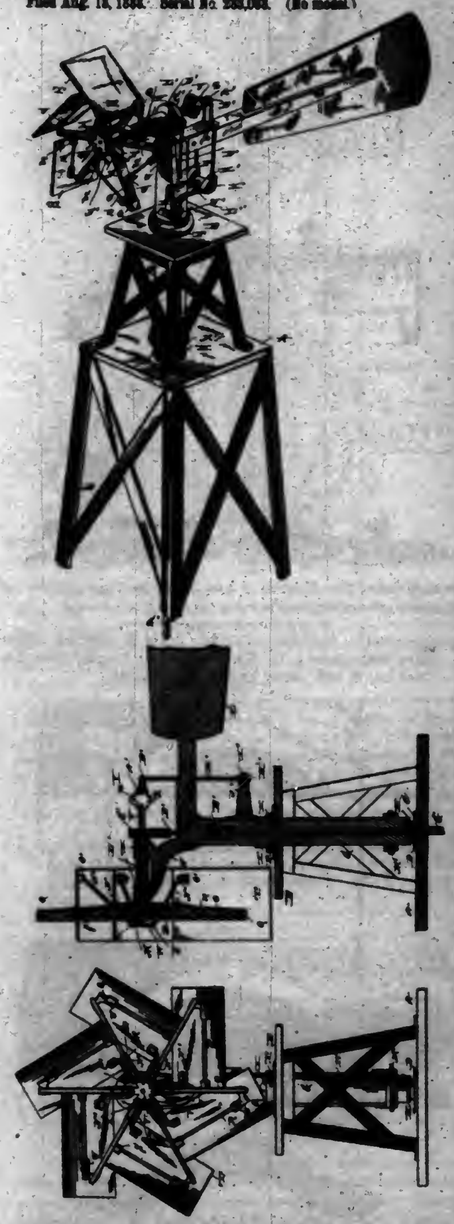
Claim.—1. In an electric lighter, a gas-pipe carrying a movable wiping-electrode, in combination with a cock and a tip, the latter having a groove, substantially as described.

2. In a gas-lighter, a burner-tip constituting one electrode and having a guiding lip or groove adapted to guide the sliding electrode or wiper over the gas-jet, substantially as described.

3. A gas-lighter device having a fixed electrode and a wiping-electrode, the former being provided with a guide adapted to guide the contacting end of the wiping-electrode over the gas-exit, substantially as described.

399,169. SASH-FASTENER. THOMAS H. TEAL and ROBERT A. CAMPBELL, Jonesborough, Tex. Filed Dec. 27, 1888. Serial No. 294,737. (No model.)

Claim.—The combination, with a window-sash, of the spiral spring D, its inner end resting in the socket *d*, its other in the thimble *d'*, locking-plate E, having the hinge-nib *d*, working in the perforation *f*, and thimble *d'*, receiving and covering the outer end of said spring, and handle *e*, said lock-plate and handle fitting and working in groove *c*, and perforation *d'*, covering-plate F, countersunk in the face of said sash, covering said lock-plate, and provided with the perforation *f* and opening *f'*, substantially as shown and described, and for the purposes set forth.



399,170. HANDLE. JOHN TOMS, Newark, N. J. Filed Jan. 12, 1888. Serial No. 260,537. (No model.)

Claim.—A handle for coffee-pots and other articles, consisting of a body, A, having a solid closed head, a longitudinal bore extending into the body to the closed head thereof, a counter-bore, *b*, extending laterally through the body at right angles to the main bore below the head, and the handle-sections B and C, extending, respectively, into

the said bores, one having formed directly in its extremity a transverse screw-socket, into which directly screws the screw-threaded end of the other, the outer ends of said sections being bent and adapted to be attached to the article, substantially as shown and described.

399,171. WINDMILL. ZACHARIAH P. TOWNSEND, Sunquoit, N. Y. Filed Aug. 18, 1888. Serial No. 283,063. (No model.)

Claim.—The windmill consisting of a hollow shaft carrying a hub provided with a series of radial arms, the blades connected to said arms by means of rods, upon which they are pivoted, the rod of each blade connecting with the outer end of one arm and to the intermediate portion of the adjacent arm, a second shaft passing through the aforesaid hollow shaft and provided upon one end with a disk connected by cranked rods to said blades near the rear edges of the latter, and the double bell-crank connected with the opposite end of the said second shaft and to a weight, substantially as and for the purpose set forth.

399,172. PROCESS OF RECOVERING GLYCERINE FROM SPENT SOAP-LYES. ARTHUR W. TERRY, Brooklyn, N. Y., assignor to Josef Glatz, same place. Filed Dec. 1, 1888. Serial No. 292,414. (No specimens.)

Claim.—1. In the process of extracting glycerine and salt from spent soap-lye, the improvement herein described, consisting in first treating said spent lye with lime, in then settling the lime, drawing off the clear liquor and evaporating the same to salting-point, in then mixing said lye with tallow or fat, in then boiling the mixture of lye and tallow or fat, and in then adding to the lye alum or muriate of tin to precipitate and carry down fatty and resinous acids in solution in the lye, substantially as specified.

2. In the process of extracting glycerine and salt from spent soap-lye, the improvement herein described, consisting in first treating said spent lye with lime, in then settling the lime, drawing off the clear liquor and evaporating the same to salting-point, in then mixing said lye with tallow or fat, in then boiling the mixture of lye and tallow or fat, in then adding to the lye alum or muriate of tin, in then filtering the liquor, and in then adding to the clear liquor caustic soda or carbonate of soda to precipitate the albuminous matter contained in the lye and any remaining alum or muriate of tin, substantially as specified.

3. The process of extracting glycerine and salt from spent soap-lye herein described, consisting in first treating said spent lye with lime, in then settling the lime, drawing off the clear liquor and evaporating the same to salting-point, in then mixing said lye with tallow or fat, in then boiling the mixture of lye and tallow or fat, in then adding to the lye alum or muriate of tin, in then filtering the liquor, in then adding to the clear liquor caustic soda or carbonate of soda to precipitate the albuminous matter contained in the lye and any remaining alum or muriate of tin, in then filtering the liquor again, and in then evaporating the liquor to proper density to deposit glycerine and salt, substantially as specified.

399,173. TAPPING-BUNG. JACOB VAN LANDT, Syracuse, N. Y., assignor of one-half to Duncan W. Peak, same place. Filed May 3, 1888. Serial No. 272,633. (No model.)

Claim.—The combination, with a barrel, of a tubular bung inserted into its head, consisting of a threaded tubular body, 3, having a flange, 4; a spider, 5, integral with the body and transverse thereto, a tubular extension, 7, integral with the body, a perforated cap, 8, closed at its inner end and fitting over the extension, a shaft, 11, integral with the head and passing through the spider 5, and provided with a spider, 12, upon its outer end, and a spring, 13, upon the shaft and between the spiders 5 and 12, substantially as described.

399,174. INCANDESCENT DEVICE. CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 8, 1887. Serial No. 230,146. (No model.) Patented in France Nov. 4, 1886, No. 172,064; in Belgium Nov. 4, 1886, No. 70,730; in England Nov. 4, 1886, No. 13,548, Dec. 12, 1886, No. 15,906, and Mar. 15, 1886, No. 3,892; in Italy Feb. 28, 1886, XXXVIII, 310; in Cape of Good Hope Mar. 4, 1886, No. 6/205; in Victoria Mar. 17, 1886, No. 4,473; in Tasmania Mar. 24, 1886, No. 306/9; in South Australia May 3, 1886, No. 676; in New South Wales May 11, 1886, No. 1,330/3; in New Zealand June 11, 1886, No. 1,303; in Queensland June 26, 1886, No. 106; in Finland July 10, 1886, No. 361; in Spain Aug. 10, 1886, No. 3,091/5,858; in Norway Aug. 26, 1886, No. 36, and in India Sept. 2, 1886, No. 40/1,145.

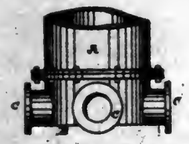
Claim.—1. An incandescent composed of the oxide of thorium, substantially as described.

2. A filament, fabric, or textile frame of combustible material impregnated with a salt of thorium in aqueous solution, substantially as set forth.

399,175. SALT OF SODIUM. JOHN I. WATTS and WILLIAM A. REMMERS, Sandbach, County of Chester, England. Filed July 5, 1887. Serial No. 243,488. (No specimens.) Patented in England Oct. 12, 1886, No. 13,891.

Claim.—The new product, the salt containing one equivalent of bicarbonate of soda, one equivalent of monocarbonate of soda, and two equivalents of water in chemical combination, (Na_2HCO_3,Na_2CO_3, $2H_2O$.)

399,176. PROCESS OF MAKING A SODIUM SALT. JOHN I. WATTS and WILLIAM A. RICHARDS, Sandbach, County of Chester, England. Original application filed July 5, 1887, Serial No. 243,349. Divided and this application filed Nov. 26, 1888. Serial No. 291,890. (No specimens.) Patented in England Oct. 13, 1886, No. 13,001; in France June 30, 1887, No. 184,551; in Belgium June 30, 1887, No. 78,082, and in Germany July 12, 1887, No. 43,888.



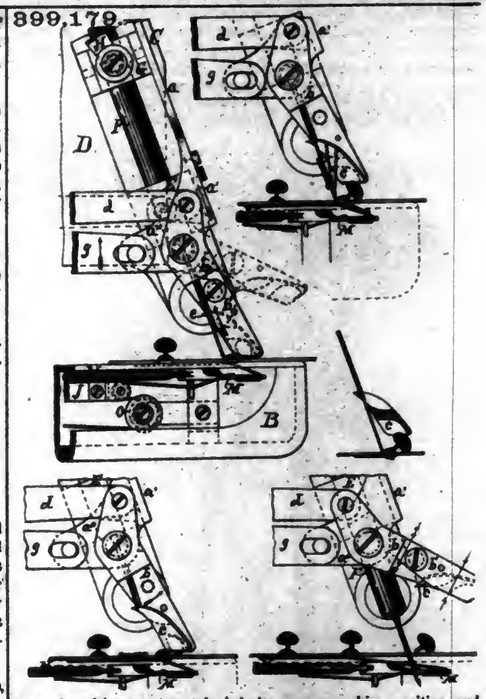
Claim.—The process of manufacturing the said salt by preparing an aqueous solution containing not less than three equivalents of soda (Na_2O) to four equivalents of carbonic acid (CO_2) and causing the salt ($Na_2H_2CO_3+2H_2O$) to crystallize from it at a temperature above 35° centigrade, substantially as herein described.

399,177. DENTAL TOOTH-REGULATING SCREW. EDWARD H. ANGLE, Minneapolis, Minn. Filed Feb. 18, 1888. Serial No. 264,531. (No model.)

Claim.—The combination, with the resistance-tube and its band adapted to be cemented to the anchor-teeth, of the delivery-tube and its band adapted to be cemented to the tooth to be moved at right angles to the resistance-tube, a screw-threaded shaft having a body adapted to closely fit said resistance-tube and a right-angled extremity adapted to closely fit said delivery-tube, and a screw-threaded nut adapted to fit said screw-threaded shaft and bear against said resistance tube, substantially as described.

399,178. CROCK-PRESS. FRANKLIN BENNETT, Canal Fulton, Ohio, assignor of two-thirds to Billings Brothers, same place, and to the Ohio Stoneware Company, Akron, Ohio. Filed Dec. 24, 1887. Serial No. 258,909. (No model.)

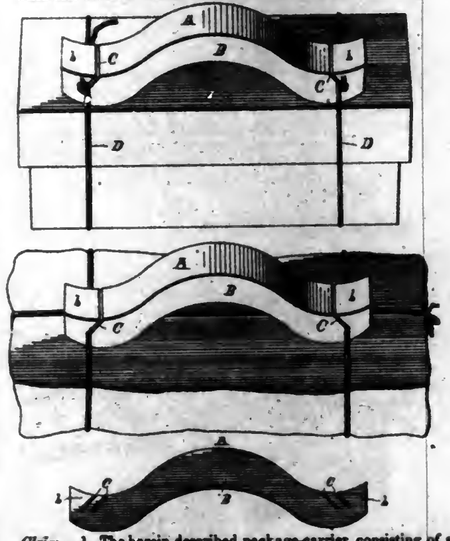
Claim.—1. In a crock-press of the class designated, the combination, with a pipe projecting from the exit-port of a clay-forcing cylinder and a crock-mold consisting of an outer case and an inner core opposite and in the axial line with said pipe, of a sleeve which envelops the end of said pipe, provided with devices, such substantially as shown, by which it is carried against and withdrawn from said outer case, substantially as and for the purpose hereinbefore set forth.



2. In a crock-press of the kind described, the combination, with a clay-forcing cylinder and an outer mold composed of segmental sections hinged and arranged to be locked together and connected at one end with an exit or discharge port of said cylinder, of a movable closed forming-cylinder mounted adjacent to and in alignment with the axis of the mold and a carriage for supporting said cylinder and for effecting the required movements thereof toward and away from the said mold, substantially as and for the purpose specified.

3. The combination, in a crock-mold having an outer case, an inner core, and rim closing the space between them at one end, and in which the outer case consists of segmental sections hinged and arranged to be locked together, of a segmental removable lining which fits in recesses in said case, substantially as shown, and for the purpose specified.

399,179. LOOP REMOVING AND SPREADING MECHANISM FOR BUTTON-SEWING MACHINES. WALTER R. BENNETT, Boston, Mass., assignor to the Morley Button Sewing Machine Company, same place. Filed June 14, 1888. Serial No. 277,108. (No model.)

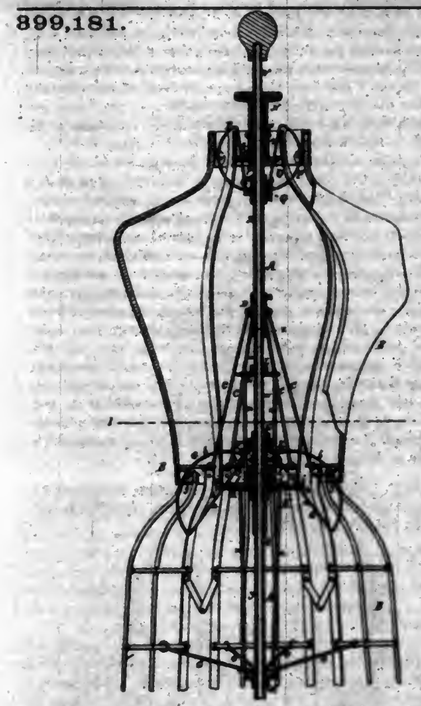


Claim.—In a shank-button-sewing machine, the combination, with the work-table, open-eyed double-barb needle, stitch-forming tension, and take-up devices and their operating mechanisms, of the loop-taker *c* and its swinging, rising, and falling carrier *b* and operating mechanisms, said loop-taker having the point at the top to receive a loop of thread from the eye of the needle, a slot to receive the point of the needle, and an opening at the bottom to receive a button-head and fitted loosely in its carrier, the latter being partially curved around

399,179.

its back and bottom to retain it in its proper working position, and operating substantially as described, for the object set forth.

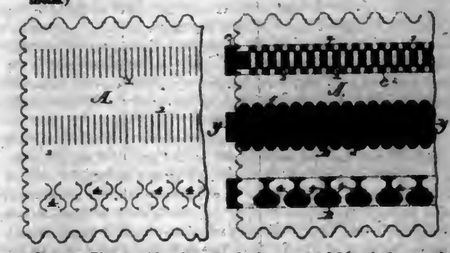
399,180. PACKAGE-CARRIER. JAMES W. BRIDWELL, Hillsborough, Ohio, assignor to the Star Manufacturing Company, same place. Filed Jan. 10, 1888. Serial No. 295,967. (No model.)



Claim.—1. The herein-described package-carrier, consisting of a bow-shaped handle having upturned ends and narrow inclined slots in the upper faces of said upturned ends, and the knotted cords secured in said slots, substantially in the manner and for the purpose specified.

2. A package-carrier consisting of a bowed handle having narrow inclined slots C formed in the upper faces and transversely of said ends, and the knotted cords engaged in said slots, all substantially as specified.

399,181. DRESS-FORM. FREDERICK W. BROWN, Cambridgeport, assignor to Oliver Whyte & Co., Boston, Mass. Filed Aug. 10, 1888. Serial No. 282,445. (No model.)

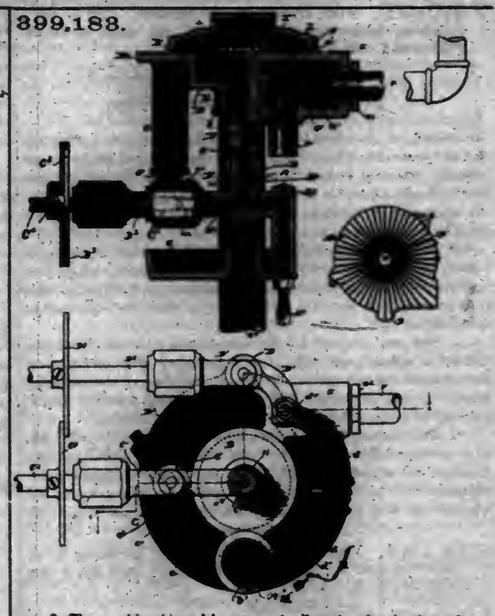


399,181.

Claim.—1. The flanged slide K, provided with openings *k*, combined with the nut L, connected to the standard, as shown, the rods *m*, connecting said nut and slide, the head F, supported on the standard, the adjusters G, pivoted to the head and connected to the flanged slide and to the form-sections, arranged, connected to each other, and supported essentially as shown and set forth.

2. The combination of the dress-form made in sections, the standard A, the nut L, and slides K and M on the standard, the head F, also on the standard and between the nut L and slide K, the rods *m*, connecting the nut L and the slide K, the rods *n*, connecting the slides M and K, the rods *o*, connecting the slide M with the dress-form sections, the adjusters G, pivoted to the head F and loosely connected to the slide K, and the dress-form sections, as set forth.

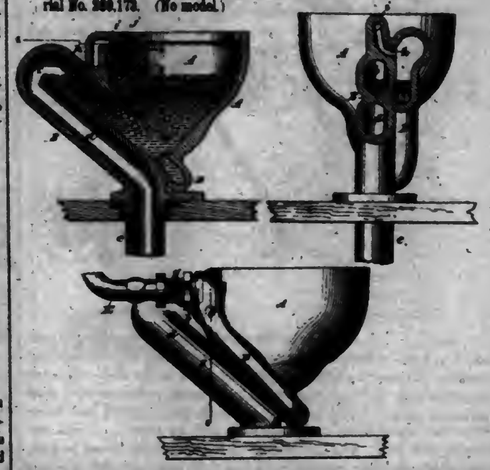
399,182. ORNAMENTAL FABRIC FOR TABLE-SPREADS. DANIEL W. CAMPBELL, West Troy, assignor of one-half to Frederick H. Stowe, Albany, N. Y. Filed Apr. 26, 1888. Serial No. 272,126. (No specimens.)



Claim.—The combination of a body-piece, of felt, cloth, or other felted or woven fabric, provided with a row of incisions, an applique-piece provided with incisions which correspond to the incisions in said body-piece, and a separable ribbon woven or drawn through said incisions, whereby said applique-piece is secured to said body-piece, as herein specified.

399,183. VAPOR-BURNER. CHARLES H. CHILDS, Cleveland, Ohio. Filed Oct. 24, 1887. Serial No. 253,265. (No model.)

Claim.—1. The combination, with the commingling-chamber having a laterally-projecting flange and a series of radial grooves in the top surface of the flange, of a burner-cap having a series of notches or serrations in its under side, said burner-cap being adapted to rest on the flange of the said commingling-chamber, substantially as set forth.



399,183.

2. The combination, with a commingling-chamber having a laterally-projecting flange with a series of grooves on the surface of the flange, substantially as indicated, of a burner-cap having a depending rim with a serrated lower edge, said serrations being made to mismatch the grooves of the generator-flange, and wings connected with the burner-cap for engaging the inner wall of the primary commingling-chamber to hold the cap centrally, substantially as set forth.

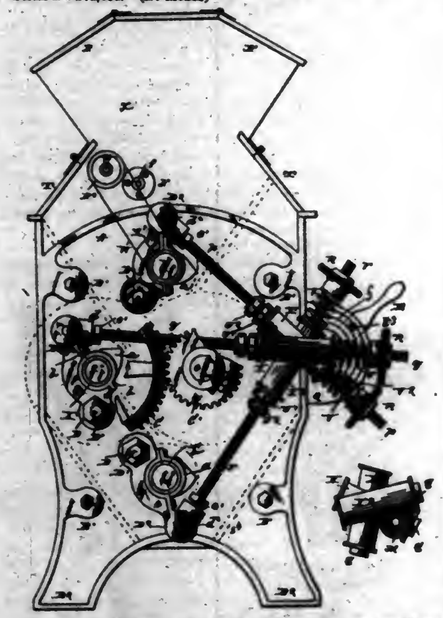
3. The combination, with primary and secondary induction-tubes, of valve-arms having ducts and jet-orifices, hand-valves for opening and closing the ducts, and stops mounted on the respective valve-stems, said stops overlapping and abutting each other, with the valves in open or closed position, substantially as set forth.

399,184. SIPHON WATER-CLOSET. HUGH H. CRAIGIE, Stamford, Conn., assignor to Julia Craigie, same place. Filed Oct. 26, 1888. Serial No. 289,173. (No model.)

Claim.—1. The bowl A, having flushing-aperture *i* and water-supply pipes D A, the pipe A being wholly above the normal level of the water in the bowl and leading upward to said aperture *i*, and the pipe D extending higher than its connection with the pipe A, substantially as described.

2. The bowl A, having flushing-aperture *i* and water-supply pipes D A, the pipe A being wholly above the normal level of the water in the bowl and leading upward to said aperture *i*, and the pipe D extending higher than its connection with the pipe A, in combination with the lower jet-nozzle, *f*, and siphon B, substantially as described.

399,185. WIRE STRETCHER AND HOLDER. JOHN W. DAVY, Kingston, Ontario, Canada. Filed May 23, 1888. Serial No. 274,670. (No model.)



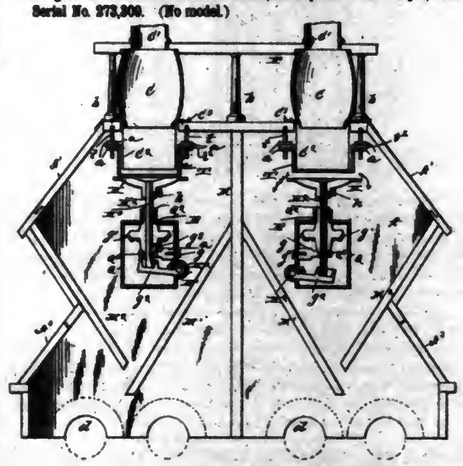
Claim.—1. As a new article of manufacture, a wire holding clip and tightener adapted to form a part of the fence and consisting, essentially, of a body portion to be secured to a post, and one or more longitudinally-adjustable rods carried by the body to which the wires are secured, and by which they are fastened to the post and are stretched, substantially as set forth.

2. The herein-described wire holder and stretcher, consisting of a body portion provided with a central slot or opening adapted to receive or slip over a post, and one or more longitudinally-adjustable rods or bolts, each provided with an eye to which the wires are secured, as set forth.

3. The combination, with the body portion provided with a central slot or aperture and with laterally-extending arms or flanges on each side, of the rods extending through said flanges, one rod being located on each side of the body portion, and each provided with an eye and screw-threaded portion, substantially as described.

4. The combination, with a post, of the herein-described wire fastener and stretcher, consisting of a clip or body portion provided with a central slot to embrace or slip upon a post, a pair of longitudinally-adjustable rods to which the wires are secured, and a wedge or pin, whereby the body portion is clamped to the post, as set forth.

399,186. ROLLER-MILL. JAMES DAWSON, Harrisburg, Pa., assignor of one-half to John H. Dawson, same place. Filed May 3, 1888. Serial No. 273,788. (No model.)



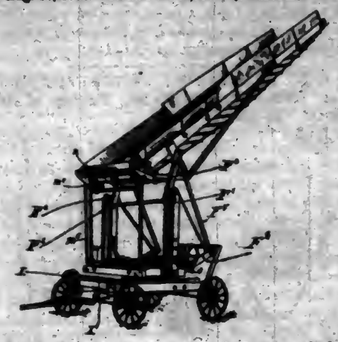
Claim.—1. In a roller-mill, the combination of the main roll journaled in fixed bearings in the center of the frame, three smaller adjustable rolls rotating in the opposite direction to the main roll, levers provided with bearings supporting said lesser rolls, eccentric studs mounted on the frame and each supporting one end of said levers, three-way union-joints, each provided with an abutment, rods connecting said joints with one end of each of the said levers, respectively, said rods being screw-threaded at their ends and each provided with a spiral spring and a hand-nut, and an eccentric-bar journaled in bearings in the frame, and having its ends swiveled in the abutments of the three-way joints, substantially as described.

2. In a roller-mill, the combination of the main roll journaled centrally in the frame in fixed bearing, and having upon its shaft the opposite similar pulleys, G, and gear-wheels C, three smaller rolls having bearings on levers S, supporting said bearings, said rolls having their shafts provided with gear-wheels C, intergeared constantly with said gear-wheels on main-roll shaft, eccentric studs D^3, adjustably bolted on the machine-frame and supporting said levers as pivots at their inner ends, three-way joints Y Y' Y^2, provided with abutments M, rods *p q r*, pivoted to the levers, respectively, on the inner ends, and passing through the three-way union-joints at their outer ends, so as to bring the lesser rolls into grinding contact with the main roll, the spiral springs V and hand-nuts R, one on each of said rods, and the eccentric bar E', journaled in fixed bearings on the frame, and swiveled at its ends in the abutments M on both said three-way joints, substantially as and for the purposes described.

3. In a roller-mill, the combination of the main roll fixedly journaled centrally in the frame, and having on both ends of its shaft a driving-pulley, G, and a gear-wheel, C', three smaller rolls having bearings on movable levers supporting said bearings, said rolls having their extended shafts provided oppositely with gear-wheels C, intergeared with the corresponding gear-wheels on the main-roll shaft, the eccentric studs D^3, supporting one end of said levers, respectively, and adapted to be adjusted to compensate for wear of the rolls, the three-way joints Y Y' Y^2, having abutments M, rods *p q r*, pivoted to the movable levers S, respectively, at their inner ends, and passing through the tubular branches of the three-way union-joints at their outer ends, said rods being provided with jam-nuts J' J^2 to limit their outward movement, spiral springs V and hand-nuts R, one on each of the ends of said rods exterior to said joints, and the eccentric bar E', swiveled at its ends to the abutments M on the three-way joints, and provided with the operating-handle E and means for holding it in its adjusted position, substantially as described.

399,187. FEED-REGULATOR. JAMES DAWSON, Harrisburg, Pa., assignor of one-half to John H. Dawson, same place. Filed May 9, 1888. Serial No. 273,909. (No model.)

Claim.—1. In a feed-regulator for roller-mills, the combination of feed-hopper having sides inclined equally to the line of deposit of the feed parallel to and along the whole length of the rolls, the main sleeve C^2, added sleeve T, attached adjustably by hangers exterior to said sleeve and both depending from the hopper-top, and the rotating disk H directly under said sleeves, an axle journaled in the casing and provided with a swinging arm supporting said disk, and means for yieldingly securing said axle, rendering the disk vertically self-adjusting, substantially as set forth.



2. In combination with the inclosing-casing Q Q', provided with the arms D^4 and secured equidistantly to the hopper-walls, the intergearing bevel-wheels *g'* and R, journaled in said casing, the tubular shaft Q^2 Q^4, secured to said wheel *g'*, the driver-shaft W', which is extended through the hopper-wall, having the bearing W^2 thereon and carrying the wheel R, the vertically-sustained shaft H^2, keyed loosely in the tubular shaft of wheel *g'*, with the disk H, secured rigidly on the shaft, substantially as and for the purposes set forth.

3. In combination with the inclosing-casing Q Q', the intergeared wheels *g'* R, the vertically-guided rotary shaft H^2, the distributer H on said shaft, and the shaft K^2, provided with the arm g^5, and means for sustaining said shaft thereon, said wheels and arm being inclosed in the casing, in whose walls they have their bearings, substantially as and for the purposes set forth.

4. In combination, the casing Q Q', provided with the arms D^4, for attaching it in mid-hopper, the bracket *g*, secured in said casing, the hollow gear *g'*, journaled in the casing and in said bracket *g*, the distributer-disk H on the shaft H^2, one end of which is guided in said hollow gear, and having an internal grooved connection to permit vertical adjustment therein, the driving-shaft W', with its bevel-wheel R, intergeared with said hollow gear, the arm g^5, on which the shaft H^2

rests, and the rock-shaft K^2, oppositely poised, with the weight W hung thereon and limited in its throw, substantially as and for the purposes shown and described.

399,188. STRAW-STACKER. LOUIS F. DEWEY, Springfield, Ohio. Filed Aug. 20, 1888. Serial No. 282,966. (No model.)

Claim.—1. The combination of a platform, vertical guides on each side thereof, sliding bearings in said guides, pivoted raising-arms connected to said sliding bearings and to the carrier-frame, supporting-arms and connecting-arms of different length, each pivoted at one end to the platform and at the other end to the carrier-frame, and means, substantially as described, for raising and lowering said sliding bearings, substantially as and for the purpose set forth.

2. The combination, with a platform having vertical guides thereon and sliding bearings in said guides, of raising-ropes passing under said sliding bearings, raising-arms connected at one end to the sliding bearings and at the other to the carrier-frame, supporting and connecting arms of different lengths, each pivoted at one end to the platform and at the other to the carrier, and operating mechanism for winding said ropes to raise the sliding bearings, substantially as and for the purpose set forth.

3. The combination, with the main frame and movable platform, of a turn-table consisting of a stationary hub or bearing-support secured in said main frame, an encircling frame secured to the platform, and the alternating guiding and supporting wheels in said encircling frame, adapted to travel on the bearing-support, substantially as set forth.

4. The combination, with the main frame and the movable platform, of a turn-table having the inner bearing-support, with a plane peripheral bearing and beveled flanges, as described, and an encircling frame secured to the platform and provided with alternating beveled supporting-rollers and plain horizontal guiding-rollers, substantially as set forth.

5. In a straw-stacker, a turn-table, substantially as described, consisting of an inner bearing-support provided with a plane peripheral bearing having flanges at each end thereof, and an encircling frame provided with beveled supporting-rollers adapted to travel on said beveled flanges, and alternating horizontal guiding-rollers adapted to travel on said plane peripheral bearing, substantially as described.

6. The combination, with the main frame and the movable platform, of a flanged ring, B^2, attached to said platform, the tripping-wheel connected to said ring by a cable, as described, and means for operating said tripping-wheel, substantially as and for the purpose set forth.

7. The combination, with the tripping-wheel D and the shaft c^2 and the intermediate moving mechanism, of a tripping-lever, f^2, the pivoted arms connected thereto, and a spring-connection connecting said arms, substantially as and for the purpose set forth.

8. The combination, with the driving-shaft and the loosely-revolving pinions thereon adapted to engage on opposite sides of a gear-wheel and drive the same in opposite directions, of a moving clutch adapted to engage either of said pinions to said driving-shaft, a trip-lever connected to said clutch, and a segmental arm geared to said trip-lever carrying at one end a spring-connection, which is connected at the other end to said trip-lever, whereby the trip-lever is forced into position to cause the clutch to change its engagements with the respective pinions when the said trip-lever is moved across a line passing through the pivoted bearings of said trip-lever and segmental arm, substantially as specified.

9. The combination, with the clutching mechanism, as described, of a trip-lever, a segmental arm geared thereto, and a spring-connection between said trip-lever and arm, said spring-connection being attached to the trip-lever and arm, respectively, on opposite sides of their respective centers of oscillation, substantially as specified.

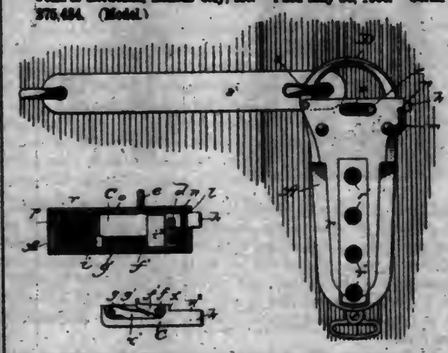
10. The combination, with the movable platform and the flanged ring secured thereto, of a tripping-wheel connected to said flanged ring by cables, as described, suitable driving mechanism attached to said tripping-wheel, and means, substantially as described, for reversing said driving mechanism when the tripping-wheel D has reached a given point, substantially as specified.

11. The combination, with the movable platform and the flanged driving ring or wheel secured thereto, of a tripping-wheel connected to said driving-wheel by cables passing in opposite directions around said wheel, and means for adjusting the tension of said cable, substantially as specified.

12. The combination, with the movable platform, the tripping-wheel, and means, as described, for connecting the same, of a driving-gear secured rigidly on the same shaft on which the tripping-wheel is adapted to turn, and means, substantially as described, for connecting said tripping-wheel with or disengaging it from said driving-gear, substantially as specified.

13. The combination, with the driving-shaft c^2, the beveled pinions turning loosely thereon, adapted to be engaged by a clutch turning with said shaft, and a driving-gear meshing with said pinions, of a tripping-wheel connected by suitable intermediate mechanism to said driving-gear, a pivoted tripping-lever connected to said clutch, a tripping-finger on said tripping-wheel, and means, substantially as described, for connecting and disconnecting said tripping-wheel to or from the driving mechanism, substantially as set forth.

14. In a straw-stacker, a turn-table having an inner bearing-support and an outer inclosing-frame, the alternating supporting and guiding rollers in said frame adapted to travel on said bearing-support, and a removable plate on the top of said bearing-support, substantially as set forth.



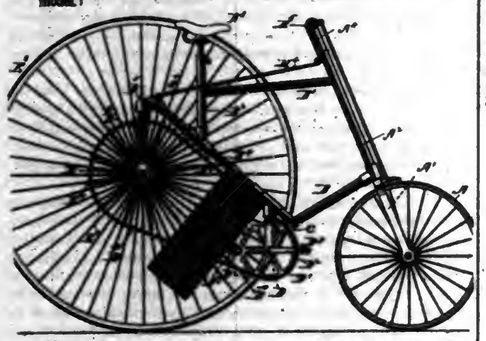
15. In a straw-stacker, the combination, with the stationary base-frame, of a turn-table and a wheel-rim secured to the movable portion of said turn-table and connected by cables to the moving tripping-wheel on the stationary base-frame, substantially as specified.

16. In a straw-stacker, the combination, with the base-frame and tripping-wheel and mechanism to drive the same supported on said base-frame, of a wheel-rim on the movable portion of said turn-table, said tripping-wheel and wheel-rim being connected together by cables, substantially as and for the purpose set forth.

17. The combination, in a straw-stacker, of the raising mechanism having sliding bearings and raising-ropes passing at each side under said bearings, said ropes being each secured at one end to a stationary post and at the other to a windlass on the moving shaft, and means, substantially as described, for adjusting the windlass to which one of said ropes is attached in relation to said shaft, substantially as specified.

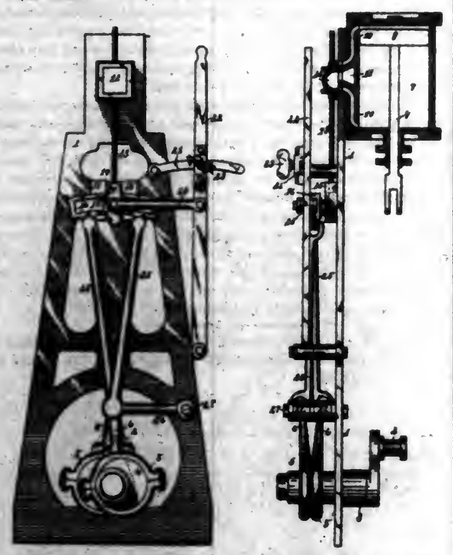
18. The combination, with the sliding bearings and the raising-ropes, of a revolving shaft having a rope-receiving windlass thereon, operating-gear on said shaft having clutching-faces adapted to engage with similar faces on one of said windlasses mounted loosely on said shaft, and means for holding said windlass in engagement with said clutching-face, substantially as specified.

399,189. LOCK. JOSEPH M. ROSAR, Argentine, Kans., assignor to John X. Reinhart, Kansas City, Mo. Filed May 26, 1888. Serial No. 275,494. (Model.)



Claim.—1. In a safety lock or guard for freight-car doors and the like, having a case provided with registering mechanism, substantially as described, the combination, with the case and registering mechanism, of a pivotal bolt, D, a sliding locking-bolt, C, engaging with the bolt D and registering mechanism, and an opening extending through the case and sliding bolt, with the latter in its locking position to admit a car-seal, substantially as set forth.

2. In a safety lock or guard for freight-car doors and the like, having a case provided with registering mechanism, substantially as described, the combination, with the case and registering mechanism, of a pivotal bolt, D, a sliding locking-bolt, C, engaging with the registering mechanism and bolt D, a slot, *a*, in the cover of the case, and



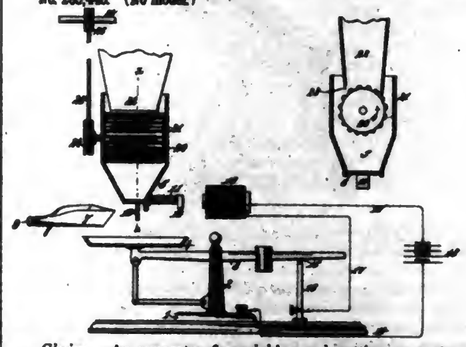
a stud, *e*, on the bolt C extending through the slot *o*, substantially as set forth.

399,190. TRICYCLE. WILLIAM C. FOSTER and HENRY W. MERRITT, Somerville, Mass. Filed Aug. 29, 1888. Serial No. 284,071. (No model.)

Claim.—In a velocipede, the combination of the sprocket-wheel device on the shaft E, adapted to be increased or diminished in diameter, with the operating mechanism consisting of the sleeves F F', collar F², forked lever H³ H³ H, and cord or chain H², all operating together, substantially as described, and for the purpose set forth.

399,191. CUT-OFF AND REVERSING-GEAR FOR ENGINES. CHARLES FOX, Stamford, Conn. Filed May 22, 1888. Serial No. 274,647. (No model.)

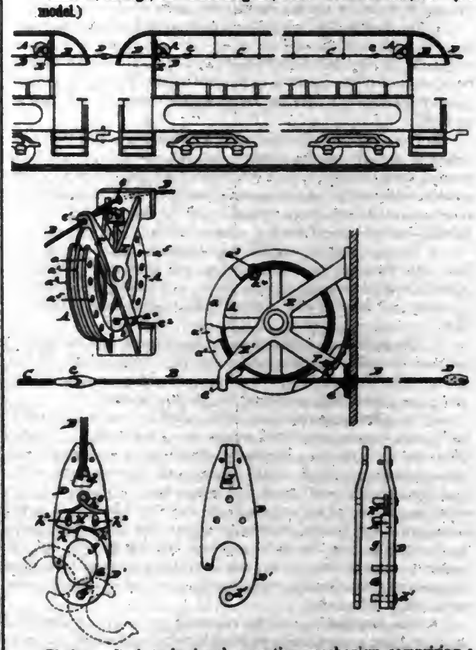
Claim.—1. In a cut-off and reversing mechanism, the combination, with the valve, valve-stem, eccentrics, and eccentric-rods, of an arc-shaped link, a block connected to the valve-stem, upon which said link slides, a reach-rod connected to the link, rods 25, pivoted to the opposite ends of the link and each pivoted to one of the eccentric-rods, and rocker-arms pivoted to a fixed point and to the eccentric-rods and rods 25 at their pivotal points to each other, substantially as set forth.



2. The combination, with the eccentric-rods, an arc-shaped link, and link-block 17, of rods 25, pivoted to opposite ends of the link and to the eccentric-rods, and rocker-arms pivoted to a fixed point and to the eccentric-rods and rods 25 at their pivotal points to each other.

3. The combination, with the eccentric-rods, rods 25, and rocker-arms pivoted to a fixed point and to the eccentric-rods and rods 25 at their pivotal points to each other, of a link to the opposite ends of which rods 25 are pivoted, and which is an arc of a circle of which the pivotal points of the rocker-arms, eccentric-rods, and rods 25 are the center.

4. The combination, with the eccentric-rods, an arc-shaped link having saddle 19, and link-block 17, of rods 25, pivoted to opposite ends of the link and to the eccentric-rods, rocker-arms pivoted to a fixed point and to the eccentric-rods and rods 25 at their pivotal points to each other, and a reach-rod pivoted to the saddle.



5. The combination, with the eccentric-rods, an arc-shaped link, and link-block 17, of rods 25, pivoted to the opposite ends of the link and to the eccentric-rods, rocker-arms pivoted to a fixed point and to the eccentric-rods and rods 25 at their pivotal points to each other, a reach-rod pivoted to the link, a valve, and a valve-stem connected to link-block 17, whereby movement of the link acts to change the point of cut-off, but without changing the lead of the valve.

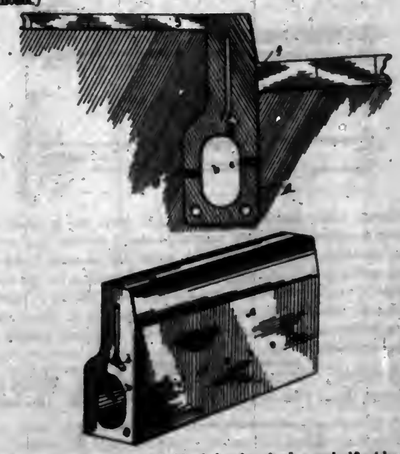
399,192. MECHANISM FOR WEIGHING PACKAGE TEA, COFFEE, &c. OWEN A. GILL, Baltimore, Md. Filed Sept. 15, 1888. Serial No. 285,440. (No model.)

Claim.—An apparatus for weighing and putting up package teas and other materials, consisting of a weighing-scale having a scale-pan, a throatway located above the scale-pan, a rotating force-feed, a supply-tube having its lower end arranged relatively to the force-feed to provide a narrow transverse channel at one side between a lower edge of the tube and the force-feed, a driven shaft, and devices, substantially as described, outside the throatway, which drive the force-feed to force the material laterally from the supply-tube through the channel and downward, and a valve for the throatway automatically closed when the scale-beam is overbalanced.

399,193. SIGNAL-OPERATING DEVICE FOR TRAINS. WILLIAM GLASGOW, Chicago, Ill. Filed Aug. 26, 1887. Serial No. 247,966. (No model.)

Claim.—1. A train-signal-operating mechanism comprising a local permanent cord-section in each car, a coupling for uniting such sections together between the cars, and a carrying-sheave at each end of the car, around which the cord-section loops or winds and is fixedly attached, in manner substantially as herein described.

2. A train-signal-operating mechanism comprising a local permanent cord-section in each car, an automatic pull-apart coupling, essentially as herein described, for uniting such sections together between the cars, and a carrying-sheave at each end of the car, around which the cord-section loops or winds and is fixedly attached, in manner substantially as herein described.



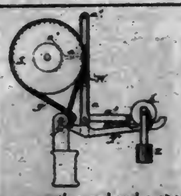
3. The combination, with the sectional pull-cord of a train-signal-operating mechanism, of a carrying-sheave, A, at each end of the car, having grooves formed by flanges *a a' a²*, the cord-section B, fitted in said grooves and passing from one groove to another through orifice *a³*, the clamping-bolt *a⁴*, and supporting frame or bracket E for said sheave, essentially as herein described.

4. The combination, with a sectional pull-cord of a train-signal-operating mechanism, of a carrying-sheave, A, at each end of the car, having grooves formed by flanges *a a' a²*, the cord-section B, fitted in said grooves and secured to the sheave by a clamping-bolt, *a⁴*, the supporting frame or bracket E, having orifice *e³*, and pin F, adapted to pass through said frame-orifice and one of a series of orifices, *a⁵*, in the rim of the sheave to lock said sheave at any desired adjustment, essentially as herein described.

5. A train-signal-operating mechanism comprising a local permanent cord-section in each car, consisting of a central connecting-section, C, and end metallic sections, B, the outer ends of which are provided with couplings D, a carrying-sheave, A, at each end of the car, having receiving-grooves in its periphery, cord-section B, fitted in said grooves, and the clamping-bolt *a⁴*, for permanently connecting the cord-section B at its middle to the sheave, essentially as herein described.

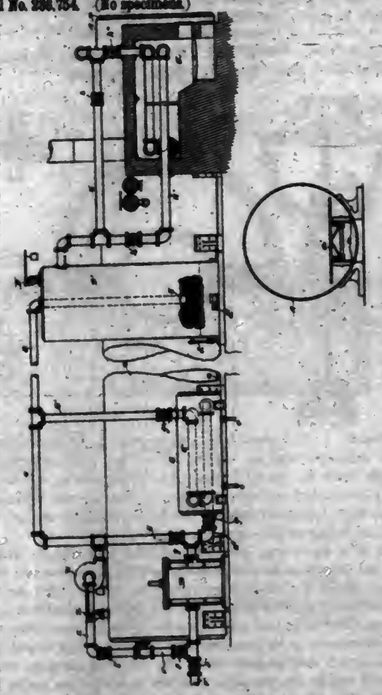
6. A train-signal-operating mechanism comprising a local independent cord-section permanently arranged in each car and an automatical pull-apart coupling for the adjacent ends of each pair of the same, consisting of a head, D, having a recess, *d*, for attachment to the ends of the cord-section B and forked ends *D'*, the C-shaped latch-bar G, pivoted at *d'* to one of the forks, and the spring dog or catch H, having a notched engaging-face to engage and hold in a yielding manner the longer arm, *g*, of the latch-bar, essentially as herein described.

399,194. STREET-CURB AND SUBSOIL DRAIN. HENRY S. HALLWOOD, Columbus, Ohio. Filed Nov. 12, 1888. Serial No. 290,633. (No model.)



Claim.—1. A street-curb block having its lower half wider than its upper half and said upper half beveled on one side, and the lower half provided with a longitudinal passage, *b*, and lateral openings leading into the passage *b*, substantially as and for the purpose specified.

2. A street-curb block having its lower half wider than its upper half, said upper half having a longitudinal passage, *d*, and the lower half having a longitudinal passage, *b*, said passages *d* and *b* being made to communicate by means of openings, substantially as described.



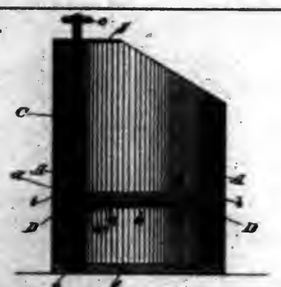
399,195. LET-OFF MOTION FOR LOOMS. SYLVANUS HAMBLIN and STEPHEN M. HAMBLIN, Plymouth, Mass. Filed Feb. 25, 1888. Serial No. 265,284. (No model.)

Claim.—The combination, with the warp-beam having a disk, as described, and the cord or strap embracing said disk, of the lever T, pivoted to the frame of the loom and having the cord or strap connected thereto, the weight and wheel carrying the same supported by the said lever T, the upright W, extending from said lever T, and the lever *e*, pivoted thereon, having an arm provided with a yoke to bear upon the warp, and a connecting-rod and a shoe bearing upon the said lever T, and controlling the positions of the wheel and weight upon the lever, all arranged substantially as and for the purpose set forth.

399,195.

399,196. METHOD OF VULCANIZING WOOD. SAMUEL E. HASKIN, Avoca, N. Y. Filed Dec. 5, 1887. Renewed Sept. 29, 1888. Serial No. 286,754. (No specimens.)

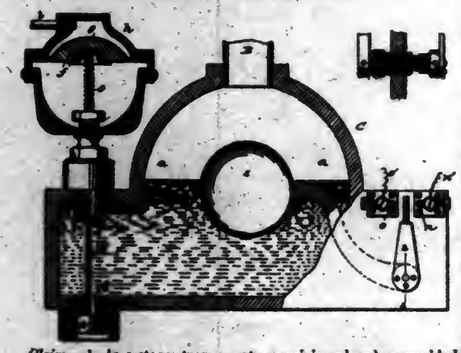
Claim.—1. The method herein described of vulcanizing wood, consisting, essentially, in introducing heated air into the vulcanizing-chamber and under such pressure as will prevent the evaporation of the sap of the wood being treated, substantially as set forth.



2. The method herein described of vulcanizing wood, consisting, essentially, of introducing heated air into the vulcanizing-chamber under such pressure as will prevent the evaporation of the sap of the wood being treated, more or less of the moisture of such compressed air having been precipitated before the air is discharged into the wood-cylinder, substantially as set forth.

3. The method herein described of vulcanizing wood, consisting, first, in compressing air and heating the same; second, precipitating the moisture of the air; third, superheating the air and introducing such dry superheated air into the vulcanizing-chamber under such pressure as will prevent the evaporation of the sap of the wood being treated, substantially as set forth.

399,197. GROCER'S MIX. LORAN B. HAWKINS, Danville, Ind., assignor of one-half to Joseph Schwartz, same place. Filed May 31, 1888. Serial No. 274,573. (No model.)



Claim.—In combination, the sheet-metal open-top tubular body A, having the cross-piece E, secured at the lower end, the socket *e*, secured to said cross-piece, the vertical screw C, loosely seated at its lower end in said socket, having a square or angular head to receive a similarly-shaped socket of a key, the metal bracket D, having a screw-threaded boss, outwardly-extended arms mounted upon the screw and adapted to be raised or lowered thereby as the screw is turned, the bottom B, secured to the arms of said bracket, and the flexible annular packing-ring *b*, secured to the periphery of said bot-

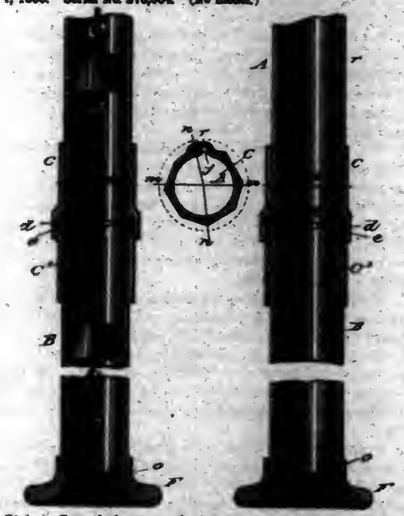
399,197.

tom B and projecting above the upper face of said bottom, all substantially as shown, and for the purpose set forth.

399,198. STEAM-TRAP. WARREN S. JOHNSON, Milwaukee, Wis. Filed Apr. 8, 1888. Serial No. 269,490. (No model.)

Claim.—1. In a steam-trap, a water-receiving chamber provided with a drainage-valve, an electric circuit, and intermediate devices through which the circuit controls the drainage-valve, a circuit-controlling switch, and a switch-operating device, such as a thermostat or its described equivalent, located within the chamber subject to the rising and falling of the water therein.

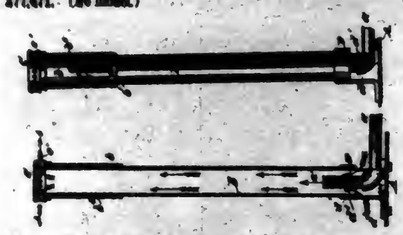
2. In a steam-trap, the water-receiving chamber, its drainage-valve, the expansion-chamber connected with said valve and with an external source of fluid-pressure supply, an electric valve controlling the delivery of the fluid to and from the expansion-chamber, an electric circuit including said valve, a switch or circuit controlling device, and a thermostat or its described equivalent connected to and operating the switch and located within the receiving-chamber, whereby the water within the chamber is caused to bring into action power from an external source to operate the drainage-valve.



3. In a steam-trap, a water-receiving chamber and a drainage-valve therefor, a spring to close said valve, the expansion-chamber to open the valve, a pipe extending from the chamber to an external source of fluid-pressure supply, and a three-way valve located on said pipe.

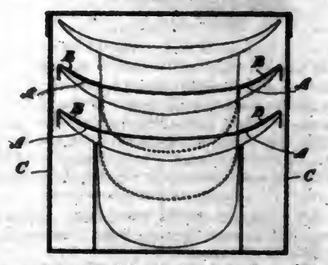
4. In a steam-trap, the combination of a water-chamber provided with a discharge-valve for the water, an expansion-chamber, by which said valve is operated, a source of fluid-pressure supply, as a compressed-air reservoir, connected with the expansion-chamber, an electric valve controlling the delivery of the pressure-fluid to the expansion-chamber, an electric circuit embracing said electric valve, and a switch-controlling device, substantially as described, actuated by the rising water within the trap, whereby the water causes the electric current to actuate the electric valve and the latter causes the compressed air or other fluid to operate the outer valve of the trap.

5. A steam-trap provided with a self-opening drainage-valve having an expansion-chamber to open the same and a self-closing drainage-valve with an expansion-chamber to close the same, in combination with a source of constant fluid-pressure supply connected to the two expansion-chambers and a valve controlling the delivery of the fluid to the chamber of the self-closing valve, whereby the last-named valve may be caused to open and close at will, while the other is caused to open automatically only when the fluid-pressure fails, to the end that ice may not be formed within the apparatus.



6. In a steam-trap, a drainage-valve, an expansion-chamber, the electric three-way valve, through which said chamber is connected with a source of constant fluid-pressure supply, said valve provided with the switch for opening and closing its two operating-circuits *a' a''* alternately, the switch *l*, adjacent to the trap, for completing said circuits, and the thermostat or its described equivalent within the trap to actuate the switch.

399,199. PUMP. WILLIAM KOEHLER, Bellevue, Iowa. Filed Apr. 7, 1888. Serial No. 270,004. (No model.)

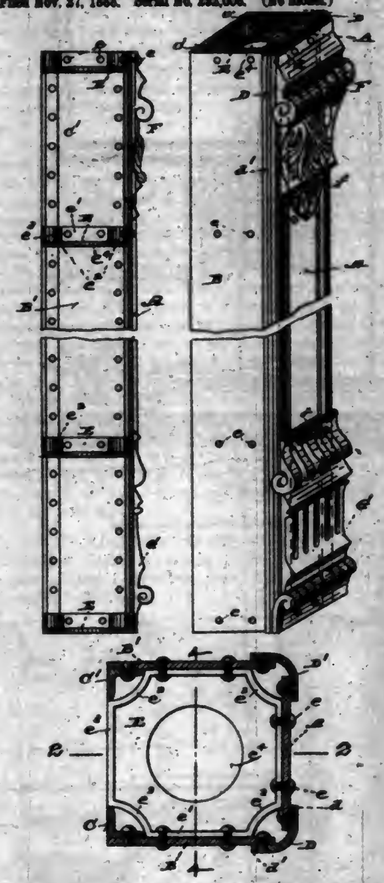


Claim.—In a chain-pump, the combination of the metallic flanged tubes A and B, having the backwater-groove *j*, seam-rib *r*, entering recesses in the coupling-thimbles C and C', and the inverted-funnel ring F, all constructed substantially as and for the purposes set forth.

399,200. APPARATUS FOR THE PASTEURIZATION OF BEER. CHARLES F. KOEHLER, St. Louis, Mo. Filed June 18, 1888. Serial No. 277,471. (No model.)

Claim.—The combination, with an open vat or tub in which bottled beer is pasteurized, of the centrally-located upright pipe or tube having openings between its legs by which it is secured to the vat-bottom, and a deflecting-cap supported over openings at the top of said pipe in conjunction with a steam-supply pipe having its opening or discharge immediately below the lower openings in the center of said stand-pipe, all substantially as shown and described, and for the purpose specified.

399,201. HAT-SUPPORT AND PACKING-RING. GEORGE LAKE, Bethel, Conn. Filed July 27, 1888. Serial No. 281,222. (No model.)



Claim.—1. A combined ring and support for packing hats, consisting of a flat ring and a flexible strip bridging said ring and secured to opposite sides of the latter, substantially as set forth.

2. The combination, with the flat ring approximately corresponding in diameter to the diameter of the hat-packing box, of the flexible strip depending through the opening of said ring and secured to opposite sides of the latter, substantially as and for the purposes set forth.

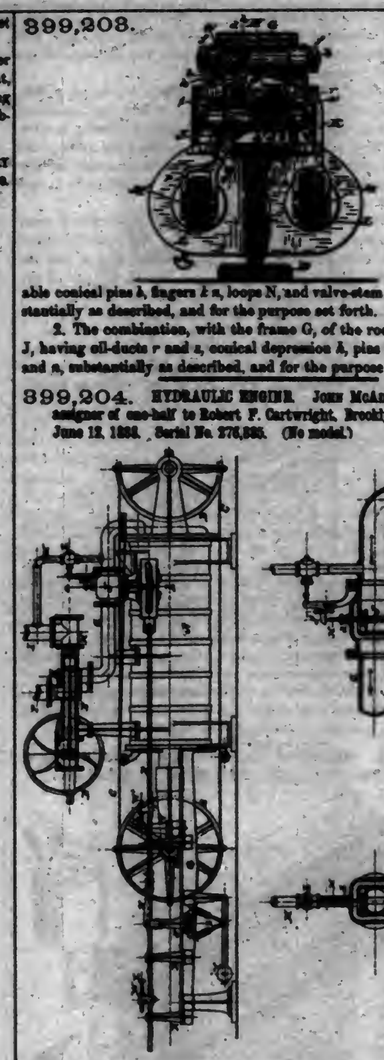
3. The combination, with the flat ring resting against the under face of the hat-brim and admitting the crown-tip of a succeeding hat, of a flexible strip secured to opposite sides of said ring and depending through the ring, whereby a support is afforded for said crown, substantially as shown and described.

399,202. PLATE-METAL COLUMN. FRANK MUNKER and HENRY F. EDWARDS, St. Louis, Mo., assignors to Munker & Brother, same place. Filed Nov. 27, 1888. Serial No. 292,008. (No model.)

Claim.—1. The combination of the front plate, the side plates, the angle-irons at the rear of the column, and the curved angle-irons at the front corners of the column, the front plate being spaced apart from the side plates, substantially as described.

2. The combination of the front plate, the side plates, the angle-irons at the back and the curved angle-irons at the front of the column, and the horizontal stiffening-plates, substantially as described.

3. The combination of the front plate, the side plates, the flanged stiffening-plates, the curved angle-irons, the angle-irons at the back of the column, and the attachments upon the front of the columns, substantially as described.



399,203. VALVE-GEAR FOR DUPLEX STEAM-PUMPS. GEORGE M. BUTLER, Canton, Ohio. Filed Apr. 4, 1888. Serial No. 269,857. (No model.)

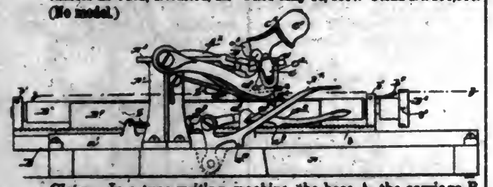
Claim.—1. The combination, with the piston-rods M M' and frame G, of the actuating-arms O K, rock-shafts H J, supported on adjustable conical pins *h*, fingers *k n*, loops N, and valve-stem support E, substantially as described, and for the purpose set forth.

2. The combination, with the frame G, of the rock-shafts H and J, having oil-ducts *r* and *s*, conical depression *h*, pins *d*, and fingers *k* and *n*, substantially as described, and for the purpose set forth.

399,204. HYDRAULIC ENGINE. JOHN MCADAMS, New York, assignor of one-half to Robert F. Cartwright, Brooklyn, N. Y. Filed June 12, 1888. Serial No. 276,980. (No model.)

Claim.—1. In a hydraulic engine, the cylinder, the supply-pipe G, leading to one end thereof, the valve J in said pipe, and the arm *h*, connected with and extending downward from the stem of said valve and carrying the wheel *i*, combined with the reciprocating block *n*, mounted in horizontal guides below said valve, the longitudinal slot *m* in said block inclosing said wheel and having the connected cam-surfaces *t*, *w*, *x*, *w'*, and *x'*, and mechanism, substantially as described, for reciprocating the block *n* in its horizontal guides to partially close the valve J during a portion of each end of the travel of the piston, substantially as shown and described.

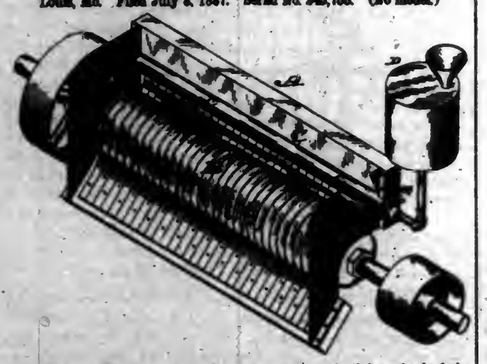
2. In a hydraulic engine, the cylinder, supply-pipe G, leading into one end of said cylinder, the vertically-acting valve J in said pipe, and the arm *h*, connected with the stem of said valve and carrying the wheel *i*, combined with the reciprocating cam-block *n*, mounted in horizontal guides below said valve, the longitudinal slot *m* in said block inclosing said wheel and having the connected cam-surfaces *t*, *w*, *x*, *w'*, and *x'*, the reciprocating rod P, rigidly connected with the cam-block, the arms W W' on said rod, the traveling arm V, carried by the main piston, and mechanism, substantially as described, for returning the cam-block to its normal position after it has been acted on by the arm V, substantially as and for the purposes described.



3. The valve J in the supply-pipe G, and having a stem extending through the box inclosing said valve, combined with the sliding cam *n*, having surfaces *t*, *w'*, *x'*, and *z*, mechanism, substantially as described, for moving said cam against the stem of valve J during the operation of the engine, the bell-crank lever *f*, adapted to be acted

ated by the upper end of valve J, and the relief-valve L in a supplemental pipe, M, extending from the pipe G to the discharge-pipe, said valve L being arranged to open and close under the influence of the bell-crank lever *f*, substantially as set forth.

4. In a hydraulic engine, the main cylinder A, the supply-pipe G, leading into one end thereof, and the valve J in said pipe, combined with the discharge-pipe I, the supplemental pipe M, having a valve, L, and passing from a point in the pipe G between the valve J and the end of the cylinder to the discharge-pipe, and mechanism, substantially as described, for actuating said valve, substantially as and for the purposes described.

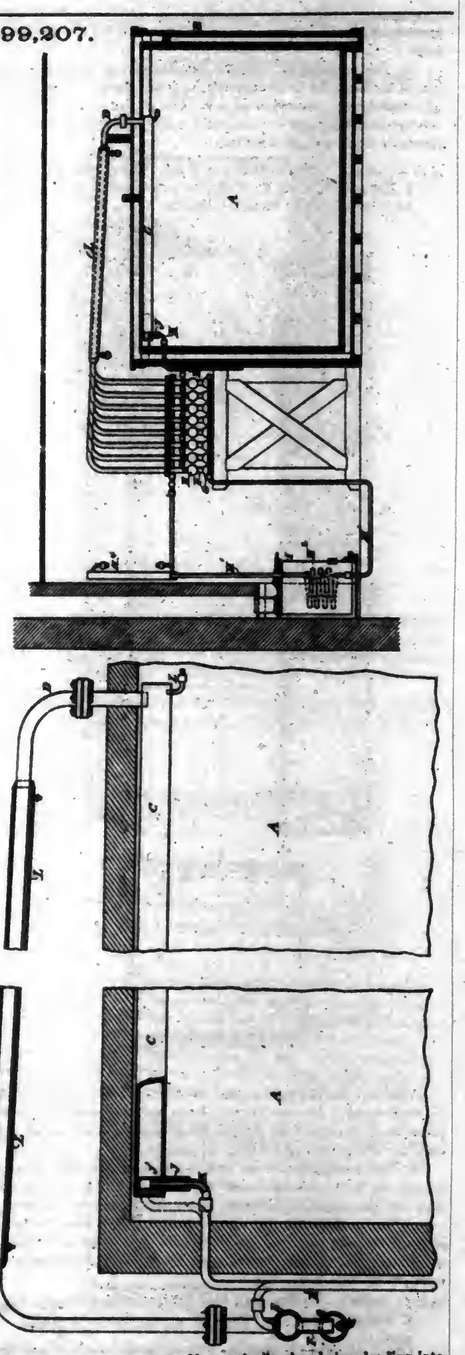


5. In a hydraulic engine, the supply-pipe, having the valve J, combined with the cam *n*, for operating said valve, the rod P, coupled with the cam *n*, arms W W' on said rod, traveling arm V, and the weight Y, equalizing-rods Z, rocker A', and link B', one end of the latter being connected with the said rocker and the other end with the rod P, substantially as and for the purposes set forth.

399,205. TYPE-WRITING MACHINE. LEVI J. ODELL, Beloit, assignor of three-fourths to John R. Burton, Lake Geneva, Wis., and Charles H. Odell, Rockford, Ill. Filed May 16, 1887. Serial No. 238,263. (No model.)

Claim.—In a type-writing machine, the base A, the carriage B, having the rack-bar, and the vibrating type-bar frame C, having the depending rigid arm C^1, combined with the spring-actuated lever A^4, carrying a pawl to engage the rack-bar of the carriage, said lever being pivoted to the base and arranged below and on a line with the arm C^1, so that upon depression of the type-bar frame the arm C^1 comes in contact with the lever A^4, the latter being extended upward and outward, whereby it is within convenient reach to be struck by the hand of the operator in spacing, as set forth.

399,206. METHOD OF GINNING COTTON. JAMES C. OSBORN, St. Louis, Mo. Filed July 8, 1887. Serial No. 243,763. (No model.)



Claim.—The herein-described improvement in the method of ginning cotton, the same consisting in applying oil to the cotton as it is being ginned.

399,207. REFRIGERATING AND FREEZING APPARATUS. LOUIS PERKINS, Gray's Inn Road, County of Middlesex, England. Filed May 26, 1888. Serial No. 275,190. (No model.) Patented in England Feb. 18, 1888, No. 2,471; in India May 4, 1888, No. 121; in France May 15, 1888, No. 190,607; in Belgium May 15, 1888, No. 81,905; in Victoria June 13, 1888, No. 5,866; in New South Wales June 14, 1888, No. 726; in Queensland June 16, 1888, No. 494; in Italy June 30, 1888, No. 23,516, and in Brazil Oct. 20, 1888, No. 698.

Claim.—1. The combination, substantially as hereinbefore set forth, of the cooling-chamber A, a system of hermetically-closed pipes extending into the chamber and outside thereof, the heaters for the pipe system outside of the chamber A and at a level lower than that of the pipes within the cooling-chamber, the overflow-pipes leading from that part of the pipe system to which heat is applied to the pipes within the cooling-chamber A, and opening therein above their bottoms, whereby the ammonia solution is automatically separated from the liquefied ammonia and carried back to the heating part of the pipe system.

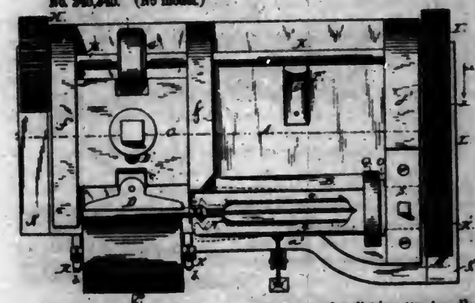
2. The combination, substantially as hereinbefore set forth, of a

399,207.

cooling-chamber, A, a system of hermetically-closed pipes leading into said chamber, and also arranged outside thereof, the heaters for the pipe system outside of the cooling-chamber and below the level of the pipes therein, the overflow-pipes extending from the pipes outside the cooling-chamber to the pipes within said chamber and opening therein above their bottoms, and a trap-pipe, J, surrounding the end of the overflow-pipe, through which the ammonia solution separated from the ammonia is carried.

3. The combination, substantially as hereinbefore set forth, of the horizontal liquor-pipe G, (filled with a solution of ammonia or like solution,) the short connecting-pipe F, rising from about the mid-level of

the liquor-pipe G, the upper liquor-pipe, E, into which the pipe F extends, the chamber A, the cooling-pipe D, extending from the liquor-pipe E into the chamber A, the liquefied-gas pipe C within the chamber A, at a higher level than the liquor-pipe G, and the overflow-pipe K, connecting the liquefied-gas pipe C to the liquor-pipe G, whereby liquid is conveyed from the liquefied-gas pipe C to the former when the liquefied-gas pipe C becomes nearly filled with liquefied gas.



4. The combination, substantially as hereinbefore set forth, of the horizontal liquor-pipe G, (filled with a solution of ammonia or like solution,) a second horizontal liquor-pipe, E, the short connecting-pipe F, rising from about mid-level of the pipe G into the liquor-pipe E, the liquefied-gas pipe C at a higher level than the liquor-pipe G, the cooling-pipe D, passing from the liquor-pipe E to the liquefied-gas pipe C, a trap-pipe, J, rising up into the liquefied-gas pipe C, and provided with an opening at the top and with an opening, J', near the bottom, and the overflow-pipe K, passing from the interior of the pipe J back to the pipe E.

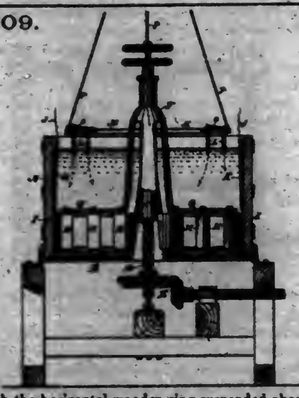
5. The combination, substantially as hereinbefore set forth, of the horizontal liquor-pipe G, the liquefied-gas pipe C at a higher level than the pipe G, the pipe D, connecting the former with the latter and an overflow-pipe extending into the liquefied-gas pipe C above the lower level thereof and connecting it with the pipe G, whereby the ammonia solution in the pipe C is separated from the liquid ammonia and automatically carried to the pipe G.

6. The combination, substantially as hereinbefore set forth, of the horizontal liquor-pipes G, (filled with a solution of ammonia or like solution,) the liquor-pipes E, the pipes F, rising from about mid-level of the pipes G and extending into the pipes E, the liquefied-gas pipes C at a higher level than the liquor-pipes G, the cooling-pipes D, connecting the former with the latter, and a water-jacket, L, surrounding each pipe D.

7. The combination, substantially as hereinbefore set forth, of two horizontal liquor-pipes, G, (filled with a solution of ammonia or like solution,) liquor-pipes E, arranged over the liquor-pipes G, the pipes F, connecting the liquor-pipes E and G, the liquefied-gas pipes C, and the cooling-pipes D, connecting the pipes C with the pipes E, said pipes D having part of the length of one pipe passing through part of the length of the other pipe.

399,208. MACHINERY FOR GRINDING AND POLISHING THE HANDLES OF CUTLERY. MICHAEL L. POWERS, Miller's Falls, Mass., assignor to Patrick O. Keefe, same place. Filed July 26, 1887. Serial No. 245,345. (No model.)

Claim.—1. In a machine for grinding and polishing the handles of case or table knives, the revolving mandrel or knife-holder composed of a shank journaled in the supporting-frame and provided with a gear-wheel, and extending from said shank two spring-fingers formed, substantially as described, and adapted to hold the blade of the knife between them while the handle projecting outside of said mandrel is being acted upon by the grinding-cylinder, as and for the purpose set forth.

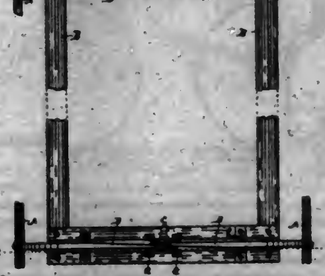


2. In a machine for grinding and polishing case or other table-knife handles, the combination, with the sliding carriage B, held to place by means of a cord and weight, substantially as described, of the bar C, inclosed in plate C, the presser-foot pivoted to said bar and the cam fixed to the driving-shaft, as and for the purpose specified.

3. The combination, with the base or bed plate provided with guide-cleats and having a grinding-cylinder fixed thereon, of the carriage movable upon the said base, the knife-holder or mandrel, substantially as described, the gear-wheels for rotating said knife-holder, and the elliptical cam fixed upon the driving-shaft to operate the presser-foot during the revolution of the knife, substantially as and for the purpose set forth.

399,209. ELECTRIC AMALGAMATOR. JULIO H. RAE, San Francisco, Cal. Filed Feb. 10, 1888. Serial No. 264,294. (No model.)

Claim.—1. In an apparatus for working ores, the pan or tub with the internal copper ring and the rotating arms or stirrers, in combi-



399,209.

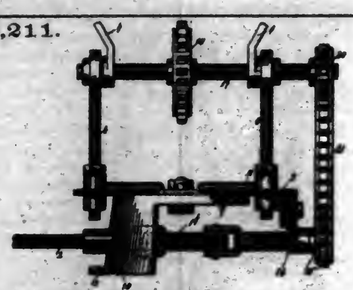
nation with the horizontal wooden ring suspended above the tub, the copper plate forming the upper surface of said ring and perforated to admit the carbons L, which pass loosely through the plates, said carbons having heads or transverse pins at the upper ends, and the movable elastic plates or springs O, pressing upon the heads of the carbons to hold them in contact with the copper plate, substantially as herein described.

2. The tube having the internal copper rings and the stirrers or arms with the outwardly and inwardly pointed shoes, in combination with the horizontal two-part rings consisting of wooden bases and copper disks suspended above the tub and having depending carbons, spring-plates pressing upon the heads of the carbons, the suspending rods or wires, and the screw-connections through which the disks are suspended and connection made between them and the positive wires of the dynamo, substantially as herein described.

399,210. VEHICLE-SPRING. SILAS H. RAYMOND, Grand Rapids, Mich., assignor to George R. Raymond & Co., same place. Filed Nov. 10, 1888. Serial No. 290,457. (No model.)

Claim.—1. In a vehicle, the levers pivoted to the body and having the non-slotted lapping ends resting upon a spring attached to the body, the other ends of said levers being attached to supports disconnected from the body, substantially as set forth.

2. In combination, a vehicle-body, the levers having the non-slotted lapping ends, and spiral springs having the connecting hair-pin arm contacting the under side of said lapping ends, substantially as set forth.

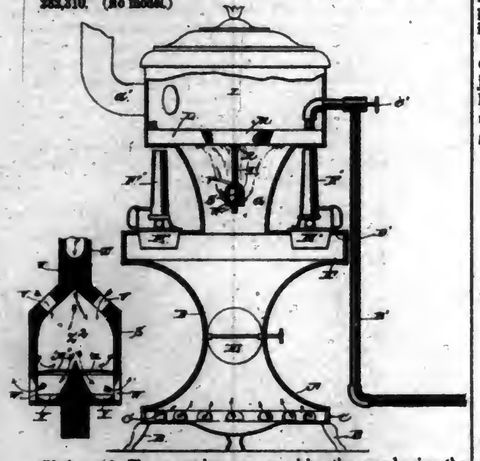


3. The combination of a vehicle-body, the levers at each end pivoted thereto and having the lapping ends, the spiral springs having the hair-pin lever portions supporting said lapped ends of the levers, and the side bars to which the outer ends of the levers are attached, substantially as set forth.

399,211. SHIFTABLE STACKER. WILLIAM S. REMEN, St. Louis, Mo. Filed Apr. 27, 1888. Serial No. 272,097. (No model.)

Claim.—1. The combination, with a shiftable stacker, of a driving mechanism for the carrier of said stacker rigidly secured to said stacker and revolving therewith, a stationary power-shaft, and a flexible slotted shafting between said stationary power-shaft and said driving mechanism, consisting of links 22, having pins projecting therefrom at right angles to each other, and a two-part link made of slotted links 23 and 24, joined rigidly together at right angles to each other and engaging the pins aforesaid.

2. A stacker having adjustable pillars, as 6 6, between the carrier-



899,211.

driving shaft and the platform which carries the mechanism for actuating said shaft, for the purpose set forth.

3. The combination, with a shiftable stacker, of offsets, as 4 4, supporting said stacker and terminating in journal-boxes, pillars, as 6 6, in which said boxes have bearings, whereby the stacker can be swung up or down, a carrier for said stacker, a shaft, as 17, journaled in said boxes and carrying gearing for said carrier, a turn-table to which said pillars are adjustably secured, a gear-wheel, as 15, carried by said turn-table, a stationary power-shaft, as 1, and a flexible connection between the latter two.

899,212. VAPOR STOVE AND BURNER. HENRY P. ROSECRS, Jamestown, N. Y., assignor of three-fourths to A. F. Allen Brown, George S. Gifford, and Martha B. Marshall. Filed Aug. 9, 1888. Serial No. 282,310. (No model.)

Claim.—1. The vapor-burner comprising the case having the mixing-chamber Z' formed in its interior, the feed-channel U and air-inlet openings communicating with the upper end of said mixing-chamber, the escape-openings W at the lower end of said mixing-chamber and communicating directly with the outer air, and the cone X, rising from the bottom of the case, substantially as described.

2. The burner having the opening U in its upper end for the admission of vapor, the air-inlet openings at its upper end, the cone X, projecting from the base of the burner, the annular groove Y, surrounding the base of the cone, the escape-openings W in the sides of the burner near its base, and the diaphragm or plate Z, arranged in the case and having central opening, A', through which the apex of the cone projects, substantially as described.

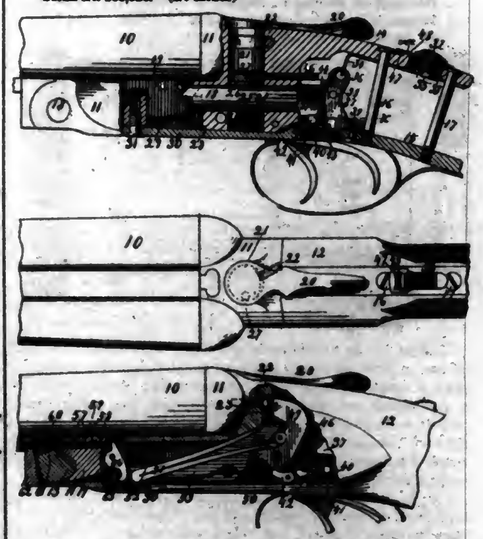
3. The vapor-burner comprising the casing S, having the vapor-supply channel U and the air-inlet openings V in its upper end, the escape-openings W near its base, the cone X, projecting from its base and the plate or diaphragm Z, arranged in the case and having the central opening, A', in combination with the combustion-chamber, in which the burner is arranged, and means, substantially as specified, to supply the combustion-chamber with an ascending current of air, substantially as described.

4. The vapor-stove having the combustion-chamber G and the drum I, in combination with the retort arranged in the drum, the burner depending from the retort and arranged in the chamber G, and the lamps E' on the outer side of the chamber G and arranged under the retort, substantially as described.

5. The vapor-stove comprising the hollow standard A, communicating at its lower end with the outer air, the table F at the upper end of said standard, the contracted combustion-chamber G, rising from the table, and the drum or oven I above said combustion-chamber, in combination with the retort and the burner depending therefrom, the said burner being located in the chamber G, substantially as described.

6. The combination of the vapor-stove having the hollow standard A, with the openings C at its base, and the contracted neck B, the combustion-chamber rising from and communicating with the hollow standard, the drum or oven above and communicating with the combustion-chamber, the retort, the burner depending therefrom and arranged in the combustion-chamber, and the damper E in the neck of the standard, substantially as described.

899,213. DYNAMO-ELECTRIC MACHINE. JAMES H. ROBERTSON, Rutherford, N. J. Filed Jan. 20, 1887. Serial No. 225,087. (No model.)



Claim.—1. In a dynamo-electric machine, an armature formed of a set of disks provided with projections of magnetic material, combined with a less number of plain disks arranged at intervals, substantially as described.

2. In a dynamo-electric machine, an armature formed of a set of disks provided with projections of magnetic material alternating with a less number of plain disks, the disks being magnetically separated from each other, substantially as described.

3. In a dynamo-electric machine, an armature constructed of plain disks placed at intervals among a larger number of disks with projections of magnetic material, the same forming an armature having longitudinal and circumferential grooves, substantially as described.

4. In dynamo-electric machines, an armature composed of plain disks placed at intervals among a larger number of disks having projections of magnetic material, the same forming an armature having longitudinal and circumferential grooves, and wire wound longitudinally and secured by binding-wires wound in said circumferential grooves, substantially as described.

899,214. BREECH-LOADING FIRE-ARM. LEROY H. SMITH, Utica, assignor to the Rhines Gun Company, Rhines, N. Y. Filed Nov. 3, 1888. Serial No. 289,980. (No model.)

Claim.—1. The combination of a gun-frame having a narrow tang forming side angles therewith, a stock fitted to the said frame and tang to fill the said angles, a bolt-retracting lever having a shaft vertically journaled in the frame and circumferentially grooved, and a screw threaded through the said frame in one of the said angles and adapted to engage one end with the said groove in the shaft when its other end is flush in the said corner, substantially as shown and described, whereby the stock will both conceal the screw and prevent its being worked out of place.

2. The combination of a gun-frame, a locking-bolt fitted to slide therein, a collar transversely grooved in its upper side and adjustably secured upon the said bolt, a lever having a shaft vertically journaled in the frame above the said collar and provided with a crank-pin projecting down from the shaft, and a shoe fitted to slide in the said groove in the collar and perforated to receive the said crank-pin, substantially as shown and described.

3. The combination of a gun-frame, a barrel pivoted to the forward end thereof and provided with a hook-lug projecting downward, a locking-bolt fitted to slide in the frame to engage the said hook and provided with a forward-impelling spring, a pin fitted to slide in the frame and into the path of the said bolt in front of the bolt when retracted, a spring adapted to impel the pin into the path of the bolt, and means, substantially as described, for connecting the said pin with the said hook-lug, whereby the descent of the lug retracts the pin, as and for the purpose specified.

4. The combination of a gun-frame, a barrel pivoted thereto and provided with a downwardly-projecting lug, a locking-bolt fitted to slide in the frame to engage the said hook, a pin fitted to slide in the frame forward of the retracted bolt and notched in one side, and a spring adapted to engage the said notch and secured at its shank to the frame and curved upward to be engaged by the said hook-lug when the barrels are closed down, substantially as shown and described.

5. The combination of the gun-frame 11, the barrels provided with the hook-lug 19, the locking-bolt 18, the pin 28, fitted to slide across in front of the bolt and notched in one side, the spring 29, fitted at one end to engage the notch in pin 28 and perforated for a screw at the other end and curved upward midway to be engaged by lug 19 when closed down, the plate 30, fitted to the frame, and the screw 31, binding the plate, the spring, and the frame together, substantially as shown and described.

6. The combination of a gun-locking-bolt, a pin fitted to move transversely thereto in the frame and adapted to spring in front of the locking-bolt in its retracted position, and connections comprising a lug, 19, projecting down from the barrel, and an arm, 29, between the pin and barrel, substantially as described, whereby, first, the bolt is retained when retracted, and, second, the retaining-pin is withdrawn and the bolt is set free by closing the gun, as described.

7. The combination of a gun-frame, 11, a knob, 32, fitted to slide upon the upper tang thereof, the reach 34 beneath the said tang and secured to the said knob to slide therewith and having a downward-bent forward end, a stop-lever, 36, pivoted in a fixture of the frame and provided with horns at its upper end to engage the reach 34 and with studs 40, projecting from its sides at its lower end, and the triggers 41, provided each with a knob, 43, having a cavity in front of it and adapted to pass up either before or behind the said studs 40, substantially as shown and described, whereby the positions may be given to the safety device, as set forth.

8. The combination of gun-triggers provided each with a knob, 43, a stop-lever, 36, having studs 40 in the path of the triggers and provided with teeth or stop-notches 44, and a spring-catch, 45, arranged to engage the said notches, substantially as shown and described.

9. The combination of the removable lower tang, 15, the block 37, secured thereon by means of a screw, 39, the stop-lever 36, pivoted in the block and having notches 44, and the spring-catch 45, fitted in the removable block 37 and adapted to engage the said notches, substantially as shown and described.

10. The combination of the gun-frame 11, the barrel-locking bolt 18, fitted to slide longitudinally therein, the collar 24, adjustably secured upon the said bolt, the stop-lever 36, pivoted in a fixture of the frame, the push-pin 46, fitted to slide in the frame between the said collar and stop-lever, and trigger mechanism connected with the stop-lever, substantially as shown and described.

11. The combination of a gun-locking bolt fitted to slide longitudinally in the gun-frame, an adjustable collar on the bolt, a safety device, substantially as described, and a push-pin, 46, or similar connection between the said device and collar, whereby a certain amount of rearward motion of the bolt communicates to the safety device a certain amount of motion whether the bolt be set forward or backward in the collar.

12. The combination of a gun-tang, the knob of a safety device, substantially as described, fitted to slide thereon, and having a window through it, and a piece of metal, of different color from the said knob and about the size and form of the said window, secured in the said tang to register with the window when the latter is in one of its fixed positions, substantially as shown and described.

13. The combination of a gun-frame, 11, a pair of cocking-levers, 53, pivoted therein, mainsprings 51, located in the frame beside the said levers and in the same slots therewith, hammers connected with both the levers and springs, and screws 52, passing through the side of the frame and across the path of the mainsprings, but not crossing the path of the cocking-levers, as shown and described.

14. The combination of the mainspring 51, the sear 42, the screw 55, and the sear-spring 54, curved upward midway forming a notch to engage the said screw and resting its ends respectively on the mainspring and on the sear, as shown and described.

15. The combination of the levers 53, the lug 19, the hook 56 removably connecting the said levers and lug, the sectional pin 57, and the spring 58, fitted to slide in the lug in line of the hook 56, the removable fore-end 62, and the stud 60, projecting therefrom in line of the pin 57, substantially as shown and described.

16. The combination of gun-cocking levers 53, a removable hook, 56, engaging the same with the gun-barrels, a stud projecting from the fore-end of the gun, and a push-pin or other means, substantially as described, for connecting the stud with the said hook, whereby the hook is held engaged when the fore-end is in position and is liberated when the fore-end is removed.

899,215. EGG-CRATE. HILLARD F. SMITH and THOMAS L. FIRESTONE, Fredericksburg, Ohio. Filed Dec. 20, 1888. Serial No. 294,302. (No model.)

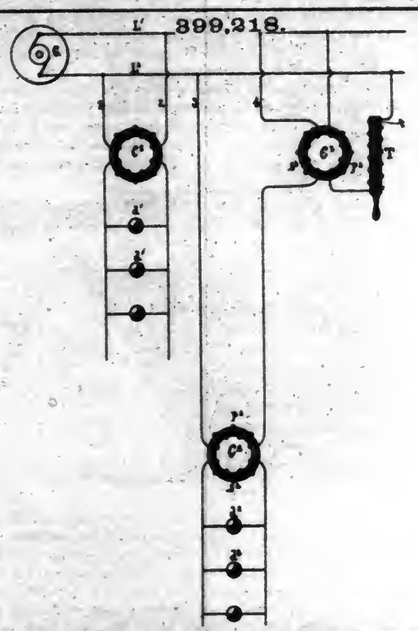
Claim.—A wooden tray or cell-frame for a cell-case, consisting of two parts secured together, each of said parts being composed of two end or supporting pieces, two side pieces, and two series of crossing division-strips halved together and to the said end and side pieces, said division-strips and side pieces being of less width vertically than said end or supporting pieces, so that the two parts of the tray or frame and superposed trays or frames will be separated from each other, substantially as set forth.

899,216. SASH-BALANCE. JOSEPH SPENCER, Chicago, Ill. Filed June 27, 1888. Serial No. 278,377. (No model.)

Claim.—1. In a sash-balance, the combination of the bed-plate *c* with the sash *a*, and cord-holding sleeve *h*, having a curved shank, *k*, and tongue *l*, engaging with the bed-plate *c*, substantially as shown and described, and for the purpose set forth.

2. In a sash-balance, the combination of the bed-plate *c*, formed with a depressed flange or shoulder, *f*, and having a T-formed eye, *g*, a cord-holding sleeve, *h*, having a curved shank, *k*, and tongue *l*, adapted to engage said eye *g*, and the sash *a*, formed with a depression, *e*, for the reception of the plate and cord-sleeve and tongue, substantially as shown and described, and for the purpose set forth.

899,217. PLOW. JOHN A. STEWART, Houston, Tex., assignor to Deere, Mansur & Co., St. Louis, Mo. Filed Apr. 4, 1887. Serial No. 233,582. (No model.)



Claim.—1. In a plow, a longitudinal center bar extending below the base of the sweep and having the pointed nose and the fan-shaped lip, substantially as described.

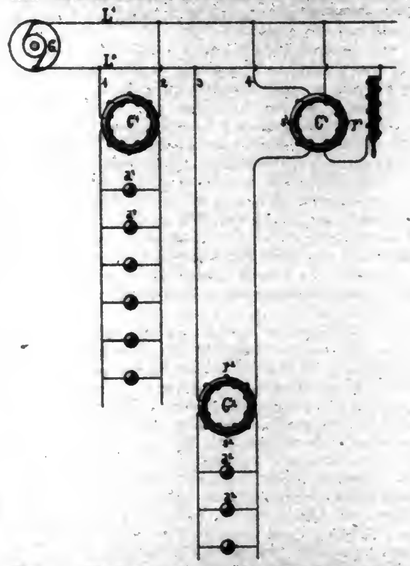
2. In a plow, the combination of the center bar, the adjustable sweep, and the saddle, substantially as described.

899,218. REGULATOR FOR SYSTEMS OF ELECTRICAL DISTRIBUTION. LEWIS B. STILLWELL, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 26, 1888. Serial No. 289,292. (No model.)

399,218.

Claim.—1. The combination of a source of alternating intermittent or pulsatory electric currents, independent electric circuits derived therefrom, an electric converter having one coil connected in one of the derived circuits, and an independent circuit connected directly across the poles of said source and including only the second coil of the converter, whereby currents will be caused to traverse said second coil in value directly dependent upon the current traversing derived circuit, said coils being wound and connected so that the currents induced in the first-named coil are superposed upon those traversing said derived circuit, substantially as described.

2. The combination, with a source of alternating, intermittent, or pulsatory electric currents, of circuits derived therefrom, and an adjustable converter having one coil connected in one of the said derived circuits, and a special independent circuit including the other coil connected in the circuit of said source in parallel with said derived circuit, the coils of said converter being so wound and connected as to superpose induced currents upon the current traversing said derived circuit.



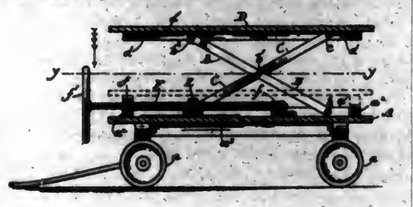
3. The combination, with a source of alternating, intermittent, or pulsatory currents, of two or more groups of translating devices respectively supplied with currents therefrom, and an electric converter having its secondary coil connected in the circuit supplying one of said groups and its primary coil connected in the circuit of the source of current independently of any other translating or transforming device, whereby an additional electro-motive force is applied to said circuit, and means for varying the amount of additional electro-motive force thus applied.

4. The combination, with a source of alternating, intermittent, or pulsatory electric currents, of two or more converters having their primary coils connected with said source in multiple arc, and a variable number of translating devices connected in their respective secondary circuits, and a device for superposing electric currents upon the primary circuit of one of said converters, consisting of an electric converter having one of its coils connected in said primary circuit in series with the converter included therein and its other coil connected in multiple arc with said converter.

5. The combination, with a source of alternating, intermittent, or pulsatory electric currents, of two or more circuits receiving currents therefrom, a regulator for one or more of said circuits, consisting of an electric converter having one coil independently connected in circuit with said source between points of approximately constant difference of potential and its other coil delivering currents to the circuit to be regulated, the first-named coil receiving currents opposite in direction from those traversing the last-named coil.

6. The combination, with a source of alternating, intermittent, or pulsatory electric currents, of two or more circuits receiving currents therefrom, a regulator for one or more of said circuits, consisting of an electric converter having its primary coil independently connected in circuit with said source between points of approximately constant difference of potential and its secondary coil delivering currents to the circuit to be regulated, the said primary coil receiving currents opposite in direction from those traversing the secondary circuit, and an adjustable reactive coil in series with the primary coil of said converter.

399,219. METHOD OF REGULATION FOR SYSTEMS OF ELECTRICAL DISTRIBUTION. LEWIS B. STILLWELL, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 26, 1888. Serial No. 289,239. (No model.)

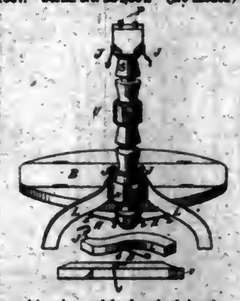


Claim.—1. The hereinbefore-described method of regulating the difference of potential upon an electric circuit, which consists in supplying to such circuit a difference of potential of a given value, deriving from the same source an induced electro-motive force approximately equivalent in value to the loss of potential upon said circuit, and in superposing such induced electro-motive force upon said circuit.

2. The hereinbefore-described method of maintaining a required difference of potential at the terminals of a variable number of translating devices connected in an electric circuit, which consists in applying a predetermined difference of potential to said circuit, deriving from the same source a variable difference of potential equivalent to or compensating for the variable loss of potential upon such circuit, and superposing the same upon said circuit.

3. The hereinbefore-described method of maintaining a normal difference of potential at the terminals of translating devices in two or more different circuits, which consists in applying to said circuits a given difference of potential, deriving independent electro-motive forces from the same source and applying the same to the respective circuits, and causing the effective value of the electro-motive force so applied to the respective circuits to approximately compensate for the loss upon that circuit due to the resistance thereof and to the amount of current traversing the same.

4. The hereinbefore-described method of maintaining a normal difference of potential at the terminals of the translating devices in two or more different circuits, which consists in applying to the terminals of all the circuits a given difference of potential, deriving a supplemental electro-motive force for one or more of said circuits, the value of which is dependent upon and variable with the loss of potential upon said circuit, and in applying such supplemental electro-motive force to such circuit or circuits.

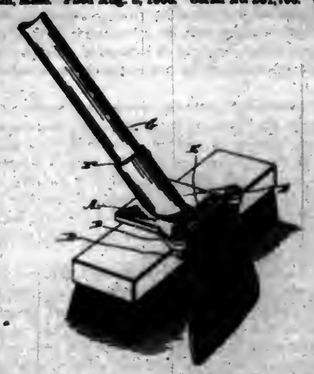


399,220. ADJUSTABLE FLY-TABLE FOR PRINTING-PRESSES. RUDOLPH TIEBOUT, Chicago, Ill., assignor to Rand, McNally & Co., same place. Filed July 23, 1888. Serial No. 280,709. (No model.)

Claim.—1. An adjustable portable fly-table for printing-presses, consisting of a hand-truck, a lazy-tongs mounted and pivoted thereon, a screw for actuating said lazy-tongs, and a table mounted upon the latter, whereby the table may be lowered in proportion as the paper is placed thereon by the fly, substantially as shown and described.

2. The combination, with a printing-press, of a table mounted upon lazy-tongs, a truck for supporting said lazy-tongs, and a screw and hand-wheel for actuating the same, whereby the top of the paper pile may be made to conform to the position of the fly, substantially as shown and described.

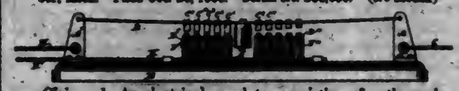
399,221. FOLDING TABLE. JAMES TURNER, Coudersport, Pa. Filed Jan. 19, 1887. Serial No. 224,804. (No model.)



Claim.—The combination, with the shaft having a central slotted or recessed collar, U, a lower recessed collar, K, and pins P, of the table top and leaves, the braces A, hinged to the collar U and provided with hook-and-eye connections, and the legs L, fitting the recesses of the collar K and having hook-and-eye connections, substantially as set forth.

399,222. MITTEN. JOHN TYRRAL, Leo, assignor to Louis Berkheimer, Chicago, Ill. Filed Oct. 30, 1888. Serial No. 289,502. (Model.)

Claim.—A reversible mitten comprising the following construction: four rectangular blanks, each having a thumb-blank extending from one end, the rectangular blanks being united in pairs along the edges provided with the thumb-blanks which are united around their edges, thereby forming the thumbs B and B', and the said united pairs of blanks being secured together near their lateral edges and folded into ears q and q' at the sides and closed toward one end, substantially as and for the purpose set forth.

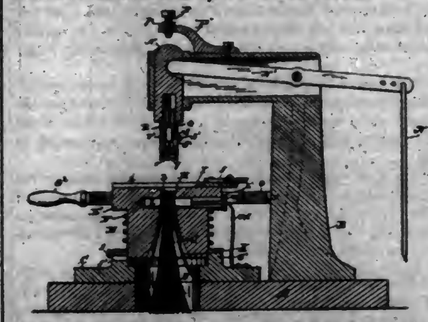


399,223. MOP AND SCRUBBING-BRUSH HOLDER. JOSEPH T. VARNEY, South Wareham, assignor of one-fourth to Edgar Robinson, Wareham, Mass. Filed Aug. 2, 1888. Serial No. 281,766. (No model.)

Claim.—1. A combined mop and brush holder, comprising a plate having depending flanges at its edges, binding-screws mounted in said flanges to secure the brush, and a clamping-bar mounted on the upper side of the plate to secure the mop, as set forth.

2. A combined mop and brush holder, comprising a plate having depending flanges at its edges, binding-screws mounted in said flanges to secure the brush, vertical screws on the upper side of the plate, and a clamping-bar on the said screws to secure the mop, as set forth.

399,224. ELECTRIC REGULATOR. FRANK C. WARNER, Ann Arbor, Mich. Filed Oct. 20, 1888. Serial No. 288,060. (No model.)



Claim.—1. An electrical regulator consisting of a thermal conductor located in circuit with a translating device requiring current regulation, in combination with a multiple-arc shunt around the translating device, and two sets of contacts, one of which sets is borne by the thermal conductor and the other connected to the multiple-arc branches of the shunt and adapted to contact successively, substantially as described.

2. A thermal electric regulator consisting of the following elements: a thermal conductor carrying multiple contacts and a shunt having multiple contacts located near the first set of contacts, substantially as described.

3. In a regulator, the combination of a thermal conductor located in the main circuit with the device requiring current regulation, a shunt around said device, and circuit-varying connections between the shunt and the thermal conductor, whereby the current is shunted around the device requiring regulation in proportion to its flow, substantially as described.

399,225. MACHINE FOR MAKING CARRIAGE-TUFTS. LOUIS P. WARNER, Rochester, N. Y. Filed July 30, 1888. Serial No. 280,456. (No model.)

Brief.—The invention has for its object to provide a machine for making the tufts used in upholstering carriage or other cushions, in which tufts the shank is clamped around the material.

Claim.—1. The combination, with a movable plunger and a device for positively securing a tuft-back thereto, of a perforated anvil through which the material passes, and with which the back co-operates to clamp it to the material, whereby upon the retraction of the plunger the material will be pulled through the anvil by the back, substantially as described.

2. The combination, with the movable plunger and device for positively securing a tuft-back thereto, of a perforated co-operating anvil through which the material passes, the edge of the perforation being arranged to compress the edges of the back toward the material, whereby upon the retraction of the plunger the material will be pulled through the anvil by the back.

3. The combination, with the movable plunger, a back-securing device mounted thereon, and an adjustable stop for limiting the movement of the plunger, of a perforated co-operating anvil through which the material passes, the edge of the perforation being arranged to compress the edges of the back toward the material, substantially as described.

4. The combination, with the movable plunger and a device for positively securing a tuft-back thereto, of a perforated co-operating anvil through which the material passes, the edges of the perforation being arranged to compress the edges of the back toward the material, and a cutting-blade adapted to be moved between the plunger and die to sever the material, substantially as described.

5. The combination, with the movable plunger and a back-securing device mounted thereon, and a stop limiting the movement of the plunger, of a perforated co-operating anvil through which the material passes, the edges of the perforation being arranged to compress the edges of the back toward the material, and a cutting-blade adapted to be moved over the top of the anvil to sever the material close to the same, substantially as described.

6. The combination with the movable plunger, of a perforated co-operating anvil through which the material passes, the edges of the perforation being arranged to compress the socket-edges toward the material, a spring for supporting said anvil, and a stationary material-guide inside the anvil, substantially as described.

7. The combination, with the movable plunger, of a perforated co-operating anvil through which the material passes, the edges of the perforation being arranged to compress the back edges toward the material, a spring supporting the anvil, feeding-rollers for the material within the die, and means, substantially as described, for rotating said rollers when the anvil is moved against the spring, as set forth.

8. The combination, with the movable plunger, of a co-operating anvil having a perforation through which the material passes, the edges of the perforation being arranged to compress the socket edges toward the material, a spring supporting the anvil, and feeding-rollers for the material within the anvil, having ratchet-wheels and a pawl to rotate them when the anvil is moved against its spring, substantially as described.

9. The combination, with the movable plunger, of a co-operating anvil having a perforation through which the material passes, the edges of the perforation being arranged to compress the edges of the back toward the material, a spring supporting said anvil, a stationary guide within the anvil, feeding-rollers, also within the anvil, and means, substantially as described, for rotating said rollers and feeding the material when the same is moved against the spring, as set forth.

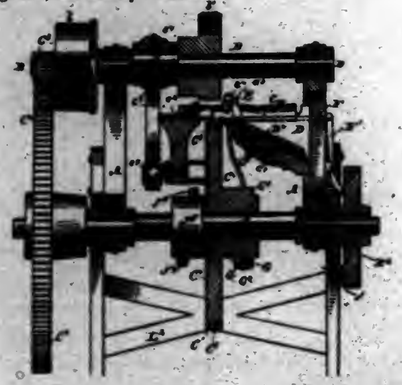
10. The combination, with the movable plunger, of a co-operating anvil having a perforation through which the material passes, the edges of the perforation tapering toward the material, a spring normally projecting it, and a stop for limiting its movement, substantially as described.

11. The combination, with the movable hollow plunger, the spring thereon, and a back-supporting device secured to the spring, of an anvil having an opening therein, the edge of the opening tapering toward the center, substantially as described.

12. The combination, with the hollow slotted plunger, the spring therein, a back-holding device secured to the spring, and a pin projecting through the slot, of a co-operating anvil having an opening within, with rolls tapering toward the center, substantially as described.

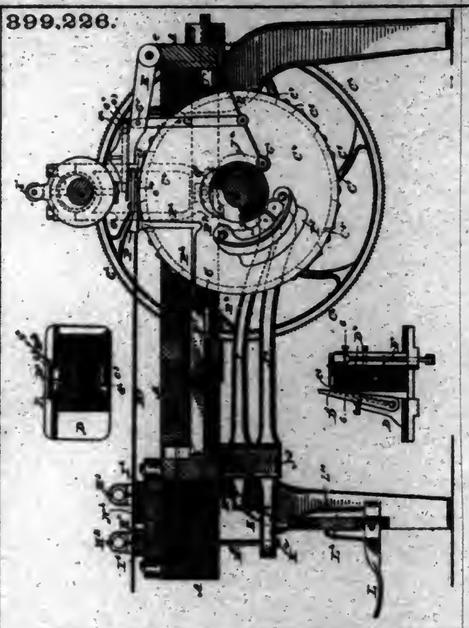
13. The combination, with the plunger, of the co-operating anvil having the perforation for the material, a spring for normally projecting the anvil, and a stop for limiting its motion, of the guides on the anvil and a sliding knife arranged to operate thereon, substantially as described.

14. The combination, with the plunger having the cavity in the end, the hook, and the spring for operating it, of the co-operating anvil having the perforation through which the material passes, the edges of which are tapered toward the center, and the sliding knife operating on the top of the anvil, substantially as described.



15. The combination, with the plunger, the co-operating perforated anvil, a spring for normally projecting the anvil, a stop for limiting its motion, and a handle for moving it against the spring, of a knife arranged to slide over the anvil-face, substantially as described.

16. The combination, with the plunger having the device for the positive attachment of the tuft-back shank thereon, of the perforated anvil through which the material passes, and with which the back co-operates to clamp it to the material, whereby upon the retraction of the plunger the material will be pulled through the anvil, substantially as described.



399,226. MACHINE FOR FORGING HORSESHOE-NAILS. DAVID F. WILLIAMS, Plattsburg, assignor of one-third to Timothy J. Sullivan Albany, N. Y. Filed Mar. 26, 1888. Serial No. 268,514. (No model.)

Claim.—1. The combination, with the roller-hammer, of the anvil-carrier and interchangeable anvils on the periphery of said carrier, substantially as described.

2. The combination, with the roller-hammer, of the rotary anvil-carrier having a peripheral groove, and anvils removably secured in said groove, substantially as described.

399,226.

3. In a machine for the purpose described, a rotary anvil-carrier provided with a peripheral groove, combined with removable and interchangeable anvils seated in said groove, and beveled clamping-pieces for securing said anvils in place, substantially as described.

4. In a machine for the purpose described, an anvil formed with a projection on the rear portion of its face, as and for the purpose described.

5. The combination, with the dies for forming the point of the nail, of guards for protecting the sides of said dies, substantially as described.

6. In a machine for the purpose described, a cutter-stock centered upon suitable bearings upon the rear end of the frame, substantially as described.

7. The combination, with the cutter-stock centered within suitable bearings upon the rear end of the frame, of the cutter secured in the upper face of the free end of the stock, substantially as described.

8. The combination, with the cutter-stock centered within suitable bearings upon the frame, of the cutter adjustably secured within a slot in the upper face of the free end of the stock, substantially as described.

9. The combination, with the cutter-stock centered within suitable bearings on the frame, of the cutter and the gage-block secured in the upper face of the free end of the stock, substantially as described

10. The combination, with the cutter-stock centered within suitable bearings upon the frame, of an adjustable cutter and gage-block secured in the upper face of the free end of the stock, substantially as described.

11. The combination, with the cutter-stock centered within suitable bearings on the frame, of the spring G, the link connecting said spring with the cutter-stock, and the anvil-carrier constructed to actuate said spring, substantially as and for the purpose described.

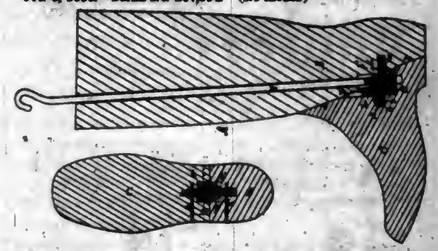
12. The combination, with the cutter-stock centered within suitable bearings upon the frame, of the spring G, the link connecting said spring with the cutter-stock, the anvil-carrier, and the cam on the hub of said anvil-carrier, constructed to actuate said spring, substantially as and for the purpose described.

13. The combination, with the cutter-stock, centered as described and carrying the upper cutter, of the spring G, connected at one end to the frame and having its other end bifurcated, the anti-friction roller carried by said bifurcated end, the link connecting said spring with the cutter-stock, the anvil-carrier, and the cam on the hub of said carrier arranged to contact with said roller, substantially as and for the purpose described.

14. The combination, with the former, of the anvil-carrier, the nail-pusher, and the disk on the shaft of said carrier, constructed to actuate said pusher, substantially as and for the purpose described.

15. The combination, with the dies and the nose-guide, of the spring-bar carrying said nose-guide, the anvil-carrier, and the cam on the said carrier, constructed to actuate said spring-bar, substantially as and for the purpose described.

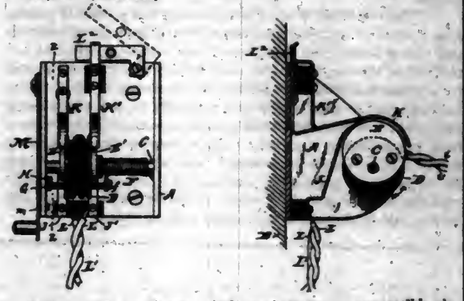
16. The combination, with the nose-guide and the spring-bar carrying the same, of the striking-hammer carrier, enlarged on its inner side, the anvil-carrier, and the cam P[2] on the side of said carrier, substantially as and for the purpose described.



17. The combination, with the striking-hammer and the die secured thereto, of the stationary die arranged at an angle, as shown and described.

18. The combination, with the striking-hammer and the die carried thereby, of the stationary die arranged at an angle, as shown and having its free face formed substantially vertical, as and for the purpose described.

19. The combination, with the block D, of the lower cutter secured in said block with its end beveled to form a cutting-edge at an angle to the direction of its length, and inclined in the manner and for the purpose specified.



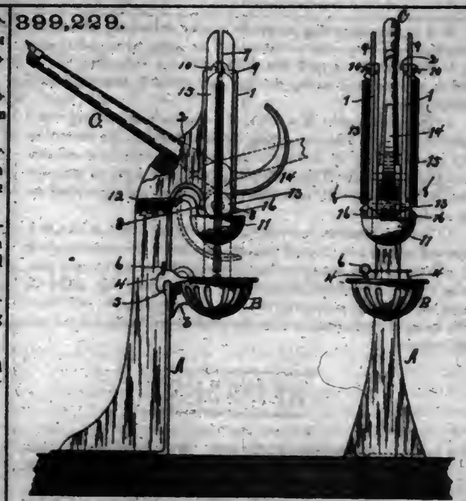
20. In a machine for the purpose described, a feeding device consisting, essentially, of a movable grip and a stationary grip having alternate periods of action, as set forth.

399,227. LAST. GEORGE H. HEALEY, Stoneham, Mass. Filed Oct. 6, 1888. Serial No. 287,354. (No model.)

Claim.—In a last or form for boots, the part B, provided with the dovetail secured thereto, the rod F, screw-threaded at its lower end and provided with a nut or shoulder to bear on the shank of the dovetail through which the rod passes, the part C of the last provided with the dovetail-grooved piece G, secured thereto, in which is a female screw to receive the screw of the rod F to connect the parts of the last together, the abutting surfaces of said parts each being formed as represented, and all being substantially as shown and set forth.

399,228. CIRCUIT-CLOSER FOR RAILWAY-CAR TELEGRAPHS. GEORGE I. HOPKINS, Manchester, N. H. Filed Dec. 21, 1887. Serial No. 258,618. (No model.)

Claim.—1. In a railway-car-telegraph system, a convertible circuit-controller consisting of two pairs of contact-springs and corresponding movable contact-pieces normally in contact with one pair only of the springs, the said contact-pieces when operated breaking contact therewith and making contact with the second pair, and an adjustable conducting-arm in electrical connection with one of the springs of the second pair and capable of being thrown into or out of contact with the other, the springs of the first pair being normally insulated from each other, as set forth.



2. The combination, with the conductors *i i'*, the insulated springs J J' and K K', and the disks E E', of the pivoted arm L, one of the springs K K' being normally insulated, and the arm L being in electrical connection with the other spring and capable of being moved into contact with the insulated spring, as and for the purpose set forth.

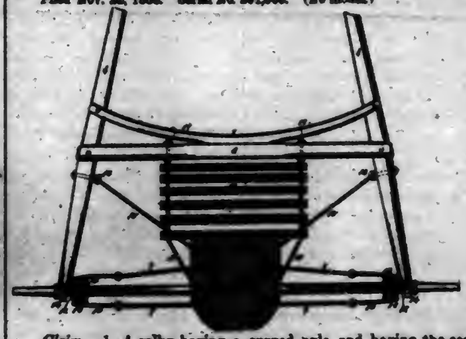
399,229. LEMON-SQUEEZER. ERWIN M. SCOTT, Auburn, N. Y. Filed Sept. 3, 1888. Serial No. 284,464. (No model.)

Claim.—1. The cup B, provided with a bracket, 3, and hooks 4, in combination with the standard A, provided with the lugs 5 upon the inner edges thereof, and the locking-pin 6, inserted through the standard above the hooks, substantially as described.

2. A fruit-squeezer consisting of a standard provided with lugs

399,229.

and bifurcated at the top, forming uprights or vertical bars 1, which are provided with flanges 8 and ears 10, the plates 11, provided with parallel stems 9, guided by the flanges and ears of the uprights, a friction-roller journaled in the plates-stems, and a cam-lever pivoted between the uprights 1 and bearing upon the friction-roller, and the springs 15, connected to the plates-stems at one end and to the ears 10 at the other, in combination with the cup B, provided with a bracket, 3, and hooks 4, hooking over the lugs 5 upon the standard, and a pin, 6, inserted through the standard above the cup-hooks, substantially as described.



399,230. COMBUSTIBLE VAPORIZING-CASE. JOHN MORRIS, Shirley Cottage, South View, Basingstoke, England, assignor to the Chemical Carbon Company, (Limited,) same place. Filed June 20, 1888. Serial No. 277,649. (No model.) Patented in England Mar. 3, 1885, No. 2,786.

Claim.—1. The within-described cone or case for dissipating active materials in a state of vapor, said cone or case being composed, essentially, of carbon combined or mixed with nitrate of potash, substantially as set forth.

2. A combustible cone or case for the purpose specified, composed of carbon and levigated fused nitrate of potash, and provided with an incombustible support or base, substantially as described.

399,231. SULKY. HENRY HEIDEMANN, St. Louis County, Mo. Filed Nov. 22, 1888. Serial No. 291,563. (No model.)

Claim.—1. A sulky having a curved axle, and having the seat thereof supported from said axle by means of coil-springs and connecting-rods arranged at each side of said seat and axle.

2. As a means for supporting the seat of a sulky, coil-springs secured to the axle of said sulky at each side of said seat, having the ends thereof arranged on each side of the axle and connected to said seat.

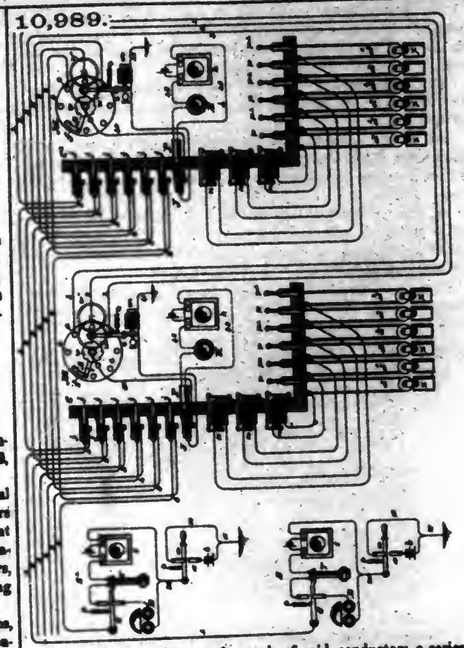
3. A spring-supporting means for a sulky embodying, essentially, connecting-rods 9, secured to the seat of the sulky, arranged at each side of said seat and at each side of the axle, and coil-springs 10, secured to said axle and having the free ends pivotally fastened to said connecting-rods.

4. The combination, in a sulky, of a seat, as 8, connecting-rods 9 at each side of said seat, supporting the same through the instrumentality of coil-springs 10, secured to the axle of the sulky, the said connecting-rods and ends of the coil-springs being arranged on each side of said axle, and cars 13, extending from said axle and supporting the coils of the springs 10.

5. The combination, in a sulky, of the curved axle 5, a seat, as 8, supported by said axle through the instrumentality of connecting-rods 9 at each side of said seat and axle, coil-springs 10, secured to said axle having their ends pivotally secured to said connecting-rods, plates 12 having ears 13 13 for supporting the coils of the springs 10, and braces 15 15, secured to said seat and to the shafts of said axle, for the purpose described.

REISSUES.

10,989. TELEPHONE-EXCHANGE. WILLIAM B. VARNEY, Plainfield, N. J. Filed Jan. 23, 1888. Serial No. 267,221. Original No. 368,529, dated Nov. 27, 1888.



Claim.—1. The combination, in a telephone-exchange, of a central station and a series of sub-stations, a series of electrical conductors uniting said central station and sub-stations, telephonic instruments at each station for the purpose of intercommunication, switching apparatus at the central station for connecting said conductors in pairs, and an automatic switch at the central station making and breaking connection with each of said conductors periodically.

2. The combination of a central station and a series of sub-stations, a series of electrical conductors uniting the sub-stations with the central station, a switch-board at the central station containing a series of spring-jacks, one for each of said conductors, a series of flexible conducting cords and plugs for electrically uniting the spring-jacks in pairs, a series of circumferentially-arranged fixed contact-points, each forming the terminal of one of said conductors, and a rotating radial arm forming the terminal of a fragment of conductor containing a receiving-telephone, said arm forming contact with each of said fixed contacts successively.

3. The combination of a central station and a series of sub-stations, a series of electrical conductors uniting said sub-stations with said central station, a switch-board at the central station containing a series of spring-jacks, one for each of said conductors, a series of flexible conducting cords and plugs for electrically uniting the spring-jacks in pairs, a series of fixed contact-points, each forming the terminal of one of said conductors, a movable contact-point forming the terminal of a fragment of conductor, a receiving-telephone located in said conductor fragment, and means for imparting a progressive movement to said contact-point, whereby the said movable contact-point is carried into connection with each of said fixed contact-points periodically and successively.

4. The combination of a central station and a series of sub-stations, a series of electrical conductors uniting said sub-stations with said central station, a switch-board at the central station containing

10,989.

a series of spring-jacks, one for each of said conductors, a series of flexible conducting chords and plugs for electrically uniting the spring-jacks in pairs, a series of circumferentially-arranged fixed contact-points, each forming the terminal of one of said conductors, a rotating radial arm located upon a suitable bearing, a toothed wheel fixed to said arm and rotating therewith, a fragment of conductor connected to said arm, an electro-magnet having its coils included in said fragment of conductor, a hooked armature-bar therefor to catch and hold the arm and wheel, and a receiving-telephone located in said fragment of conductor, all arranged and operating substantially as described.

5. The combination of a central station and a series of sub-station, a series of electrical conductors uniting said sub-stations with said central station, two or more duplicate switch-boards at the central station, upon each of which each of said conductors has an electrical connection, suitable switching devices at each board for uniting the conductors in pairs, and in close proximity to each board a separate subdivision or group of said conductors connected to a series of fixed contact-points, a movable contact forming the terminal of a fragment of conductor containing a receiving-telephone, and means for imparting a progressive movement to said movable contact, whereby the said movable contact is carried into connection with each of said fixed contacts periodically and successively.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

McDONOUGH *v.* GRAY *v.* BELL *v.* EDISON.

Decided February 23, 1889.

STATEMENT.

Statement of the litigation growing out of the several interferences declared between the patents granted to A. G. Bell and the applications of later applicants; the inventions distinguished and compared with the previous state of the art, and the decisions rendered by the various tribunals in the Office considered and discussed.

1. GRAY'S PETITION TO REOPEN.

Held that the petition "is of no avail for any purpose whatever;" that Gray proposes no new evidence as to dates, nature, or the character of his own invention; that it was conclusively shown in the evidence that Gray, at the time of filing his caveat, while having a conception of the telephone, did not understand the invention, and was unable to explain the mode of its operation; that he adhered to the idea that articulate speech must be transmitted upon the multiple-telegraph principle; that he positively conceded that he did not reduce his invention to practice for a long time after the issuance of patent to Bell; that he regarded the invention patented to Bell as trivial, and called it a "scientific toy," and turned his attention to other and, in his opinion, more important inventions; that he negligently omitted to file his application for a patent until two years after the grant of Bell's patent, and was then stimulated to do so only by other parties, who had acquired an interest in his inventions; and that his present petition, filed without notice to the adverse parties, was delayed for 3 years and 5 months after the decision of the Examiner of Interferences awarding priority to Bell, and was then accompanied by a request that it should not be acted upon until further motion was made.

2. CHARGES OF FRAUD.

For reasons stated, the charges in Gray's petition that Bell had fraudulently secured access to his caveat, purloined his invention, and interpolated a description thereof in his application *Held* not sustained.

3. PRIORITY OF INVENTION AND VALIDITY OF BELL'S PATENT.

Held that the decision of Commissioner Butterworth, of March 3, 1885, was elaborately considered and deliberately rendered, and that a rehearing could only be justified upon clear and satisfactory evidence showing in such decision error in the conclusions of fact or in the application of the law, and that evidence could be produced establishing that Gray could antedate Bell's invention, that he could prove a prior conception and reduction to practice, or that, having made an earlier conception, he had diligently prosecuted it to a reduction to practice. In the absence of showing the existence of such evidence, upon the testimony filed before and considered by the various tribunals in the Office, *Held* that "the award of priority of invention was justly given to Bell," and, in view of the construction given by the Office and the courts to the patent, the grant was properly issued, and the protection afforded the inventor was authorized.

4. EXTENDING THE MONOPOLY.

The public has a direct and immediate interest in the further prosecution of Gray's application for a patent. If the award of priority given to Bell can be vacated and set aside, it should only be done upon a showing of merits that would entitle Gray to a patent. Such patent would run for a period of 17 years from its date, and would dominate and control all devices relating to the telephone for another period of 17 years. The effect would be to subject the public to a renewed monopoly in all nearly, if not quite, thirty-four years. Such result would be in contravention of the spirit of the statute, and, in view of the liberal provisions of the patent system, cannot be tolerated except when the inflexible rules of law and justice compel it, especially in the present case, wherein it is clearly shown that the Bell Company is the "equitable if not the legal owner of Gray's telephone inventions."

5. TITLES AND RIGHTS UNDER ASSIGNMENTS.

The Commissioner has no equitable jurisdiction over the rights of parties claiming under assignments and grants of inventions and patents. He cannot set aside or vacate such instruments, nor can he recognize equitable rights growing out of transactions between inventors and applicants and other parties. While the Commissioner is authorized to recognize formal legal assignments, and when they have been filed in the Patent Office before patent issues may give the assignee control of the management and prosecution of an application and direct the patent to issue in the name of the assignee, yet he cannot recognize equitable rights under executory or other equitable contracts; but where the relief asked, as in a petition for rehearing, is founded upon an alleged state of the title to the invention, the Commissioner possesses the power to determine the allegation as to title in order to exercise his discretion in granting or refusing the relief.

6. MCDONOUGH'S PETITIONS.

As to the petition of McDonough that he be allowed to demonstrate the operativeness of the make-and-break principle, the Commissioner holds the decisions of his predecessors are conclusive on that question; that McDonough never claimed to be the original inventor of the telephone, but a mere improver upon Reis's instruments; that he accepted and still accepts the make-and-break system of Reis as the foundation of his invention; and, in view of the settled judgment of the Patent Office that speech cannot be transmitted by an instrument which operates solely by the making and breaking of the circuit, and also in view of the fact that the Supreme Court of the United States has also definitely settled this question with reference to Reis, he must regard the matter *res adjudicata*.

7. NO INTERFERENCE BETWEEN MCDONOUGH AND BELL.

As to the petition to reopen on the merits, the Commissioner holds that McDonough's original claim for the receiver having been rejected on reference to Bell's patent, and he submitting thereto and canceling the claim, and McDonough having been brought into the interference in consequence of the later applicants, so as to compel them to establish an earlier date of invention than himself, it follows, inasmuch as there could have been no interference between McDonough and Bell alone, that when Gray and the other later applicants were defeated and taken out of the interference there could be left no contest between McDonough and Bell.

8. CLAIMS VOLUNTARILY CANCELED.

Whether an applicant who has voluntarily eliminated his claims and apparently abandoned them should be permitted, after the invention has been publicly introduced and made commercially valuable, to return after 11 years and amend and claim an interference with a patent so long outstanding is a serious question, and the right to the relief should be most convincing.

9. PETITIONS DENIED—INSUFFICIENT SHOWING.

Petitions denied because the showing is deemed insufficient to justify the Commissioner in setting aside former decisions and decrees, since he is fully convinced that another trial on the question of priority would result in another award in favor of Bell.

PETITIONS of Elisha Gray and James W. McDonough to amend and to reopen.

TELEPHONES.

A. G. Bell, Patent No. 174,465, granted March 7, 1876,

on application filed February 14, 1876. A. G. Bell, Patent No. 186,787, granted January 30, 1877, on application filed January 15, 1877. Elisha Gray, applications Nos. 1, 2, and 3, filed October 29, 1877. James W. McDonough, application filed April 10, 1876.

Mr. James J. Storrow and *Mr. Roscoe Conkling* for Bell.

Mr. Robert G. Ingersoll and *Mr. Frank H. Hurd* for McDonough.

Mr. M. B. Philipp and *Mr. Casey Young* for Gray.

HALL, *Commissioner:*

On the 26th of March, 1878, a series of interferences, lettered from A to M, were declared, and by an order of the Commissioner, dated March 6, 1879, case H was consolidated with case F and case K was merged in case I. By a stipulation between the parties thereto it was agreed that case No. 1 of a series of six interferences, declared August 14, 1879, should be proceeded with and presented in connection with the lettered series. In September, 1880, case M was suspended by consent. Owing to the complex nature of the inventions and the variety of detail of events involved in the controversy the issues were tried together upon the evidence taken by the respective parties, so far as it was relevant to the several issues.

The parties originally involved in one or more of the issues were A. G. Bell, James W. McDonough, T. A. Edison, E. Berliner, G. B. Richmond, E. Gray, A. E. Dolbear, A. G. Holcombe, C. E. Chinnock, C. A. Randall, F. Blake, J. H. Irwin, and G. M. Phelps. W. L. Voelker was made a party to case No. 1 November 3, 1879, and cases A and B December 29, 1879.

Prior to the date on which the cases were submitted to the Examiner of Interferences decisions had been rendered against Richmond, (except as to case C,) Holcombe, Randall, Phelps, Chinnock, and Berliner, so that they were no longer parties to the controversy.

The evidence presented to the Examiner of Interferences was contained in 5 volumes: I. Testimony on behalf of Edison. II. Exhibits of Edison. III. Testimony on behalf of Voelker, Irwin, Gray, Dolbear, McDonough, Blake, and Bell. IV. Vol. 1 of the record in the case of the *Bell Telephone Company* v. *Dowd*, comprising Bell's answers and proofs introduced by stipulation. V. Vol. 2 of the record in the Dowd case, comprising exhibits, &c.

The taking of evidence was practically concluded in May, 1881. The case was argued before the Examiner of Interferences, and fully submitted to him in October and November, 1881. He held the case under advisement until July 21, 1883, when he filed his decision, which covers 348 pages of closely-printed matter. In cases A, B, C, E, F, I, J, and L he awarded priority of invention to Bell; in cases D and No. 1 to Edison, and in case G to McDonough. From this decision of the Examiner of Interferences Edison appealed to the Examiners-in-Chief in cases A, B, C, G, J, and L. Voelker appealed in cases A and B and No. 1. Bell and Gray appealed in case G, and Irwin in case No. 1. This relieved the controversy of cases D, F, and I, which remained finally disposed of by the decision of the Examiner of Interferences.

After having held the cases under advisement nearly a year the Examiners-in-Chief, on October 23, 1884, rendered a decision affirming the decision of the Examiner of Interferences as to all of the issues except issue G, as to which they reversed him and awarded priority to Bell. From this decision Voelker appealed to the Commissioner as to issues A and B, but Gray aquiesced therein and took no appeal. McDonough and Gray appealed as to issue G.

Pending the appeal before the Commissioner, McDonough, on December 19, 1884, presented a motion—

to have the above-mentioned interference (G) reopened in order that I may be permitted to introduce proof before the proper tribunal as to the operative character of the telephone-transmitter shown in my application of April 10, 1876, involved herein, and for such other and further action in the premises as may be rendered necessary.

The grounds of the motion were that the Examiners-in-Chief had held that a make-and-break apparatus such as McDonough described was incapable of transmitting articulate speech; that this was at variance with the action of the Primary Examiner in declaring the interference, who must have found the apparatus to have been an operative one, and because, under the rules, the only method of raising the question of operativeness was by reference to the Primary Examiner. After full argument this motion was denied by the Commissioner on January 16, 1885.

On March 3, 1885, the Commissioner filed his decision affirming the action of the Examiners-in-Chief as to all issues. This was a final award of priority in favor of Bell upon all the issues involved.

Nothing further appears to have been done by any of the parties in the interferences until December 30, 1886, when there was received by the Office the following petition of Gray:

To Hon. M. V. Montgomery, Commissioner of Patents:

Elisha Gray, one of the parties to the above-stated proceedings, brings this, his petition, to set aside the various orders, decisions, and judgments heretofore made and rendered therein, and to reopen the same upon the following grounds, viz:

I.

Upon the ground of newly-discovered evidence, important and material in its character, and which would, as petitioner believes, have changed the various orders and judgments made and rendered in the progress of, and upon the final hearing of, said interference proceedings, if the same had been presented at the proper time to the officers of the Patent Office having them in charge and passing upon the matters and things pertaining thereto, and which evidence was not known to petitioner to exist, nor did he have any reason to suspect that it did, until long after the final decision in said interference proceedings was rendered against him, and in favor of A. G. Bell, upon nearly all the material issues therein involved; and therefore no laches can be imputed to him in not having earlier discovered and presented the same.

II.

The said newly-discovered evidence will, as petitioner is informed and believes, establish the following facts, viz: That on or about the 1st day of March, 1876, A. G. Bell, the successful party in said interference proceedings, went to the Patent Office, and by undue and unlawful means and influences procured full knowledge of the contents of, and drawings attached to, a certain caveat, accurately describing a speaking-telephone, then recently (viz., on the 14th day of February, 1876) filed by petitioner, and upon which caveat, and the invention therein set forth, and the apparatus therein described, were based the three (3) several applications for patent for a speaking-telephone afterward filed by petitioner and involved in said above-mentioned interferences.

III.

By the knowledge thus obtained, in violation of law and the rights of petitioner, the said Bell was enabled to construct an apparatus, a few days afterward, by which he succeeded in transmitting articulate speech, and which apparatus, so constructed in exact accordance with the drawings attached to and the description and specification set out and contained in petitioner's said caveat, he, the said Bell, subsequently claimed was the apparatus set out, described in, and covered by an application which he had filed in the Patent Office on the said 14th day of February, 1876, purporting on its face to be an application for patent for "an improvement in telegraphy," but was never in any way claimed by the said A. G. Bell to be for a speaking-telephone, nor recognized as such by any one else, until long after a patent had been issued thereon, on the 7th day of March, 1876, numbered 174,465, and which was involved in the aforesaid interference, while in fact no one of the devices or apparatuses set out and described in the said application never had previous thereto and never since, as petitioner is informed and believes, been made to transmit articulate speech.

IV.

It was not until after the time and the occurrences above narrated that the said Bell claimed he had invented the speaking-telephone, or that he had mentioned, described, or claimed any such invention, or any device or apparatus constituting a part thereof, in said application filed on the aforesaid 14th day of February, styled an "improvement in telegraphy;" and the fact is that the said Bell did not, in his said application, describe or claim any apparatus or device that could or can be made to operate as a variable-resistance telephone for the transmission of articulate speech; but by reason of having wrongfully and illegally obtained information as to the nature and contents of petitioner's aforesaid caveat, and of being thereby enabled to construct an apparatus theretofore unknown to and never previously conceived of by him that would transmit speech, and which apparatus he forthwith claimed as his own, the officers of the Patent Office were induced to adjudge him to be the first and original inventor of the speaking-telephone, as against petitioner and others, because, as it was then believed, by reason of the above-recited fraudulent acts upon the part of the said Bell, he had first reduced the same to practice, though it was found and so reported by the Examiner of Interferences that he was not otherwise entitled to claim, or have awarded to him, priority over petitioner as to the said invention; and it was further found and so reported by said Examiner of Interferences that petitioner lost whatever right he might have had and secured under his said caveat to be adjudged the first and original inventor of said art of telephony as against said Bell, because of his own laches in not completing and reducing it to practice before the same was done by him, the said Bell.

V.

Petitioner further shows that by reason and in consequence of the aforesaid wrongful and fraudulent acts and doings upon the part of the said Bell, together with certain other irregular and illegal proceedings, hereafter to be set out, had and taken in the Patent Office concerning and in respect to his aforesaid caveat and the application of the said Bell, he, petitioner, was deceived and misled as to his real legal status in the Patent Office in respect to the speaking-telephone and as to his rights in relation thereto acquired by virtue of having filed his said caveat, and which rights were subsequently involved in the interferences aforesaid; and by being so deceived and misled he failed and neglected to take such action and to obtain and present such proof in the beginning and during the progress of said interferences as he would otherwise have done, and which would, as he believes, have secured a judgment in his favor upon all the material issues involved therein, instead of being given in favor of said Bell; and among the said irregular, wrongful, and illegal acts and doings petitioner submits the following, to wit:

VI.

The aforesaid caveat of petitioner and application of said Bell being filed in the Patent Office on the same day, to wit, the 14th day of February, 1876, without any noting of the hour at which the respective filing occurred, the same was entitled to and should have been considered as a simultaneous act; and when said caveat and said application came for action before Z. F. Wilber, the Primary Examiner to whom they were referred, he held and decided in accordance with the law and practice in that behalf, which had always theretofore prevailed in and governed the action of the Patent Office, that they were filed simultaneously, and that therefore said application should be suspended for ninety days, and that petitioner was entitled to notice of the pendency of said application, and to be also notified to complete the invention set out in his said caveat within the time prescribed by law; and the said examiner did, pursuant to law, give such notice to petitioner. But, contrary to and without authority of law, he also notified said Bell of the pendency of petitioner's caveat, informing him, at the same time, that it appeared to interfere with certain designated parts of his application. Upon the *ex parte* application, however, of the said Bell, through his attorneys, Messrs. Pollok and Bailey, the aforesaid decision of the said Wilber was reversed, and it was then decided, without the taking of any competent and sufficient proof and without notice to the petitioner, that his caveat was filed some hours later in the day than was the application of the said Bell. Whereupon the notice given petitioner to complete his said invention was withdrawn; and soon thereafter, to wit, on the 7th day of March, 1876, a patent was issued, on the aforesaid application, to the said Bell, without models having been filed by him, as required by law, of the different devices or apparatuses claimed to be set out and described therein, and without his ever having shown and demonstrated to the officers of the Patent Office, or to any one else, that the same were in any way fitted for or capable of performing the functions of a speaking-telephone. By all of which petitioner says the rules of the Patent Office were disregarded, the law violated, and great injustice done to him.

VII.

And petitioner further shows that said interferences should be reopened and set aside for further proceedings therein, because the same were wrongfully instituted, as aforesaid, and were not conducted in good faith, with a view to reach the real merits thereof, but were collusive and simulated in this: That before any proof had been taken in said interferences, or any substantial progress had been made in the same, those to whom the said Bell had previously transferred the ownership of the two patents involved, namely, patents numbered 174,465, and 186,787, acquired, or supposed they had acquired, by assignment, all the other patents and applications for patents (which were thought to possess any value) that had been put in interference with those of petitioner and of others; and among the patents and applications so acquired, it was supposed, by the aforesaid owners of the two abovementioned patents of the said Bell, that the alleged interfering applications of petitioner were included; and petitioner being under a misapprehension in that regard, brought about by no act of his, supposed this to be true until long after the proceedings in said interferences were ended in the Patent Office.

VIII.

From the time these patents and applications were acquired, or supposed to have been acquired, as aforesaid, the interference proceedings in respect thereto, as between those representing the interest and claims of the said Bell and petitioner and certain other of the defendants, were mainly under the management and control of those who had acquired the aforesaid interest therein, and with the view of reaching such results as they desired, they paying, as petitioner is informed and believes, the counsel on both sides, as well as other necessary expenses.

IX.

And as a further and additional ground upon which petitioner submits that the various decisions made in the progress of said interferences should be set aside and the same reopened is the following: That the patent of the said Bell, numbered 174,465, was adjudged by the officers of the Patent Office to be for a speaking-telephone, and that it described an apparatus therefor, not upon any evidence presented to establish that fact, but because it had been so held and adjudicated in a consent decree taken and entered in a certain collusive suit known as the "Dowd" case, in which the same party, to wit, the American Bell Telephone Company, who had represented the interest of the said Bell in the aforesaid interferences, was the complainant, and one Peter A. Dowd was the nominal defendant; and in the progress of the same the parties thereto consolidated their interests, and a consent decree was entered in favor of the complainant, the American Bell Telephone Company, it paying the counsel fees on both sides of the case, together with all other costs and expenses of the same, as petitioner is informed and believes. Under authority of this collusive adjudication the officers of the Patent Office held that the aforesaid patent of the said Bell, numbered 174,465, should be put in interference with the applications of petitioner, though it was also held that said patent did not describe a speaking-telephone, and that but for said adjudication it could not and would not have been put in interference as aforesaid.

X.

Petitioner asks that said interferences be reopened, upon the further ground that the officers of the Patent Office erred in putting the aforesaid patent of the said Bell in interference with the applications of petitioner as to the broad art of telephony, in this, that the said patent contains no description, specification, drawings, or claim that would inform any one that it in any way relates to the art of transmitting articulate speech by any means pointed out or suggested therein; but it plainly appears upon the face thereof that it was intended alone for an improvement in telegraphy. And in this, that the apparatus which is described in said patent, and shown in the drawings attached thereto, is in no way like that set out in petitioner's application, and shown in the drawings thereof, but is of entirely different construction, and operates, if it will operate at all for any purpose, upon a wholly different principle.

XI.

And petitioner further says that the officers of the Patent Office especially erred in awarding priority to said Bell in issue G of said interferences, as against him, petitioner.

XII.

And, finally, petitioner moves the honorable Commissioner to set aside said interferences, upon the further ground that the various orders, decisions, and final judgment had and rendered therein are not supported by the evidence, nor warranted by the law applicable thereto.

XIII.

Therefore, petitioner brings this his petition, with accompanying affidavits, proofs, and exhibits, in support of the allegations therein set out and contained, and prays that the various orders, decisions, and final judgment made and rendered in said interferences be set aside, and that the same be reopened, to the end that such other and further proceedings may be held in respect thereto as shall seem to the honorable Commissioner to be just and lawful in that behalf.

ELISHA GRAY.

M. B. Philipp, attorney for petitioner.

District of Columbia, United States of America:

Before me, A. S. Taylor, a notary public in and for said District, this day personally appeared Elisha Gray, who made oath that the statements contained in the foregoing petition are true, to the best of his knowledge, information, and belief.

Sworn to and subscribed before me this twenty-fourth day of December, A. D. 1886.

[SEAL.] A. S. TAYLOR,
Notary Public.

[Endorsement.]

Office of Commissioner of Patents. Received Dec. 30, 1886, Petition of Elisha Gray to reopen the telephone interferences between himself, A. G. Bell, and others.

The petition is presented by Hon. Casey Young, with the statement that Mr. Philipp, counsel in the case, does not desire to have it acted upon until he shall hereafter present a formal motion asking therefor.

M. V. MONTGOMERY,
Commissioner.
Dec. 30, 1886.

No formal motion was subsequently presented by Gray asking for any action on the above petition, nor was any motion served by Gray upon Bell or other party of the filing thereof or that action would be asked. It was not until a general order of the Commissioner was made applicable to all old cases pending in the Office, to prevent delays and the prolongation of monopolies, that this petition was brought to the knowledge of the present Commissioner, and under his direction it was set down for disposition on February 1, 1888, and Bell and other parties notified.

February 18, 1887, an order was made by Commissioner Montgomery suspending action in Gray's case No. 3. Why this order was made, or upon what reason, does not appear. It was made in case No. 3 as *ex parte*.

February 23, 1887, Gray presented a proposed amendment in case No. 3, which was not entered in the case.

On April 4, 1887, Gray presented another amendment in case No. 3, which was not entered, but which is now before the Commissioner as an *ex parte* case. The amendment covers the metallic diaphragm.

March 2, 1887, McDonough filed in the interference case two petitions, as follows:

I hereby move for an order for reopening the above-entitled interference, with leave to furnish proofs in regard to the operativeness of my teleloge as a speaking-telephone; and respectfully present the following as the grounds for this motion:

I.

That the Commissioner of Patents, when the said interference was under argument on its merits, erred in receiving, at the instance of the assignee of the contestant Bell, and in considering, certain depositions, or what purported to be copies of certain depositions, of Professors Brackett and Young, taken as a part of the evidence in the suit of the American Bell Telephone Company against the Overland Telephone Company, but forming no part of the interference record.

II.

The Commissioner of Patents erred in that he heard and decided the interference with the avowed determination, as expressed in his opinion, not to determine the issue adversely to the owners of the Bell patent, it being explicitly stated by him in such opinion that if he had become convinced that the Board of Examiners-in-Chief were wrong in their judgment in awarding priority to Bell he would have declined to reverse such judgment. His exact language was as follows: "If, on examination of the evidence in consideration of the arguments, I had become convinced that the finding and decision of the Examiners-in-Chief were erroneous, or if a serious doubt in that behalf had been raised in my mind, I would have felt constrained to leave the case undecided, to be reheard by my successor."

III.

The Commissioner of Patents erred in that, instead of deciding the question of priority involved in the interference he did not either dissolve the interference (so far, at any rate, as Bell and myself were concerned) or else suspend it, and institute a special investigation as to the operative character of my "teleloge" as a speaking-telephone.

In deciding the motion to reopen the interference, in order to permit me to adduce proof as to the operative character of my telephone, heard by the Commissioner of Patents January 15, 1885, and refused by him in an opinion rendered on the following day, he said as follows: "If, on the hearing of this cause, I should ascertain that there is doubt about the operativeness of this device, and the question of priority should turn wholly on that point, and through inadvertence, mistake, or surprise the evidence was not full and satisfactory, so as to enable me to reach a right conclusion without further evidence, such proceedings could be taken in that behalf as might be fit and proper to ascertain the truth. My opinion is that the case should proceed. If it occurs that further investigation shall become necessary, it is not only within the power, but it would be the duty of the Commissioner, to make such inquiry by means best calculated to ascertain the exact fact."

In view of this ground of denying the then motion to reopen, it was error for the Commissioner, subsequently, in considering the interference on its merits, to find (as it fully appears, from an inspection of his opinion in the premises, he did find) that the operativeness of my apparatus was a controlling factor in determining the question of priority, and at the same time not to take proper and effectual steps for the full investigation of that question, particularly in view of the fact that at the time of taking the testimony in the interference no issue was made between the parties as to the operativeness of my teleloge, neither Bell nor any other of the contestants having offered evidence to rebut the proved facts in regard to the actual transmission of speech by means of the instrument, or even theoretically in regard to its capability to transmit speech.

The Commissioner erred specially, in that, finding that the operativeness of my teleloge was vital to the determination of the question of priority, he allowed his mind to be influenced, in the settlement of this fundamental question, by the introduction into the case of matter taken from depositions that formed no part of the record, and as to which no opportunity was, or under the circumstances could be, afforded me to cross-examine the witnesses.

That the depositions thus wrongfully introduced and considered had a controlling influence upon the Commissioner's decision appears from his opinion, in which he says: "I have considered the affidavits of Professors Young and Brackett, *in connection with the evidence given by them in the case of the American Bell Telephone Company v. The Overland Telephone Company of New Jersey*," (being the depositions of which it is alleged that they wrongfully introduced.) "Taking the evidence of these two scientists as a whole, I cannot find that they have demonstrated, or that they unqualifiedly affirm, the fact to be that a telephone using the make-and-break system as contemplated by McDonough will transmit articulate speech within the terms of the issue. It transpires in the cross-examination of those learned gentlemen" (in the depositions that form no part of the interference record, and in which I had no opportunity to cross-examine them) "that they assume," &c.

IV.

The Commissioner of Patents erred in that, in considering McDonough's invention of the teleloge, as described in his application of 1876, he failed to distinguish between the *actual invention* therein described and the *theory* therein presented, in regard to the operation of the apparatus that constitutes the real invention.

V.

The Commissioner erred in holding that the underlying principle of my teleloge was that it should operate by a "palpable" make-and-break system.

VI.

The Commissioner erred in not making award of priority as between me and Gray, it being upon the claim of the said Gray that the interference was based.

VII.

The Commissioner erred in holding that my teleloge was inoperative to transmit speech.

VIII.

The Commissioner erred in holding (as in substance he did hold) that a telephone constructed on the make-and-break system will not talk, as is abundantly shown by the subsequent practice of the Patent Office in granting patents, special reference being made in this connection to the patent of Bonta, No. 333,810, January 5, 1886.

IX.

The Commissioner erred in awarding priority of invention to Bell, such decision being contrary to the law and the facts of the case, and contrary to sound practice.

Wherefore, I respectfully petition the honorable the Commissioner of Patents for an order reopening the aforesaid interference, or for such other or such further relief in the premises as to your honor may seem meet and proper, and may be just and equitable.

JAMES W. MCDONOUGH.

State of New York, City and County of New York, ss:

I, James W. McDonough, being duly sworn, depose and say that I am the person whose application for a patent for a teleloge (filed April 10, 1876) was involved in the interference above named; that I am advised and verily believe that an injustice has been done me by the decision in the said interference awarding priority to Mr. Bell; and that the above are good and sufficient reasons for reopening the interference.

Subscribed and sworn to before me, this second day of March, 1887.

[SEAL.] ROBT. F. GAYLORD,
Notary Public, (168,) *N. Y. Co.*

[PETITION OF ASSIGNEES.]

Your petitioner, J. W. McDonough, a resident of the city and State of New York, and one of the parties to the above-stated interference proceedings, brings this petition, and respectfully asks that the aforesaid interference proceedings be set aside, and the various orders, decrees, and judgments rendered therein be vacated and annulled upon the following grounds, viz:

I.

Because the same were not conducted in good faith, as petitioner believes, and charges were fraudulent and collusive, and carried on with the purpose and intention of securing an award in favor of Alexander G. Bell upon all material issues therein involved.

II.

Because all of the orders, judgments, and decrees taken and held in said proceedings, in so far as priority of invention as to the speaking-telephone was awarded to Alexander G. Bell, were erroneous, and not supported by either the law or the facts applicable to the same.

III.

Because the proof does not show that Alexander G. Bell was the first and original inventor of the speaking-telephone, or any material or necessary part thereof, but, on the contrary, the evidence shows that petitioner was himself first and original inventor as against the said Bell and the other parties to the proceedings.

For the reasons above stated and others to be hereafter presented, petitioner prays that said interference proceedings may be reopened, and the different orders, judgments, and decrees made and entered therein be vacated and annulled, and that all the issues therein involved be heard *de novo*.

FRANK H. HURD,
Attorney for E. S. Stokes and the North American Telephone Company, Assignees of J. W. McDonough.

District of Columbia, ss:

Personally appeared before me, this second day of March, A. D. 1887, Frank H. Hurd, who, being duly sworn, says that the aforegoing petition is true, to the best of his knowledge and belief.

FRANK H. HURD.

Sworn and subscribed to before me,

[SEAL.] CHAS. S. BUNDY,
Notary Public, D. C.

It will be seen that the first of these motions seeks two kinds of relief: *first*, to have reopened the interferences and permit McDonough to take additional evidence as to operativeness; *second*, to have set aside the decision of Commissioner Butterworth of March 3, 1885, on the merits, and to have a new trial granted. On March 17, 1887, this motion was submitted to Commissioner Montgomery, who, on March 29, 1887, filed a decision holding that as to the first branch of the motion he was concluded by Commissioner Butterworth's decision of January 16, 1885, which rendered the matter *res adjudicata;* but as to the second branch of the motion, the right to move to set aside the decision of Commissioner Butterworth of March 3, 1885, on the merits of the interference, remained, unless it had been lost by laches. The decision concludes as follows:

First. That McDonough has a right to be heard on the subject of vacating the award of priority made by Commissioner Butterworth, and such hearing is hereby fixed for the nineteenth day of April next, at twelve o'clock noon, at which time the petition filed on the 2nd instant by the assignee of McDonough, and which petition is not under consideration at present, will be called up for hearing.

Second. I must decline to entertain that part of the present motion which is but a repetition of the one which was passed upon by my predecessor.

This proceeding was conducted wholly independent of Gray's petition and proposed amendment, the former lying dormant, as before explained.

This motion of McDonough for a rehearing was not heard on April 19, but was continued from time to time until February 1, 1888. In the meantime Gray's amendment was a second time referred to the Primary Examiner for report. Bell was allowed to be heard, and on July 14, 1887, the examiner reported adversely to admitting the amendment. Subsequently Bell moved that the further hearing of Gray's motion to amend be postponed until after the Supreme Court should dispose of the telephone cases then pending before that tribunal. This motion was denied on November 23, 1887, and this decision advised Bell for the first time that Gray had filed a petition to reopen and set aside the interferences.

Gray's motion to amend was submitted before the Commissioner on December 1, 1887, and the argument of this motion resulted in causing the McDonough petitions and the Gray petition to be set down for disposition February 1, 1888. Gray made no request to have his petition so set down, nor did he do anything to have his petition called up for action. As previously stated, when the Commissioner ascertained that such a petition was on file it was deemed that the public interest required that it should be disposed of without further delay. It was accordingly directed that notices issue fixing February 1, 1888, as the date of hearing. At that date parties appeared, the presentation of the McDonough petition began, and that of Gray's petition followed the conclusion of the former.

It has been deemed important to recall and set out this history of these proceedings, not only for the better understanding of the merits of questions involved, but because they characterize the conduct of the parties, to some extent, as to laches or diligence, which may affect to greater or less extent the merits.

The proposed amendment of Gray in case No. 3 has been disposed of separately as an *ex parte* case. Reference to it here is due to its intimate relations with the matters now under consideration.

The McDonough and Gray petitions must be considered separately; but there are matters common to both which may be presented before entering upon them.

THE ISSUES.

The issues in these interferences are as follows:

A.

The hereinbefore-described art of transmitting and reproducing at a distance sonorous waves or vibrations of any description, which consists in increasing and decreasing the strength of an electric current, traversing a circuit in such a manner as to produce in said circuit a series of electrical waves or vibrations precisely corresponding in their intervals of succession and relative amplitudes to the sonorous waves which are to be reproduced at the receiving station or stations, so that oral conversations or sounds of any description may be telegraphically transmitted.

In this interference was Gray's case No. 1, the subject-matter being that of his first claim, the Bell patent of March 7, 1876, and, among other applications, those of Edison, filed April 27, 1877, No. 130, Emile Berliner, filed June 4, 1877, and A. E. Dolbear, filed October 31, 1877.

B.

The hereinbefore-described improvement in the art of transmitting vocal sounds or spoken words telegraphically, which consists in throwing upon the line through the medium of a varying resistance electric impulses corresponding to the vibrations of a diaphragm operated by the movements of the air produced by a spoken word.

In this interference was also Gray's case No. 1, the subject-matter being that of his second claim, the Bell patent of March 7, 1876, and, among other applications, those of Edison, filed April 27, 1877, No. 130, and Berliner, filed January 4, 1877.

C.

First. The transmitter consisting of the combination, in an electric circuit, of a diaphragm and a liquid or equivalent substance of high resistance, whereby the vibrations of the diaphragm cause variations in the resistance of the electric circuit, and consequently of the strength of current traversing said circuit.

Second. In a telegraph-instrument operated by sound, the combination, with the diaphragm, of two or more electrodes placed in electrolytic liquid and operating to increase and decrease the resistance of the electric circuit by the movement derived from the diaphragm.

In this interference was Gray's case No. 2, the first part of the subjects-matter being that of his first claim, the Bell patent of March 7, 1876, and, among other applications, that of Edison, filed September 5, 1877, No. 144, the second part of this subject-matter being that of his first claim.

E.

In an acoustic telegraph, an armature-plate, the electro-magnet for the same, and a closed circuit passing from the helix of such electro-magnet to the source of undulatory electric energy.

In this interference was Gray's case No. 3, the Bell patent of March 7, 1876, and, among other applications, one of Edison, filed December 13, 1877, No. 145, and that of Dolbear, filed October 31, 1877.

F.

A telephonic transmitter consisting of a coil of wire, one or more magnets, and a disk or diaphragm so arranged relative to each other that a motion of the diaphragm shall induce in the coil of wire an electro-motive force in virtue of the pressure of the magnet or magnets.

In this interference was Gray's case No. 1, the Bell patent of March 7, 1876, and, among other applications, that of Dolbear, filed October 31, 1877.

G.

A telephonic receiver consisting of the combination, in an electric circuit, of a magnet, and a diaphragm supported and arranged in close proximity thereto, whereby sounds thrown upon the line may be reproduced accurately as to pitch and quality.

In this interference was Gray's case No. 3, the Bell patent of March 7, 1876, and, among other applications, that of Dolbear, filed October 31, 1877, one of Edison, filed December 24, 1877, No. 148, and one of James W. McDonough, filed April 10, 1876.

H.

The combination in one circuit of two or more coils of wire, two or more magnets and two or more disks or diaphragms so arranged relatively to each other that if one of the disks or diaphragms be put in motion by the voice, by a current of air, or otherwise, it shall induce a transient current of electricity in its associated coil, which current shall actuate the other disks or diaphragms in virtue of the coil and magnets associated with them.

In this interference was Gray's case No. 1, the Bell patent of March 7, 1876, and, among other applications, that of Dolbear, filed October 31, 1877.

J.

The combination, with an electro-magnet, of an iron or steel diaphragm secured to a resonant case for rendering audible acoustic vibrations.

In this interference was Gray's case No. 3, Bell's patent No. 186,787, of January 30, 1877, on application filed January 15, 1877, also applications of Edison and Dolbear.

The other issues are of no importance.

After the declaration of these interferences a motion was made by Bell to consolidate them, which motion was denied by the Commissioner, because the motion was made *ex parte*, the other parties not being notified. (See *Bell* v. *Gray*, 15 O. G., 385.)

A second motion was made by Bell to re-form the issues or consolidate them. This motion was resisted by both Gray and McDonough, and was denied by the Commissioner on March 6, 1879. (See *Bell* v. *Gray*, 15 O. G., 776.) In this decision Commissioner Paine very clearly defined and construed the issues, and that construction has been recognized in all subsequent decisions both of the Office and the courts.

The Examiner of Interferences rendered a most elaborate and exhaustive decision, in which he set forth the state of the art, settled what efforts had been made by the respective parties in the direction of the invention of the subjects-matter of the several issues, and the dates thereof, determined the facts relative to each, gave his construction to the issues, and awarded priority, as hereinbefore stated. This decision, with the single exception of the construction of issue G and consequent award to McDonough, has stood the test of all subsequent investigations, and as a determination of the facts of the case is, in my judgment, unassailable. No tribunal proceeding upon the evidence before the Examiner of Interferences would ever reach any other determination of facts.

THE STATE OF THE ART.

The decision of the Examiner of Interferences has not been officially published. I might, perhaps, be justified in setting forth his statement of the state of the art at the time the several parties to these interferences came into the Office, but it would doubtless take more space than would be best, and I shall therefore content myself with a brief statement.

Morse's patent for a method of telegraphy was issued in 1846, and reissued in 1848. Prior to that various modes of telegraphing and making signs and signals by means of electricity had existed from as early a date as 1787. This had been accomplished by means of the movements of pith-balls, electric sparks, &c., but the results of these methods were evanescent. The state of the art in this respect is concisely set forth in Morse's specifications. (See statement of the case in *Morse* v. *O'Reilly*, 15 How., 86.) But Morse invented a method by which stable or permanent signals or characters could be telegraphed. His method involved an electric circuit that could be closed and opened (make-and-break) and a piece of iron that could be magnetized and demagnetized. The ordinary Morse telegraph is well understood.

The elements required were a battery and circuits; a key to be manipulated with the hand; a piece of soft iron in the shape of a horseshoe-magnet, around which passed the line-wire of the circuit, and an armature within the field of the magnet suspended on a spring. When the hand pressed upon the key and closed the circuit, the iron was magnetized and the armature was attracted to it, causing the pin to impress a dot or dash upon a scroll of paper, depending upon the length of time the circuit was closed. The click of the armature as it came in contact with the magnet also indicated the signals—the dots and dashes—and soon experienced operators became able to read the sounds of the instrument.

Here we have all the rudimentary parts from which have been evolved and developed the telephone. There are the transmitter, (the key,) the electric circuit, and the receiver—the magnet and armature or plate, (or disk.) The transmitter operated upon the make-and-break principle, and yet it contained all the potential qualities of the modern microphone-transmitter. When actually open no electric current or impulse traversed the circuit; but during the brief periods when the hand pressed the metallic electrodes constituting the keys together with greater or less force the variable resistance of the microphone was actually executed, although without the knowledge of any one, for the secret possibility was unknown and unthought of. On the other hand, the armature suspended on the delicate spring unquestionably responded to and was capable of responding to not only the make-and-break variations, but also to the more delicate and imperceptible variations resulting from the variations of force by which the metallic electrodes of the keys were held together. If, instead of employing the hand to open and close the circuit, a toothed wheel had been adjusted so that the movement of each tooth should close and open the circuit, the armature would have faithfully responded. If the revolutions of the wheel were increased so that the circuit was opened and closed with a sufficient degree of speed, a tone would be produced at the transmitter and also at the receiver; but the tones would be those resulting from the mechanical clicking of the keys and the armature upon the magnet. Still it would also be true that the armature vibrating back and forth under the influence of the magnet would produce air-waves reproducing the tone, although they might be drowned or lost in those of the mechanical clicking of the armature.

Here we see the elements of modern discovery and invention. The transmitter was that of Reis—the make-and-break. The receiver was the magnet and the metallic diaphragm. In the Morse telegraph the armature responded to the mechanical opening and closing of the circuit; but it was potential of all that has succeeded. Was it only a new use of that armature when Reis, or Edison, or Bell, or Gray, or McDonough caused it to respond to the vibrations of tone? Was it a second new use when Bell, or Gray, or McDonough caused it to respond not only to pitch but to quality—articulate speech?

The invention of the Morse telegraph stimulated investigation and invention in electricity. The idea of transmitting articulate speech took possession of inventive genius in Europe and America. Instead of making and breaking the circuit with the hand or a toothed wheel, it was proposed to introduce a mechanism so delicate that the makes and breaks could be effected by the sound-waves of the human voice. The delicate mechanism which in ancient times in the temple of Delphos was set into musical motion by the mere force of the rays of the morning sun was to be

surpassed not only in the delicacy and infinite variety of movement, but the results were to be transmitted in infinite directions and to infinite distances, and to constitute the invisible bridge between mind and mind. So that Morse had given to the world a receiver of the character described and which possessed the capabilities that have since been discovered.

The Reis telephone had been given to the world. He introduced a transmitter constructed of electrodes which were opened and closed by the tone-waves of the voice or of a musical instrument operating on a delicate membrane, called the "diaphragm." His receiver consisted of an iron rod attached to a sounding-box, the rod being elongated and shortened under the influence of the rapidly-interrupted electric current, as an iron rod is more slowly elongated or shortened by the effect of heat.

As early as 1854 Bourseul had given to the world in publications suggestions as to the transmission of articulate speech, which contained descriptions of a receiver and transmitter. He said:

> The electric telegraph is based upon the following principle: An electric current passing through a metallic wire circulates through a coil around a soft piece of iron, which it converts into a magnet. The moment the current stops the piece of iron ceases to be a magnet. This magnet, which takes the name of "electro-magnet," can thus in turn attract and then release a movable plate, which by its to-and-fro movement produces the conventional signals employed in telegraphy.

Then, after adding the mode in which speech is transmitted by the vibrations of the air, he continues:

> Suppose that a man speaks near a movable disk sufficiently flexible to lose none of the vibrations of the voice, that this disk alternately makes and breaks the connection with a battery, you may have at a distance another disk which will simultaneously execute the same vibrations.

In *The Wonders of Electricity*, a publication translated from the French of J. Baile, published in 1872, there is found a further description of a receiver and transmitter. After adverting to the marvels accomplished in the transmission of thought, handwritings, and drawings, and referring to the acoustic telegraph as disclosing a new principle or discovery, he says: "Already experiments have been made for this purpose," and he proceeds to describe an apparatus resembling that of Bourseul, with the addition of an electro-magnet for giving motion to the plate in the receiver. The transmitter contains a plate, which, at each vibration, touches a small point placed in front of it, and so throws an impulse of electricity on the line, which shall cause the attraction of the second plate, whose size and quality are identical with the former, causing it to perform the same number of vibrations per second and give forth a sound "which will have the same musical value as the first. If this be perfected, a series of sounds, a tune, a spoken sentence, and conversation" may be transmitted, but as yet it has not been accomplished.

Here is a complete description of a make-and-break telephone having a receiver consisting of an electro-magnet operating upon a metallic disk placed before it. There is no occasion here to consider or dwell upon the multiple or harmonic telegraphs invented by the various parties to these interferences. They all proceeded upon the make-and-break principle, to be hereinafter considered. But the important fact to be noted is that at the date these several inventors entered upon the field of invention in respect of the transmission of speech the electric circuit was old; the Reis transmitter was old; the metallic disk or armature attracted by a magnet was old. As to the receiver, unless there were invention in applying it to harmonic telegraphy over the Morse use of it in his telegraph, or in applying it to the reception of quality over and above both, then neither Bell, Gray, McDonough, nor any one else could secure a patent for it, broadly. It was as old as, if not older than, the Morse telegraph.

At the time these parties to the interference came into the Office it was old to produce variation in the strength or volume of the electric current by means of the variable resistance, whether effected upon the principle of the microphone or the liquid of high resistance. It is also proper to say that the telephone does not depend upon a diaphragm-receiver, and that with a proper transmitter speech can be transmitted wholly without a diaphragm as an element in the receiver.

Thus when properly understood it will be seen that the telephone when invented consisted of elements which were all old, and that the invention consists in an adjustment and arrangement between these old parts by means of which a result never before reached was attained. It must also follow that not any of these old elements could be broadly claimed, but must necessarily be limited to their proper place and situation in that new arrangement and combination, and to their specific construction.

As the present petitions seek to have all the orders and decisions set aside, new evidence taken, and a rehearing upon the merits, it is necessary to a proper understanding that so much of the material portions of the decisions as relates to the claims of Bell, Gray, and McDonough be set out.

As to Bell, the Examiner of Interferences gave him as the date of his invention the date of the filing of his application. It was urged before him that Bell's application and patent, No. 174,465, did not show the invention, and that he in fact had never conceived the invention of the telephone nor reduced it to practice until after his patent issued; but the Examiner of Interferences, while evidently inclining to this view, felt concluded by the decisions of Commissioner Paine and of the courts. He says:

> Upon the evidence presented it must be held that the subject-matter of this interference * * * had not been invented—that is, demonstrated—by any of the parties to this interference prior to the filing of Bell's application, February 14, 1876; nor is it entirely clear that he had at that time any knowledge of a practical mode or mechanism for producing the results contemplated by the invention. But as the Office as well as the courts have determined that the patent contains a sufficient disclosure of the subject-matter in dispute, it must be held that the invention was made at least as early as the date on which he filed his application. Bell's claim does not, however, depend upon the application alone, for he was in fact and in law the first to disclose and publicly explain the principle, as well as the first to construct and use instruments not only designed and adapted to carry into effect that principle, but actually and successfully used for that purpose.

As to issue C, which covers the liquid transmitter, he says:

> While no such instruments are found described in Bell's patent, his proof as to "Exhibit 41," its description, use, and exhibition, are considered as amply sufficient to defeat the claims of Gray and Edison founded upon the facts appearing in the record, at the same time anticipating Richmond's record date of August 24, 1877.

As to Gray, the examiner finds:

> * * * He claims, however, that at this time (1867) he conceived the idea of constructing an instrument for transmitting tones "similar in its general aspects to the instruments made at a later date." As the character of these mental speculations cannot at this day be determined, and as they took no material form or expression until seven years later, they can no more be considered as affecting inventions subsequently developed than can Bourseul's prophecy regarding the transmission of speech by electricity. He does not appear to have considered the matter further until the latter part of January or first part of February, 1874, when his attention was again accidentally called to the subject by what is known as the "bath-tub experiment." His nephew was engaged in taking shocks from an induction-coil by connecting one end of the secondary coil to the zinc lining of a bath-tub and holding the other end in one hand. Upon rubbing the zinc

lining with the free hand to complete the circuit Gray noticed that a sound proceeded from under the hand at the point of contact apparently of the same pitch and quality as that of the electrotome of the induction-coil. His curiosity was aroused and he at once tried the experiment himself, and was astonished to find that by rubbing hard and rapidly he could amplify the sound, and that by changing the rate of vibration of the electrotome a corresponding change was effected in the pitch of the sound under his hand. (Int. III, 387; Dowd 1, 123.)

He says of this experiment that his attention was particularly attracted to the fact that "the quality as well as pitch and loudness could be transmitted electrically through a telegraphic circuit and received upon a common or universal receiver." (Dowd 1, 123.) Experiments were continued during February and March, using the same induction-coil and various receivers, among which was the exhibit "Animal Tissue Violin Receiver," wherein a plate of metal is substituted for the strings, and by rubbing the hand across this plate the sounds of the electrotome were produced. It was during this period, according to Gray, that he "conceived the idea of transmitting musical compositions and sounds of all kinds, including articulate speech." (Int. III, 388.) But, as would appear from the record, his energies were directed exclusively to the transmission of musical tones and their utilization for telegraphic and other purposes, no attention being given to instruments for the *reception*, transmission, and *reproduction* of articulate speech until along in February, 1876, and, although he claims to have had some conception of the *possibilities* late in the fall of 1875, (Int. III, 391; Dowd 1, 125,) he neither disclosed them to others nor clothed them in any fixed and positive form until he made the sketch for his caveat, February 11, 1876. Whatever may have been the inherent capacities of the instruments constructed in the interim, they were not designed for, nor known to be capable of, the transmission and reproduction of articulate speech, (Dowd 1, 389, 98-99; Int. III, 375-389,) nor were his transmitters either intended or adapted for the reception of sounds, but were designed to create and originate the particular sounds to be conveyed. Both Gray and Goodridge were led to *believe* that the receivers used in the winter of 1874-5 were adapted to reproduce the sounds of the human voice, (Dowd 1, 99-107-108-124,) if they could be impressed upon and transmitted by the electric current, but they were totally unaware of any transmitter capable of performing this highly important and essential task, and it was not until Gray had witnessed the successful operation of Bell's telephone at the Centennial that the possibility of using his receiver as a transmitter was suggested to his mind, as Gra frankly admits. (Dowd 1, 399.) His idea of a transmitter—and it was merely an abstract idea, such as cannot under the law be regarded as a conception—is thus stated by him, (Int. III, p. 388:) "During these experiments I observed that the quality of the sound made by the transmitter was faithfully reproduced in the receiver. This led me to the conclusion that it was only a question how to convert the aerial vibrations made by the production of any sound whatever into electrical vibrations of a similar character with respect to rate, amplitude, etc., to solve the problem of transmitting articulate speech. I was *convinced* that the receiver would reproduce articulate words inasmuch as it *seemed* to be capable of reproducing any form of vibration that I was *able* to transmit. I remember speaking of this to different ones about this time. I may have mentioned this before the first of April, (1874,) or it may have been a little while after. My impression is that I first mentioned it before. My conception then of an instrument for transmitting articulate speech was one of a complicated character, having a series of transmitting-points adapted to respond to all the tones of the human voice, somewhat similar to the apparatus referred to in my caveat of February 14th, 1876." The description contained in said caveat is as follows:

"I contemplate, however, the use of a series of diaphragms in a common vocalizing-chamber, each diaphragm carrying an independent rod and responding to a vibration of different rapidity and intensity, in which case contact-points mounted on other diaphragms may be employed."

When called upon to explain the construction of the apparatus thus ambiguously outlined, Gray confesses that it was but a general idea not clearly defined in all its details, and was based upon a theory which has since proved to be false. (Dowd 1, 135.) The instrument was never constructed by him.

Thus, by tracing this original idea of a transmitter from its conception, in 1874, to its mere mention in the caveat of 1876, we find that it amounts to nothing but an abstract speculation. Passing now to the form of transmitter described and illustrated in said caveat and the applications of October 29, 1877, we will endeavor to trace back its origin, premising, however, that Gray alone testifies as to these mental operations, for Goodridge, his assistant in all experiments during this period, when asked if Gray had ever described any instrument which he had devised for transmitting speech electrically by talking to the transmitter prior to the caveat, says, (Int. III, 371:) "I heard no description from Mr. Gray of any instrument which he had devised fully, but merely some idea or plan by which it could or might be done;" and his first definite knowledge of the transmitter illustrated in the said caveat was February 11, 1876, when the exhibit "Speaking Telephone Caveat, original sketch," was handed him for the purpose of having drawings made for a caveat. (Int. III, 396, 394.)

* * * Gray seems to have been indebted to the so-called lovers' telegraph for suggestions as to the construction of an instrument for transmitting speech electrically. "The observation in respect to the lovers' telegraph proved to my mind that the movements of a single point on the diaphragm corresponded accurately with the movements of the air produced by any spoken word or sound," (Int. III, 397,) and it was after this observation in November or December, 1875, (Dowd 1, 122,) that he seems to have abandoned his preconceived ideas of multiple diaphragms, (undoubted y intended as analyzers, each diaphragm being tuned to and adapted for the transmission of a given note corresponding to its fundamental or normal rate of vibration,) and to have fixed upon a single diaphragm as theoretically adapted for the reception of sound-waves and their conversion into corresponding electrical impulses. Gray thus describes the results of his observations on the lovers' telegraph, (Dowd 1, 125:) "I saw that if I could reproduce electrically the same motions that were made mechanically at the center of the diaphragm by speaking upon it such electrical vibrations would be reproduced upon a common receiver in the same manner that musical tones were; and from the fact that the electrical vibrations were the same in respect to rate, amplitude, and form or complexity as the motions made in the air by uttering words or sounds, it followed that the receiving-diaphragm would be thrown into mechanical vibration or motion of a corresponding character, and consequently reproduce the same word or sound. The fact that the longitudinal movement (in water or other fluid of poor conducting quality) of a wire or some good conductor of electricity, with reference to another wire or metal conductor, produced variations in the resistance of an electric circuit proportional to the amplitude of movement, was old in the art of that time; so that the last link of knowledge necessary to solve the problem in my mind was furnished in the capabilities at the longitudinal vibrations of the string in the before-mentioned so-called lovers' telegraph." But this knowledge does not seem to have been disclosed to others, nor to have been reduced to form until February 11, 1876, when the sketch for the caveat was made.

The answer above quoted most satisfactorily confirms the conclusions reached regarding the incompleteness of his preconceived multiple diaphragm idea, for in it he acknowledges there was a defect or missing link, even in his theoretical transmitter, which was remedied or supplied by the "lovers' telegraph" and the knowledge derived from observations made as to its operation. February 11, 1876, is therefore the earliest date that can be accorded Gray for the conception of his first instrument organized designedly for the transmission of articulate speech. * * *

* * * He had already made and patented instruments capable of responding to varying impulses of electricity, but, instead of relying upon these for receivers, he contrived a new form of receiver, retaining only that part which was well known, long before his discovery, to be capable of responding to fluctuations in the current—*i. e.*, an electro-magnet and armature, and to this applied the membrane diaphragm and vocalizing chamber of the lovers' telegraph.

These circumstances lead to the conclusion, as before stated, that the invention of the art of transmitting and *reproducing* articulate speech, and the means therefor, was not contemporaneous with nor the natural outgrowth of the transmission and production of musical tones, as previously practiced by him; but it is to be regarded, under the law and upon the evidence adduced, as anterior to and derived from the "lovers' telegraph," so called. * * *

* * * It was during these experiments that he claims to have observed that the *quality* of the sound made by the transmitter was faithfully reproduced in the receiver, from which he drew the conclusion "that it was only a question how to convert the aerial vibrations made by the production of any sound whatever into electrical vibrations of a similar character, with respect to rate, amplitude, &c., to solve the problem of transmitting speech," (Int. III, 388.) He says, moreover, that he was "convinced that the receiver would reproduce articulate words, inasmuch as it *seemed* to be capable of reproducing any *form* of vibration that I *was able to transmit*."

In the early history of the art the *possibility* of transmitting and reproducing speech by *imaginary* devices did not lack advocates, several of whom, prior to these alleged mental speculations of Gray, had approached much nearer in their prophecies and predictions than he ever claims to. The various descriptions of the Reis telephone evince a recognized capacity in the receiver to respond to such tones as were thrown upon the line by the transmitter; and various scientists have said it were possible *if* the means could be devised. Gray was therefore no nearer the solution of the problem when he recognized that the question was *how* to convert sound into electrical vibrations of a similar character than many who had preceded him. * * *

* * * The history of his experiments, from the bath-tub experiment in January or February, 1874, to the caveat sketch in February, 1876, as narrated above, establishes, beyond peradventure, the character of the inventions upon which he was engaged—viz., the electrical production of music and the multiple transmission of telegraphic messages. He neither sought nor contemplated the *transmission* and *reproduction of sound* as such; not a single transmitter was designed or adapted for converting sound-waves into corresponding electrical impulses; on the contrary, every tone or sound heard at the receiver, instead of being a reproduction, was a new creation, the product of a certain series of undulations induced in the current by the transmitter and made manifest for the first time at the receiver. Tones accompanied the action of the transmitter while establishing these series of electrical vibrations or undulations; but they were merely incidental. He was aware of Reis's experiments, but evinced no disposition to follow in the same direction. He proceeded to develop a system of telegraphy wherein two or more transmitters were employed, each capable of setting up an arbitrary series of electrical impulses or vibrations in the line. The receivers at first were designed to respond to the tones resulting from these vibrations. (Dowd 1, 100-1.) The knowledge possessed by him at that time led to the use of an electro-magnet for this purpose, for the researches of Page, Henry, and others, and his experiment in 1867, demonstrated the capacity of such an instrument to respond to electrical vibrations or impulses, and he himself acknowledges having observed this property in 1874, and that the armature or diaphragm, so called, was unnecessary, (Int. III, 390,) the duration of the vibrations of each transmitter was to be divided into longer and shorter periods representing the dot and dash of the Morse alphabet, and the sound of each, as produced by the receiver, was to be noted separately, (Dowd 1, 99-100;) the resonant box, the wash-basin, and the tin cup were in all probability designed and used for the sole purpose of simplifying the sounds. At least there is no evidence to the contrary. In his first patent embodying the resonant-box magnet-receiver—No. 166,095—he says, speaking of the secondary circuit: "As the receiving electro-magnet is connected with the circuit it will be caused to vibrate, thus producing a tone of corresponding pitch, *the sound of which may be intensified* by the use of a hollow cylinder S, of metal placed on the poles of the magnet." The "diaphragm-box magnet-receiver" was regarded as a modification of the "resonant-box magnet-receiver," and was not made as a new form of receiver, but for use in testing the feasibility of transmitting tones over a long line. It was necessary that a receiver of some kind should be employed, and inasmuch as at the time of said trial, 9th of February, 1875, one of the two resonant-box magnet-receivers had been filed as a model in the Office, and the other sent to New York, where it remained, (Dowd 1, 84-95,) he had this diaphragm-box magnet-receiver made as substantially the same thing. The "concave metallic-diaphragm magnet-receiver" may therefore be regarded as the last of its type. Passing from this style of receiver, wherein two or more tones were produced, and, when employed telegraphically, required that the operator should disregard all but the one which he was to answer for, (Dowd 4, 329,) he devised a means for deadening all tones except the particular one corresponding to a given transmitter, and to this end he employed separate receivers, with sounding-boxes as analyzers, and this he also adopted for his musical receivers. The next step forward was to provide the analyzing receivers with means for operating a local circuit, in which was included a Morse or other telegraphic receiver, when, and only when, the corresponding transmitter was in use.

That this line of invention would ever have eventuated in the modern articulating-telephone no one can predict. The capacity of his receivers to respond to electrical undulations induced by a proper transmitter under the influence of sound-waves of any description, whether articulate, as in the modern telephone, or musical, as in the Reis telephone, was not capable of demonstration under the conditions in which they were used. It was a purely latent property, and would never have been discovered had the articulating-transmitter not been invented. He does not appear to have even contemplated their use with a Reis transmitter or any other of its kind; hence his inventions were not engrafted upon the former as improvements.

His mental speculations or anticipations of future possibilities for his instruments cannot be classed as inventions, nor even as conceptions of inventions, for they were neither reduced to definite form and proportions nor experimented upon with a view to their development.

The several receivers described were not designed or used for the *reproduction* of articulate speech or other sounds, but it is claimed that some of them, at least, possessed the inherent capacity of rendering audible sound impressed currents; that this function was inseparable from the structure and was sufficiently demonstrated by the use made of the instruments. The devices mainly relied upon are the "resonant box, concave metallic diaphragm, and diaphragm box magnet receiver." These were used in 1874 and 1875 for rendering simple and complex tones, as produced by the musical transmitters heretofore described, and when so used included in a closed circuit.

While it is satisfactorily established that they did perform the functions of musical receivers and operated satisfactorily to render audible certain electrical waves or undulations created by the transmitting-instruments, it is equally certain that such use was occasionally and experimentally only, and their use was ultimately abandoned and their place supplied by instruments of a different design.

Aside from the fact that after a few trials they were laid aside and never utilized or applied in the same or modified form, it is extremely doubtful if the so-called diaphragms were intended to be responsive to the varying attractive force of the magnets, as from the testimony inferences alone can be drawn as to their actual operation. As one of the later applicants, all doubts on this score must be resolved against Gray.

The blacking-box, wash-basin, and tin cup were none of them employed primarily for producing the sound; that function was performed by the electro-magnet itself, as appears from the testimony and patent number 166,095. Their purpose seems to have been the same as the resonant case and cover of the Reis receiver—*i. e.*, to increase the volume of the sound proceeding from the magnet. It is nowhere stated in evidence that any other purpose was had in view; hence it is fair to presume that if the diaphragms did, in fact, respond to the electrical variations it was an unforeseen and unnoticed circumstance. And again, the magnet being under the conditions of use the source of sound, there was no necessity or opportunity for discriminating between the sounds which might have emanated from the diaphragm and those known to proceed from the core; hence the capacity of a diaphragm to respond to sound-waves electrically transmitted could not and was not ascertained or taken advantage of.

None of the witnesses refer to any observations made as to the capacity of the diaphragm to vibrate and thereby produce sound, irrespective of the audible effects produced by the magnets. There is every reason to believe that the cases were intended to act as reflectors or resonators, and that in so far as the other functions of a vibrating diaphragm sensitive to sound-impressed currents was concerned it was unknown, unappreciated, and would not have been mentioned as pertaining to the structure or use of these instruments were it not for the invention of the articulating-telephone, the introduction of which was the signal for the presentation of claims based upon devices which, so far at least as the sensitiveness of the diaphragm was concerned, had never been tested, the use of which in the system proposed had been discontinued, and the instruments virtually abandoned. * * *

* * * The system favored by Gray, and to which his attention seemed the most devoted, did not require or demand the sensitive diaphragm. Aside from what are termed the animal tissue receivers, we find him experimenting with universal receivers for a time and ultimately putting them aside for individual responsive receivers. The first and third he embodied in a variety of forms in patents, but the second found no place in these patents, except the resonant box receiver, which, as has been shown, was not alleged or claimed as containing a diaphragm.

When he came to file his caveat, instead of nominating one of his old instruments for receiver he devised a new one, including a diaphragm stretched across a chamber and carrying a piece of soft iron to act as an armature. This diaphragm becomes, in his application, a thin sheet of steel or iron rigidly supported at its edges. Clearly the use of these old instruments in the manner and for the purpose described in the application was an afterthought, incident upon the introduction of the articulating telephone.

Until then there was no suggestion as to their action, nor was the use to which they were put such as to develop or prove their capacity. As matters of evidence they furnished no fund of information from which the public or their projectors could derive any benefit. The so-called diaphragms were not regarded as the sound-producing medium; that was the accredited function of the magnet; but the devices of which they formed material portions were added to re-enforce or deflect the tones like a sounding-board and a sound-board, respectively.

As to McDonough, the examiner finds:

* * * This brings us down to the period when he claims to have first disclosed the invention to others. It will be well to consider the nature of the testimony we have been discussing and its bearing upon the invention.

In the first place, there is not the slightest proof as to the nature, structure, or mode of operation of any instrument devised by him for the purpose of transmitting and reproducing articulate speech, nor does he even seem to have had a definite idea of such an instrument. There are but three circumstances that can be adduced in his favor: the experiment of 1867; the sketch of 1871, with its legend, "to send speech through wires by means of electricity," and his conversation with Eastman, in the spring of 1874, wherein he expressed his opinion that it might be possible to send speech over a wire, at the same time referring to the sketch of 1871 as being designed for that purpose. The question at once arises, does this constitute satisfactory proof of the conception of an instrument adapted for the transmission and reproduction of speech, or for any other purpose? The experiment of 1867 must be disregarded not only as uncorroborated and unwitnessed but as clearly abandoned. The sketch of 1871, as previously remarked, was made solely as a memorandum for recalling to mind fugitive ideas. Except for its legend, there is nothing to indicate in the slightest the purpose of the device represented, and the manner in which that object was to be attained is neither expressed in the illustration described to others nor, so far as the evidence shows, was it understood or even devised by McDonough himself. * * *

Apparently spurred on by the discussion with Eastman, (1875,) he entered upon what may be regarded as the first stage in the process of invention. He does not appear to have had such a knowledge of and familiarity with the art as it then existed as would enable him to judge of the correctness of his theory with any degree of certainty. He speculated upon possibilities, and was groping in the dark for the means of realizing his expectations.

Let us assume that he had in contemplation an instrument for transmitting and reproducing articulate speech, wherein was to be embodied a diaphragm to receive the sound-waves and another to reproduce them with *some means* unknown and unexplained, whereby the vibrations of one diaphragm were to set up corresponding vibrations in the other through the medium of electricity. If this constituted an invention, it was clearly anticipated by Du Moncel's description of a combination in every way as complete as any disclosed by McDonough up to this time. "Imagine that you speak against a sensitive plate, so flexible as to lose none of the vibrations produced by the voice, and that this plate makes and breaks successively the communication with the electric pile. You may have at any distance another plate, which will undergo in the same time the same vibration." (Prescott, 147.)

But, it is argued, McDonough had made and tested his receiver in 1867, and made drawings of a transmitter and receiver in 1871, and subsequently, in 1875, made an instrument, whereas Bourseul never did. To this it is answered that the 1867 experiment, whatever it was, amounts to nothing, having been entirely and completely abandoned, while the 1871 sketch, standing, as it does, alone and unexplained, proves nothing whatever. A speaking-telephone made according to Du Moncel's description has never, so far as we are advised, been successfully operated, and there are defects and omissions which, in the present advanced state of the art, make it apparent that it could not be made to work. But what can be said of McDonough's devices? He has made no record of his ideas; hence we cannot say they were either good or bad, for the simple reason that we do not know what they were. As to the receiver alleged to have been made in 1867, there is nothing to indicate its capacity even to receive and reproduce the impression made upon the current by a proper transmitter, had one existed; but inasmuch as the transmission of articulate sounds by means of electricity had not been, to his knowledge, accomplished, the capacity of the receiver to respond thereto could not have been determined by him had the said receiver been in his possession and in daily use with the mechanical transmitter. This, then, was the status of McDonough's inventions when, in the latter part of May, 1875, he began the construction of his first instruments designed for the transmission and reproduction of articulate speech by means of electricity. (488.)

* * * As to the results produced, McDonough says: "We could hear with this instrument perfect tunes and could distinguish the tones of the voice; but I do not remember of hearing any distinct words," (492.) Whereas Eastman, who assisted, says: "The results from these experiments, as heard at the other end, or in the receiver, was a variation of rattling sound and musical tones," (510;) and again: "We made many experiments with this machine, and at times we could distinguish the tune that was sung." (Ibid.)

Without apparently understanding the cause of his failure or, at least, without any express purpose to depart from the general principles embodied in these first instruments, he constructed a new transmitter and receiver, (493-4-5,) which he tested at a date not later than the 30th of June, 1875, (496.) Although McDonough fails to state the purpose of any changes effected in those new instruments, Eastman says he thought the diaphragms were too small, (510,) and that the needle was abandoned because he could find no way to keep it from jumping, (511;) whereas, it would appear from his previous answers (q. 15, p. 510) that McDonough sought to facilitate the movement of the needle by putting in the glass tube; and the new transmitter, as at first constructed, did not provide a means for maintaining contact, but the necessity for some device for preventing the displacement of the contact-piece was suggested by the use of the instrument. (495.) The instrument made at this time is illustrated in "McDonough Drawing No. 4," "Transmitter Exhibit No. 3," and "Receiver Exhibit No. 4," and is substantially identical in principle and mode of operation with that upon which the present application was based. (502.) He took the iron hoop, twelve inches in diameter, (499,) used in his 1867 experiment, and had a duplicate made. Upon each of these hoops he fastened parchment diaphragms, by first winding cotton cloth around the hoops and then pasting the parchment to it. Near the center of one of the diaphragms is pasted a piece of tinned iron, and mounted the hoop upon a base in front of the electro-magnet used in his previous experiment. This constituted the receiver.

The other hoop he used in the transmitter. Near the center of the diaphragm two pieces of thin German silver were pasted, about an

inch and a half apart, (499,) with a wire attached to each. A bridge or arch-shaped piece of thin German silver rested loosely upon the pieces of German silver on the diaphragm. The circuit was from one of the pieces, through the bridge to the other piece, thence through the coil of the receiver back to the battery.

When these devices were first tested it was found that the bridge-piece was shaken off from the contact-pieces by the vibrations of the diaphragm; and to remedy this he sought to maintain the bridge-piece in place by passing a thread through it and the diaphragm, tying a knot above the former and one below the latter. He mentioned incidentally that they "twisted the thread to tighten it," (495,) referring to the bridge-piece. With these instruments, McDonough says, "we could distinguish tunes and some words distinctly." (496.) He then substituted for the thread a screw-threaded pin, fastening it to the diaphragm by two nuts—one above and the other below—and placed another nut above the bridge-piece.

This constitutes the perfection of his invention, and it only remains to consider the nature of the results obtained therewith. * * *

* * * The results obtained are testified to as follows by McDonough: "We obtained results as follows, viz., clearly-recognizable tunes and entire sentences of clearly-understood words were transmitted through the instruments and heard at the receiver," (496;) and when asked to specify the tunes or spoken words, he says: "To my knowledge, the tunes were 'Swanee River,' 'Muffin Man,' 'Shoo-fly,' and some others. The words which impressed themselves upon me more particularly were 'Way down upon the Swanee Ribber, far, far away,' which I heard consecutively and clearly, noticing the elision at the beginning of the word 'way' and the change of 'v' to 'b' in the word 'river.' The words of other tunes were distinct when the instruments were properly regulated. I myself could distinguish peculiarities of voice in those speaking or singing." (497.)

Eastman: "I assisted Mr. McDonough in operating the machine whenever I had time and we were home together—generally every evening—and I guess we exhausted all the songs we ever heard. I can give you the names of a few of them; others I do not remember. They were 'Swanee River,' 'Down in a Coal Mine,' 'Old Zip Coon,' and others that I have forgotten. I heard many of the words of these songs; exactly which words I can't remember. I also heard Mr. McDonough say 'Halloo, Frank,' and other words that I can't remember now." (512.)

Wilsey, McDonough's step-father: "It was in the latter part of June—the exact date I can't recollect—1875, at 72 Warren avenue, Chicago, I asked Mr. McDonough what results he was getting. He told me he was pretty well satisfied. I requested him to let me listen, in order to hear whether I could hear anything or not. I listened at it. At first I heard nothing. I concluded that I was a little too far from the machine. By getting very close to it I could hear singing; I was able to determine what tune he was singing. I also was enabled to catch now and then a word; that is all." (522.)

J. E. McDonough, applicant's brother: "It was at 72 Warren avenue, in the latter part of June or near the first of July, 1875. I was called to listen by my brother one evening while my mother was singing in the parlor of the house, and I heard the singing; and, slapping my brother on the back and saying, 'By George, Jimmie, you've got it after all,' (524,) I heard 'Down Come Uncle and Aunt, Down Come Sister Caturah.' That's about all I can recollect at the time of hearing. (525.) The words referred to above were the words of a song he had often heard his mother sing." (526.)

The above are the only parties who testify of their own knowledge as to the working of the device. In addition to this, however, there is the evidence of three parties—Jeffery, (527), Cobb, (529,) and Wilkins, (532)—to the effect that in 1875 McDonough incidentally stated to them he had an instrument with which he could send speech through wires by means of electricity. * * *

With respect to the construction and mode of operation of the several devices before referred to evidence of two kinds is presented, and from this and the surrounding circumstances we are called upon to determine, as best we may, the nature and extent of McDonough's invention, for with the filing of his application his work as an inventor in this line came to a standstill.

The two kinds of evidence referred to are the testimony of witnesses as to transactions occurring a number of years previous, and the description of the apparatus as contained in the application. With respect to the first of these it would seem, upon a careful examination thereof, to be insufficient to establish beyond doubt or question the successful reduction to practice of an articulating-telephone, whatever else it may prove. Not a single witness describes, nor does it appear that he was conversant with, the conditions necessary to render the instruments capable of transmitting and reproducing articulate speech. It is not pretended that, prior to the last of June, 1875, any instrument had reproduced a single articulate sound, and this was due, it would seem, to the fact that the transmitter broke the circuit instead of maintaining a constant control over it. Without designing, so far as the record shows, to depart from the principles underlying previous constructions, he made an instrument such as is embodied in his application, obviously capable of operating in the same manner as those that preceded it, and with it obtained the results stated. Conversation was not carried on with it, but tunes were recognized, together with some words of the tune. A sound approximating to a familiar tune naturally suggests to the mind the words. It is frequently a mental deception, as observation teaches. That his experiments amounted to more than this has not been satisfactorily proved. He may have advanced a little beyond Reis, but it is not certain.

Not having fully realized his expectations, he attempted to improve not alone the loudness, as he would have us understand, but the distinctness also, (513;) in this he failed. Fearful lest others should outstrip him in the accomplishment of that for which he was seeking, but had not found, he concluded to file an application for a patent.

This application, then, must be presumed to contain the best explanation of his invention that he could furnish to the public. It forms the standard with which his invention must be compared and measured. Further progress was abandoned, the instruments neglected or destroyed, and, except as described in said application, not a single person, including himself, knew how to construct and operate the devices for the accomplishment of the end in view. Even if, accidentally, and without knowing how to repeat the operation, he had used the devices in such a manner as to produce the result aimed at, he had not made the invention, for he could not repeat the effects. He is not entitled to a patent for possible combinations, but for such only as he has devised and can, and does, instruct the public in the use of. The mere allegation that a described combination will produce a certain result, when in fact it will not, does not render him entitled to exclude others from using the same elements, in a different relation, for producing that result. Such changes amount to independent inventions. What others may succeed in doing with the instrumentalities he had constructed, by establishing a relation of the parts unknown to him, does not inure to his benefit, nor entitle him to claim such invention as his own.

The application, which we will now consider, was filed by an attorney who undoubtedly received information for the preparation of the drawings and specifications, directly or indirectly, from McDonough himself. He is not produced, however; hence the application stands alone as representing what he had accomplished, and it cannot be departed from; and, if it could, there is certainly nothing in the testimony to warrant the conclusion that, without apparent reason or purpose, he, either ignorantly or designedly, described his invention other than as he knew it. The instrument is denominated a "telelogue," and, as we find no evidence of its having been so termed before, it is fair to presume that the word was coined at the time and for the purpose of the application.

* * * Then follows a description of the apparatus made the last of June, 1875, the bridge-piece being referred to as the *circuit-breaker*, and is thus described: "D is the circuit-breaker, which consists of an arch-shaped piece of metal *loosely* secured at its center upon the bolt D, and is bent upward at each end, and from the membrane A, as shown in Figure 3, so as to form independent V-shaped points adapted to rest upon the respective plates C C. The circuit-breaker D is so fitted upon the bolt D as to admit of a free and easy ascending and descending movement, *the limit of its ascending movement being determined by its contact with the nut E on the bolt, and the descending movement being limited by its contact with the plate C C.*" * * *

* * * There cannot be the shadow of a doubt but that he claimed to have invented an instrument which should operate to transmit articulate speech by opening and closing, or, as he says, "breaking and closing," an electric circuit. It is the judgment of all the experts examined in this case, as well as of the Office, that articulate speech cannot be transmitted by such an instrument. Had a patent been granted upon this application as it stands it would undoubtedly be void as for an inoperative device.

As opposed to this proposition, what do we find tending to establish the contrary? Only the testimony of three or four witnesses that they recognized the words of some familiar tunes, and the allegation contained in the application that a device constructed as described will transmit and reproduce articulate speech. This, it is submitted, is not sufficient proof of the fact; the only inference that can be drawn from the record is that the witnesses are either mistaken or he operated the device in a manner different from that set forth in his application, and unknown to him.

But these are not the only circumstances from which such a conclusion can be drawn. He describes in his application an alternative form of transmitter, which must be presumed to operate upon the same principle and with the same results as the one illustrated. *It is the instrument made in May, 1875*, with which they could "recognize tunes *but no words*," and is thus described: "I do not limit myself to the construction and arrangement of the circuit-breaker D, as shown and described, as other means may be employed, as for example, only one of the plates C may be attached to the membrane and the other made either in the form of a plate or *needle* and attached directly to the connecting-wire, and adjusted to rest upon the plate *so as to break the connection by the vibration of the membrane, which will accomplish the same result.*" * * *

* * * There is but one more circumstance to be noted, and the history of McDonough's invention will be completed. Interferences A to L were declared March 26, 1878, at which time the applications were open to inspection by the several contestants. McDonough was included in G alone, but from the complex nature of the several cases they were treated substantially as one case, and he undoubtedly knew of the other issues involved, and knowledge is brought home to him in the matter of the decision of the Commissioner, published in the OFFICIAL GAZETTE of May 13, 1879, he being a party thereto. In a communication addressed to the Office and filed August 23, 1879, he makes the following inquiry: "Having fully described in my application filed April 10, 1876, a *speaking* telephone, am I not properly concerned in the case of Interference A?" To which the Examiner of Interferences replied, under date of August 28, "that the judgment of the Office was that he could not be a party to case A. If he thinks that judgment wrong, his proper remedy is to move (by regular motion) to be made a party thereto."

Had the Office regarded McDonough's mode of operation as the same as that of the contestants in Case A, his application would have been included therein; but as it purported upon its face to be for a different method, and the Office not being in a position at that time, for want of sufficient information on the subject, as yet in its infancy, it was not rejected as inoperative for the transmission of articulate speech, but the interference was declared as to the receiver alone.

As to issue G, the Examiner of Interferences finds:

For the reasons heretofore stated in construing the issues this interference is held to embrace a receiver containing an electro-magnet and a diaphram supported and arranged in close proximity thereto, *and adapted to respond to variations in the electric current passing through the coils of the magnet, when used in connection or combination with a transmitter adapted to create sound-producing fluctuations in the electric current, whether said electrical variations, waves, pulsations, or undulations represent or are derived from sound-waves or mechanical vibrations.* * * *

* * * McDonough's application was filed April 10, 1876, shortly after the grant of Bell's patent, and before his lecture of May 10, 1876, or the introduction and use of the articulating-telephone, so that his efforts in this direction may be regarded as entirely independent of and uninfluenced by Bell's disclosures and inventions.

It is evident that McDonough represented and claimed for his transmitter more than it had been proved competent to perform, but it is equally clear that as to his receiver it was shown to be capable of carrying into execution this invention and of responding to such electrical

waves or pulsations as he was able to transmit. The Office held his instruments to be modifications or variations of the Reis-Legat telephone, and with that understanding included him as a party to this interference, thereby admitting that his receiver as described and shown embodied the invention, and that it differed from or was an improvement upon the Reis-Legat receiver.

Now, it is satisfactorily proved that McDonough made and used substantially the receiver shown in his application, and in connection or combination with substantially the same form or character of transmitter there shown, as early, at least, as May, 1875, for transmitting and reproducing musical tones, and that he was reasonably diligent in the prosecution of his experiments, which eventuated, not in a successful articulating-telephone, but in the instrument contained in his application.

There is some evidence tending to show an earlier conception of this invention, but he cannot derive any benefit therefrom because of his unreasonable delay and want of diligence prior to May, 1875, in carrying into practice his designs.

It is perfectly evident that, under the law, McDonough cannot be deprived of his right to a patent for such matters as he is shown to have actually invented, diligently prosecuted, and for which he has filed an application, (and it matters not that the advance or improvement was but slight, and restricted in its application,) unless it shall appear that, prior to the date of completion of his invention, another had perfected or had conceived and was diligently prosecuting to completion the same invention.

Taking, therefore, May, 1875, as the date of McDonough's invention of the receiver in issue, it only remains to be considered whether Bell has proved prior conception, for he does not pretend to have constructed such a receiver prior to July, 1875.

Upon the evidence submitted it is impossible to find that he had conceived, much less disclosed, the invention in issue in this case. In his disclosures to Blake, in October, 1874, no suggestion is made of any change in his system, as illustrated in the "harp instrument," except as to the means for transmitting sound-vibrations, and from that time until June, 1875, no further disclosures or experiments were made, and when the matter was taken up in June, 1875, and the first tangible expression given to his ideas, he used a reed receiver.

Upon this count, as defined and explained, J. W. McDonough is awarded priority of invention.

Upon all the other issues now involved priority was awarded to Bell, as already stated.

THE DECISION OF THE EXAMINERS-IN-CHIEF.

Gray did not appeal from the decision of the Examiner of Interferences as to any of the issues, except issue G, but acquiesced. Voelker and Edison did appeal. Bell, Gray, and Edison appealed as to issue G. It is unnecessary to set out the decision of the Examiners-in-Chief, excepting in so far as it relates to issue G. As to the other issues, it is in accord both as to the construction of the issues and the conclusions of fact with the decision of the Examiner of Interferences, whose decision was affirmed except as to issue G.

As to Bell, the Examiners-in-Chief said:

Bell is the only one of the contestants having patents. Of these his first, granted March 7, 1876, has been vigorously attacked upon the ground that it does not disclose the invention in controversy; but this question has already been determined, by the Office when the patent was granted, when the interference was declared, and when, in *Bell* v. *Gray*, (C. D., 1879, 42,) the Commissioner defined the various issues, and by the courts, in *American Bell Telephone Company* v. *Spencer*, (8 Fed. Rep., 509,) and *Same* v. *Dolbear*, (15, Ib., 448.) It is not now therefore to be considered by this tribunal as open. Neither will it be necessary for Bell to prove reduction to practice. Having a patent, the law presumes that his invention was complete when he filed his application describing it.

They cite in support of the last proposition the following authorities: *Wheeler* v. *Chenowith*, (C. D., 1869, 43;) *Hammond* v. *Laird*, (C. D., 1875, 23;) *Potter* v. *Holland*, (1 Fish., 382;) *Cahoon* v. *Ring*, (Ib., 397;) *Busha* v. *Phelps*, (C. D., 1876, 119;) *Huntly* v. *Smith*, (C. D., 1880, 182;) *Starr* v. *Farmer*, (C. D., 1883, 34;) *S. C., Secretary of Interior's Decisions*, (C. D., 1883, 116.)

The Examiners-in-Chief then cite numerous authorities to show that in an issue between an applicant and a patentee the burden of proof is upon the former, and the evidence to sustain priority over the patentee must show an earlier conception, followed by diligence toward reduction to practice, or an actual reduction to practice, and such evidence must be of the clearest and most satisfactory character. In their decision the Examiners-in-Chief say:

The issue is in substantially the language of Gray's claim and its exact scope and meaning have been made the subject of much controversy. The controversy has arisen from the fact that the issue states the combination as a telephone-receiver, and its object the reproduction of both the pitch and quality of the transmitted sound.

On this account it is contended on the part of Bell that there must be read into the claim a device for transmitting quality—that is, an articulating-transmitter, and on the part of Gray that it is sufficient if the transmitter transmit "rythmical vibrations of any and every description, including the tones of the human voice and articulate speech." McDonough, it seems, agrees with Bell.

The examiner, reasoning from the premise that while the other parties show articulating-transmitters, neither McDonough nor Edison does, and Gray contemplates the transmission of sounds produced either by mechanism or the human voice, reaches the conclusion that the issue embraces any receiver consisting of the elements named, whether used in connection with an articulating or other transmitter, and whether it reproduces quality or not.

The construction given the claim, [he says,] the combination of the electro-magnet, the diaphragm, and an electric circuit over which sound-producing currents are transmitted, is in harmony not only with the express declaration of the applicant upon whose demand for a patent these proceedings were instituted, but also with the action of the office in including the applications of Edison (No. 148) and McDonough.

If an articulating-transmitter forms an essential element of Gray's claim, these applications could not properly have been joined in the interference, for neither shows or describes such an invention.

It is, however, necessary for the determination of the issue that some kind of transmitting-instrument be used to throw sounds upon the line. The terms of the issue require this, and also that the quality of such sounds shall be reproduced. Hence if it be possible some means must be adopted to bring all the parties within these terms; but to do this the manifest requirements of the issue should not be disregarded.

It is held by the examiner, as above quoted, that a limitation of the issue to an articulating-transmitter would do violence to the direct statement of the applicant whose claim forms the basis of this issue, but this does not necessarily follow. Upon examination of Gray's specification it appears that he states the object of his invention to be "to provide an apparatus capable of accurately reproducing in an electric circuit not only the different tones but the pitch and quality of sounds, whether produced by mechanism or the vocal organs." In Fig. 2 he shows his receiver in connection with a series of vibrating reeds, each transmitting a tone of different pitch, which may be operated simultaneously or successively. It is not intended to transmit quality with this apparatus, but the statement is simply that the *tones* are transmitted and reproduced. When, however, the arrangement shown in Fig. 3 is described, in which receiver and transmitter are alike, it is expressly stated that "articulate words spoken in one instrument will be accurately reproduced in the other both as to pitch and quality as well as *tone*." It is upon this latter description that the claim is based, for after stating the elements of the combination he uses substantially the language employed in describing Fig. 3, whereby sound thrown upon the line may be reproduced accurately as to tone, pitch, and quality.

It thus appears that not only is no violence done to Gray's statement by such a limitation of his claim, but that a fair inference to be drawn from considering it in connection with his specification is that he himself so intended to limit it, else why insert so carefully the word "quality?" The fact that his receiver is also capable of reproducing other sounds should not be decisive in construing the issue. The greater includes the less. If a given apparatus transmit and reproduce quality, it will likewise pitch and tone, and the issue is not who first constructed a device to reproduce these, but these in conjunction with quality.

As to Edison, it is true that his application No. 148 does not show or describe an articulating-transmitter, and that he therefore does not transmit quality; neither does McDonough. It is, however, none the less true that Edison's application No. 145 does not disclose such a transmitter; but the Commissioner, when these issues came before him for construction and re-formation, held that issue E, which includes and is, in fact, based upon Edison's claim in No. 145, embraces a device which was a necessary part of the means for carrying out the method involved in issue A—*i. e.*, the transmission of articulate speech. Following his lead, this tribunal made an articulating-transmitter an element of that issue, and such a course is equally proper here, for this issue was similarly construed by the Commissioner in that same decision.

In considering it he says:

It is true that this receiving device is but the transmitting device of "Interference F" reversed, but the fact that the device as used in "Interference G" would enable an undulatory current of electricity to reproduce at the point of delivery the same sound-vibrations which had been caused *by articulate speech* at the starting-point was not enough to suggest to the skilled workman or electrician that the same device would, if reversed, enable the sound-vibrations, caused *by the spoken word*, to cause such variations of the electric current as to reproduce at a remote point of the circuit the same sound-vibrations.

Language could not more plainly indicate than this the guiding principle of this entire proceeding, and it was not only the intent of the Office that the invention of the speaking-telephone should be tried here, but it was also the intent of the parties. Their testimony has all been directed to this end, and with the exception of Gray they are all still insisting that they invented not only the art but the apparatus. At the beginning of this controversy Gray made the same contention, and filed simultaneously three applications, one for the method, one for the transmitter, and one for the receiver. That he has withdrawn from the contest, except as to this issue, does not entitle him to have one of these applications used as a basis for an interpretation which neither he nor the other parties originally intended. Bearing this intent in mind, then, and the further fact that no other one of the issues will permit it, where else shall the question of priority as to the receiver be determined if not under this issue?

It was pertinently remarked by counsel for McDonough that without an articulating-transmitter the receiver of this issue could not be practically tested, and its capability of reproducing indiscriminately the quality of any and all sounds could not therefore be known. It may as pertinently be asked how then can the question of priority be decided upon an issue whose terms require the transmission of quality unless the only instrument which has this capacity be included—*i. e.*, an articulating-transmitter?

To sum up briefly, it appears that this interference was sought by the parties to determine who invented the speaking-telephone, the art, and apparatus for carrying it out; and the declaration was made by the Primary Examiner for the same purpose. The Commissioner, upon a proceeding to reform the issues, recognized and confirmed this, the parties accepted it, and the testimony was taken with it in view. Gray formerly insisted, and Edison and McDonough still insist, that not only the art is of their invention, but the apparatus also, and it is only by including an articulating-transmitter in this issue that the question of priority as to the receiver can properly be determined.

If the construction of the issue given by the Examiner of Interferences is to prevail, and priority be awarded to a party who had no articulating-transmitter, it would result that an experimentor who had tried to transmit speech and failed, or one who had never tried, should so dominate the art that an inventor who had worked out the idea, patented his process of carrying it out, introduced it to the public, and put it into extensive use could not practice the art which he had created without being tributary to his unsuccessful rival. * * *

* * * Stated more specifically, his (Gray's) proposition is:

"That as certain devices he mentions are not only capable of acting as receivers of articulate speech, but when properly organized as to their circuit-connections will operate both as receivers and transmitters of articulate speech, * * it makes no difference whether Gray knew or not that his instruments possessed this quality, so long as they did possess it. Gray knew that his receivers would reproduce the quality of sounds transmitted through the line, and he believed that if he could transmit articulate speech it would probably be reproduced, but he at that time did not have the conception of such a transmitter."

That is, indeed, a shadowy theory upon which to rest his case, and the most conclusive answer to it is that of counsel for McDonough, before quoted, that he could not know his receiver would reproduce speech unless he was able to test it, and this could only be done by a speech-transmitter. If he did not know this, how could he impart the knowledge to the public, and how obtain a patent?

It is a prerequisite to the grant of a patent that it shall convey to the public the knowledge necessary to enable it to practice the invention, and it is just here that Bell and Gray differ. If Gray had obtained a patent for his instruments which he now says can transmit and reproduce speech, the public would not have been in any manner enlightened as to this art. He stands in an entirely different light from Bell, and the decision of Mr. Justice Lowell in *American Bell Telephone Company* v. *Spencer, infra*, does not help him. It was not held in that case that it was enough for a person to have constructed an apparatus capable of doing a certain thing, although he did not know it. Another and a controlling element entered into the decision, that a mode of doing this thing had been pointed out and that the apparatus operated after this mode.

"There is some evidence," say the court, "that Bell's experiments with the instrument described in Fig. 7 before he took out his patent were not entirely successful; but this is now immaterial, for it is proved that the instrument will do the work, whether the inventor knew it or not, *and in the mode pointed out by the specifications.*"

Gray had not only not pointed out how his receiver could reproduce speech, but he did not know himself until taught by Bell's patent.

In this view of the case it will not be necessary to look into Gray's evidence, for it is admitted that he had never transmitted speech before the date of Bell's patent or application, and in the view we take of this issue it is immaterial when the devices upon which he now relies were constructed.

The case of McDonough is somewhat similar to Gray's, though with this important difference, that he still insists that he is the inventor of the speaking-telephone. His case, as stated by his counsel, is as follows:

"We submit, therefore, that Mr. McDonough was the original and first inventor, because he had in 1867 practically used the magnet and diaphragm in combination for a receiver; had in 1871 conceived of the use of said combination for articulate speech; had reduced the same to a drawing, and in April, 1874, attempted to embody the same; being prevented by sickness he went to Europe; returning in the fall of 1874, he began in April, 1875, again to put his receiving apparatus together, and combined and used it with a transmitter in May, 1875, and applied for his patent April 10, 1876."

All these acts of McDonough may be admitted, and yet priority cannot be awarded to him unless he can be shown to have had an articulating-transmitter. Upon this depends his entire case, and it becomes important to determine what he really had.

The history of McDonough's efforts and devices is then set out, following a line similar to that of the Examiner of Interferences. In conclusion the Examiners-in-Chief add:

Upon the whole, McDonough's proofs cannot be held to be sufficient to overcome Bell's record dates. We have seen that a party contesting the right of a patentee must show completed and perfected apparatus. That McDonough did not have this is clear. Had a patent been granted to him for it as described in his application or as experimented with in June, 1875, the public would have been no wiser than before. It still would have been ignorant of the method and apparatus for speech-transmission, for no instrument working upon its principle of making and breaking contact can accomplish that result. In this respect McDonough gave no more to the world than Reis. As was said of Reis by Mr. Justice Lowell, in *American Bell Telephone Company* v. *Spencer*, above, a century of McDonough would never have produced a speaking-telephone.

GRAY'S CASE.

As noticed several times, Gray acquiesced in the decision of the Examiner of Interferences as to all the issues except G. It is important to understand why he pursued this course. This decision was rendered July 21, 1883. His present petition was not filed until December 30, 1886, three years and five months after the decision. Even then the petition was filed with a request that it should not be acted upon until further motion was made, and no notice of its filing was served upon the adverse parties. It is well settled that a petition filed and presented under such circumstances is of no avail for any purpose whatever. It performs no function. In the meantime rights of other parties are accruing or vesting from lapse of time, statutes of limitation run, &c. It is only from December 1, 1887, that this petition can be justly said to have been filed—the date at which the Commissioner directed all matters relating to these interference cases to be set down for disposition.

Why, therefore, did Gray acquiesce in the decision and wait so long before action?

It appears from the record, and about this there is no dispute, that for a long time after Bell's patent issued Gray conceded and acknowledged that Bell was the first original inventor. He also regarded the invention as a trivial and unimportant one, a scientific toy. As early as November 1, 1877, he had written his attorney, Baldwin:

Bell's talking-telegraph—it only creates interest in scientific circles, and as a scientific toy; it is beautiful, but we can already do more with a wire in a given time than by talking, so its commercial value will be limited.

This was after Gray had seen Bell's telephone at the Centennial, in 1876, at Philadelphia, and had heard it talk. In letters to Mr. Bell and others, in lectures at Chicago and elsewhere, in 1876 and 1877, Gray publicly and privately conceded priority of the invention of the telephone by which articulate speech could be transmitted, to Bell, and awarded him the honor of being the inventor. That he did these things is fully conceded by Gray.

Gray was a prolific inventor, and had prior to 1876 taken out a number of patents. These related to multiple and harmonic telegraphy, among other things. Some of these inventions subsequently became the foundation of his claim to have invented the telephone—for instance, his patent No. 166,095. At an early date he had interested a Dr. Samuel S. White in his inventions. At the time Dr. White became interested Gray had never succeeded in transmitting speech, but undoubtedly was speculating upon the subject. Recognizing Bell as the inventor, Gray filed no application for a speaking-telephone until October 29, 1877, although, as he says in a statement prepared and published in April, 1878—

As early as March, 1874, Dr. Samuel S. White, of Philadelphia, had purchased an interest in all of my telephonic inventions which I had made or might thereafter make.

That this would include and was subsequently made to include Gray's caveat cannot be doubted, as subsequent important transactions and Gray's evidence abundantly show.

Being thus jointly interested, Gray and White concluded to conduct their business under a corporate organization, and by articles, dated May 26, 1876, they organized "The Harmonic Telegraph Company," with

a capital of 5,000 shares, $100 each, of which Gray had 2,475, White 2,475, Andrews about 50, and some others a few shares.

Evidently this organization looked to the exploiting of Gray's patents, and did not contemplate the subject of telephones so much as the introduction of telegraphic inventions, for at this date Gray regarded the telephone as a toy and Bell as the inventor.

There existed at this time the Gold and Stock Telegraph Company, which controlled the inventions of Edison, Dolbear, and others. In the fall of 1877 Gray and White, representing the Harmonic Telegraph Company, opened up negotiations with the Gold and Stock Telegraph Company for the sale to them of all inventions Gray had made or might make thereafter relating to speaking-telephones. By this time it had been demonstrated that the telephone was not a toy; its commercial importance was beginning to be understood, and it was being introduced.

In this condition of things, being under the belief that Bell was the first inventor, having organized the Harmonic Telegraph Company, and negotiating for the sale of his telephonic inventions to the Gold and Stock and the American Speaking Telephone Company, about to be organized, Gray filed his applications Nos. 1, 2, and 3, October 29, 1877. He says in his affidavit of November 9, 1885—

Being in this belief, I did not take steps to file my application upon my caveat promptly, but the matter rested without any application until November, 1877. This long delay will be understood in view of what I have already stated. Some time prior, however, to the filing of said application it was suggested by the American Speaking Telephone Company, under the idea that it was the owner of said [my] caveat, *that some advantage or benefit might be derived from it.* [That is, Gray filing his applications.] I accordingly filed my applications. This was my act thus done, and done by my counsel at the request of said company.

He is mistaken about the suggestion coming from The American Speaking Telephone Company, for that was not organized at the date he filed his applications. It came either from his own company, the Harmonic, or else from the Gold and Stock, or the Western Union. It was probably the latter companies, which had become owners of Edison's, Dolbear's, and other inventions, and who knew that sooner or later a bitter controversy must rise between themselves and The Bell Telephone Company as to the validity of Bell's patents. It was probably these latter companies which were then negotiating with Gray and White, as the owners of these inventions, who advised Gray to file his applications, expecting "that some advantage or benefit might be derived from it." These companies expected to become interested in Gray's inventions as the result of the pending negotiations, and thus having control of Gray's inventions, as well as Edison's, Dolbear's, and others, they would be better equipped to enter the legal lists with the Bell Company. There is no other possible explanation of Gray's course in filing his three applications and making the oath to them, when he, as he now testifies, still believed that Bell was the first inventor. It was long after this that Gray changed his belief, though he has not seen proper to state the precise time when the change occurred. As will presently be seen, up to and long after the decision of the Examiner of Interferences he conceded priority to Bell, except as to issue G.

The American Speaking Telephone Company was organized pursuant to an agreement of date November 17, 1877, between the Harmonic and the Gold and Stock Companies and the Western Union Telegraph Company. The Harmonic Company was to transfer to the former—

all existing and future patents and inventions owned and controlled by it, or which may thereafter be owned and controlled by it, so far as the same *relate to speaking-telephones*, more particularly the *patents and inventions and right to future patents and inventions of Elisha Gray.*

The Gold and Stock Company were in like manner to transfer to the American Speaking Telephone Company the patents and inventions, present and future, of Amos E. Dolbear.

These agreements were subsequently carried out. The American Speaking Telephone Company organized under articles dated December 1, 1877, and, the transfer made, Gray received large blocks of stock in the new company, was a director thereof, and also held important and responsible positions for the company. It is somewhat difficult to understand just what position Gray assumes with reference to these transactions. He now declares that for some years he *believed* that he had transferred his telephonic inventions, including those now in controversy, and virtually that all the parties with whom he dealt *believed* that they had acquired them. He does not assert that he did not *intend* to assign them and transfer them to the Harmonic Company, of which he was an officer and stockholder, or that they were not intended to pass to the American Speaking Telephone Company. But he appears to simply assert that the formal conveyances from himself to the former company were not in law sufficient, because the inventions were not specifically named or described, or because the contract was of an executory character. Precisely what he relies on is not definitely known; but that he believed he had assigned and transferred them, and that he received large and valuable consideration for the supposed transfer, is as clearly shown as that the parties receiving the transfers believed they were thereby acquiring the right and title and paying for them. This is shown by Gray's own statements and testimony and by the subsequent litigation between Gray's supposed assignees and the Bell Company both in the Patent Office and in the courts, in all of which Gray took part both as party and as witness, *believing* that he had invested the American Speaking Telephone Company and the Western Union Telegraph Company with the title to his telephone inventions. What were these contests about? The telephone. To suppose that this contest, extending until recently decided in the United States Supreme Court, was one that did not include Gray's telephone, and that those great companies, as well as Gray, were resisting the Bell Company in any other belief than that they owned Gray's inventions, is incredible.

Thus organized, and controlling the several inventions and patents of Gray, Edison, and Dolbear, the American Speaking Telephone Company began to put out telephones in the winter of 1877–'78, and before the close of 1879 had put more than twenty thousand into commercial use. This company paid the expense of preparing and presenting Gray's applications, the erection of necessary telephone-lines, material, bells, batteries, &c.

Peter A. Dowd was an agent of the American Speaking Telephone Company and was engaged in their telephone business. In September, 1878, the Bell Company at Boston sued him and the American Speaking Telephone Company and the Western Union Tele-

graph Company as infringers of the Bell patents, and thus the expected contest was begun. The defense of the suit was assumed by the Western Union and associated Companies. It was determined to set up Elisha Gray as a prior inventor of the speaking-telephone and of various important features of telephones then in use. Gray prepared a printed statement of all he had done toward the invention. It occupied nearly 100 pages. While it does not appear that he had changed his opinion as to the original inventorship, the importance of the pendency of his three applications in the Patent Office and of the interference between them and Bell's patents, which had been declared in the meantime, is apparent. The answer to the Bell Company suit justified under Gray. Every exertion appears to have been made to present Gray's inventions in the strongest light. Besides furnishing the statement alluded to, Gray went to New York and spent most of the winter and spring of 1878-'79 in assisting in the preparation of the defense. He also gave his testimony, and in the present procedure it is not pretended that he can add anything or throw any new light upon the subject or history of his invention. He has disclosed everything and has no more to tell. There were thus pending contemporaneously two contests or proceedings, the interferences in the Patent Office and the Dowd suit in the United States Circuit Court for the District of Massachusetts. The taking of evidence progressed, but that in the Dowd case was completed first. It was practically closed on the 19th of September, 1879, including the complainant's evidence-in-chief, the defendant's evidence-in-chief, and the complainant's evidence in rebuttal. No question is made but that up to this date the contest was most vigorously and bitterly conducted, the Bell Company claiming under the Bell patents and the Western Union having control of Edison's, Dolbear's, and Gray's inventions, as was supposed and believed. Eminent counsel represented the respective parties and the litigation became a matter of public notoriety and its determination one of public interest.

At this stage of the litigation, when the evidence had been concluded and counsel were in condition to take a definite survey of the facts, counsel, including Mr. Gifford, advised the Western Union and the associate companies that the Bell patents were valid, and that the defense must fail. But valuable improvements had been made upon the speaking-telephone which were deemed important to the commercial success of the original invention, and the Western Union and associate companies controlled these—such as Edison's carbon telephone, the Page patent covering the induction-coil, &c. With impending defeat before them, the Western Union Company, proceeding upon the basis of these valuable improvements, opened negotiations with the Bell Company to compromise the litigation and unite all patents relating to the speaking-telephone upon terms to be agreed upon. Such an agreement could not well have been proposed or made unless it had been believed that Gray was not the first inventor, and also that the Western Union had acquired his inventions, for his inventions had been those under which they had justified, and to settle that litigation leaving his inventions out would have been absurd. This settlement was effected and a preliminary memorandum was executed on September 27, 1879. This preliminary agreement was a voluminous instrument settling and determining the rights of the various parties in and to these various inventions, and determining in what manner the telephone business should be conducted, &c. It is not necessary to set the agreement out with any great particularity. It appears that when this preliminary memorandum was made it contemplated that it should subsequently be reduced to a more complete and perfect form, which was afterward done, of date November 10, 1879. There is no claim that there is any essential difference between the memorandum and the subsequently executed formal instrument, except in Article 16, which provides—

> The existing suits and interferences shall be disposed of as counsel of the parties of the first and second parts may advise to recognize and protect the rights of the respective inventors to their several inventions, subject to the orders of the courts and the decisions of the Patent Office.

This paragraph in the memorandum read as follows:

> The suits and the interferences shall be disposed of as counsel for the respective parties may advise to carry out the purpose of this agreement, so long as it shall continue in force.

Article 17 provided that the contract should go into effect as of November 1, 1879, and remain in force for 17 years thereafter. Pursuant to this contract a decree was entered in the Dowd case on the 4th of April, 1881, adjudging Bell's patent to be valid and perpetually enjoining the infringement of the same. This decree recites the fact that it is by consent of parties.

The evidence in the Dowd case was by stipulation of all parties to the interference proceedings transferred and introduced in the interferences as evidence to be used and considered in those cases.

The effect of the contract of November 10, 1879, by which the Dowd suit was settled, was to invest the Bell Telephone Company with the ownership of all the telephone inventions, which at that time were supposed and believed to include Gray's inventions, and obligated it to pay to the Western Union Telegraph Company 20 *per centum* of all rentals or royalties received or rated as paid by licenses or lessees for speaking-telephones, and also 20 *per centum* of the net profits of the manufacture of telephones made in the United States for export.

As further explaining Gray's course in failing to file his applications sooner than he did, and also in making the subsequent concessions hereinbefore referred to in favor of Bell as the prior inventor, it is proper to call attention to some additional circumstances which appear in the history of the matter.

Bell's application was prepared and executed January 20, 1876. Gray's caveat was prepared and executed February 14, 1876, and both were filed in the Patent Office on the same day—viz., February 14, 1876. The examiner at that time in charge of the division to which they were referred, following what appears to have been the practice theretofore, treated Gray's caveat as having been filed first, within the meaning of the statute, and issued notices to the parties advising them of the fact of an apparent interference between the application and the caveat, and required Gray to proceed and file his application within the 90 days if he desired to avail himself of the caveat. Bell's attorneys at once made an inquiry of the Office to know the precise date on which the caveat was filed. This was a matter which of course they were entitled to know, and finding that the date of filing

the caveat was the same as that of Bell's application they insisted that it was proper to determine which was in fact filed first, regardless of the date or day. This matter was then referred to the Commissioner, who instituted an investigation, and ascertained to his satisfaction at that time that Bell's application was filed first, and as matter of law he held that the caveat was not filed within the time or before the application within the meaning of the patent law, and directed that the notices which had been theretofore issued to the parties should be withdrawn and that Bell's application should not be suspended to await action on Gray's part. This investigation made by the Commissioner at that time appears to have been conducted as any other investigation would be in the Patent Office under similar circumstances—*ex parte*. It was instigated, of course, by Bell's attorneys. Gray, however, had he manifested the same diligence, could have set on foot a similar investigation and been heard. Indeed, the record discloses the fact that Gray's attorney, on March 3, 1876, advised his partner, S. S. White, of the situation, and added:

> We could still have an interference by Gray's coming down to-morrow and promptly filing an application for a patent. If you want this done, telegraph me in the morning on receipt of this and I will have the papers ready in time to stop the issue of Bell's patent; but my judgment is against it, as Gray made the invention, as I understand it, while here, after Bell's application was sworn to. He may, however, have invented the resistance part of the application at an earlier date, and Bell's claim is for the system of graduated interruptions by a varying resistance instead of the abrupt interruptions, as I have mentioned.
>
> (Signed) WM. D. BALDWIN.

Neither Gray nor his partner White responded to the suggestion of this letter. No application was filed, and Bell's patent issued.

Quoting now from Gray's affidavit of November 16, 1885, this explanation of his inaction is given:

> At the Centennial Mr. Bell exhibited a telephone which transmitted articulate speech. I witnessed the exhibition. He did not use a liquid transmitter on this occasion, but used an instrument very nearly resembling the receiver of my invention. I communicated this fact to my counsel and requested his opinion as to how my case stood in view of said fact, *and he informed me that practically my claim was defeated*, that Bell's application was filed on the same day as my caveat, and that Bell having made an instrument that successfully transmitted articulate speech he occupied a better position and would undoubtedly succeed.
>
> Upon this advice of my counsel and my friend I acted. I had the fullest confidence in him. I believed that he was not only faithful in all respects, but that he had the necessary learning, ability, and experience to advise me rightly. In the latter it seems I was mistaken; but I did not for a long time find out the mistake, and did not know that the advice thus given was wrong and not in accordance with the law, as I am now advised.
>
> All my subsequent correspondence, admissions, statements, and interviews must be construed with this in mind and in view of the fact that I supposed I had parted with all my pecuniary interests in this and other inventions and was therefore only interested as to my reputation as an inventor, and it seems my counsel, so called, had the same idea in view, as stated in his letters of October 24 and 29, 1881, as set forth in his last affidavit, in which he wrote as follows:
>
> "I am devoting my argument more to a vindication of your position than to attacking your adversary, though I am stating some facts in regard to Bell and Edison very plainly."
>
> In the letter of October 29, 1881, he says: "Inclosed find an advanced copy of my argument in your behalf in the speaking-telephone interference case. My object has been mainly to place you right before the public on the scientific side of the question. I hope I have succeeded, but I am not proud of the performance."

This state of mind on the part of Gray appears to have continued down to a point of time which was later than the decision of the Examiners in-Chief in the interference proceedings.

Mr. Baldwin was Gray's attorney in preparing his caveat and his applications, and also in conducting the interference. Baldwin says that upon the settlement of the Dowd case, in November, 1879, it was understood and agreed that the questions of priority pending in the interferences involving a personal pride and feeling to the parties should be settled by adjudication in the Office.

That particular plan was in accordance with a correspondence between Mr. Gray and myself. The plan set forth in that correspondence was faithfully followed by me throughout to the best of my ability. Moreover, Mr. Gray was kept advised from time to time of the plan on which the argument and appeal were made.

The record is very satisfactory that Mr. Baldwin kept his client, Mr. Gray, constantly advised of what was being done in the cases. The correspondence is produced and not controverted. The relations of the Bell Telephone Company to the applications of Gray, Dolbear, and Edison, which were the result of that settlement, were thoroughly understood by Gray at the time. In a printed brief, prepared by Gray's counsel in the interferences, it was stated that articulate speech had not been transmitted by either of the inventors or others prior to the Bell patent; that Bell's first reduction to practice was after his patent issued and by means of a liquid transmitter. It was also stated in the brief:

> When, however, in the course of subsequent litigation, the fact was developed that as between Gray and Bell the latter really was the first to conceive the invention of transmitting articulate speech and to reduce the invention to practice, Gray voluntarily came forward, like the straightforward, fair-minded man that he is, and conceded that fact to his rival. We shall therefore retire from the contest over the issues in cases A and B so far as relates to the question of electrical transmission of articulate speech. * * * The ground was so thoroughly cultivated then (in the Dowd case) that it was not seen where it could be improved by harrowing it again, and the entire record was accordingly stipulated into this case (the interference) that we might have the benefit of the numerous and valuable facts developed. * * * The fifth claim of this patent has since been interpreted and sustained by the courts as broadly as Bell himself could desire in the recent case of *American Bell Telephone Company* v. *Spencer*, (20 O. G., 229.)

It also appears that copies of this brief were furnished Gray by his counsel, Baldwin, of which he acknowledged the receipt in a note, dated New York, November 14, 1881, as follows:

> DEAR BALDWIN:
>
> I received the patents and also a copy of your brief. The latter was a very able document and you did yourself "proud." I would like a few copies for distribution.

In response to this 50 copies were sent to Gray and it does not appear that he ever expressed any disapproval of its contents. After the decision by the Examiner of Interferences Mr. Baldwin advised him in a note—

> My opinion is to appeal on the receiver cases and let the rest go.

This course was either approved or acquiesced in by Gray, and the appeal was subsequently taken, as explained, from the decision so far as it related to the receiver, issue G, with the results heretofore set forth, so that it must be recognized as one of the established facts in the present matter that Gray's recognition of Bell as the first original inventor, as explained above, was made deliberately and publicly.

In order more fully to understand the question of collusion, as urged in these proceedings, it is necessary to state in this connection that prior to November 2, 1880, negotiations had been entered into between the American Bell Telephone Company and McDonough with reference to the purchase by the company of McDonough's inventions in telephony, and on the 2d day of November, 1880, a written contract was executed between those parties, of which the following is a copy:

> This agreement, made the second day of November, A. D. 1880, by and between James W. McDonough, of the first part, and the American Bell Telephone Company, a corporation, of the second part, witnesseth:
>
> In consideration of *five thousand dollars*, paid by said corporation to said McDonough, the receipt of which is hereby acknowledged, it is agreed as follows:
>
> If said McDonough on his inventions shall obtain a *valid* patent, covering broadly the art of transmitting articulate speech by electricity, he shall assign the same to said corporation, and said corporation shall thereupon pay him the sum of *two hundred thousand dollars* therefor. If said McDonough, on his own inventions, obtains a *valid* patent, covering broadly variable resistance contact transmitters for electric speaking-telephones, he shall assign the same to said corporation, and said corporation shall thereupon pay him the sum of *fifty thousand dollars*.
>
> If said McDonough, on his own invention, shall obtain a patent covering broadly magnetic receivers for electric speaking-telephones, he

shall assign the same to said corporation, and said corporation shall thereupon pay him the sum of *fifty thousand dollars*.

It is understood that Mr. McDonough is not to take out foreign patents in such a way as to shorten the life of the United States patents, which if granted, will be subject to this agreement.

Signed and sealed at Boston on the first day above written.

This agreement is not to be taken as any manner of admission by either party as to the validity or invalidity of claims made by the respective parties.

(Signed) THE AMERICAN BELL TELEPHONE COMPANY,
By W. H. FORBES, *President*.

In presence of C. Emerson as to W. H. F.

(Signed) JAMES W. McDONOUGH. (Seal.)

Received $5,000, as within, November 2, 1880.

(Signed) JAMES W. McDONOUGH.

Attention is called to the closing paragraph, which clearly indicates that neither party contemplated assisting the other in procuring their respective patents, but that each party evidently undertook to look after his own interests in the prosecution of his claims.

With this statement of the facts relating to Gray's case I now proceed to consider the merits of his petition. In advance it must be understood that the case is before me upon a petition for rehearing, in which I am asked to set aside all of the orders heretofore made and to reinstate the cases for reconsideration upon new and additional evidence and upon the merits broadly. The decision which is sought thus to be set aside was rendered by Mr. Commissioner Butterworth in March, 1885. The subject was allowed to pass over the entire administration of Mr. Commissioner Montgomery for presentation or consideration other than to file the petition with an indication that it should not be acted upon until further motion should be made, and it now comes before me, the second successor of the officer who decided the case.

Rule 144 of the Office, which has been in force during all this period, provides as follows:

Cases which have been deliberately decided by one Commissioner will not be reconsidered by his successor except in accordance with the principles which govern the granting of new trials.

An attempt is made in argument to show that this case was not deliberately decided by Commissioner Butterworth, for the reason that in his decision he made use of the following expression:

If on examination of the evidence and consideration of the arguments I had become convinced that the findings and decisions of the Examiners-in-Chief were erroneous, or if a serious doubt in that behalf had been raised in my mind, I would have felt constrained to leave the case undecided, to be reheard by my successor. Had I reached a different conclusion it would have been desirable that the reasons for overruling the decision of the Board should be stated at length.

I am not able to see the force of the argument that this expression indicates that Mr. Butterworth's decision was not one deliberately made. On the contrary, if any inference can be drawn from it, it is that the case was elaborately considered and deliberately determined, and that he had no doubt about the result which should be reached, and accordingly announced his decision. The record shows that the case was argued at length and was given great consideration, and it is this which, in my judgment, determines whether a case has been deliberately decided or not. It follows, therefore, that the case is not before me upon its merits, and I am not in a situation to be called upon to grant a rehearing upon a mere preponderance of evidence, as if the case were before me originally, where the preponderance of evidence would prevail; but I am to bear in mind that this controversy has extended through a period of years in the Office, that it has passed through all of the tribunals, and with a single exception—viz., as to issue G—the decisions have all been uniformly in the same direction, and a case must now be presented which justifies the exercise of a judicial discretion before a rehearing can be granted, and this must be done by evidence either of an error in the conclusions of fact or in the application of the law of a very clear and satisfactory character.

At every stage of the contest in this Office one of the serious and important questions has been the effect and legal construction to be given to the Bell patent of March 7, 1876. The Examiner of Interferences felt concluded by the construction which had been put upon that instrument by the Commissioner and the courts, evidently referring to the Spencer case. The same is true of the Examiners-in-Chief, who cite the Spencer case and the Dolbear case. Before me it has been urged with great force of argument that those cases were not authoritative; that Bell's patent was not a patent for a telephone, but for a multiple telegraph, and that Bell in fact had never invented the telephone. But I am relieved of any further consideration of these questions by the recent decision of the Supreme Court in the *Telephone Cases*, (126 U. S.,) where that tribunal has finally and definitely settled such questions. That Court says:

In the present case the claim is not for the use of a current of electricity in its natural state as it comes from the battery, but for putting a continuous current in a closed circuit into a certain specified condition, suited to the transmission of vocal and other sounds, and using it in that condition for that purpose. So far as at present known, without this peculiar change in its condition it will not serve as a medium for the transmission of speech, but with the change it will. * * * We see nothing in Morse's case to defeat Bell's claim; on the contrary, it is in all respects sustained by that authority. It may be that electricity cannot be used at all for the transmission of speech, except in the way Bell has discovered, and that, therefore, practically, his patent gives him its exclusive use for that purpose; but that does not make his claim one for the use of electricity distinct from the particular process with which it is connected in his patent. It will, if true, show more clearly the great importance of his discovery; but it will not invalidate his patent. But it is insisted that the claim cannot be sustained because when the patent was issued Bell had not in fact completed his discovery. While it is conceded that he was acting on the right principle and had adopted the true theory, it is claimed that the discovery lacked that practical development which was necessary to make it patentable. In the language of counsel, "there was still work to be done and work calling for the exercise of the utmost ingenuity and calling for the very highest degree of practical invention."

It is quite true that when Bell applied for his patent he had never actually transmitted telegraphically spoken words so that they could be distinctly heard and understood at the receiving end of his line; but in his specification he did describe accurately and with admirable clearness his process—that is to say, the exact electrical condition that must be created to accomplish his purpose—and he also described with sufficient precision to enable one of ordinary skill in such matters to make it a form of apparatus which, if used in the way pointed out, would produce the required effect, receive the words, and carry them to and deliver them at the appointed place. The particular instrument which he had and which he used in his experiments did not, under the circumstances in which it was tried, reproduce the words spoken so that they could be clearly understood; but the proof is abundant and of the most convincing character that other instruments, carefully constructed and made exactly in accordance with the specification, without any additions whatever, have operated and will operate successfully. A good mechanic with proper skill in matters of the kind can take the patent and by following the specification strictly can without more construct an apparatus which, when used in the way pointed out, will do all that it is claimed the method and process will do. * * *

The law does not require that a discoverer or inventor in order to get a patent for a process must have succeeded in bringing his art to the highest degree of perfection. It is enough if he describes his method with sufficient clearness and precision to enable those skilled in the matter to understand what the process is, and if he points out some practicable way of putting it into operation. This Bell did. He described clearly and distinctly his process of transmitting speech telegraphically by creating changes in the intensity of a continuous current or flow of electricity in a closed circuit, exactly analogous to the changes of density in air occasioned by the undulatory motion given to it by the human voice in speaking. * * *

The apparatus, "as herein described," which is included in the claim, is undoubtedly one in which an electro-magnet is employed and constructed "substantially as set forth" in the specification. One acting on the variable-resistance mode is not described further than to say that the vibration of the conducting-wire in mercury or other liquid included in the circuit occasions undulations in the current; and no other special directions are given as to the manner in which it must be constructed. The patent is both for the magneto and variable-resistance *methods*, and for the particular magneto *apparatus* which is described, or its equivalent. There is no patent for any variable-resistance apparatus. It is undoubtedly true that when Bell got his patent he thought the magneto method was the best. Indeed, he said in express terms he preferred it; but that does not exclude the use of the other if it turns out to be the most desirable way of using the process, under any circumstances. Both forms of apparatus operate on a closed circuit by gradual changes of intensity and not by alternately making and breaking the circuit or by sudden and instantaneous changes, and they each require to be so adjusted as to prevent interruptions. If they break, it is a fault, and the process stops until the connection is restored.

It is to be observed that in so far as the Supreme Court gave a construction to the Bell patent and held that it disclosed the invention, they were united and there was no dissenting opinion.

It has thus been established, in my judgment, definitely and finally that Bell's patent discloses the invention of the telephone, covering both the method and the apparatus, one composed of a transmitter, a closed circuit, and a receiver; that this patent relates back to the date of the application, and also to the date of its execution, viz: January 20, 1876, as the first original date of conception. It does not follow, of course, unless established by other evidence, that Bell was the first inventor, or that he was an original inventor. But whoever attempts, either in these interference proceedings or in an infringement suit or suits, such as those decided in the Supreme Court of the United States, to antedate Bell's invention and establish an earlier invention, must prove by clear and satisfactory evidence a prior conception and prior reduction to practice to the date of Bell's application, or that having made an earlier conception than he did such inventor diligently prosecuted it to a reduction to practice. These propositions may be supported by innumerable decisions of the Commissioner and of the courts, but I see no occasion to cite them.

INTERFERENCES A, B, C, E, AND F.

First comes the inquiry whether there is anything submitted to me in the record which justifies me in reaching a conclusion that there was any error in the action of the Examiners-in-Chief with reference to the date of Gray's invention, or whether in fact he ever did invent the telephone. In this consideration I exclude for the present issue G, which relates to the receiver.

A most careful and laborious examination of the evidence and arguments submitted failed to impress me with any want of satisfaction in the facts as found by the Examiner of Interferences. It is conceded by all parties that Gray's caveat, prepared and filed February 14, 1876, was the first description he ever made of the invention covered by the issues under consideration. Prior to that date the subject was evidently one of speculation and experiment. As is said by the Examiner of Interferences—

His energies were directed exclusively to the transmission of musical tones and their utilization for telegraphic and other purposes, no attention being given to instruments for the *reception*, transmission, and *reproduction* of articulate speech until along in February, 1876, and although he claims to have had some conception of the *possibilities* late in the fall of 1875, he neither disclosed them to others nor clothed them in any fixed and positive form until he made the sketch for his caveat, February 14, 1876.

Gray says:

I was *convinced* that the receiver would produce articulate words, inasmuch as it *seemed* to be capable of reproducing any form of vibration that I was *able* to transmit. I remember speaking of this to different ones about this time; I may have mentioned this before the first of April, 1874, or it may have been a little while after. My impression is that I first mentioned it before. My conception then of an instrument for transmitting articulate speech was one of a complicated character, having a series of transmitting-points adapted to respond to all the tones of the human voice, somewhat similar to the apparatus referred to in my caveat of February 14, 1876.

The description contained in his caveat is as follows:

I contemplate, however, the use of a series of diaphragms in a common vocalizing-chamber, each diaphragm carrying an independent rod and corresponding to a vibration of different rapidity and intensity, in which case contact-points mounted on other diaphragms may be employed.

When called upon to explain the construction of the apparatus thus ambiguously outlined in his caveat, Gray confesses that it was a general idea, not clearly defined in all its details and based upon a theory which has since proved to be false. The instrument was never constructed by him.

It is evident that while Gray's caveat may be accepted as a conception of the invention of the telephone, a method, and also an apparatus, Gray himself did not fully understand it and, as stated, was unable to explain the mode of its operation. In other words, even after filing the caveat and before the true secret of the telephone had been made known by the publication of Bell's patent and his lectures and experiments at the Centennial, Gray still adhered to the old idea that articulate speech must be transmitted upon the multiple-telegraph principle by the use of a series of diaphragms in a common vocalizing-chamber, each diaphragm carrying an independent rod and responding to a vibration of different rapidity and intensity, so that the earliest possible date of conception which can be given to Gray is February 11, 1876. But of course this cannot affect Bell's patent, for the reason that the evidence is satisfactory and it is absolutely conceded by Gray that he did not reduce his invention to practice for a long time after the issuance of Bell's patent; that in the meantime, regarding the invention as of trivial importance, he neglected it altogether and turned his attention to other inventions, to the exclusion of this, so that the Examiners-in-Chief were justified in finding that Gray was neither diligent in filing an application in the Office nor was he diligent in reducing to practice, and consequently, under well-settled principles of law, cannot be given the benefit of his date of conception as against another independent inventor. But Bell is shown to have conceived the invention on the 20th of January, 1876, when he prepared his specification and showed it to others, and subsequently filed it in the Office, on the 14th of February, as heretofore stated. There is no doubt that Bell prosecuted his discovery with great diligence, at once filing his application and obtaining the patent at the earliest moment possible.

These facts are not only conclusive and convincing, but the conduct of Gray afterward is equally satisfactory as to the same. His concessions were made at a time when he was vastly interested in making the most thorough examination of the facts before he should concede anything. His omission to file his applications until nearly two years after the date of his caveat, his concessions made in the Patent Office as matter of record in a controversy, and the further fact that when he filed his applications it does not appear that he had changed his belief as to who was the first inventor, but was acting in the interest and under the direction of parties who had in view a litigation with Bell as to the validity of his patent, all serve to confirm the correctness of the decisions of the Office giving priority to Bell.

So far therefore as the present petition of Gray may be said to be a motion for a rehearing of these issues upon the alleged ground of error in law or in fact, or both, in the decisions to be reviewed, it might well be regarded as disposed of here; for Gray proposes no new or additional evidence as to the dates, nature, or character of his own invention. What he did as an inventor, the experiments he made, the date of conception, his caveat, applications, &c., remain fully stated,

described, and disclosed in the evidence already submitted by him. He does not propose to add anything to the evidence upon which the several decisions before the Office have heretofore proceeded; nor does he pretend that the collusion and misapprehension on his part or the supposed mis advice of his counsel, or other matters to be hereinafter considered, prevented him in any manner from given his testimony, from giving all the facts—the whole truth—with reference to the history of his own efforts and transactions as an inventor. Upon the evidence introduced and considered the decisions were correctly made and the award of priority of invention was justly given to Bell. With his patent construed and sustained, as it has been in the courts, Bell must upon the record before the Office be held to have been the first to conceive; the first to disclose and by his patent give the invention to the world; the first to reduce the invention to practice, first, constructively by his patent, and actually, later, by the transmission of speech in the early part of 1876, as explained. But in his petition to reopen the interferences Gray seeks to go farther and affect these decisions in the Office upon the evidence adduced by a direct attack upon the procedure in the Office, and by the introduction of new and additional evidence to establish the alleged fact that Bell was not an independent inventor, but pirated the invention from him, Gray.

Without presenting all the points *seriatim*, or following the petition and argument in their exact order, the several propositions may be stated as follows:

First: As to these issues before any substantial progress had been made in taking the proof in these interferences: The Bell Telephone Company, owning Bell's two patents, had acquired or supposed they had acquired, by assignment, all the other patents and inventions supposed to possess any value involved in the interferences, including Gray's; that from thence on the proceedings in the interferences were mainly under the management and control of said company and its associates, with the view of reaching such results as they desired—viz., priority to Bell—said company paying counsel on both sides and all other necessary expenses, and the proceedings were therefore collusive and should be disregarded and set aside.

Second: That the concessions of priority made by Gray in favor of Bell were made under incorrect and improper advice of his (Gray's) counsel, who later on in the interference was paid for his services by the Bell Telephone Company combination, acting under the Dowd settlement of November 10, 1879, and was under their influence; and that it was in consequence of this improper advice under these conditions that he declined to appeal from the decision of the Examiner of Interferences as to these issues. Also, that these concessions were made and his subsequent course governed by the belief that Bell was in fact an original inventor—had actually filed his application in point of time earlier than Gray's caveat had been filed; whereas he now believes that neither of said conditions existed, but, on the contrary, Bell had fraudulently secured access to his caveat, purloined his invention, and carried the description therefrom into his application.

Third: Upon the ground of newly-discovered evidence, important and material, which petitioner did not know to have existed in time to produce it before the Office, which new evidence will show that those portions of the Bell specification containing the description of the variable-resistance appliances were not contained in it when originally filed and were not in any of Bell's previous specifications or writings, that he obtained the knowledge and description of them from his fraudulent inspection of Gray's caveat and then fraudulently caused them to be written into his application after it had been filed, and so he, Bell, was not in respect to them an original inventor.

Fourth: That the decisions of the Office were erroneous in law and in fact, because as matter of fact Gray's caveat was filed before and not after the filing of Bell's application, and consequently it was error to give Bell the status of a patentee, the rule being in such cases that Bell was to have been regarded as a mere applicant for a patent on an equal footing with Gray.

1. *The alleged collusion.*

Gray alleges that the proceedings in these interferences in the Patent Office were collusive because the Bell Telephone Company, as was supposed, had acquired all the interests involved, and was therefore able to mold and control the decisions in such form as it saw proper. This proposition of course depends upon whether this company had then acquired Gray's inventions. He now claims that it had not, that the inventions then belonged and still belong to him, and that it was merely a matter of supposition at the time that it had acquired his inventions. He does not pretend that in consequence of that belief he was in any manner deterred from presenting all his evidence and receiving all the consideration to which he was entitled, or that he can now add anything to the evidence or present any new consideration as to the origin or date of his invention.

It is rather a peculiar situation in which he finds himself. He is forced to assert that the company had acquired his inventions in order to establish the collusion, and is required then to deny that it had so acquired them in order to find a standing for his petition to vacate the decisions upon the ground of collusion. His counsel cite in support of the proposition the following authorities: *Cox* v. *Hardwick*, (Cases Temp, Hardwick, 237;) *Earl of Bandon* v. *Betcher*, (3 Clark & Finnelly's Reports;) *Lord* v. *Veazie*, (8 How., 351;) *Cleveland* v. *Chamberlain*, (1 Black, 419;) *Wood Paper Company* v. *Heft*, (8 Wall., 333;) *Gardner* v. *Goodyear Dental Vulcanite Company*, (6 Fish., 329;) *Fletcher* v. *Peck*, (6 Cranch, 147.) These decisions settle the proposition, as stated by the counsel, that courts will not try and adjudge cases in which there is no controversy or where the controversy has been settled by the parties themselves; nor will they try moot questions for the purpose of obtaining decisions affecting injuriously the rights of third parties; but none of them establishes that the courts will vacate or set aside their action where in the proceeding before the court the court has been fully advised of the situation and relation of the parties, and with full knowledge has proceeded and rendered judgment. Nor will the court vacate or set aside such judgment where the interests of third parties are not affected at the instance of the parties to the controversy, unless they have acted promptly and called the attention of the court to the settlement, or the fact that there is no controversy as soon as that condition arises.

When these interferences were declared and up to November 10, 1879, there could have been no collusion, for the reason that during this period the Bell Telephone Company had not acquired Gray's interest, and the contest between that company and the American Speaking Telephone Company and others was being hotly conducted. It is clearly established that the Patent Office was well advised, and all parties understood that the Bell Telephone Company had come to be the owner of most of the inventions involved, and had acquired an interest in that of McDonough, (involved in issue G,) and that the proceeding before the Office after the settlement of November 10, 1879, was conducted in accordance with the practice which has existed from time immemorial. It is a matter of common occurrence that interference proceedings are conducted after the inventions involved have been assigned to the same person or corporation. Counsel are employed to represent the respective inventors, take evidence, and conduct the proceedings, and the decision of the Office is given for the purpose of ascertaining which of the inventors was the original and true inventor, within the meaning of the statute, in order that the assignee may obtain a valid patent. This practice has been assailed in argument as being irregular and improper and coming within the condemnation of the courts, as found in the decisions just cited; but I do not think the decisions are applicable.

In these interference proceedings the public is interested in seeing that a valid patent issues, and the rules of practice are such as to require the procedure to be conducted to a conclusion. The Office is not always willing to award priority upon a stipulation between the parties, but requires that the award of priority shall be determined either by the record date of the parties or by a satisfactory showing.

Under the English system a patent may be issued to the assignee of a number of applicants for the same invention and his patent will be valid, provided either of the assignors was the real inventor. In such a case it cannot be presumed that the public will be injured by a patent issued to the assignee under such circumstances, for the reason that he represents the true inventor, although it may not be known at the time which of the several applicants was the true inventor. But under our system a judicial investigation is required by the statute to enable the Office to ascertain who was the true inventor. This requirement is on behalf of the public, or the third party, as it is sometimes called, for in an interference between a patentee and a later applicant the public is distinctly interested in not having the monopoly prolonged by the issuance of a second and later patent, unless it be made to appear clearly that the applicant was in fact the original inventor, justly entitled to a patent which he could obtain in no other way than by an award of priority. For this reason, as just suggested, the Office will not always receive the concessions of the parties themselves as to priority, but insists upon the evidence being produced; and this is just as essential in cases where both inventions belong to the same assignee as in other cases, for otherwise it would be placed in the power of the assignee to obtain a second patent and thus prolong his monopoly. Besides, the patent, if issued for the invention of the wrong assignor, would be void if the fact should be developed.

It is urged by Gray's counsel that instead of having what he terms an apparent contest after the Bell Telephone Company had become practically the owner of the inventions, it could have been settled upon the record, and Bell's application having antedated all others he would have received an award of priority, and that the course pursued in this case was due to a purpose on the part of what is called the combination of the Bell Company and its associates to secure a decision of the Office which could be used in courts and elsewhere and was so used in several suits to support the *primas facies* of the patent and to obtain preliminary injunctions *pendente lite*.

It must be apparent that if the course suggested here had been pursued and an award of priority entered upon the record without the production of evidence, most of which, as already explained, was taken in a hotly-contested controversy, a still stronger objection could have been urged to the award of priority than is now brought against the course which was pursued. The question would have been asked then—why did they take an award upon the record and not pursue the ordinary course of taking testimony and establishing the fact upon an investigation? I can see no force in this objection. It may be true that the parties to these interferences at that time desired to secure a proper decision of the Office in order that they might derive such benefit from it as the law and the practice in the courts entitle them to; but it must be understood that at that time Gray was interested in the combination and was not only assenting to this course, but was promoting it, and it is difficult to see how he now can challenge the course of procedure in the Office upon these grounds, when his relation to it was such as stated. Even if it were true that it is bad practice to award priority, as was done in this case, after several interests have become vested in a single assignee, and that the practice should be abolished, it should be for future cases and not for the purpose of vacating and setting aside a case already disposed of, and especially not for the purpose of reinstating it for a retrial.

It is evident that in the present petition Gray does not ask to have the decisions of this Office set aside so as simply to avoid them and leave the matter standing on Bell's patent alone, but for the secondary and more important purpose of having the contest reinstated and a retrial and readjudication. In other words, he asserts that at the time the interferences were heard before the Office his mental condition was such that he believed the Bell Telephone Company with its associates to be the owner of his inventions; that his mental condition in this particular has since changed and he desires the rehearing in order that it may be retried under the new mental condition. He may still, however, be in error as to the ownership, for the record presents strong evidence that his first belief or opinion was correct and that the Bell Company is in fact the true and equitable owner of the inventions; and if this be true the supposed "collusion" would exist in the new trial as much as in the original.

As already stated, Gray promoted this interference procedure with full knowledge on his part of the set-

tlement and of the facts which he now asserts constitute the collusion. He was also aware that it was conducted before the Office with full knowledge and consent on its part, and in accordance with its recognized practice with reference to such interferences. If this collusion exists, it existed then, and then was the time for Gray to have promptly moved, after November 10, 1879, to arrest proceedings in the Office, on the ground that to proceed further would be in violation of public policy and contrary to the rules recognized by the courts; but having failed to do this, and not only allowed without objection, but promoted the controversy to a final decision, in order that he might succeed if he could and obtain an award of priority on behalf of his assignee, he has seen proper to wait until defeated before raising this question of collusion. To permit this to be done would enable a party to trifle and experiment with the Office, accept its results if favorable, and repudiate them if unfavorable. But there is no judgment in these interferences which the rule of the courts in cases cited would require to be set aside. Priority was awarded to Bell and patents denied to the other interfering parties, much as a bill is dismissed for want of equity. No execution can issue nor other order be made affecting the rights of third parties, injuriously or otherwise. The condition of parties remains precisely as it was before the interferences were declared, and as if nothing whatever had been done. In my judgment no court would interfere with an award of this character, and certainly not for the mere purpose of reinstating the contest.

It must follow that if the rehearing is to be granted at all it must be upon other grounds than the collusion referred to.

2. *Gray's concessions.*

In his present petition Gray seeks to avoid the effect of his admissions and concessions in favor of Bell's priority, upon the ground that they were the result of misapprehension, improper advice of his counsel, and of fraud practiced by Bell in pirating his invention and deceiving him about the facts. He insists that his admissions have been introduced as part of the evidence submitted, and have had more or less influence in affecting the judgment of the Examiner of Interferences; that his concessions of priority and withdrawal from the contest before the Examiners-in-Chief and his failure to appeal from their decision to the Commissioner were the results of the same continuing influences operating upon his mind and misleading him; that in consequence the decision should be set aside, he should be restored to his original status as a suitor, and should be allowed to retry the issues upon the original evidence and such new evidence as he can produce.

It is undoubtedly true that Gray's admissions were introduced in the evidence submitted, and that they were adverted to by the Examiner of Interferences in his decision. The Examiner of Interferences says:

> In addition to the testimony we have the direct admissions of Gray, in lectures, publications, and letters to Bell, acknowledging that the latter was the first inventor of the apparatus for transmitting vocal sounds. In a letter to Bell, dated March 5, 1877, Gray says, referring to the matter of transmitting vocal sounds: "I do not, however, claim even the credit of inventing it, as I do not believe a mere description of an idea that has never been *reduced to practice*—in the *strict sense* of that phrase—should be dignified with the name of invention." It is clear, therefore, that Gray cannot be regarded as the inventor of the articulating-telephone *per se*, and, recognizing that fact, he seeks to maintain such of his claims as are involved in these interferences upon other experiments and inventions made by him with respect to the transmission of sounds generally; and these will next be considered.

It is also true that the Examiners-in-Chief recognized Gray as having withdrawn from the contest as to all of the issues except issue G. They say:

> Gray, as before stated, has withdrawn from the contest as to all but this issue. His case does not rest upon the fact that he is the inventor of the art or even of an articulate transmitter, but upon the proposition, as stated by his counsel, that "having invented, discovered, and reduced to practice prior to the other contestants in this case an apparatus involving the combination" of the issue, he "is entitled to a patent for that apparatus with all its functions, incidents, and capabilities, whether known at the time or not."

Even if the law will permit Gray, in consequence of the alleged misapprehension, the improper advice of his counsel, and the alleged fraud of Bell, to be restored to his original status and to have a retrial, it will do so only when he shall have clearly established these allegations as to the mistake, advice, and fraud.

An examination of the decision of the Examiner of Interferences shows clearly that while he adverted to Gray's admissions he was by no means controlled by them. His decision proceeds upon the evidence of Gray and the other parties to the interference as to their several acts and proceedings in inventing, and upon this evidence he finds that Bell was the first inventor. As stated, he gives Gray as the date of his conception February 11, 1876, the date of the sketch on which his caveat was based, and in my opinion no retrial of the case will ever change that conclusion. His decision also shows that Bell's application, prepared January 20 and filed February 14, 1876, was regarded as his (Bell's) first conception, antedating Gray, and that Bell diligently prosecuted his application and secured his patent. This settled and still must settle beyond serious question Bell's priority, provided Bell's application and patent disclose the invention. Throughout the entire history of these interferences this has been one of the important questions contested. It was determined by the Examiner of Interferences, not upon any concession by Gray, but upon the decisions of the Commissioner and the courts, who had placed a construction upon the patent, holding that it did disclose the invention. The same decision in this particular was made by the Examiners-in-Chief. These tribunals did not cite the decisions of the courts for the purpose of ascertaining any date or priority as to Bell's patent, because whatever it disclosed it was certainly prepared on January 20, and filed on February 14, 1876, and was proof of a conception of whatever invention was disclosed by it. The courts held, and all the tribunals of the Patent Office have held, that it disclosed the inventions involved, and consequently priority of invention was awarded to Bell upon these facts. As heretofore stated, this question has since been finally settled by the Supreme Court of the United States in the telephone cases, so that it is palpable and clear that if Gray's admissions, which are found in the evidence, and his concessions, which were made as a matter of record in the interferences, be wholly withdrawn from the case, the conclusion as to the priority remains unaffected thereby.

As to the allegation that his counsel, Mr. Baldwin, gave Gray improper advice or was actuated by any improper influences, it is necessary to notice what the advice was and the circumstances under which Mr. Baldwin was placed with reference to his client. It is to be remembered that the advice to which Gray refers was given long before the interferences were declared and before the relations came into existence which grew up between the Bell Company and Gray

and others, arising from the contract of November 10, 1879. It was at a time when no influence is claimed to have been operating upon Mr. Baldwin as an attorney except a proper regard for the interest of his client. Gray says:

> At the Centennial Mr. Bell exhibited a telephone which transmitted articulate speech. I witnessed the exhibition. He did not use a liquid transmitter on this occasion, but used an instrument very nearly resembling the receiver of my invention. I communicated this fact to my counsel and requested his opinion as to how my case stood in view of said fact, and he informed me that practically my claim was defeated; that Bell's application was filed on the same day as my caveat, and that Bell having made an instrument that successfully transmitted articulate speech he occupied a better position and would undoubtedly succeed.

Now, as to this advice which is made the foundation of the charge of Gray, it is proper to say that the position assumed by Mr. Baldwin has been shown to have been correct by every decision in relation to the subject since it was given in the Patent Office and in the courts. As to Mr. Baldwin's subsequent course in the conduct of the case, it appears clearly that he acted diligently; that he kept his client, Gray, constantly advised of everything which was done, and in his subsequent relations with other parties and with the Bell Telephone Company Gray was fully advised and made no objection whatever to them. Under such circumstances a court would hesitate long before granting a relief upon the allegations now presented by Gray or condoning either the advice or the conduct of his attorney.

The allegation that Bell had fraudulently obtained access to Gray's caveat and had pirated the invention and was not himself the original inventor is a material one, and will be considered further on in connection with the subject of the newly-discovered evidence presented by Gray. But even conceding that Gray could establish these several allegations, there is a grave question whether he could be restored to his original position and be allowed to retry and recontrovert these issues. If the matter involved were of such a character as to be purely personal between Bell and Gray and the controversy related to private matters alone, there is no doubt that a rehearing might be granted; but in this case there are in fact three parties. The public is a party interested and whose rights are to be protected as well as those of Bell and Gray.

Bell's patent has now been running since March 7, 1876. Gray has seen proper, as already explained, to concede priority to him; has come into the tribunal where the question of priority was being determined judicially, and has entered a plea awarding priority to Bell and withdrawing from the controversy. For a valuable consideration he has allowed other parties, supposing themselves to have become the owners of whatever inventions he had made, to invest largely in the property. He became himself personally interested as a stockholder, an officer, and in other particulars in a corporation or a combination of corporations dealing with both the Bell property and his own, and inducing the public to become interested in them upon the strength of the decisions in this case and his recognition of Bell's priority. As he himself says in one of his affidavits as to these issues, he has acted and conducted himself upon the belief that Bell was the first inventor and that the Bell Telephone Company was the owner of his (Gray's) inventions, which they were regarding and inducing the public to regard as invalid and subservient to the Bell inventions. While receiving consideration for his supposed transfer of his inventions he has for several years regarded the matter as settled and disposed of, and until the filing of his present petition, which proceeds upon the assertion that he has obtained new and additional information, he has acted like one who has completely abandoned the invention. It is not necessary to a disposition of this petition to hold that Gray has actually abandoned these inventions to the public if they do not belong to Bell, but I have little doubt that his conduct establishes such an abandonment.

The course pursued by Gray in disclaiming the invention, asserting and publicly indorsing Bell as the inventor, and for these reasons entering before the Examiner of Interferences in October, 1881, his formal withdrawal from the contest was with full knowledge that the invention then had been in public use for over three years, and that private enterprise throughout the country was investing vast sums of money in the promotion and introduction of the invention. While it is true he still asserted, both in the Patent Office and in the courts, his claim for invention of the receiver, (issue G,) yet as to the art or method and the transmitter as involved in these issues he made no move to avoid his disclaimer or reassert his inchoate right as inventor until he filed this petition, December 30, 1886, more than five years after his disclaimer, during all which period the public use continued and increased. Now, whether the invention belongs to the Bell Company as assignee of Bell or of Gray, regardless as to which of the two was the real inventor, the invention had gone into public use and innumerable persons had invested in it. Gray was a party to and had encouraged its public use with a disclaimer on his part. It is difficult to conceive much stronger evidence of abandonment on his part. (*Pennock* v. *Dialogue*, 4 Wash., 538; *Kendall* v. *Winsor*, 2 How., 322; *Am. H. & L. S. Co.* v. *Tool Co.*, 1 Holmes, 503.) It is settled that abandonment may be after application is filed or patent issued, (*Bell* v. *Daniels*, 1 Bond, 212,) and after abandonment the inventor's right is as much beyond recall as when two years' public use intervene before application is filed. He cannot regain his inchoate rights or be restored thereto upon the ground that he was misled or deceived by fraud, &c. (*Mellus* v. *Silsbee*, 4 Mason, 108; *Bowles* v. *Mason*, 2 Am. L. T. R., (U. S.,) 106; *Jones* v. *Sewell*, 3 Cliff., 563; *Bell* v. *Daniels*, 1 Bond, 212.)

Without absolutely holding that Gray has abandoned the invention there are considerations which are quite as fatal to his petition. It is evident that the public has a direct and immediate interest in the further prosecution of Gray's application for a patent. If the award of priority heretofore given to Bell can be vacated and set aside, it should only be done upon a showing of merits that would entitle Gray to an award of priority and to a patent. Such a patent would run for a period of seventeen years from the date of its issuance, and would dominate and control the method and all the devices relating to the telephone for another period of 17 years. Its effect would be to subject the public to a renewed monopoly—in all nearly, if not quite, 34 years. Such result is in such contravention of the spirit of the statute and so unnatural a consequence, in view of the liberal provisions of the

patent system, that it cannot be tolerated, except where the inflexible rules of law and justice compel it. Before an inventor can demand such a result or a patent that would bring about such consequences he must show himself not only absolutely entitled, but that he has been diligent and persistent in the prosecution of his rights, and that the failure to sooner secure them has been unavoidable and not due to his own mistakes, laches, or failure. It scarcely needs comment or requires suggestion to show that Gray does not bring himself within the requisite conditions for such relief.

If, in addition to the foregoing considerations, there shall be added the further fact that the Bell Telephone Company acquired the equitable ownership of Gray's invention under the settlement of November 10, 1879, and the transactions prior thereto, and that a patent to Gray would at once inure to that company and enable it or a new combination in this manner to prolong for another full statutory period its monopoly of the invention, there would appear conclusive reasons for refusing the present petition. There is not the slightest evidence before me of the existence of collusion between the Bell Company and Gray and his present associates by which such a result is sought after; but unless the rights of the public shall be strictly guarded and the principles of law properly enforced such combinations could easily be made and could successfully and unduly extend their monopolies. It is to prevent such consequences that, in many cases, the Office is unwilling to award priority in interference proceedings upon stipulation of parties.

The state of the title as to Gray's invention will be considered further on.

(3.) *The newly-discovered evidence: Bell's piracy of Gray's invention.*

The proposition to be established is that on the 14th day of February, 1876, when Gray's caveat and Bell's application were filed, the latter contained no reference to the variable-resistance method (issues B and C,) and claim 4 was not in it; that through improper and fraudulent influences of Bell's attorneys at Washington with the examiner in charge of the subject the former were permitted to see the caveat, and thereupon surreptitiously and fraudulently withdrew Bell's specification, rewrote it, incorporating the portion now found relating to the variable resistance and the new claim 4, and substituted the amended and unverified specification for the old. This, if done at all, must have been done before the 19th day of February, for the official letter of that date, addressed to both Gray and Bell, advising them of the interfering matter, shows conclusively that the suspected matter of the specification was in it at that date.

There is no claim or pretense that Bell received his ideas from Gray in any other way or by any other means than by this alleged fraud of stealing them from the caveat. Indeed, the charge does not connect Bell personally with the matter, for it is conclusively shown that Bell was not at Washington during the period between February 14th and 19th, 1876, nor was he in any manner cognizant of the alleged alteration at the time. The theory presented makes it necessary that the fraudulent alteration should have been made by Bell's attorneys at Washington upon their own responsibility and without the authority or consent of their client. The evidence of this alleged fraud is the "newly-discovered" evidence relied upon by Gray as one of the grounds for setting aside the award of priority in these interferences. It consists of certain evidence—the testimony of Bell himself, taken in "The People's Case," so called.

In March, 1876, Bell had written Gray:

> My specification had been prepared months before it was filed, and a copy had been taken to England by a friend.

This was George Brown, of Toronto, whom Bell had interested in his inventions in the fall of 1875. In his testimony in the Dowd case Bell had produced the original rough draft of the specification in 7 sheets. He testified that he began to work upon the specification in September, 1875, in Canada. He had searched for other drafts of his specification made in the course of preparing his application, but was unable to find them. This was in July, 1879, when he was giving his deposition. He says the 7 sheets of the original draft then produced do not read successively, and were—

> the mere remains of my first attempt to put into correct language the ideas embodied in my specification. Some passages are written in pencil, others in ink, and many of them are so disfigured by the corrections, &c., that it is difficult in some cases now to read them.

He further says these original drafts are by no means all he made in preparing the specification for his application. He also states that he had concluded arrangements with Mr. George Brown to have the specification filed simultaneously in England and the United States, and the application was not filed here until February 14, 1876, because he was waiting for a cablegram from England. While he does not specifically state that he gave Brown a copy of his specification, his testimony inferentially makes it clear that he did, for he produces a sketch which he placed in Brown's hands before the latter went to England, which was handed back to Bell in 1878. But in the cross-examination Bell was not asked to produce that copy which he gave Mr. George Brown, nor to state its contents, or whether it contained anything relating to the variable resistance. The original first draft then produced did not contain any reference to it, and as this was one of the important facts involved the most natural inquiry would have been to ask Bell about it.

When the newly-discovered evidence now relied upon comes to be considered, there can be no doubt that, had he been asked by Gray or any one in the Dowd suit, Bell would have replied that the George Brown copy of the specification did not contain claim 4, or any reference to the variable resistance, and would have given substantially the same statement now relied upon, though he might not at that time have been able to produce the copy.

The evidence in the Dowd case was closed in September, 1879.

In the case of *The People's Telephone Company* v. *The American Bell Telephone Company*, Mr. Bell again testified at great length. His deposition was taken in March, 1883, pending the decision of the Examiner of Interferences, whose decision was announced in July following. While Gray was not a party to this suit, he must have been interested in it and cognizant of the progress made therein. At this time Bell was able to produce some additional memoranda, letters, &c., and, among other things, he produced the George Brown copy of Bell's specification, which the latter had taken to England, with the view of taking out

the English patent, and which he had returned to Bell in 1878. It is this evidence of Bell relating to the George Brown copy which is relied upon as being new, important, and relevant. It is stated substantially as follows: In his decision (page 320) the Examiner of Interferences calls attention to—

> certain suspicious circumstances attending the production and development by Bell of the liquid resistance or water telephone that demand attention. There is an entire and absolute absence of evidence tending to prove that at the time or prior to the filing of his application of February 14, 1876, he had conceived, disclosed, experimented upon or tested, or even contemplated so doing, any form or system of articulating-telephones other than magneto, as disclosed in Fig. 7 of his patent, with the single possible exception of the abandoned and discarded idea of the vibrating wire.

In September, 1875, while in Canada, Bell began the preparation of the specification for his patent and continued it in Boston during the early part of October following. In the Dowd case he produced some rough drafts of his earliest efforts, which were mere fragmentary remains of his first attempt. His specification was prepared subsequently for Mr. Hubbard to take to Washington and have examined by their attorney, Pollok. In January, 1876, Hubbard wrote to Bell:

> I have been over your specification with Mr. Pollok. He is very much pleased with it and says he does not think it will require any alteration.

A fair copy of the specification was received from Mr. Pollok on the 19th or 20th day of January, 1876, as shown by a letter addressed to Mr. Bell, under date of January 18, 1876.

In his preliminary statement Bell says:

> I completed the specification for my American patent early in January and sent it to Mr. Hubbard in Washington to be examined by Mr. Pollok. I am not able to fix the date when I sent it; but on the 18th of January I received a letter from Mr. Hubbard expressing his satisfaction with it, and it must have been returned to me then or immediately after, as I made oath to it in Boston on the 20th of January, 1876, and sent it back to Mr. Hubbard. The reason why it was not filed immediately was that it was deemed important that I should meet Mr. Pollok and go over it with care. We met in New York shortly after and spent a day, January 25, 1876, in considering the specification. No change whatever was made in it, and Mr. Pollok took it back with him and filed it in the Patent Office.

Hubbard testifies:

> I saw the specification of the speaking-telephone in October, 1875 I believe it was substantially like the one for which the Letters Patent were issued, though several changes were made in it subsequent to my first seeing it. I believe I took it with me to Washington on the first of December, 1875. I showed it to Mr. Pollok, brought it back with me on leaving Washington, December 14th or 15th; then took it with me on my return to Washington, which was, I think, on the 10th of January, 1876; showed it again to Mr. Pollo ; then I returned it to Mr. Bell for his signature and oath.

On the 28th of September, 1875, Bell wrote from Toronto to Hubbard that he was about arranging with his friend, Hon. George Brown, ex-Premier of Canada, to become interested in the subject of the invention. On the 29th of December, 1875, a contract was made between Bell, George Brown, and J. Gordon Brown, in Toronto, by which Bell agreed to assign them a fourth interest in all his "patents and inventions that are now or may be hereafter taken out in any other parts of the world, except in the United States of America," and on the same day received a memorandum from the Browns agreeing to pay him, Bell, $25 apiece per month while perfecting his inventions in telegraphy and preparing the necessary specifications for taking out patents under their agreement of that date.

Hubbard also testifies:

> I met Mr. Bell in New York about January 25th, at his request, to meet Mr. George Brown, of Toronto. We met Mr. Brown, and he agreed to take out Letters Patent in Great Britain. Mr. Bell gave me his copy of the specification, which I was to take under a promise which he exacted from me that it should not be filed at Washington until Mr. Brown should have filed it in England. He did not hear from Mr. Brown, as he expected, and finally wrote to me that if he did not hear by a certain day that I might file it. I strenuously objected to the least delay; but it was of no avail, as he wished to have it taken out in his native country, that he might there have the benefit of what he believed to be a great invention.

All the foregoing testimony was given in the Dowd case. Now follows the "new testimony," which is found in the People's Record:

> 567. Q.—About when did Mr George Brown go to England? A.—About the last week in January, 1876.
>
> 568. Q.—Did he take with him a specification furnished by you corresponding to the specification of your patent of March 7, 1876? A.—He did.
>
> 569. Q.—Please look at the paper now shown you, and state whether it is the specification which you furnished to Mr. George Brown? A.—It is.
>
> (Complainant's counsel puts a copy of the paper in evidence to be marked "Complainant's Exhibit George Brown Specification.")
>
> 570. Q.—How long before Mr. George Brown sailed for England did you deliver this paper to him? A.—I only know that it was handed to him between the date of the agreement, December 29, 1875, and the time he sailed, the latter part of January, 1876.
>
> 571. Q.—When was this paper written? A.—In October, 1875.
>
> 572. Q.—I observe that it is headed "United States Patent Office," from which I infer that this particular paper was originally prepared for your American specification and not for the purpose of being handed to Mr. George Brown; what is the fact about that? A.—Certainly that is the fact.
>
> 573. Q.—Did you at or about the time when you handed this paper to Mr. George Brown also give to him descriptions of your other electrical inventions patented and unpatented? A.—Yes.
>
> 576. Q.—In the Exhibit George Brown specification there are some alterations made by drawing a pen through words or phrases, and interlining others in place of them; what is your recollection as to when these changes were made? A.—I have not any clear recollection of the time when these changes were made excepting that they were made before the specification was given to Mr. Brown, March 12, 1883.
>
> 585. Q.—You have told me this morning that you wanted to make some addition to your answer to Interrogatory 571. Please do so. A.—Yes; I desire to state that, though from the language used in this paper I know that it is a copy of the specification as I wrote it in October, 1875, I cannot be perfectly certain that the copy was itself made in October, 1875, although it is my belief that it was. It was made as a fair copy, not in my handwriting. The interlineations and corrections are in my handwriting.
>
> 586. Q.—I observe that the fifteen sheets of which it is composed are numbered consecutively, and each of them bears at the top the initials 'G. B.;' are those initials Mr. George Brown's handwriting? A.—They are; I saw him write them.
>
> 587. Q.—The last sheet, which happens to be the sheet of drawings, contains on the back this indorsement: "These papers were received by me from Prof. Alex. G. Bell in the winter of 1875-76, shortly before I left for England. I can fix the exact date by reference to my books and papers, but have not them at hand now. George Brown, Toronto, 12th November, 1878." In whose handwriting is that? A.—In the handwriting of Mr. George Brown. I saw him write it.
>
> 621. Cross-Q.—On the papers which you gave to George Brown preparatory to his going to England, I find indorsed the words "November 12, 1878;" how happened that? A.—I had just returned from Europe at that time, and understanding from Mr. Watson, who met me at Quebec, that interferences were arising in the Patent Office, I thought it might be important to obtain from Mr. Brown whatever papers he might have. We therefore called on Mr. Brown in Toronto, on the 12th of November, and at my request Mr. Brown indorsed the papers and gave them to Mr. Watson.

The argument which is founded upon this new evidence naturally connects itself with the history of Gray's caveat, and insists that the procedure in the Patent Office, in changing its practice with reference to the dates on which caveats are filed, and holding that Gray's caveat had not been filed prior to Bell's application, the failure to declare an interference and hold Bell's application until Gray could file one, the speed with which Bell obtained his patent, and the circumstances disclosed by this evidence in connection with the evidence in the Dowd suit, establish the fact that when Bell's application was filed it did not contain claim 4 or any reference to the variable-resistance matter.

It is insisted by Gray's counsel that in pursuance of the contract made by Bell with Brown, December 29, 1875, in order to obtain patents in England, Bell handed him, after December 29, 1875, a copy of the specification which had been prepared to take to England to be used there; that Brown met Bell, Pollok, and Hubbard on the 25th of January, 1876, in New York, when he agreed to take out a patent in England. This was done to have the applications filed simultaneously in England and in the United States, the intention being that Bell should arrange to have both filed simultaneously; and that as George Brown sailed for

England the last week in January he must have left after January 25 and before February 1, 1876. It is further urged that Brown filed no application for a patent in England upon the specification he took there, and it was not until the 9th of December, 1876, that the application was made for a patent in England by Bell, in the provisional specification of which appears the description of a liquid transmitting device.

It is concluded by counsel:

> There can be no doubt, in view of this evidence, that the specification which George Brown took to England in January, after the 25th, 1876, was a copy of the specification sworn to by Bell five days before on the 29th of January of the same year; but this copy taken by Brown *does not contain the portion of the description regarding the variable-resistance appliances found in the present Bell specification in the Patent Office.* It is impossible to believe that if Bell had thought of these variable-resistance devices prior to Brown's going to Europe he would have omitted to describe them in the specification which Brown took there to file simultaneously with the application in this country.

I think the argument has been fairly stated and as strongly as made by the counsel, and it will be seen that the entire force of the argument resides in the proposition that the Brown specification, which had been given to him by Bell, was the exact copy of the specification sworn to by Bell on January 20, and filed in the Patent Office February 14, 1876.

The George Brown specification is headed "United States Patent Office," and Bell says it was prepared for the American specification, which shows quite conclusively it was prepared before he had made any definite arrangement with Brown. Bell testifies that the paper was written in October, 1875—that is, that it is a copy of a specification written by him in October, 1875, and while not certain that it was made (as a copy) in October, it is his belief that it was. Bell further testifies that the original drafts produced in the Dowd suit were by no means all the specifications he prepared between September, 1875, and January 20, 1876, so that it is reasonably established that Bell was industriously at work preparing, amending, rewriting, and improving his specifications between those dates. It is clear, of course, that the American specification was completed about January 10, 1876, and remained unchanged until filed February 14.

Now the argument for Gray concedes that Bell had invented the magneto-undulatory telephone and described it both in the original drafts and in the George Brown specification; for it clearly appears in both. In the latter Bell distinctly asserts that he does not limit himself to any particular mode of producing the electrical undulations, and attempts to broaden his description so as to include others. He says in the George Brown specification:

> There are many other ways of producing undulatory currents of electricity, but all of them depend for effect upon the vibration or motion of bodies capable of inductive action. A few of the methods that may be employed I shall here specify.

He then adds four illustrations of known methods, but does not include the variable resistance. In the statement that all of them depend upon inductive action he was mistaken, for the liquid resistance mode was then known.

Whether Mr. Bell was sufficiently skilled in patent law to know the importance of embracing in his specification all known methods of producing variations or undulations in the electric current is not shown, but the above quotation indicates that he was, and that he was attempting to specify them. Certainly any one possessing such knowledge would have embraced all *known* methods. The situation was this: Bell had made the discovery which depended upon the vibratory or undulatory current. This called to its aid and dominated all known methods of producing those undulations. Any one would properly desire to introduce into his specification and cover all the methods. In preparing his specification in October, 1875, Bell evidently tried to do this and incorporated four methods, but omitted the fifth—the liquid resistance method. But this was a well known method, just as well known as the others. Bell invented no methods of producing variations in the current. He only applied what were already known. The liquid resistance mode was then as well known as the other methods which Bell described in his George Brown specification. It required no invention to apply it, for the use of a diaphragm was then so well known that the attachment of a diaphragm to the wire which was to be vibrated in the liquid could have been made by any ordinary mechanic. It was fully suggested in the *lover's telegraph*, where the vibrations of the diaphragm operated longitudinally on the string. Why then did not Bell introduce this liquid resistance method into his October specification. Possibly because at that date he may not have known of the liquid resistance method, or, if he did, it did not occur to him at the time. Where then could Bell learn this? Is there no source from which he could have derived this knowledge prior to filing his application, unless he acquired it through Gray's caveat? Must he have thus acquired it from Gray's caveat and then have fraudulently incorporated it in his application? Assuredly not. The information existed in books and was matter of common knowledge. It could be obtained from associates, those with whom he conversed. It is probable that Bell possessed the knowledge previously, but it did not occur to him when preparing the first drafts of his specification, the magneto undulatory mode, depending upon induction, through which the invention had been made, being at that time uppermost in his mind.

A comparison of the original draft, the George Brown draft, with the final specification shows that they present internal evidence of progression toward completeness, and that they were not written at the same time, nor can either be a copy of the other.

A complete *alibi* is shown for Bell. If the fraudulent interpolation was made it must have been made between the 15th and 19th of February by his attorneys without his knowledge or consent. There is not a scintilla of evidence that they had any possible knowledge of the existence of the caveat until after the 19th of February. The Bell specification is word for word the same as his patent. I have personally examined the specification and find that it is written upon both sides of the paper, in a clear, fair hand, so continuously from page to page that if any such change or alteration was made the entire specification must have been abstracted and a new one restored in place of it.

It is incredible that attorneys of intelligence and standing would, without their client's knowledge, change a specification which had been prepared with such unusual care, and thus imperil his rights in such a novel and valuable invention. They could not know that the additional matter could be properly added, and consequently the act might be condemned by their client, not only as prejudicial but as an infamous

fraud. If the alteration was made by the attorneys who had stolen the idea from the caveat, it would have introduced the identical invention found there, for they were neither electricians nor experts; but the invention introduced was a different one and shows that whoever wrote the passage understood thoroughly the secret of the telephone, which Gray did not. Gray used a liquid of *high* resistance. This suspected passage in Bell's specification called for a liquid of *low* resistance. Bell had been in pursuit of the delicate sound-waves that constitute *quality*. This Gray did not understand when he prepared his caveat, for, as shown heretofore, Gray was unable to explain the operation and still adhered to the multiple tone idea. In other words, the suspected passage shows a full appreciation of the invention which is not found in the caveat and which neither Gray nor the attorneys of Bell possessed sufficiently to have prepared it.

The change in the practice as to caveats which held a day *punctum temporis*, was made by the Commissioner upon consideration and not by the suspected examiner, whose action in the matter had been adverse to Bell. There can be no question that Commissioner Spear's action was correct. (*Louisville* v. *The Bank*, 104 U. S., 469.) The fact that the Bell application was filed in the Office earlier in the day than the Gray caveat was determined by an investigation instituted by the Commissioner at the time, when it was susceptible of investigation. Both Bell's and Gray's attorneys knew just when the respective papers came into the Office. Attention has already been called to the fact that when the Commissioner withdrew his notices as to the caveat Gray could have had an investigation, but did not, nor did he arrest the issuance of Bell's patent, when he might have done so by filing his own application. But he did neither, and no doubt it was because his attorneys were entirely satisfied that the Bell application preceded the caveat "a couple of hours." Notwithstanding that this subject was urged upon the attention of the Supreme Court in the telephone cases that Court appears to have disposed of it in a single sentence: "Bell's application was filed February 14, 1876, and afterward, during the *same day*, Elisha Gray filed a caveat," &c. The order of filing was thus judicially declared, and there is no intimation that, having been filed on the "same day," one was not filed earlier than the later, or that the caveat had not been given its proper status in the Patent Office.

The Bell patent issued very promptly. It met with neither anticipating reference nor with interference. It was a new art for the transmission telegraphically of articulate speech, and so went speedily to patent because it went unchallenged.

In concluding this subject of the alleged fraudulent alteration of Bell's specification it is proper to observe that this very question, based upon this identical new evidence, was presented to the Supreme Court in the telephone cases and was fully considered and passed upon. I might have contented myself merely with citing the portions of the opinion relating to it, but I felt it necessary to dwell upon some considerations not mentioned there. One extract from the opinion will be sufficient:

> On the 27th of January, 1876, Bell met Brown, who was then on his way to England, in New York. It is now assumed that the paper which Brown took to England was handed to him then, and because the variable-resistance method and the fourth claim were not in that it is argued that they could not have been in the American specification at that time. But no one has said when the paper was actually handed to Brown. Bell says he cannot tell, but that it must have been after he made his contract with Brown, on the 29th of December. As the American specification was signed and sworn to five days before the interview with Brown on the 25th of January, and the paper of Brown differs from it in so many particulars besides that now in question, it would seem to be clear that the paper was a copy of some former draft which Bell had made—possibly one taken to Canada in December—and not of that which was perfected afterward. As the specification which had been prepared and sworn to was a fair copy, without erasures or interlineations, the fact that the paper handed Brown was not a fair copy would imply that it was not intended to be an exact transcript of the other. At any rate, the bare fact that the difference exists under such circumstances is not sufficient to brand Bell and his attorneys and the officers of the Patent Office with that infamy which the charges made against them imply. We therefore have no hesitation in rejecting the argument. The variable-resistance method is introduced only as showing another mode of creating electrical undulations. That Bell had had his mind upon the effect of such a method is conclusively established by a letter which he addressed to Mr. Hubbard on the 4th of May, 1875, and which is found in the Dowd record, introduced into the Overland case by stipulation. Its insertion in his final draft of his specification is another proof of the care with which his work had been done.

I am of opinion that this so-called new evidence is really not such. It does not appear but that all the facts sought to be established by it—viz, that the George Brown specification did not contain the variable-resistance clause—could have been ascertained by asking for it in the Dowd deposition. Neither is it shown that by the use of ordinary diligence Gray could not have discovered this evidence in the People's case years before he did. The difficulty is that he has been acting under the belief that he did not own the inventions and that Bell was the prior inventor, and has allowed years of inaction to follow. Under these circumstances he cannot allege diligence or be excused negligence. Especially will not a court excuse his negligence and delay when the causes assigned are not established and it accepts his former opinion as to ownership and priority to have been correct. But even if satisfied that the evidence was newly discovered and that Gray could not have earlier discovered it by the exercise of diligence, it would still be unavailing, for the reason that, giving it all the force and effect asked for it, it could not change the result or throw any doubt upon the correctness of the former decision.

As to issue C, it is insisted by Gray that the decision in the interferences was erroneous because Bell does not show or describe a liquid transmitter in his patent, and that consequently there should not have been an interference nor an award of priority to Bell. Some justification for the suggestion may be found in the decision of the Examiner of Interferences, who says:

> While no such instruments are found described in Bell's patent, his proof as to "Exhibit 41," its description, use, and exhibition are considered as amply sufficient to defeat the claims of Gray and Edison, founded upon the facts appearing in the record, at the same time anticipating Richmond's record date of August 24, 1877.

But evidently this view is a misapprehension of what the Examiner of Interferences means. He does not mean that a liquid transmitter is not shown, but that its specific construction was not shown in Bell's patent. As heretofore stated by me, the liquid-resistance method and means of applying it by moving the wire by hand or otherwise were well known, as was also the use of a membrane or diaphragm, so that any one skilled in the art would know from Bell's patent how to construct such a transmitter. It was therefore deemed to be shown in that patent. The examiner declaring the interference must have so held, otherwise he would not have made Bell a party to issue C. Not only this, but Gray made no motion to dissolve the interference, and I have no doubt as to the correctness of the action of the Office in either declaring or deciding the issue. What has been said about issues A and B is conclusive as to this.

GRAY'S TITLE.

The Commissioner of Patents has no equitable jurisdiction over the rights of parties claiming under assignments and grants of inventions and patents. He cannot set aside or vacate such instruments, nor can he recognize equitable rights growing out of transactions between inventors and applicants and other parties. While he is authorized to recognize formal legal assignments, and when they have been filed in the Patent Office before patent issues may give the assignee control of the management and prosecution of an application and direct the patent to issue in the name of the assignee, yet he cannot recognize equitable rights under executory or other equitable contracts. (*Ex parte Edison*, C. D., 1875, 42.) But when a party to an interference which has been determined adversely to him asks a rehearing and bases such request upon the allegation that during the trial he was laboring under the supposition that he had parted with the ownership of his inventions, and that in consequence, although he remained a party, was active in securing and giving testimony, the parties to whom he supposed he had transferred were the actual managers of the case; that in consequence—"I had no counsel, I was not a litigant. The whole apparent controversy was, as I now believe, collusive, carried on with an appearance of an array of opposing counsel"—the question of ownership is made material and it is competent for the Commissioner to examine it in order to know how to exercise his discretion intelligently. A party cannot make the question of ownership or non-ownership a material ground of the relief sought and at the same time deny the power of the tribunal to consider and pass upon it.

It is unnecessary to again refer at length to the transactions between Gray and White and the American Speaking Telephone Company and its associates, resulting in the settlement of November 10, 1879. It is evident that that agreement and the transfer of telephone inventions were made under the belief that it included Gray's inventions, and but for such belief it would not have been made. Gray so understood the agreement and was a beneficiary under it. The American Speaking Telephone Company had previously put out large numbers of Gray's telephones as its own property. In the settlement of November 10, 1879, it was expressly stipulated that the inventions of Gray became the property of the Bell company. That all this was done with the full knowledge of Gray is not controverted. With this knowledge and acting under this belief Gray has allowed seven years to pass, knowing that third parties were also acting in the same belief and making investments upon the strength of the transactions and that the interests of the general public were directly involved. If Gray can now repudiate these transactions and assert his ownership, it would constitute *pro tanto* a rescission of the agreement of November 10, 1879, though it would be totally impossible to restore any of the parties to their original situation. Under these circumstances the authorities relied upon as to the estoppel seem conclusive. The Bell Company is certainly the equitable if not the legal owner of Gray's telephone inventions. *Bronson's Exr.* v. *Chappell*, 12 Wall., 681; *Morgan* v. *R. R. Co.*, 96 U. S., 716; *Bank of U. S.* v. *Lee*, 13 Pet., 107; *Dickerson* v. *Colgrove*, 100 U. S., 578; *Baker* v. *Humphrey*, 101 U. S., 494; *Close* v. *Glenwood Cemetery*, 107 U. S., 466. It follows therefore that Gray was not mistaken in his original opinion that the Bell Company had become the owner of his inventions, also that his original belief that Bell was the first original independent inventor and had not pirated any invention from his caveat was also correct, and that all the alleged grounds for reopening these interferences and granting a new trial must fail.

ISSUE G.

A telephonic receiver consisting of the combination, in an electric circuit, of a magnet and a diaphragm supported and arranged in close proximity thereto, whereby sounds thrown upon the line may be reproduced accurately as to pitch and quality.

This issue relates to the receiver. All that has been said about the title of Gray's inventions involved in the other issues is equally pertinent here; but the conclusion is much strengthened by transactions not yet referred to.

Gray took out a patent, No. 166,095, on July 27, 1874. This covered what is commonly called the "blacking-box receiver." It has been formally transferred, with other of Gray's inventions, by mesne assignments, until it came to belong to the Harmonic Company. It was reissued to the latter company. In 1880 the Harmonic Company assigned it to the American Speaking Telephone Company, so far as it related to speaking-telephones, but not including its use for harmonic telegraphic purposes. This patent, subject to this limitation, subsequently went to the Bell Company, under the contract of November 10, 1879. Gray obtained reissues of the patent with claims of which this is one:

The diaphragm or disk of metal capable of responding to all kinds of tones vibrating in unison with the electro-magnet included in the electric circuit, substantially as set forth.

In his testimony in the Dowd case and in his preliminary statement in the interferences Gray repeatedly stated that he had made the inventions embraced in issues G, I, C, and E in the year 1874, and that they were covered in his patent, No. 166,095, which, as already explained, has been assigned, then reissued to the Harmonic Company, and then, as to the use of said inventions as telephones, transferred to the Bell Company. Thus, according to Gray's description of the inventions and his claim for the same, there is a technical formal transfer of them, and he is not the owner of them. His Patent No. 166,095 and the reissue would bar his present claim, and even though he could take out a patent it would at once become the property of the Bell Company.

While it is true that Patent No. 166,095 and the reissue of the same cover a receiver, "the diaphragm or disk capable of responding to all kinds of tones vibrating in unison with the 'electro-magnet,'" &c., yet the present contention of Gray, in issue G, is that he had invented a receiver that would thus respond to *tones*, and he believed and also expressed the opinion that such a receiver was capable of responding to quality and of reproducing articulate speech, if a transmitter could be found; and that therefore his *tone*-receiver was a *quality*-receiver, the latter capacity of responding to quality arising only from a new or additional use of which the receiver was originally and at all times capable. It is clear that if this be true still the invention, whatever it was and however capable, has been assigned, and as a telephone-receiver is now the property of the Bell Telephone Company.

The argument urged with so much force by Gray, that after one of the parties has acquired all the interests in the controversy there should be no further contest, is certainly applicable here, where the objection is presented and urged. Especially is it true that under such circumstances a defeated party, who has parted with all his interest, cannot be allowed to reopen an adjudication in order to retry a matter in which he can have no interest. The discretion of the Commissioner cannot properly be called in aid of a request to reopen and retry these interferences simply to gratify the personal pride or reputation of one of the parties. If the title to Gray's invention is vested in the Bell Company and that company is content with the adjudication, no one else can properly complain.

Referring now to the merits of this issue G, its proper construction must be determined. As heretofore shown in the statement of the facts and extracts from the decisions, the Examiner of Interferences held the issue to mean—

A receiver containing an electro-magnet and a diaphragm supported and arranged in close proximity thereto, and adapted to respond to variations in the electric current passing through the coils of the magnet, when used in connection or combination with a transmitter adapted to create sound-producing fluctuations in the electric current, *whether said electrical variations, waves, pulsations, or undulations represent or are derived from sound-waves or mechanical vibrations.*

In other words, he held in effect that the issue covered a receiver which was capable of responding to and reproducing the tones in pitch of sounds, possessing the capability, when operated on by a proper transmitter, of responding to and reproducing the more delicate variations that constitute quality; that it was merely a new use when a receiver which had responded to a transmitter of tone or pitch was placed in connection or combination with a transmitter capable of transmitting quality or articulate speech. I have already called attention to the fact that the potential possibility of a disk held in close proximity to an electro-magnet was old. It existed in a rudimentary state in the Morse telegraph, and has not only been described in such publications as those of Bourseul and others, but it was long known that the armature or diaphragm would respond to the increased or decreased energy of the electro-magnet in connection with the electric circuit. Not only this, but it was believed and so expressed by scientific men and published in publications that if the circuit could be controlled by some proper device or transmitter articulate speech could be transmitted and reproduced by the receiving-disk. But between these speculations and the discoveries which realized them there lay long regions of invention. When it is recalled to mind how near Reis came to discovering the telephone, what a slight apparent line lies between his transmitter and the microphone-transmitter of Berliner—so near, indeed, that the former sometimes, without the knowledge of its inventor, may have operated on the principle of the microphone and sent across the circuit a stray word or syllable, and, in the light of more recent knowledge, can be adjusted to act as a microphone—we can appreciate how near men may approach to great discoveries without finding them, and what distances in invention sometimes separate necessities or speculations that are almost contiguous.

If it can be said that there is no invention or patentable difference between a receiver which, by reason of want of skill and knowledge, can only reproduce tones, and one which, by the invention of a proper transmitter, can reproduce quality, and that the new relation or adjustment of the latter is only a new use of the former, then we may go back and say of the former that there is no patentable difference between it and the Morse receiver, or that described by Bourseul and others, and that its use as a tone-receiver is only a new use; for the old diaphragm placed in close proximity to the electro-magnet possessed all the qualities and potentialities of the Bell or Gray diaphragm; but between these stages of development there was invention. As well might it be said that the reversing of the magneto-receiver and using it as a transmitter was merely a new use of it and disclosed no invention. In my judgment no broad claim for a magneto-receiver can be maintained. It must be limited to its relation to the transmitter with which it is combined, for between such a combination that will transmit and reproduce pitch alone and one that will do this and also transmit quality or articulate speech there is great invention. The history of the subject, the vain and failing efforts of scientific and learned men of genius for years, demonstrate this, no less than the philosophical and scientific principles involved. If, however, issue G could properly bear the construction given it by the Examiner of Interferences, it will not avail Gray; for if he were allowed to take dates of invention for a receiver of tone or pitch, so should also the other parties to the interference. Edison and McDonough had made inventions of receivers which would reproduce pitch, and of course their tone-receivers possessed the same capabilities as to new uses, quality, &c. It is unnecessary to dwell at any length upon the evidence relating to the efforts of these various parties, as the construction of the issue cannot be maintained and was reversed by the Examiners-in-Chief. It is sufficient to say that it is doubtful if Gray ever conceived the invention prior to his caveat; but admitting that he did, even earlier than Bell or McDonough, he never reduced it to practice or gave the public the benefit of it, nor did he prosecute it diligently by efforts to reduce it to practice, or by filing an application. Consequently it is impossible for him, upon his own statement of facts, to overcome Bell's record date.

The Examiner of Interferences awarded priority to McDonough, holding that he had first conceived the invention in May, 1875, and had been diligent in prosecuting it up to the filing of his application, April 10, 1876. This decision was subsequently reversed by the Examiners-in-Chief, who awarded priority to Bell and whose decision was affirmed by Commissioner Butterworth; but this need not be considered further here, as it relates to McDonough's case, between whom and Bell the controversy remains. In any event Gray cannot succeed in this issue.

The proper construction given the issue by the Examiners-in-Chief and the Commissioner does not affect Gray's status with reference to it. If priority could not be awarded to him under the former construction, it could not be under the latter, for under the latter, as already shown, his earliest date is that of his caveat, which fails to overcome Bell's record date.

Upon these considerations, Gray's petition to set aside the orders, &c., in the interferences and open up the case anew must be denied.

MCDONOUGH'S CASE.

McDonough's application was filed April 10, 1876, for

a teleloge, or far-speaker. He did not claim to have invented a method of transmitting articulate speech:

The object of my invention is to provide a *means* for transmitting articulate sounds from one place to another through the medium of electricity; and it consists in the combination, with an electrical battery, circuit-wires, armature, magnet, and circuit-breaker, of a transmitting and a receiving membrane or sounding apparatus. * * *

My invention also consists in the novel construction of the circuit-breaker, as hereinafter more fully described.

His original claims were as follows:

1. The combination, with the battery, circuit-wires, magnet, armature, and circuit-breaker, of the transmitting-membrane A and receiving-membrane F, substantially as and for the purpose specified.
2. The combination, with the plates C C, of the circuit-breaker D', whereby the circuit is alternately opened and closed by the vibrations of the membrane A, substantially as specified.
3. The combination of the bolt D and adjusting-nut E of the circuit-breaker D', substantially as and for the purpose specified.

April 28, 1876, his claims were rejected upon reference to the "old Reis telephone." His claim to the receiver was rejected upon reference to Bell's patent, No. 174,465. March 4, 1878, McDonough amended his specification, adding, among other things—

The breaking of contact may be rendered more abrupt and the contact rendered more perfect by a drop of water or oil.

He also struck out all the claims and inserted the following:

The combination, with the membrane A, plates C C, the circuit-breaker D', of the bolt D and adjusting-nut E, *for confining the vibrations* of the membrane against the circuit-breaker, substantially as specified.

At the date this application was filed the principle of the microphone had not been discovered or applied; but at the time this amendment was filed it had been and was known. The change by the amendment whereby the nut E was given what se. med a new function, not originally contemplated, "for *confining* the vibrations of the membrane against the circuit-breaker," was regarded by the Office as a departure from the original invention and as an attempt to adopt or incorporate the new feature of the microphone. Accordingly, on March 8, 1878, the Office replied as follows:

The amended claim, filed March 4th, it is thought may be allowed. The matter introduced at the end of the specification by this amendment is, however, held to be new matter, as it describes modifications nowhere adverted to or shown in the application as originally filed. This matter should consequently be erased.

This claim involved nothing but the peculiar construction of the *circuit-breaker*, and thus left the application without any claim to a receiver or other element in the telelogue or telephone. From that date until the present time no other claim has been presented.

On March 26, 1878, the interferences were declared and notices issued to the parties. Under the practice then and ever since existing McDonough could not have been put into interference with Bell and no issue could have been formulated between their inventions, for the reason that McDonough claimed nothing shown or claimed in Bell's patent. He was brought into the interference in consequence of the fact that applicants whose cases were filed later than his, (Edison, Gray, and others,) made claims to elements in the telephone which he showed, but did not claim. In other words, when rejected upon reference to Reis, and to Bell's patent, McDonough submitted to the rejection and voluntarily eliminated the claims, much as a suitor in court dismisses certain counts in his declaration; but inasmuch as his application still showed a so-called "telephone" he was put into interference with Gray and others, so as to compel them to establish that they made their inventions earlier than that shown by McDonough. His position was therefore one of obstruction to Gray and other later applicants, but not to Bell, whose application was earliest in the Office. It would, seem therefore, a natural and necessary consequence, inasmuch as there could be no interference between McDonough and Bell alone, that when Gray and the later applicants were defeated and taken out of the interferences there could be left no interference or contest between the former two. Especially would this seem to be true in view of the fact that McDonough had expressly avoided an interference with Bell by dismissing his claims. Not only did he do this, but afterward, August 20, 1879, he wrote the Office, among other things—

I should like to ask a question, if not improper. Having fully *described* in my application, filed April 10, 1870, a *speaking*-telephone, am I not fully concerned in the case of interference A? By answering you will oblige, &c.

He was informed that he could not properly be a party in case A, and that if he thought otherwise he should make proper motion, &c.; but he took no action whatever.

McDonough's preliminary statement, filed May 1, 1879, is as follows:

James W. McDonough, being duly sworn, deposes and says that he is one of the parties to the above-entitled interference; that he conceived the idea of a *telephonic receiver* consisting of the combination in an electric circuit of a magnet, a diaphragm supported and arranged in close proximity thereto, whereby sounds thrown upon the line may be reproduced as to pitch and quality, and also constructed a practical instrument as early as 31st of December, 1867; that subsequently, on the 20th of August, 1871, this deponent made drawings of a speaking-telephone embodying his said ideas, and that thereafter, on the 30th day of June, 1875, this deponent reduced the same to practice by constructing and operating a speaking-telephone, substantially as shown and described in his said application.

It is insisted by McDonough's counsel that this in itself constitutes a claim to a receiver and relieves his case of the difficulty referred to. It will be observed that by the award of priority Gray and all the later applicants for whom the interferences were declared have been fully disposed of. They are no longer parties, and McDonough is now seeking to reopen the contest as between himself and Bell, when upon his application no such contest could have been originally declared. Nor, under the rules of practice, so long as his present petition stands, can McDonough amend so as to justify such a contest.

I am not prepared to hold that McDonough is barred of this right to petition, in view of the condition of his case. Had he not originally dismissed his claims voluntarily and acquiesced in the rejection at a time when he knew the telephone was going into public use there probably would have been no question as to his right to amend within a reasonable time so as to claim the receiver; but having voluntarily eliminated his claims at a time when his alleged receiver was going into public use, and allowed eleven years to elapse without any other effort to amend or file a divisional application including the claim, a very different case is presented. At the date of his preliminary statement the invention had been in public use for over two years, and this, as just stated, with a voluntary cancellation of his claims.

I am not willing to dispose of the petition upon this ground, or hold that, even if McDonough could reopen the interference as to Bell and secure an award of priority, he could not amend; but the situation is suggestive. A patent to McDonough under these circumstances would dominate the entire telephone inventions as far as now of any commercial value, and it is certainly a serious question whether an applicant who has canceled his claims and apparently abandoned them, under the circumstances stated, ought to be

permitted, after the invention has been introduced and made valuable, to reinstate his claims and receive the benefit of others' enterprise, energy, and capital. While it may be said that all through the interferences he has been contending for his receiver, and this was public notice that he had not abandoned it, yet, as already stated, this was done in a controversy with the later applicants.

It is from his application alone that there can be ascertained what an applicant's claims are, and this showed, at least as to Bell and those claiming through him, that McDonough had acquiesced in the references cited in the rejection, Bell being one of them, had canceled the claims, and allowed them to remain so canceled, and in 1879 had his attention called specifically to the subject of the general interference A, with a statement that he could not be made a party to it.

While it may be that this condition of McDonough's case is not such as to constitute a bar to the relief sought in his petitions, it certainly suggests that his right to the relief should be most convincing before it should be granted.

THE PETITIONS.

The petition signed by counsel as attorneys for the North American Telephone Company *et al.* is so vague and general that it could not be considered in the civil courts either as a motion for rehearing or an assignment of errors. It assigns the following:

First. The interferences were fraudulent and collusive and carried on in the interest of Bell, &c.

This has been fully disposed of in Gray's case, where it more appropriately belongs. McDonough is not in a situation to raise the objection. In interference G there was a contest between himself and the Bell Company, as assignee of all the important inventions. It is true that he also had given the Bell Company an executory agreement to transfer his invention to that company, but it was conditional upon securing his patents, so that he still retained the title so as to support his demand for the consideration whenever the condition thereto should be performed. He was a proper and active party. Although much was said in argument about a conspiracy and combination between Bell and others to conduct the interferences in the interest of Bell, the evidence does not support the charges. Indeed, it is impossible to see how McDonough can avail himself of such a charge. It is asserted, by implication at least, that the Bell Company undertook or were in some manner under obligation to aid him (McDonough) in the contest to secure his patents; but clearly there is nothing to justify such an idea. In the agreement of November 2, 1880, on which $5,000 was paid McDonough, it is expressly provided: "This agreement is not to be taken as any manner of admission by either party as to the validity or invalidity of claims made by the respective parties." This was executed long after the declaration of interferences, after the settlement of the Dowd case, and when McDonough knew well that the respective parties were preparing to establish, if possible, their claims to priority. At that date the Bell Company had become the owner of the important inventions of Edison and others, and had secured a hold upon McDonough by virtue of this contract. However much that company might prefer to secure an award to Bell, it is clear that its status could not be injured by securing, as assignee, a patent to the person whom the Patent Office should adjudge the prior inventor, for it would then hold both patents. In any event, there is nothing in the statute, the practice, or in reason why the Bell Company, as assignee of Edison and other inventors, should not contend for such priority as they deemed right and proper; nor is there anything in the relation between McDonough and that company upon which he can found complaint that such course has been pursued by it. He was simply a party to the interference, interested in establishing his own priority. In contested litigations each party necessarily looks after his own case, and cannot complain that the adverse parties do not assist him, or do not forego their own interests. Such proceedings are open and public, and before they can be attacked some actual fraud or wrong on the part of the successful party must be shown whereby the right of the losing party has been prejudiced or by which he was prevented from fairly presenting his case.

It is in view of these propositions that McDonough insists that the Dowd record, to which he was not a party, and in which the testimony of witnesses whom he never had opportunity to cross-examine was taken, was stipulated into the interference without his knowledge and consent; but the record shows that this stipulation was made by his own attorney, and that long before the trial of the interferences and at a time when he could have interposed objection he was made aware of the fact and was furnished with a copy of the record. At no time did he interpose objection or make any movement to strike the Dowd record out of the case or seek to examine the witnesses. A client is bound by what is done by his attorney in the course of conducting and managing his cause in court. He is presumed to know what is done by his attorney and to authorize it; but here it is shown that McDonough was advised in time to have recovered from the position if there had been anything objectionable or improper in it. It may be, as suggested, that, not being a lawyer, and relying upon his attorney, he did not personally read and inspect the voluminous record, nor understand what it contained; but this will not avail here. If he is unwilling to be bound by the acts of his attorney, then he must act for himself, and cannot plead his own failure as a justification. Especially cannot he do so after trial in support of a motion for a new trial.

As to the difference between the paragraph found in the memorandum of settlement and the formal contract of November 10, 1879, I am not able to perceive that any importance can attach to it. It is immaterial whether in preparing the original draft there was present the idea of submitting the question of interference to the Patent Office or not. If it occurred to the parties afterward, when they came to put the memorandum in formal shape, it was proper to insert it. The interferences had been declared a year before and were pending. It was necessary to dispose of them. Issue G was a seriously contested matter. The Dowd case was still pending in court. To add to the paragraph the words—"Subject to the orders of the courts and the decisions of the Patent Office," was certainly appropriate in view of the situation in which the contracting parties were placed.

The second and third assignments of error relate to the question of priority of invention and the effect of

Bell's patent, and will be disposed of hereafter, with the consideration of the merits.

The other petition, signed by McDonough, assigns the following causes for the relief asked, viz: Reopening interference G and granting leave to furnish proofs in regard to operativeness, &c.

First. Error on the part of Commissioner Butterworth in considering certain affidavits of Professors Brackett and Young, taken and used in the suit of *The Bell Telephone Company* v. *The Overland Telephone Company*, but which were not part of the record in the interferences. It appears, however, that these affidavits were read, or parts of them were read, by the respective counsel of McDonough and the Bell Company without objection from either, so that, although not taken regularly or formally in the interference proceeding, they were used therein. Of course, this being so, it cannot be complained of by either party as error.

Second. That the Commissioner decided the interferences with a determination not to decide the issue adversely to Bell. This has been disposed of in the Gray case, where the objection was made that the Commissioner's decision was not a "deliberate" decision. There is nothing to justify the idea or suggestion that the decision was made with any predetermination in either direction.

Third. That, having denied, in his decision of January 16, 1885, the motion to reopen the case and remand McDonough's application to the Primary Examiner on the question of operativeness, there was error in his final decision in not taking further steps to investigate the operativeness of McDonough's invention; also, in considering the affidavits of Young and Brackett in the Overland case. The decision of Commissioner Montgomery, of March 29, 1887, disposes of this so far as it relates to operativeness, although I hold that this question inheres in Commissioner Butterworth's final decision and can now be properly urged in McDonough's motion for a rehearing as to that. It will be considered hereinafter in connection with the merits of the petitions. As to the affidavits of Young and Brackett, that question is disposed of above.

The remaining assignments of error relate to the operativeness of the invention and the merits of McDonough's case, and will be considered under the general subject of—

MERITS.

From what has been shown it is clear that McDonough has never claimed to have been the original inventor of the telephone, either the method or the apparatus. This appears clearly from his specification in his application and his preliminary statement. In the former he limited his claim to a little device for making and breaking the circuit—according to Reis. In the latter he claimed the magneto-receiver. He calls himself a mere improver upon Reis's instruments, accepting him as the original inventor. In presenting the petitions under consideration his counsel, Mr. Hurd, says:

In 1874-'5 "there were two classes of applicants before the Office—those who recognized Professor Reis as the inventor and whose efforts and attention were directed exclusively to the development of his instruments and the operation of the methods which he described by which speech might be transmitted." Of these McDonough was probably the most prominent.

So, also, Mr. Ingersoll, after stating that the first point in the investigation is whether the evidence absolutely shows that Reis's telephone, as invented by him, will speak, adds:

The importance of that is perfectly manifest from the further fact that McDonough claims an improvement on that system, so that the first question is, Will the Reis telephone talk? Was it intended to be and is it a speaking-telephone?

It will be remembered that Reis's receiver is what is known as the "knitting-needle" receiver—a bar of iron within the coil of the circuit-wire and affected by the make and break in the circuit. The only improvement presented by McDonough is to substitute his diaphragm and magnet for this knitting-needle receiver. He had never conceived of the undulatory current or the variable resistance, but accepted and still accepts the make-and-break system of Reis as the foundation of his invention. The Examiner of Interferences, the Examiners-in-Chief, and the Commissioner have held that articulate speech cannot be transmitted by means of the Reis instruments as made and described by him and as made and described by McDonough. In other words, it has been and is the settled judgment of the Patent Office that speech cannot be transmitted by any instrument which operates solely by the making and breaking of the circuit according to Reis. This also has been definitely settled with reference to Reis by the Supreme Court of the United States in the telephone cases:

But it is needless to quote further from the evidence on this branch of the case. It is not contended that Reis had ever succeeded in actually transmitting speech, but only that his instrument was capable of it if he had known how. He did not know how, and all his experiments in that direction were failures. With the help of Bell's later discoveries in 1875 we now know why he failed. * * *

We have not had our attention called to a single item of evidence which tends in any way to show that Reis or any one who wrote about him had it in his mind that anything else than the intermittent current caused by the opening and closing of the circuit could be used to do what was wanted. No one seems to have thought that there could be another way. All recognized the fact that the "minor differences in the original vibrations" had not been satisfactorily reproduced, but they attributed it to the imperfect mechanism of the apparatus used rather than to any fault in the principle on which the operation was made to depend.

It was left for Bell to discover that the failure was due not to workmanship but to the principle which was adopted as the basis of what had to be done. He found that what he called the intermittent current—one caused by alternately opening and closing the circuit—could not be made under any circumstances to reproduce the delicate forms of the air vibrations caused by the human voice in articulate speech, but that the true way was to operate on an unbroken current by increasing and diminishing its intensity. This he called a vibratory or undulatory current, not because the current was supposed to actually take that form, but because it expressed with sufficient accuracy his idea of a current which was subjected to gradual changes of intensity exactly analogous to the changes of density in the air occasioned by its vibrations. Such was his discovery, and it was new. Reis never thought of it, and he failed to transmit speech telegraphically. Bell did, and he succeeded. Under such circumstances it is impossible to hold that what Reis did was an anticipation of the discovery of Bell. To follow Reis is to fail, but to follow Bell is to succeed. The difference between the two is just the difference between failure and success. If Reis had kept on he might have found out the way to succeed, but he stopped and failed. * * *

So as to James W. McDonough. We presume that it will not be claimed that he is entitled to more than he asked for in his application for a patent, filed April 10, 1876, and there a "circuit-breaker," so adjusted as to "break the connection by the vibrations of the membrane," is made one of the elements of the invention. The Patent Office was clearly right in holding that he had been anticipated by Reis.

The question must now be regarded as finally settled in the Patent Office. The fact that certain patents have been issued to persons *ex parte* by the Patent Office, whether erroneously or inadvertently, which appear to recognize a different opinion cannot change a deliberate conclusion thus reached in a contested matter after full consideration.

It must also be recognized as settled that if an occasional word was ever transmitted by the Reis instrument the result was due to the fact that the instrument, at the moment it happened, failed to operate in accordance with the principle of its construction; the make and break did not occur; the contact of the electrodes remained, and the instrument

secretly and without Reis knowing the fact operated upon the principle of the microphone, which was not yet discovered.

It must also be recognized as settled that if an instrument constructed according to Reis and as described by McDonough in his application can now be made to transmit speech it must be by means of adjustment of the electrodes so that it operates, not upon the make-and-break principle, as described, but upon that of the microphone, which has been discovered since Reis made his invention.

Now this distinction is not one of mere theory or speculation, but of principle or knowledge and specific construction of the invention. Under the patent law, invention is not recognized in the mere doing of something new or the accomplishing of some new result. A new and valuable product may be accidentally discovered and produced and the discoverer not be able to recall the steps of his process or reproduce the product. There is the first specimen. It is new, concrete, tangible, and useful; but there is no invention within the meaning of the patent law. Though the operator has made the product, he does not know how it was made and cannot explain the process to others.

The accidental effects produced in Daniell's water-barometer and in Walther's process for purifying fats and oils preparatory to soap-making are of the same character. They revealed no process for the manufacture of fat acids. If the acids were accidentally and unwittingly produced while the operators were in pursuit of other and different results, without exciting attention, and without its even being known what was done or *how it had been done*, it would be absurd to say that this was an anticipation of Tilghman's discovery. (*Tilghman* v. *Proctor*, 102 U. S., 711.)

To constitute invention it is required by the statute that the inventor shall possess knowledge of the very construction of the instrument or means and of its mode of operation, so that he can communicate the same to the world and enable others, pursuing the very directions pointed out, to construct the same instrument or means, operate it in the manner pointed out, and accomplish the same result. This Reis could not do as to this instrument, for his description of construction and operation was that the electric current must be broken and closed, whereas, to make it transmit speech, the very opposite was required, viz: That the electrodes should remain in contact, so that the microphonic principle of variable resistance could operate. His knowledge was such as would lead the world in directly the opposite direction from that required to produce the desired result, and would show others how not to do it. The true construction and necessary mode of operation remained in the secret arcana of nature until discovered later on. They were not discovered when McDonough filed his application in which, in compliance with the statute, section 4888, he attempted—

A written description of the same (his invention) and of the manner of making, constructing, (compounding,) and using the same, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains or with which it is most nearly connected to make, construct, (compound,) and use the same; and in case of a machine he shall explain the principle thereof, and the best mode in which he has contemplated applying that principle, so as to distinguish it from other inventions, &c.

What has been said of Reis is equally true of McDonough. He built upon the palpable make-and-break system. The fatal vice of giving the wrong description and directions is in his application, and he can never depart from what was and is now in it. If his teleloge has ever talked or can now be made to transmit speech, it must be changed in its construction and mode of operation, so as to become a microphone; or if by the light of later knowledge and experience the makes and breaks, instead of being palpable and of full amplitude, are rendered inappreciable, so that its mode of operation is different, the original invention becomes lost in a newer and later one, which must be presented in a new and later application.

McDonough presents a number of affidavits and statements of scientific persons who testify to having been able to make the Reis telephone transmit articulate speech. He has also presented evidence that tends to show that his original instruments did so; but did they do so *in the mode pointed out* by Reis or, by McDonough in his application? These witnesses do not so testify. Most of them simply undertook to make a telephone, constructed like Reis's, talk without regard to the principle, the mode, or the description given by Reis. It may be conceded that anyone skilled in the art can, in the light of present knowledge, accomplish this; but it proves nothing, except that those who know how can so adjust and arrange the Reis transmitter that it ceases to be a make-and-break device which will not transmit quality, and becomes a microphone, which will. The only witnesses produced by McDonough who claim to have been able to transmit speech by means of a Reis instrument, when called upon to explain the conditions, practically concede this. If, therefore, Reis never invented a telephone or transmitter capable of transmitting articulate speech, if the art of transmitting speech by a transmitter was unknown, and McDonough makes no claim to have invented more than a receiver to co-operate with a Reis transmitter, what reason is there to open up the interference to enable McDonough to introduce evidence of operativeness, that the Reis transmitter does transmit quality? He could without doubt produce witnesses to testify that they to-day could make the Reis transmitter transmit quality; but is it not clear that that is not the question at all? The question is: Did Reis possess, and does McDonough's application show, the knowledge of the principle of construction and mode of operation which explains the transmission of speech, (if they ever did transmit it,) and which, without later knowledge and discoveries of others, could have communicated that knowledge to the world? This question has already been sufficiently answered in the negative.

What has been said in Gray's case in regard to the claim that a receiver of multiple tones is also a receiver of quality, because of its potential qualities of responding to every variation in the magnetic and electrical force, is equally pertinent in its application to McDonough's receiver. This appears to have been the view of the Examiner of Interferences, at least this result would seem to follow the adoption of his views; but the Examiners-in-Chief and the Commissioner disposed of the matter as stated.

Say the Examiners-in-Chief:

Gray formerly insisted, and Edison and McDonough still insist, that not only the art is of their invention, but the apparatus also, and it is only by including an articulating-transmitter in this issue that the question of priority as to the receiver can properly be determined.

If the construction of the issue given by the Examiner of Interferences is to prevail, and priority be awarded to a party who had no articulating-transmitter, it would result that an experimenter who had tried to transmit speech and failed, or one who had never tried, should so dominate the art that an inventor who had worked out the idea, patented his process of carrying it out, introduced it to the public, and put it into extensive use, could not practice the art which he had created without being tributary to his unsuccessful rival.

This construction of the issue was insisted upon by McDonough throughout the interference, not only

when Bell moved to reform the issue before Commissioner Paine, but ever since, up to the present petitions. Not only is it the correct construction, but McDonough cannot, at this late hour, ask to have a different one given to it as a ground for rehearing.

As frequently stated by me, in view of the state of the art when McDonough's application was filed, no one could secure a broad claim for a receiver, *per se*. A receiver of tone or pitch would not have been patentable in the absence of the invention of a transmitter which would transmit tone; and while it is true that a receiver of quality will necessarily respond to tone, yet the reverse is not necessarily true. As to such a receiver, it is dependent upon a transmitter through the umbilicus of patentable combination and necessary union, and cannot be said to have been discovered or invented until a transmitter of articulate speech had been invented or discovered. It is insisted, however, by counsel for McDonough that speech was occasionally transmitted by the transmitter constructed after Reis; and whether it occurred accidentally and was attributed to the wrong cause or mode of operation, it was articulate speech, reproduced and delivered by the magneto-diaphragm receiver; and that while McDonough might have been ignorant of the mode of operation of the transmitter he was not of that of the receiver, whose functions had long been known. This, however, is, in effect, a complete reversal of all that McDonough had insisted upon heretofore, and eliminates the articulating-telephone from the issue and leaves remaining only a receiver. Why McDonough insisted upon the former construction of the issue—unless he thought it the correct one—does not appear, except he may have feared that as to a mere receiver Edison, Gray, or Voelker might antedate him. Evidently he cannot be permitted to secure an award upon a limited issue which puts all his adversaries out of the case and then insist upon another and broader construction for himself. Not only this, but the relation between the receiver and transmitter is such that the invention is not complete as to the receiver until it is as to the transmitter also. They are one, in the conception and completion of invention, and cannot be divided or separated. It could not be known that such a receiver would reproduce quality until a transmitter could be found to transmit it. If quality were transmitted accidentally and only occasionally, it could not be certainly and absolutely known but that the failure to transmit regularly and when desired was due to a defect in the receiver. In other words, it required a result which could be controlled and relied upon, which could be repeated at will, and that the construction and mode of operation should be known and understood, as required by the patent law. This involved the transmitter as well as the receiver, and until a transmitter had been made which would successfully transmit speech, whose construction and mode of operation were understood, there could be no invention of a receiver, within the meaning of that law. It is urged most strenuously, however, that this question of operativeness is one belonging to McDonough's case *ex parte;* that in the interference the Office is bound by the action of the Primary Examiner who declared the interference, and that the only mode of considering or reviewing that question is to remand the case to the examiner and give McDonough an opportunity to be heard and present proofs before him. Further, it is insisted that when the right to a patent is denied for want of operativeness or utility, it must be by rejection by the Primary Examiner, giving the applicant his right of appeal; but this view cannot be maintained. The Commissioner, as the ultimate head of the Patent Office, has the power to withhold a patent which in his judgment ought not to issue; but the present question does not depend upon the power. There are two modes of rejecting an application: one upon references, want of utility, &c., as an *ex parte* case; the other through the procedure of interference. The former may be appealed from the Commissioner to the Supreme Court of the District of Columbia; in the latter, the decision can be reviewed only by a bill in equity.

The statute requires an interference to be instituted whenever in the opinion of the Commissioner there is pending an application which interferes with another or with an unexpired patent. This interference was declared at a time when the nature of the telephone was not so well known and understood as now. I am not prepared to say but that a motion to dissolve should have been sustained if urged upon the ground that McDonough and some others of the parties did not disclose an operative invention. A motion to reform was made, which, had it been sustained, might have remanded McDonough's case to the Primary Examiner; but he opposed the motion and insisted upon the interference and elected that mode of trial. The trial has progressed through several years, and a final decision has been reached. There is not the slighest doubt that in determining the question of priority, in such interference proceeding, it is right and proper for the Commissioner to determine and pass upon the entire merits of each invention involved, including utility, operativeness, &c. The very question involved is: When did the respective parties first make the inventions set forth in the issues? If the evidence shows that one of the parties never made any invention, as defined in the statute, and consequently is not entitled to an award of priority, while another party did and is so entitled, the Commissioner is unquestionably authorized to so decide and award priority of invention accordingly. He possesses the power in such case to dissolve the interference if he thinks best to do so; but he is not required to do it. In cases of doubt, when he is not certain as to the want of operativeness, he may very properly suspend or dissolve the interference, remand and make the case *ex parte*, giving the right of appeal, so that the question could come back to him illuminated by the action of the Primary Examiner and the Examiners-in-Chief. If the doubt as to operativeness should be resolved in favor of the applicant, the interference would be reinstated and decision made accordingly; but where there is no doubt, when the question is one settled in the Office, settled in a number of circuit courts, and by the Supreme Court of the United States, such a course cannot be seriously considered.

This is all that is asked by McDonough. His petition is, in effect, a motion to dissolve and be permitted to establish to the satisfaction of the Patent Office the operativeness of the invention. He claims that, in consequence of the collusion and the manner in which the interference has been conducted, he has been deprived of an opportunity to do this. It is expressly stated by his counsel that—

> It is not supposed to be possible in another hearing that any addition to the testimony could be made.

He was offered on the hearing before me an opportunity to present any experiments or tests proving his case; but none were submitted.

The question of collusion has been disposed of. The record shows that Bell in taking his testimony directly attacked the operativeness of McDonough's invention, and he had knowledge of the fact personally, as well as by counsel. He had ample time allowed him to rebut this evidence and establish all he could; but he took no such evidence. Neither did he ask the Office to enlarge the time, nor did he make any motion in that direction. Having had all these opportunities and neglected them, he cannot now complain if he is denied any further time; but it would not avail him if it were given. The alleged fact is incapable of being established. It thus appears that McDonough's application has received the consideration provided for it under the statute. The interference has been pending since 1878. Final decision was rendered by the Commissioner on March 3, 1885, in which it was held that McDonough had never invented a speaking-telephone, and consequently was not entitled to an award of priority as against Bell, who had. The present petitions ask me to vacate this decision, remand the case, &c. It is to be disposed of upon the principles applicable to new trials.

I am not convinced that there has been any error or mistake in the former decision; but, on the contrary, I am satisfied that another trial would necessarily result in the same conclusion. McDonough's petitions are therefore denied.

EX PARTE GRAY.

(Case No. 3.)

Decided February 23, 1889.

1. AMENDMENT REFUSED.

   Applicant proposes to amend his claim so as to limit his invention to a metallic diaphragm, and such amendment has been refused admission.

2. RIGHT TO AMEND LOST.

   When the Office has called the attention of an applicant to his right to cover in his claim certain specific matter and advised him to amend accordingly, and the applicant, declining to do so, enters into an interference contest upon the broad issue, in which he is finally defeated, he cannot, after acquiescing for a long period in such award of priority and waiting nearly ten years after filing his application, return to the Office for the purpose of proposing the amendment suggested by the Office and declined by him, and which, if admitted, would result in a new interference.

3. DECISIONS ON ISSUE IN INTERFERENCE CONCLUSIVE.

   The tribunals adjudicating the interference discussed and considered the specific invention and intimated that a motion to dissolve and re-form the issue would be entertained; but applicant declined to avail himself of the suggested remedy. *Held* that the decisions, involving the very question presented in the amendment now insisted upon, are final and conclusive upon Gray's right to claim the subject-matter presented in the proposed amendment.

4. DEFECTS CURED BY VERDICT.

   It is a fundamental principle in the common law of pleading that when there is any defect, imperfection, or omission, whether in substance or form, which would have been a fatal objection upon demurrer, (motion to dissolve or re-form,) if the issue joined be such as necessarily required on the trial proof of the facts so defectively or imperfectly stated or omitted, or without which it is not to be presumed either that the judge would have directed the jury to give or the jury would have given the verdict, such defect, imperfection, or omission is cured by the verdict.

5. SAME.

   In the matter of issues in interferences there is no rule applicable except that which provides the motion to dissolve. Clearly, however, when an issue has received a construction as to its meaning by the court and has been tried under that construction and the parties have acquiesced in it the case becomes one in which the issue must be held to be complete and to read according to the construction thus given it.

6. ADJUDICATION OF PETITIONS TO REOPEN CONCLUSIVE AS TO PROPOSED AMENDMENT.

   The adjudication of the petitions to reopen the interference is conclusive as to the subject-matter of the proposed amendment.

PETITION to amend.

TELEPHONES.

Application of Elisha Gray filed October 29, 1877.

Mr. M. B. Philipp and *Mr. Casey Young* for the applicant.

HALL, *Commissioner:*

This application was filed October 29, 1877, and on the 26th of March, 1878, was put into interference with Bell's patent of March 7, 1876, and applications of Dolbear, Edison, McDonough, and others. Two of the issues were as follows:

ISSUE G.

A telephonic receiver consisting of the combination, in an electric circuit, of a magnet and a diaphragm supported and arranged in close proximity thereto, whereby sounds thrown upon the line may be reproduced accurately as to pitch and quality.

ISSUE J.

The combination, with an electro-magnet, of an iron or steel diaphragm secured to a resonant case for rendering audible acoustic vibrations.

Issue G is a broad claim for a telephonic receiver consisting of *any* diaphragm supported and arranged in close proximity to the magnet in an electric circuit. Issue J embraces as an element specifically an iron or steel diaphragm.

Such proceedings were had in the interferences that the Examiner of Interferences gave an award of priority in issue J to Bell on July 26, 1879. Gray acquiesced in this decision, and has never appealed from it, though on December 30, 1886, 7 years afterward, he presented a petition to the Commissioner of Patents asking to have all the orders and decisions in the interferences set aside and a new trial granted. This will be more clearly seen by a reference to the decision of this date in the interferences.

In issue G priority of invention was awarded to McDonough by the Examiner of Interferences. Gray and Bell appealed to the Examiners-in-Chief, where the decision was reversed and priority was awarded to Bell October 23, 1884. Upon appeal by Gray and McDonough this decision was affirmed by Commissioner Butterworth March 3, 1885. Subsequent proceedings in reference to this issue are set out in the decision in the interferences above referred to.

Pending the petition for rehearing in the interferences Gray presented an amended claim February 23, 1887, which was not admitted or entered, probably because the effect of his petition was to preserve the pendency of the interference, during which amend-

ment affecting the issue cannot be made. April 4, 1887, Gray presented a second amendment waiving inferentially the first. It is as follows:

The combination, substantially as hereinbefore set forth, in an electric circuit, of a magnet and metallic diaphragm supported and arranged in close proximity thereto, whereby sounds thrown upon the line may be reproduced accurately as to tone, pitch, and quality.

Issue G was framed upon Gray's original claim—

The combination, substantially as hereinbefore set forth, in an electric circuit, of a magnet and a diaphragm supported and arranged in close proximity thereto, whereby sounds thrown upon the line may be reproduced accurately as to tone, pitch, and quality.

It will thus be seen that the only difference between the two claims is that the latter covers *a* (*any*) diaphragm, while the former is limited to a metallic diaphragm.

Prior to the filing of Gray's application Bell had taken out his two patents, Nos. 174,465 and 186,787, the former containing a broad claim for a diaphragm generically and the latter a specific claim for the metallic diaphragm. January 30, 1878, Gray's claim was rejected upon Bell's patent, No. 186,787. Subsequently this was withdrawn and the rejection made upon Bell's patent, No. 174,465. This was because the latter contained the broad claim. In the letter of rejection the Office called Gray's attention specifically to the metallic diaphragm, and advised him that if he desired to make a specific claim to the metallic diaphragm he should do so. He declined to do this, although his application showed the metallic diaphragm, and in his specification he states that he prefers to use such a diaphragm. In his letter to the Office, March 20, 1878, he stated that he intended "to contest the matter in its broadest scope."

The declaration of interferences followed, in which, among other issues, were formulated G and J. From this statement it will appear that it became necessary for the examiner, in preparing the interferences, to frame two issues, one covering the broad or generic claims and one covering the specific claims, for while Bell claimed each in his patents, and Gray, claiming the invention broadly, only showed the specific construction, yet there were other parties behind or later than Gray who showed and claimed the specific construction—the metallic diaphragm. It was to meet this necessity that issues G and J were framed, Gray and Bell being parties to each.

The decision of issue G disposed of the broad or generic claim in favor of Bell. It so happens that without a metallic diaphragm the telephone cannot be made commercially valuable; and while Bell's broad claim would dominate the specific metallic-diaphragm-claim, yet the latter would really be the controlling one, without which the other would be of little use.

Now, in this condition of the case, nearly ten years after the filing of his application, nearly four years after the decision of issue J, and not quite two years after the final decision of the Commissioner in issue G, Gray tendered this amendment and asked to be allowed to claim the metallic diaphragm. Notwithstanding Gray's petition to reopen the interferences was on file, this amendment was referred by my predecessor to the examiner for report, who made a favorable report April 6, 1887. Upon my succeeding to the position of Commissioner I resubmitted it to the examiner. It appeared that possibly the amendment might affect the interests of parties under the adjudications in the interferences. Accordingly, notice was given to Bell to appear and be heard, if he desired, upon the question as to how far Gray was concluded by the adjudications and whether they precluded him from filing this amendment and setting on foot a new interference. Objection was made by Gray that at this time his case was *ex parte*, and the Office had no right or power to bring Bell in or give him notice of the claim; but this view did not prevail. It was known that if the amendment were admitted it would result in a new interference, which would at once disclose Gray's claim to Bell, and in view of the long and expensive proceedings in the interferences which had been closed, it was deemed best to have a full hearing before opening them up again on an *ex parte* motion. The result was that the case was fully argued before the Primary Examiner, who advised against admitting the amendment. It was fully argued before the Commissioner and is now to be disposed of.

Gray claims the right to amend because his application is still pending, undisposed of. He insists that the right to amend is given by statute; that the amendment was not admissible pending the interferences, which were only disposed of March 3, 1885; that he tendered an amendment February 18, 1887, which was within two years succeeding the last action of the Office; that from this date he was entitled to two years longer to appeal from the action of the Office refusing to admit the amendment, or to take such other appropriate action as he saw proper; that he filed another and different amendment, and in consequence his application is not abandoned, and that he is entitled to action upon it.

Bell introduces the record and adjudications in the interferences and in effect pleads them in bar of this amendment. The entire record is before me in support of the plea. Bell also insists that the inventions of Gray belong to the Bell Telephone Company; that Gray's case is abandoned, and that in the exercise of a proper discretion the Commissioner ought to deny Gray's motion to amend.

The case was argued orally at great length, and elaborate briefs, showing great research, have been presented to aid me in disposing of the questions involved. The record discloses the fact that in the interferences Gray has introduced all the evidence attainable, so far as concerns his invention, whether we consider a membranous diaphragm with an armature or a metallic diaphragm, "the blacking-box receiver," "the wash-basin receiver," or "the tin-cup receiver," and whether the issue be a generic claim to *any* diaphragm-receiver or a specific claim to a metallic diaphragm-receiver. It also appears clearly that in declaring the several interferences the examiner endeavored to formulate them in such a way as to cover the whole subject of the telephone and all its elements as shown and claimed by the various parties. The situation was such that it was the duty of the examiner in formulating the issues to frame one covering a receiver, consisting of a magnet, a metallic diaphragm, &c., for it was shown in all the applications later than Gray and claimed by one of them, as well as by Bell in his second patent. That issue J was intended to meet this requirement there is little doubt. If it does not, then an issue that would meet it ought to have been framed. While it is true that primarily the examiner prepares and formulates the issues, yet a duty also rests upon the parties with respect to the matter. The rules provide that they may move to dissolve the interference or to remodel or reform the issues. They bear much the same relation to the issues that suitors do to feigned issues in equity.

In the interferences the evidence was taken and introduced, as if every possible question were presented. It was argued, apparently, upon the same general presumption. That this is true is clearly shown by the elaborate decision of the Examiner of Interferences:

Now, it is true all of the parties to this count describe receivers containing an electro-magnet and an iron or steel diaphragm secured *to a resonant case*, but not to *a resonator*, such as Edison's, nor are they adapted to respond only to a given series of electrical impulses. Gray shows the diaphragm attached to a flaring, bell, or trumpet-shaped case. Dolbear fastens his diaphragm to a rigid frame or support, K, and says: "A bonnet or tube, t, may be attached to the frame K, as shown, or in any other convenient manner; *but, although it facilitates speaking and hearing, it is not essential to the successful operation of the instrument.*" Holcombe, speaking of his instrument, says: "I find it *convenient* for but *not absolutely necessary* to the satisfactory performance of the instrument to have a box to partially inclose the disk, and also to have a tube or mouth-piece which shall direct the voice more effectually upon the vibrating or transmitting disk. * * * When the instrument is used as a receiver, this mouth-piece or tube can be applied to the ear, and serves to concentrate upon the ear the sounds evolved from the receptive and vibrating disk."

Richmond's transmitter is provided with a strained metallic diaphragm, above which extends "a removable speaking tube or channel, through which the sound it is desired to transmit is conveyed to the diaphragm," and he mentions placing an electro-magnet under this diaphragm to convert it into a receiver, and Bell employs a metallic diaphragm fixed to a rigid support with a cover, and what he terms a "speaking-tube."

From the circumstance that all of the parties mention the use of a resonant case or tube, though totally unlike Edison's in purpose and function, it might be inferred that the term "resonant case," as employed in the declaration, comprehended any and all such devices, whether used to confine and direct sound-waves or as an analyzer to respond to a given series. This would be the logical conclusion deduced from the facts as they appear, were it not for the alleged interfering claims of Bell and Dolbear, which are said to comprehend the same subject-matter as Edison's claim, and hence should contribute in an equal degree to its definition.

Bell's third claim relates to the combination of an electro-magnet with a plate of iron or steel or other material capable of inductive action, so arranged as to be thrown into vibration by sound-waves or the attraction of a magnet. No reference whatever is made to the resonant case or tube, nor does the specification warrant its inclusion as a necessary element. It was properly included in cases I and J, because of the reference to its action as transmitter and receiver.

Turning next to Dolbear's third claim and the absence of a resonant case is equally apparent. He mentions it in his specification as a useful but non-essential element, and claims: (3.) "One or more helices or coils, included in the circuit of the main line, and surrounding a core or cores, in combination with an elastic inductive plate or armature facing the poles of said core or cores, and a rigid support or frame to which the opposite edges of said plate or armature are secured."

Were it not for the specific reference to Edison's "resonant case for rendering audible acoustic vibrations," a middle ground common to all of the parties might be found in the combination, with the electro-magnet, of an iron or steel diaphragm secured at its edges to a rigid support or frame, and adapted to render audible electric waves or undulations traversing the electro-magnet; but such a construction, while supported by Dolbear's claim 3, is at variance and totally irreconcilable with Edison's *invention* as expressed in his claim and the declaration. No proper and legitimate interference is believed to exist between the parties hereto on Edison's claim. It refers and pertains to a different system, device, combination, and purpose from anything disclosed by the other parties. It is not coextensive with, nor does it include, the invention claimed by Bell and Dolbear.

Inasmuch as Edison's claim, when restricted to the invention described by him, is insufficient to support the declaration, but two alternatives are present, either to report the case for dissolution or give to the claim a fictitious value. As the parties are at liberty to move for a dissolution, it is thought best to proceed with the case, and, if possible, so construe the terms of the count as to include matter common to the patent and the several applications.

To satisfy all the conditions the instrument may be either a producer or reproducer of sound, for Edison develops the former capacity only, while the remaining parties employ the latter. The diaphragm must be of iron or steel, because Bell's first patent describes a membrane diaphragm; and the diaphragm must be secured at its edges to a resonant case, which latter may be, *first*, a resonator adapted to pick out and respond to a given series of electrical waves as described by Edison; or, *second*, a conveyer for confining and directing all series and characters of sound-waves as described by the remaining parties.

Such is believed to be the only rational and consistent interpretation that can be given to the declaration and at the same time create an interference. * * *

It results from this condition of affairs that the inventor of a device consisting of an electro-magnet and a diaphragm fastened to the end of a resonator, and used in connection with a reed or harmonic transmitter, with whose rate of vibration the column of air is in accord, the whole being so arranged, adjusted, and used that the tones produced by the vibrations of the transmitter shall alone be rendered audible; that the inventor of such a device, adapted and used only as an acoustic or harmonic telegraph receiving-instrument, may claim and thereby subordinate an instrument, which, although it includes the diaphragm and electro-magnet, is so constructed and used that, instead of responding to one tone only, as produced by a vibrating reed with which its resonator is made to accord, responds to any and all tones not produced but transmitted by an instrument under the influence of sound-waves.

Yet such would be the legitimate outcome of this interference were it proved that Edison's invention of the devices shown and described in his application antedated the inventions of the other parties.

It appears, however, from the evidence adduced that Edison's Exhibits A and A', relied upon in support of his claim, were no more than abandoned experiments, abandoned for no other reason than because they were found to be incapable of satisfactorily performing their alloted duty, and were regarded as of no value.

None of Gray's instruments made in 1874, 1875, or 1876 are proved to have possessed the features in issue. Dolbear's suggestions of October, 1876, as to the substitution of a sheet-iron diaphragm for the rubber and iron, as applied to the tube, were not carried out in the instruments commenced in December, 1876, and finished in February, 1877.

Irrespective of the construction of the instrument, which seems to have been about the time the application for the second patent was filed, it is evident that Bell had practically made the invention when he suggested and applied the first iron diaphragm. He had invented and applied all the other elements, and the iron diaphragm was to take the place of the membrane diaphragm previously employed.

Priority of invention is accordingly awarded A. G. Bell on this count.

Although Gray did not appeal from the decision of the Examiner of Interferences in issue J, he did in issue G, and must have known at once what the decision was in issue J, as between Bell and Edison.

The Examiners-in-Chief adopted the construction placed upon the issue by the Examiner of Interferences. They say:

The problem presented by this state of facts is how to construe the issue so that Bell's patent, the applications of the other parties, and the three claims of Bell, Edison, and Dolbear may be held to cover the same subject-matter, for it is evident that if Edison's application and claim alone be the guides there would be no interference. It is true the dissolution of the interference might be recommended, but, remembering the present advanced stage of the case, the failure of any of the parties to whom all of these matters have long been known to seek dissolution in the manner described, and, above all, the controlling fact that this proceeding was instituted, and by common consent has been conceded to have been instituted, to try the question of the inventorship of the speaking-telephone, it is thought best to pursue the course adopted by the Examiner of Interferences, and award priority upon a meaning given to the issue which will best accomplish this end. If either party feels aggrieved by this course, his remedy is ample. The effect of the adoption of a contrary course is so clearly set out by the examiner that we quote his language entire:

"It results from this condition of affairs that the inventor of a device consisting of an electro-magnet and a diaphragm fastened to the end of a resonator, and used in connection with a reed or harmonic transmitter with whose rate of vibration the column of air is in accord, the whole being so arranged, adjusted, and used that the tones produced by the vibrations of the transmitter shall alone be rendered audible, that the inventor of such a device, adapted and used only as an acoustic or harmonic telegraph receiving-instrument, may claim and thereby subordinate an instrument which, although it includes the diaphragm and electro-magnet, is so constructed and used that, instead of responding to one tone only, as produced by a vibrating reed with which its resonator is made to accord, responds to any and all tones not produced but transmitted by an instrument acting under the influence of sound-waves.

"Yet such would be the legitimate outcome of this interference were it proved that Edison's invention of the devices shown and described in his application antedated the inventions of the other parties."

To obviate this difficulty two constructions of the issue are presented—one by the decision of the Examiner of Interferences and the other by the argument for Bell. Both of them may be here stated: The former is, in effect, an instrument for rendering audible acoustic vibrations, consisting of an electro-magnet and an iron or steel diaphragm secured at its edges to a resonant case consisting either of a resonator which picks out and responds to a given series of electrical waves, or a conveyer which confines and directs all sound-waves, the latter a speaking-telephone receiver consisting of an electro-magnet and an iron or steel diaphragm mounted on a suitable support.

Though this latter construction appears to be more in accordance with the spirit of this interference and the recognized purpose for which it was declared, it in fact makes little difference which is adopted. In either case the establishment of Edison's contentions would give him an award of priority. * * *

It thus appears that in either view which may be taken of the meanings of this issue Edison has neither overcome Bell's record dates nor gone beyond his ascertained date of invention.

It thus clearly appears that issue J was construed and decided as covering a speaking-telephone receiver consisting of an electro-magnet and an iron or steel diaphragm mounted on a suitable support. Not only this, but it also appears that in determining the issue the Examiner of Interferences gave consideration to the whole of Gray's evidence. He discussed and considered the claims of Gray as they were predicated upon each of his specified receivers containing his alleged metallic diaphragms, and he awarded priority to Bell over Gray and the other parties. Gray acquiesced in this decision until he presented his petitions to reopen the interferences. These petitions having been disposed of, the adjudication is conclusive as to the subject-matter of the present amendment. If there was error on the part of the Examiner of Interferences in giving to the issue the construction he did and in not taking steps to have the issue re-formed, it could have been corrected by appeal to the Commissioner or by moving to have the issue re-formed. It was as much the duty of Gray to move in these directions as of the Office or the other parties. Unquestionably it would have been better and more satisfactory to have had the issue put in better shape; but it was allowed to stand, and must be allowed to stand as a final adjudication. Not only this, but the construction given to the issue was favorable to Gray according to the claims he then made and the claims to invention he now urges. So far as is known, he may himself have been largely instrumental in convincing the examiner and inducing him to accept this very construction of the issue. Some of the other parties to the issue possibly might have had just grounds for complaint at the construction. For instance, Edison might have insisted upon a patent for his resonant case receiver, notwithstanding priority was given to Bell under this construction upon the ground that as to his receiver he was not a proper party to the interference; but he made no motion to re-form the issue, nor has he made any complaint. The same is true as to Gray. Although the Examiner of Interferences suggested the difficulty, as did also the Examiners-in-Chief, and intimated that it might be a case for a motion to dissolve and re-form the issue, yet both Gray and the other parties acquiesced, and Gray declined to appeal from the decision of the Examiner of Interferences, so that as to him the decision is final and conclusive. It was a decision upon a well-understood issue, involving the very question presented in the amendment now insisted upon, and to which issue the whole evidence in the case was directed. If the amendment shall be admitted, it would result in a new interference with the same patent of Bell. Without doubt a new and better issue would be framed; but it would be precisely the same in meaning, scope, and effect as issue J, as construed, tried, and determined.

It is a fundamental principle in the common law of pleading and is recognized in all code pleading that where there is any defect, imperfection, or omission in any pleading, whether in substance or form, which would have been a fatal objection upon demurrer, (motion to dissolve or re-form,) yet, if the issue joined be such as necessarily required on the trial proof of the facts so defectively or imperfectly stated or omitted, or without which it is not to be presumed either that the judge would have directed the jury to give or the jury would have given the verdict, such defect, imperfection, or omission *is cured by the verdict*. (Chitty on Pleading, 16 Am. Ed., and notes.)

In the matter of issues in interferences there is no rule applicable except that which provides the motion to dissolve. Clearly, however, where an issue has received a construction as to its meaning by the court and has been tried under that construction and the parties have acquiesced in it the case ceases to be one of defective pleading, and becomes one in which the issue must be held to be complete and to read according to the construction thus given it.

The decision of the Examiner of Interferences upon issue J, thus construed, read, and understood, is conclusive upon Gray's right to claim the subject-matter presented in the proposed amendment. (*Harlow* v. *Guernsey*, C. D., 1875, 47; *Whiteley* v. *McCormick*, C. D., 1870, 229; *Beloit* v. *Morgan*, 7 Wall., 619; *Cromwell* v. *Sac County*, 94 U. S., 352; *Wilson's Executors* v. *Deen*, 121 U. S., 525.)

The subject-matter of this amendment was not only involved in issue J and claimed there, but it was adjudicated as a matter of *fact* in issue G, and, under well-settled principles recognized in the decisions just cited, such an adjudication is conclusive.

In issue G Bell's broad claim to a receiver was involved. The examiner gave him as the date of his invention the date of the filing of his application—February 14, 1876. Gray attempted to establish priority by introducing evidence of his metallic diaphragms in 1874 and 1875 or at any time earlier than February 14, 1876. If he had established by his proof that he had invented the metallic-diaphragm receiver at an earlier date, this would have entitled him to a broad claim to any receiver, for whoever invents a species at the same time invents the genus; but it was expressly found and decided by the Examiner of Interferences, the Examiners-in-Chief, and the Commissioner that Gray did not make such invention and complete it so as to take priority over Bell's date of February 14, 1876. They also expressly found that Gray did nothing toward completing any invention involved until long after Bell's second patent was applied for and issued. These findings are based upon Gray's testimony, which (as he states) is all that he can produce relating to the metallic-diaphragm receivers—the "blacking-box receiver," the "wash-basin receiver," and the "tin-cup receiver."

These adjudications and findings cannot be reviewed by me here. I must accept them as correct, just, and conclusive, for the reason that in the interference proceedings I have been called upon to make such review and re-examination, and have not been able to see my way clear to disturb them.

It follows that Gray's motion to amend is denied and the amendment refused.

Sub-Classes Established.

(ORDER No. 533.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., February 28, 1889.

The following sub-classes are hereby established under Class 75, Metallurgy, Division III:

Blast-furnaces, charging devices.
Blast-furnaces, charging devices, bell-and-hopper.
Blast-furnaces, protecting walls.
Blast-furnaces, tymps and slag-spouts.
Charcoal, kilns.
Charcoal, processes.
Charcoal, retorts.
Coke, ovens.
Coke, ovens, charges and dischargers.
Coke, ovens, doors.
Coke, ovens, dumping-bottoms.
Coke, processes.
Coke, retort-ovens.
Cupolas, drop-bottoms.
Cupolas, fore-hearths.
Cupolas, water-jackets.
Cupolas, wind-chests and tuyeres.
Finery fires.
Gas-furnaces, steam-boiler.
Leers, grids.
Mechanical puddlers, rotary hearths.
Mechanical puddlers, tools.
Melting-furnaces, open-hearth.
Puddling-hearths, chills and bottoms.
Puddling-hearths, doors and bits.
Roasters, blasting.
Roasters, hearths.
Roasters, hearths, rotary.
Roasters, revolving retorts.
Roasters, muffles.
Roasters, stirrers, endless-chain.
Roasters, stirrers, reciprocating.
Roasters, stirrers, rotary.
Roasters, stirrers, screw.
Reverberatory furnaces, fire-boxes.
Reverberatory furnaces, heating air.
Reverberatory furnaces, necks and chimneys.
Reverberatory furnaces, water walls and roofs.
Slag.
Slag, disintegrating.
Slag, heaters.
Slag, separators, centrifugal.
Hot-blast valves.

The titles of the following sub-classes in the same class are changed to read:

Blast furnaces, accessories, to *blast furnaces*.
Calcining kilns to *roasters, kilns*.
Furnaces, annealing, to *leers*.
Furnaces, cupola, to *cupolas*.
Furnaces for heating blanks to *furnaces, blank*.
Furnaces, melting, pot-furnaces, to *furnaces, melting, pot-hearths*.
Furnaces, melting, tank-furnaces, to *furnaces, melting-tank*.
Furnace-protecting, fire-brick, to *fire-brick*.
Furnaces, puddling, to *puddling-hearths*.
Furnaces, shaft and shelf, to *roasters, shaft and shelf*.
Furnaces, slag, to *slag-heaters*.
Iron and steel, direct, furnaces, to *iron and steel, direct, apparatus*.
Iron and steel, direct, retort-furnaces, to *iron and steel, direct, retorts and hearths*.
Mechanical puddlers and tools, to *mechanical puddlers*.
Regenerators, continuous or double surface, to *regenerators, double surface*.
Regenerators, discontinuous or single surface, to *regenerators, single surface*.

The following sub-classes are abolished:

96. Blast-furnaces, bells.
8. Coke and charcoal.
10. Furnace-protecting.
11. Gas-furnaces.
88. Gas-furnaces, heating air.

It is also directed that a sub-class of *Wipers* be established in Class 96, Coating with Metal.

BENTON J. HALL,
Commissioner.

Issue of March 12, 1889.

DESIGNS.

18,951.—RECEIVING-CARD.—*David Lawrence Clinton*, Clintonville, Conn. Application filed December 22, 1888. Serial No. 294,429. Term of patent 3½ years.

18,952 and 18,953.—TRIMMING.—*Johann C. F. Edelmann* and *Alphonse H. Kursheedt*, New York, N. Y., assignors to *The Kursheedt Manufacturing Company*, same place. Applications filed January 21, 1880. Serial Nos. 297,102 and 297,103. Term of patents 7 years.

18,954.—WIRE SCREEN.—*Alonzo J. Griffin*, Wilkes-Barré, Pa. Application filed January 22, 1889. Serial No. 297,201. Term of patent 3½ years.

18,955.—ADVERTISING-FRAME.—*William H. Hardin*, New York, N. Y. Application filed January 29, 1889. Serial No. 298,033. Term of patent 7 years.

18,956.—HINGE.—*William H. Hart* and *Thomas Corscaden*, New Britain, Conn, assignors to *The Stanley Works*, same place. Application filed January 26, 1889. Serial No. 297,687. Term of patent 14 years.

18,957.—DRESS-TRIMMING.—*Joachim Maidhof*, New York, N. Y. Application filed February 13, 1889. Serial No. 299,741. Term of patent 3½ years.

18,958.—BED-PAN.—*Irene H. Ovington*, Brooklyn, N. Y. Application filed October 12, 1888. Serial No. 287,965. Term of patent 7 years.

18,959.—ORNAMENTATION OF GLASSWARE.—*Frederick S. Shirley*, New Bedford, Mass. Application filed November 24, 1888. Serial No. 291,817. Term of patent 7 years.

18,960.—PICTURE SUPPORT.—*Seymour A. Curtis*, Stratford, Conn. Application filed February 13, 1889. Serial No. 299,743. Term of patent 3½ years.

18,961.—FOOT WARMER OR SUPPORT.—*John B. Doyle*, Lansingburg, assignor of one-half to *Jerome F. Young*, New York, N. Y. Application filed February 8, 1889. Serial No. 299,198. Term of patent 7 years.

18,962.—ARTIFICIAL FEATHER.—*Hugo H. Plaut*, New York, N. Y. Application filed January 19, 1889. Serial No. 296,948. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,357.—SPROAT-HOOKS AND OTHER FISH-HOOKS.—*Samuel Allcock & Co.*, Redditch, county of Worcester, England. Application filed January 24, 1889. Used since October, 1873.
"The representation of a stag or deer in an erect position."

16,358.—CARPENTERS' PENCILS.—*American Lead Pencil Company*, Hoboken, N. J. Application filed January 29, 1889. Used since 1884.
"The words 'MECHANICS' FAVORITE.'"

16,359.—CARPENTERS' PENCILS.—*American Lead Pencil Company*, Hoboken, N. J. Application filed January 29, 1889. Used since 1884.
"The words 'CARPENTERS' PET.'"

16,360.—CARPENTERS' PENCILS.—*American Lead Pencil Company*, Hoboken, N. J. Application filed January 29, 1889. Used since 1884.
"The words 'CARPENTERS' FRIEND.'"

16,361.—CARPENTERS' PENCILS.—*American Lead Pencil Company*, Hoboken, N. J. Application filed January 29, 1889. Used since 1884.
"The words 'AUNTY HUB.'"

16,362.—CHEWING AND SMOKING TOBACCO.—*Arnold, Carlton & McCord*, Atlanta, Ga. Application filed February 4, 1889. Used since April, 1866.
"The bust-picture of JEFFERSON DAVIS."

16,363.—OINTMENT.—*Hutchins C. Cady*, Columbus, Ohio. Application filed February 6, 1889. Used since December 1, 1888.
"The word 'MONONA.'"

16,364.—SIZING FOR FABRICS.—*The Gloy Manufacturing Co.*, London, county of Middlesex, England. Application filed August 10, 1887. Used since 1881.
"The word 'GLOY.'"

16,365.—BLANK ACCOUNT-BOOKS.—*Samuel W. Goldberg*, Dallas, Tex. Application filed January 18, 1889. Used since August 1, 1888.
"The word 'MATURITY.'"

16,366.—STEAM-EXHAUST HEADS.—*Wilfred C. Lyman*, Chicago, Ill. Application filed February 4, 1889. Used since 1869.
"The word 'LYMAN.'"

16,367.—PREPARED WHALEBONE.—*Francis E. Merriman*, Boston, Mass. Application filed January 21, 1889. Used since 1876.
"The representation of a right whale swimming on the surface of the water and in the act of spouting, and in connection therewith the word 'ARCTIC' and representation of a row-boat one of whose occupants is standing and preparing to throw a harpoon."

16,368.—REMEDIES FOR FEMALE COMPLAINTS.—*Charles O. Prosser*, Westerly, R. I. Application filed January 12, 1889. Used since January 1, 1864.
"The words 'BARKO UTERINE.'"

16,369.—METAL-POLISHING PASTE.—*Walter J. Ramsay*, New Bedford, Mass. Application filed January 25, 1889. Used since June, 1888.
"A three-quarter front view of a pair of horses at speed drawing a steam fire-engine and the following-named letters of the alphabet disposed about it—viz., the letter 'M' at the left of the picture, the letter 'S' at the top, and the letter 'P' at the right of the same."

16,370.—HOSE OF RUBBER, COTTON, OR LINEN.—*Revere Rubber Company*, Boston, Mass. Application filed February 2, 1889. Used since December 1, 1888.
"The word 'TRIDENT.'"

16,371.—HOSE OF RUBBER, COTTON, OR LINEN.—*Revere Rubber Company*, Boston, Mass. Application filed February 2, 1889. Used since December 1, 1888.
"The word 'CRESCENT.'"

16,372.—HOSE OF RUBBER, COTTON, OR LINEN.—*Revere Rubber Company*, Boston, Mass. Application filed February 2, 1889. Used since December 1, 1888.
"The word 'NAVY.'"

16,373.—WOOD-PRESERVING OIL.—*Adolf Wingenroth*, Mannheim, Baden, Germany. Application filed November 14, 1888. Used since December 15, 1887.
"The representation of an eagle."

16,374.—TOILET WATERS AND LOTIONS.—*Zobel & Failmezger*, Brooklyn, N. Y. Application filed February 4, 1889. Used since November 1, 1887.
"A bust-picture of PROFESSOR DR. G. JAEGER."

16,375.—KEROSENE-OIL.—*William Briscoe & Son*, London, county of Middlesex, England. Application filed October 24, 1887. Used since September 2, 1878.
"The representation of a trident with the word 'DOMESTIC' above and the letters 'B B B' below."

16,376.—COTTON LININGS.—*Burton Bros. & Co.*, New York, N. Y. Application filed February 9, 1889. Used since January 2, 1889.
"The word 'ETRUSCAN.'"

16,377.—SIRUP FOR THE CURE OF ASTHMA.—*Mary A. Cunningham*, St. Albans, Vt. Application filed February 9, 1889. Used since October 21, 1888.
"A monogram of the letters 'C A S.'"

16,378.—NEWSPAPER OR WEEKLY PAMPHLET.—*Manufacturers' Record Company*, Baltimore, Md. Application filed February 6, 1889. Used since November 23, 1882.
"The words 'MANUFACTURERS' RECORD.'"

16,379.—MEDICINE FOR EXTERNAL USE.—*Fanny G. Mass*, Brooklyn, N. Y. Application filed February 7, 1889. Used since January 1, 1880.
"The fac-simile signature 'MRS. G. MASS.'"

16,380.—FIRE-BRICK, STOVE-LININGS, AND ARTICLES MADE WHOLLY OR PARTLY OF FIRE-CLAY.—*Francis A. Ostrander*, Troy, N. Y. Application filed February 8, 1889. Used since June 14, 1888.
"The letters 'OB' in monogram form."

16,381.—BEER.—*The Phillip Best Brewing Company*, Milwaukee, Wis. Application filed April 10, 1888. Used since April or May, 1882.
"A band of red crossing a label or similar field obliquely from one corner to the other."

16,382.—GAS-BURNER TIPS.—*Draper Manufacturing Company*, North Attleborough, Mass. Application filed January 24, 1889. Used since November 15, 1888.
"The representation of a gas-burner tip with jet of flame, and sole of a human foot and plain capital letters 'D. M. C.' appearing in the flame."

16,383.—FRESH AND PICKLED EGGS.—*Mackenzie, Chase & Co.*, New York, N. Y. Application filed January 10, 1889. Used since 1869.
"The initials 'R. P. B.'"

16,384.—CIGARS.—*Clifton G. Sauerhammer*, Littlestown, Pa. Application filed February 9, 1889. Used since December 1, 1888.
"The words 'MA' DIX' and the monogram 'C G S'"

16,385.—CONFECTIONERY.—*Philip Wunderle*, Philadelphia, Pa. Application filed March 3, 1868. Used since September, 1867.
"The representation of an open scroll with a seal thereon."

LABELS.

5,843.—Title: "M. BEHREND & SON'S DESCRIPTIVE SCHOOL BOOK LABELS."—*M. Behrend & Sons*, New York, N. Y. Application filed February 6, 1889.

5,844.—Title: "WARRANTED GENUINE WHALEBONE."—*Francis E. Merriman*, Boston, Mass. Application filed January 21, 1889. (Trade-Mark Registered.)

5,845.—Title: "THE STANDARD METAL POLISH."—*Walter J. Ramsay*, New Bedford, Mass. Application filed January 25, 1889. (Trade-Mark Registered.)

5,846.—Title: "SIEKE'S RECIPE FOR RHEUMATISM AND GOUT."—*Anthony Sieke*, New York, N. Y. Application filed February 15, 1889.

DISCLAIMERS.

219,464.—*Philip Hake*, Hoboken, N. J. IMPROVEMENT IN VISITING-CARDS. Patent dated September 9, 1879. Disclaimer filed March 6, 1889, by the patentee.

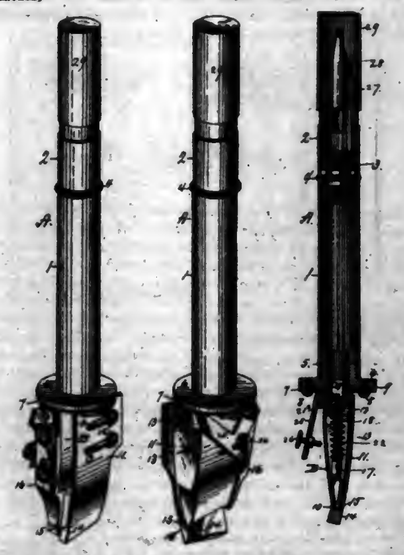
Enters his disclaimer to the second claim of said patent, which is in the following words, to wit:

"2. A stationer's card having all the edges beveled from one face and the cut surface sized, metal-coated, burnished, and embossed, as herein specified."

PATENTS

GRANTED MARCH 12, 1889.

399,232. FASTENING FOR RAILWAY-STRINGERS. DUNCAN ATWOOD, Milwaukee, Wis. Filed Dec. 11, 1888. Serial No. 293,250. (No model.)



Claim.—1. The combination, with the ties of a railway and stringers resting thereon, of metallic straps placed over said stringers and fastened at the ends to the ties on which they are seated, substantially as and for the purposes set forth.

2. The combination, with the stringers of a railway and cross-ties on the tops of which the stringers are supported, of inverted-U-shaped metallic straps perforated at the ends and center, and spiked or bolted through said perforations to said ties and stringers, substantially as and for the purposes set forth.

3. The combination, with the ties of a railway, of rail-supporting stringers spiked or bolted to the tops of said ties, and inverted-U-shaped straps turned outwardly at right angles at the ends, and seated upon and secured to the ties on opposite sides of said stringers, substantially as and for the purposes set forth.

4. The combination, with the ties of a railway, of rail-supporting stringers supported upon said ties, and inverted-U-shaped straps turned outwardly at the ends, seated upon and fastened on opposite sides of the stringers to the ties and sunk into the upper sides of the stringers, substantially as and for the purposes set forth.

399,233. PANELING AND STRIPING IMPLEMENT. ANDREW J. AVERY, Norway, Me. Filed Oct. 24, 1888. Serial No. 289,090. (No model.)

Claim.—1. In a paneling implement, the combination, with a hollow handle, of a shell formed with an ink-slot in its end, a spring-actuated plunger in the shell adapted to set with its end in the slot of the shell, and a lever connected to the plunger to lift it from the slot in the end of the plunger, substantially as described.

2. In a paneling implement, the combination, with a hollow handle, of a shell formed with an ink-slot in its end, a spring-actuated plunger in the shell arranged to set with its end in the slot of the shell, a lever connected to the plunger to lift it from the slot in the shell, and an adjustable gage or guard fitted on the shell with its gage-piece adapted to close the slot in the end of the shell, substantially as described.

3. The paneling-instrument composed of the hollow handle, a shell formed with an ink-slot in its end, a spring-actuated plunger in the shell arranged to set with its end in the slot thereof, a lever connected to the plunger to lift from the slot in the shell, an adjustable guard or gage fitted on the shell, and a scoring-knife to score the sole of the shoe, substantially as described, and for the purpose stated.

4. In a paneling implement, the combination of an ink-holding tube, a shell on the tube having an ink-slot in its end, and a gage adjustably fixed on the shell, with the gage part formed to project below the end of the shell and having a channel to set over and close the slot in the shell, substantially as described, and for the purpose stated.

5. The paneling and striping implement consisting of a separable ink-tube having a partition at the point of separation, a paneling-tool fixed to one end of the tube, and a striping-tool fixed to the other end, substantially as described.

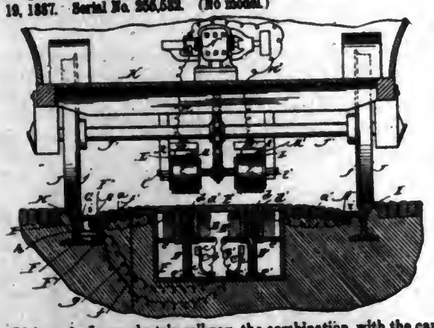
6. The combined paneling and striping implement, composed of a separable ink-tube having a partition at the point of separation, a paneling-tool fixed to one end of the tube, and a striping-tool fixed to the other end, said striping-tool consisting of a plug fixed in the tube, and a striping-tube projected through the plug, substantially as described.

7. The combined paneling and striping implement, composed of a paneling-tool, a striping-tool separably attached to the paneling-tool, and a handle having a gage-piece detachably connected to the striping-tool, substantially as described, and for the purpose specified.

399,234. VETERINARY MEDICAL APPARATUS. CYRUS H. BARR, Dwight, Ill. Filed Nov. 17, 1888. Serial No. 291,120. (No model.)

Claim.—The combination of the closed vessel B, having the perforations *a*, with the vessel A, substantially as and for the purpose set forth.

399,235. TALLY-SHEET. FREDERICK W. BARRETT, Springfield, Ohio. Filed Aug. 24, 1888. Serial No. 283,622. (No model.)



Claim.—1. An improved article of manufacture consisting of a principal tally-sheet having columns a' a^2, main body a^3, and total-column a^4, and having a crease between the column a^2 and the main page a^3, and another crease between the column a^4 and the main body a^3, and one or more other creases in said body, whereby the sheet may be folded over to bring the crease 4 in proximity to the crease 2, so that the total-column will follow at the right, the column a^2 bearing the phrase "Names of Persons Voted for."

2. In a combined poll-book and tally-sheet, the principal tally-sheet A, consisting of the columns a' a^2, main body a^3, total-column a^4, and having the creases 2, 3, and 4, the one 2 being directly on a line with the outside border-line of column a^2, the one 4 being on a direct line with the inner border-line of total-column a^4, and the one 3 being directly central between the creases or folding-lines 2 and 4, whereby the sheet A may be folded over to bring the inner boundary-line of the total-column on a direct line with the outer boundary-line of column a^2 or column headed "Names of Persons Voted for," substantially as set forth.

3. The principal tally-sheet A, having the columns a', a^2, a^3, and a^4 and creases or folding-lines 2, 3, and 4, located as described, the column a^4 terminating at a point considerably remote from the outer edge of the sheet A to form a margin or holding-strip, D, in combination with certificate pages or sheets c, to overlap the margin or holding-strip D when the tally-sheet is folded over to bring the total-column a^4 in close proximity to the column a^3 and hold the same pressed down, all substantially as shown and described.

4. The combination, in a poll-book and tally-sheet, of the principal tally-sheet A, having the columns a', a^2, a^3, and a^4, the creases or folding-lines 2, 3, and 4, the ones 2 and 4 being located on a line with the outer and inner edges of the columns a^2 and a^4, respectively, and the one 3 being central between the ones 2 and 4, as and for the purpose described, and having the projecting margin or holding-strip D, the supplemental tally-sheet B, having the crease or folding-line 5 directly central between the outer boundary-line of column a^4 of the sheet A when the same is folded over in close proximity to column a^3 and the outer edge of said sheet B, and the certificate-page C, creased and adapted to be folded over upon the margin or holding-strip D, with their inner edges directly aligned with the total-column a^4 when it is desired to certify to the number of votes taken, all substantially as and for the purpose described.

399,236. ELECTRIC RAILWAY. JOHN R. BLAIR, Chicago, Ill., assignor to himself and Ulric Bickenderfer, same place. Filed Nov 19, 1887. Serial No. 256,582. (No model.)

Claim.—1. In an electric railway, the combination, with the car, of a motor carried by it for propelling its wheels, an electrical connection between said motor and conductors along the car, contact bolts or cores adapted to be projected above the road-bed or track, the main conductor-connections between said conductors and the contact-bolts, and means for projecting said bolts or cores above the bed or track to complete the circuit through the motor, substantially as described.

2. The combination, with an electric motor carried by a car and having electrical connections with conductors along the car, of bolts or cores adapted to be projected above the road-bed or track, helices or coils around such bolts or cores, and means for completing a circuit to project the bolts or cores above the road-bed or track and form an electric circuit from a main conductor through the car-motor, substantially as described.

3. In an electric-railway system, the combination, with the road-bed or track, of helices or coils, bolts or cores having an axial motion through said helices or coils and above the road-bed or track, the main conductors and connections between the same and said contact-bolts, a circuit-closer, a car carrying a motor having electrical connections with conductors along the car, and a trip or arm on the car for operating said circuit-closer, substantially as and for the purpose described.

4. In an electric-railway system, the combination, with the road-bed or track, of a main conductor, helices or coils having electrical connection, bolts or cores through the coils and having an axial movement above the road-bed or track, and a circuit-closer, substantially as and for the purpose set forth.

5. In an electric-railway system, the combination, with the road-bed or track and a car carrying a conductor and a motor having electrical connections with the conductors, of a bolt or core adapted to be projected above the road-bed or track, electrical connections for influencing said bolt, and a circuit-closer, the said electrical connections and circuit-closer projecting said bolt and establishing a current through it while the car is passing over it and permitting it to drop and cutting off the current therefrom in its normal position after the car has passed, substantially as described.

6. In an electric-railway system, the combination, with the road-bed or track and a car carrying a conductor and a motor having electrical connections with said conductor, of a bolt or core adapted to be projected above the road-bed or track, a main conductor, a circuit-closer acted on by a part of the car, and electrical connections between the bolt and the circuit-closer and main conductor, substantially as described, for projecting the bolt and holding it projected and passing a current through it while the car is passing, and cutting off the current and permitting the bolt to drop to its normal position after the car has passed, substantially as described.

7. The combination, with the main conductor A, helix or coil B, spring C, and axially-moving bolt or core D, and wires a b, of contact-springs F and G, sliding pin H, and connecting-wire to the spring C, completing a circuit to project the bolt and complete a circuit from the main conductor through the coil and bolt, substantially as and for the purpose specified.

8. The combination of a main conductor, A, helices or coils B B', springs C C', sliding bolts or cores D D', and connecting-wires a b b', with the contact-springs F G, sliding pin H, and connecting-wires f g, for closing a circuit and projecting the bolts or cores to form a circuit from the main wire or conductor, substantially as and for the purpose specified.

9. The combination of the wire or conductor A, helix or coil B, spring C, axially-moving bolt or core D, contact-springs F and G, sliding pin H, conductors L, plate M, wire s, motor N, wire s', plate M', conductors L', axial moving bolt or core D', spring C', helix or coil B', and electrical connection between the main conductors, the helices, and the contact-spring, substantially as and for the purpose described.

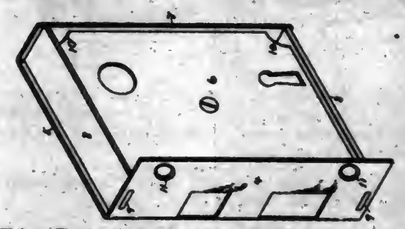
10. The combination, with a main conductor and a helix or coil connected therewith, of a bolt or core adapted to project above the road-bed or track, and a connection between the bolt or core and its helix or coil for completing the circuit from the main conductor through the bolts or core when the helix is energized, substantially as specified.

399,237. SHOE-CLASP. MELLEN N. BRAY, Boston, Mass. Filed Nov. 23, 1888. Serial No. 291,623. (No model.)

Claim.—In a buckle for securing together two sides or portions of a shoe or other article, the combination of a tongue-engaging plate having a plurality of transverse bars separating rectangular slots formed in said plate, said plate being constructed and adapted to be secured to one side or portion of the shoe or other article, a spring-plate secured by each end to the inner side of said tongue-plate and extending across the slots in said tongue-plate, and having formed in its surface next the tongue-plate a plurality of depressions or indentations corresponding in number and position to the bars in the tongue-plate, a hinge-plate constructed and adapted to be secured to the other side or portion of the shoe or other article, and a tongue in the form of a lever of the first order pivoted to said hinge-plate, the short arm of which lever is constructed to enter a slot in and engage with a bar of said tongue-plate, and provided upon its under side between its end and fulcrum with a projecting lug or detent constructed and arranged to snap into an indentation in said spring-plate when the long arm of the tongue is pressed down upon the slotted plate, and thus lock said tongue in closed position.

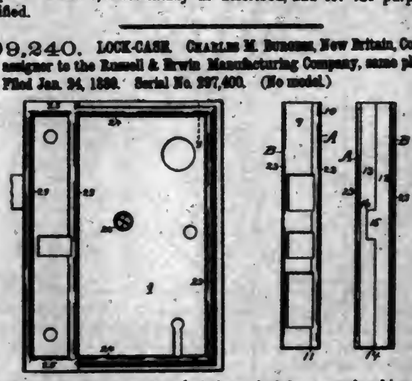
399,238. COMBINED SHIRT OR VEST AND SUSPENDERS. JOHN T. BROSNAN, New Orleans, La. Filed Aug. 27, 1888. Serial No. 282,998. (No model.)

Claim.—1. The combination of an under-garment having a re-enforce at each side of its front and another re-enforce at or about the center of its back, each re-enforce provided with a vertical slit,



399,238.

or with a series of vertically-arranged slits, as described, with the button-strap provided with devices for connecting it to the pants, and for connecting it adjustably directly with the slits in the re-enforce, substantially as described.



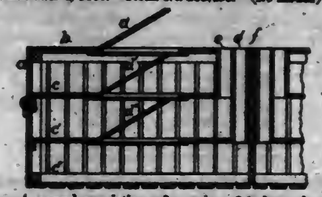
2. The combination of a shoulder-supported garment having a re-enforce at each side of its front and at or about the center of its back, the said re-enforces being each provided with a vertical slit, or with a series of vertically-arranged slits, as described, with the independent straps, each provided with an adjustable fastening device adapted to engage directly with the material of the re-enforce at each side of the slit and at any desired point thereof, substantially as described.

399,239. SHEET-METAL LOCK-CASE. CHARLES M. BURDSAL, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Jan. 24, 1888. Serial No. 267,392. (No model.)

Claim.—The herein-described sheet-metal lock-case, consisting, essentially, of the face-plate 4, lock-plate 5, rear edge plate, 7, all formed from a single piece of sheet metal, a cap-plate, and the top and bottom end pieces, 8 8, provided with tenons at each end, by means of which said top and bottom end plates are firmly secured to the parts 4 and 7, substantially as described, and for the purpose specified.

399,240. LOCK-CASE. CHARLES M. BURDSAL, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Jan. 24, 1888. Serial No. 267,400. (No model.)

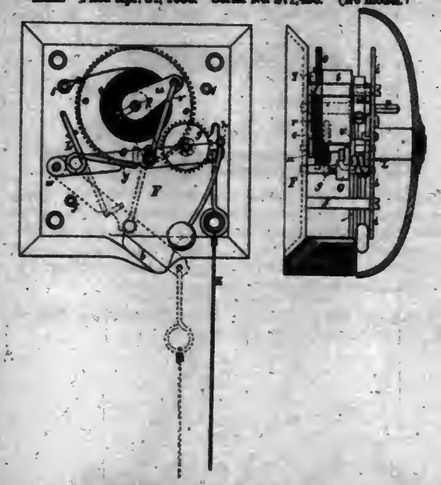
Claim.—1. The Janus-face lock formed of sheet metal and having its lock-plate and cap-plate ribbed or corrugated, substantially as described, and for the purpose specified.



2. A Janus-face sheet-metal lock having its lock-plate and cap-plate bent toward each other at their front vertical edges to form the face-plate, substantially as described, and for the purpose specified.

3. A Janus-face sheet-metal lock having its lock-plate and cap-plate bent toward each other at their vertical edges to form the face-plate and rear edge of the lock-case, substantially as described, and for the purpose specified.

4. In a Janus-face lock formed of sheet metal, the lock-plate and cap-plate provided with horizontal beads or corrugations at their upper and lower ends, in combination with the upper and lower end plates, whose edges are received within said corrugations, substantially as described, and for the purpose specified.



5. In a Janus-face lock, the hollow sheet-metal post 20 within the body of the lock-case and provided with the integrally-formed nut 21, for receiving the cap-screw, substantially as described, and for the purpose specified.

399,241. POUND FOR LOBSTERS. JAMES R. BURNS, Friendship, Me. Filed Jan. 4, 1888. Serial No. 295,430. (No model.)

Claim.—A pound consisting of a series of independent compartments arranged one above the other, each compartment having a door through which the fish can be removed, and chutes extending down from the top of the pound into each separate compartment, substantially as and for the purposes specified.

399,242. ALARM FOR DOORS, &c. HARVEY J. BURT, Maplewood, Mass. Filed Apr. 21, 1883. Serial No. 271,430. (No model.)

Claim.—1. The combination of the frame constructed as described and provided with the inclined stop, as shown, and having the bell-hammer-operative mechanism arranged therein, as represented, said mechanism consisting of the arbor p, mainspring t, and ratchet r, fixed thereto, gear o, revolubie thereon, pawl q, and spring t, connected to said gear o, the lantern pinion, escape-wheel, and shaft, the pallets and their shaft, with the arm O, pivoted in the frame connected with the arbor p of the mainspring by the arm u and link v, as shown, and having the actuating-wire E applied to it near its free end, all substantially as described and represented.

2. The combination of the frame constructed as described and provided with the inclined stop, and having the bell-hammer-operative mechanism arranged therein, essentially as set forth and represented, with the arm O, pivoted in the frame, connected, as shown, with the mainspring-arbor p, by the arm u and link v, and the take-up spring L, secured to the frame and applied to the notch j' of the arm O, as represented, the actuating-wire being attached to the said arm near its free end, all as shown, and for the purpose set forth.

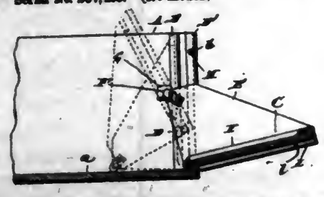
3. The back plate, F, constructed as shown, and provided with the inclined stop, in combination with a door-bell-alarm apparatus secured to said plate F and having the pivoted arm O, and the stop limiting the movement of the arm, as and for the purpose set forth.

399,243. MANUFACTURE OF PLUMBERS' TRAPS. ROBERT CLARKE, Gravesend, N.Y. Filed Oct. 12, 1888. Serial No. 287,909. (No model.)

Claim.—1. As a new article of manufacture, a plumber's trap having a body contracted at one end to form a neck provided with a cap, B, and at the other end to form the bottom in one piece with the body, with a central closing-plug at the bottom and with inlet and outlet pipes, substantially as set forth.

2. The within-described improvement in the manufacture of plumbers' traps, the same consisting in spinning down one end of a soft-metal tube to form the contracted neck of a trap-body, in spinning down the other end and forming a bottom in one piece with the body to close such end, with the exception of a central opening, and then plugging said opening, substantially as set forth.

399,244. TUBING. EDMUND C. CONVERSE, New York, N.Y. Filed Oct. 22, 1888. Serial No. 288,761. (No model.)

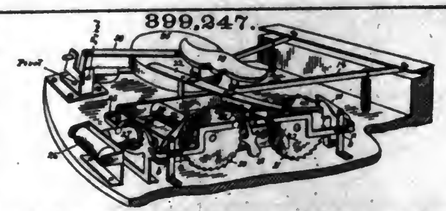


Claim.—A new article of manufacture, consisting in a drawn-iron or soft-steel tube having a soft metal or alloy compressed into and forming a composite alloy with the molecules of the metal of the tube, on the interior and exterior surfaces thereof, substantially as and for the purposes set forth.

399,245. MANUFACTURE OF TUBING. EDMUND C. CONVERSE, New York, N.Y. Filed Oct. 22, 1888. Serial No. 288,762. (No model.)

Claim.—The herein-described improvement in the art of forming tubing, consisting in coating the interior and exterior surfaces of the tube with a molten soft metal or alloy which will alloy with the metal of the tube, and then forcing the soft metal or alloy into the body of the tube and elongating it by cold-drawing the tube interiorly and exteriorly, substantially as and for the purposes set forth.

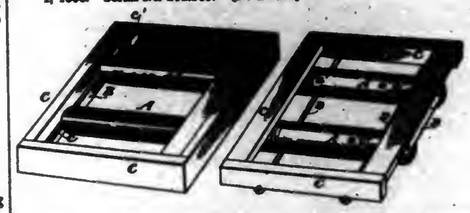
399,246. END-GATE. ISAAC CRIBAR, Waggoner, Ill. Filed Oct. 6, 1888. Serial No. 287,423. (No model.)



Claim.—1. The combination, with a wagon-body having guide-strips upon its inner sides, of the end-gate having trunnions D fitting between the said guide-strips and provided with ears *d d*, which pass on opposite sides of the end-gate, the wings E E on the ends of the said gate, provided at their front ends with hooks, and the catches or keepers G G, secured to the sides of the wagon-body and provided with slots adapted to be engaged by the said hooks, substantially as specified.

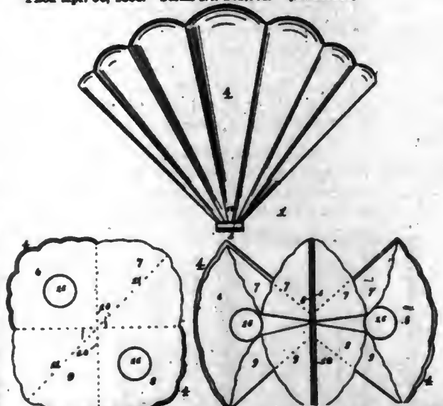
2. The wagon-body having the guide-strips B', combined with the end-gate provided at its ends with wings E, substantially triangular in form, with their bases or lower edges perpendicular to the plane of the end-gate, the latter being provided further at its ends with trunnions D, which fit and slide between the strips B', whereby the end-gate may be inclined forward on the front angles of the wings and elevated to separate it at its lower edge from the bottom of the wagon-body, the hooks F at the front ends of the wings, and the keepers G, engaged by the hooks F when the end-gate is tilted outward, as set forth.

3. The combination, with a wagon-body, of the end-gate pivoted between the sides thereof, the wings at the ends of the said gate provided with inturned flanges lying on the inner side thereof, the cleats I, bearing against the said flanges and provided with beveled inner edges, and the horizontal cleat extending between the upper ends of the cleats I I, and provided with beveled ends which overlap the beveled edges thereof, substantially as specified.



399,247. STENOGRAPHIC MACHINE. CHARLES A. DAMON, Fenton, Mich. Filed Apr. 23, 1888. Serial No. 109,773. (No model.)

Claim.—1. In a stenographic machine, substantially as described, the combination, with a bed-plate, of the operating keys and levers arranged in a plane above the bed-plate and slightly inclined to the rear, an ink-ribbon feed and a paper-feed arranged in the space between the bed-plate and the forward ends of the key-levers, and the paper-carriage having a swiveled standard to permit folding underneath the keys, all substantially as described.



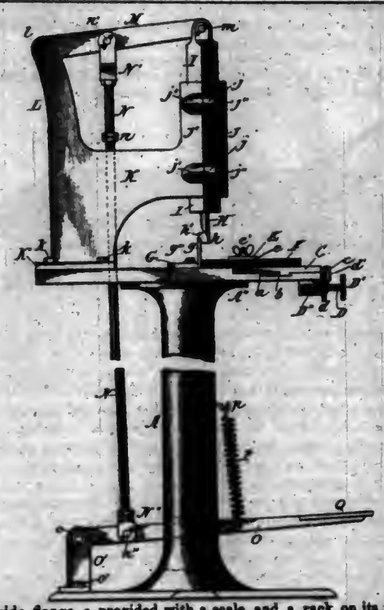
2. In a stenographic machine, substantially as described, the combination, with the spacing-key, its lever and cross-bar, of a reversible ink-feed actuated thereby, and consisting of the feed-rollers 24 25, loose roller 26, ratchet-wheels 30 31, reversible gravity-pawl 28, reversing-lever 29, and spring-clicks 32 33, connected to and operated by the reversing-lever, all substantially as described.

399,248. TRUCK. CHARLES G. DEMING, Leeds, N. Y. Filed Dec. 1, 1888. Serial No. 292,363. (No model.)

Claim.—In trucks, the combination of the rolls A A, carrying journals *a a*, the connecting-frame B, attached to said journals, and the weight-supporting frame C, having the opposite grooves *c c*, substantially as shown and described.

399,249. BOOK OR ALBUM. NANCY J. DOBBINS, Denver, Colo. Filed Apr. 30, 1888. Serial No. 272,391. (No model.)

Claim.—1. A book or album having its leaves creased or folded diagonally into segmental quarters, two of the quarters being creased or folded into half-segments of such quarters, the leaves being united together at the angle or union of the creased or folding lines, substantially as set forth.



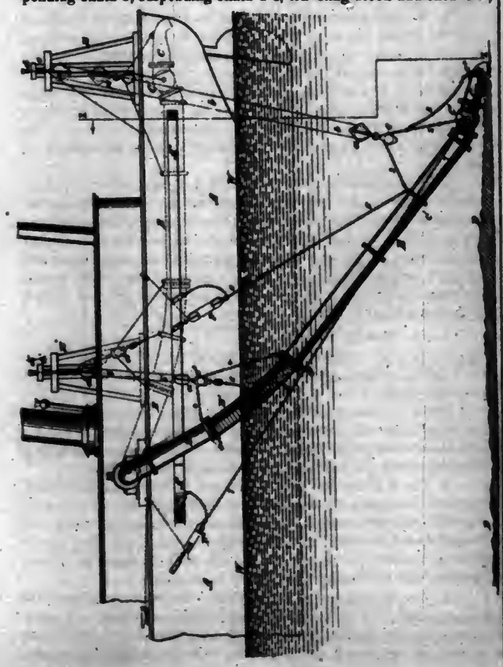
2. An album or book having its leaves creased or folded segmentally into quarters, two of the quarters being creased or folded into half-segments of such two quarters, and a cover of shape corresponding to the shape of the quarters, cover and leaves being united at the angle or union of the creased or folding lines, substantially as described.

3. A book or album comprising the leaves having folding or creased lines dividing each sheet into quarters, two of which quarters are again creased or folded each into halves of quarters, the contiguous quarters of two adjoining leaves being secured together at their edges to form a pocket, 12, one of the walls of the pocket being perforated, and a cover of shape corresponding to the quarters, leaves, and cover being secured together at the angle or intersection of the creased or folding lines, substantially as set forth.

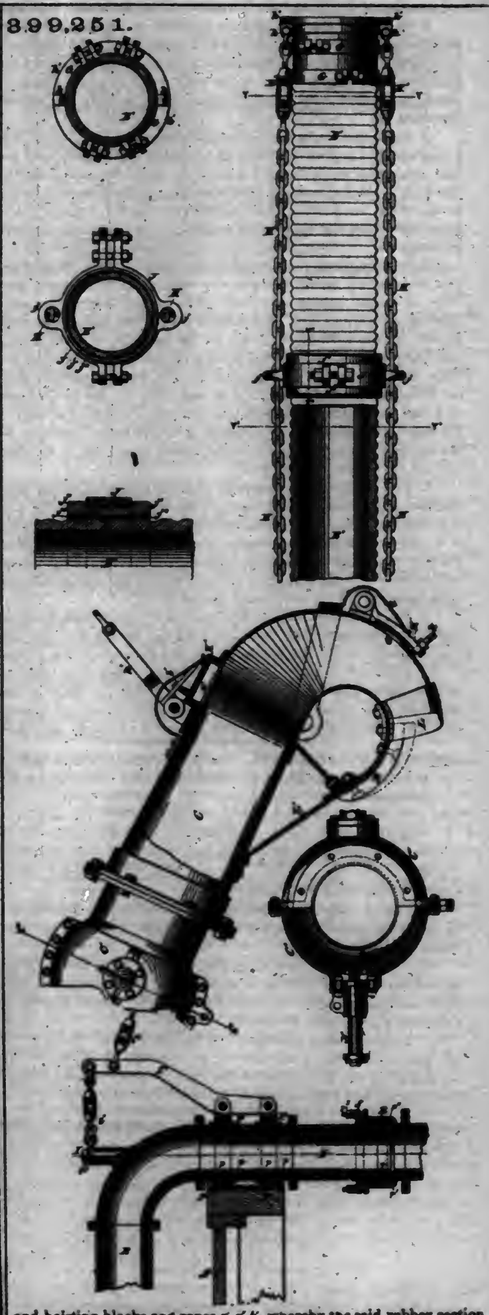
399,250. MACHINE FOR CUTTING INDEXES. EDWARD P. DONNELL, Chicago, Ill. Filed Mar. 8, 1886. Serial No. 194,653. (No model.)

Claim.—In an index-cutting machine, the bed B, having recess *a*, sliding plate C, having dovetail *b* on its under side to enter the recess

399,250.



a, and side flange, *c*, provided with a scale, and a rack on its upper and under faces, respectively, in combination with the rod D, gear-wheel *d*, and pointer *d'*, substantially as and for the purpose specified.



399,251. DREDGING-MACHINE. JOSEPH EDWARDS, Brooklyn, N. Y. Filed Dec. 21, 1888. Serial No. 294,333. (No model.)

Claim.—1. In a pump dredging-machine mounted on shipboard, the combination of the flexible section B' B' of the suction-pipe B B, the supporting-chains H H, the iron portions of the suction-pipe B B, the clamp-band J, having the perforated ears *j j*, and suspending-chain 5, whereby the said chains H H and rubber section are kept in line with each other and from unduly sagging in the middle, as and for the purposes described.

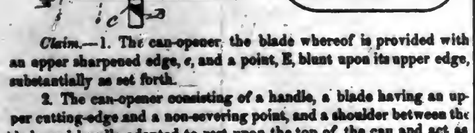
2. In a pump dredging-machine mounted on shipboard, the combination of the rubber section B' B' of the suction-pipe B B, the suspending-chain 5, suspending-chain 4 4, traveling block and sheave *c*,

399,251.

and hoisting blocks and ropes *a a' b'*, whereby the said rubber section of the suction-pipe is kept nearly in a straight line and prevented from deviating from a gentle curve irrespective of whatever angle the said suction-pipe takes with the horizontal plane, substantially as and for the purposes set forth.

3. In a pump dredging-machine mounted on shipboard, the combination of the suspending-chain 2 2, traveling block and sheave *c*, drag-holding chain 3, suction-pipe B B, drag C, and hoisting blocks and ropes *a a b*, whereby the strain of the suspending-chain 2 2 is equally applied to two distant points of the said suction-pipe and the drag is held from falling below the line of the said pipe when lifted from its work, whatever be the angle formed by the suction-pipe with the horizontal plane, as and for the purposes set forth.

4. In a pump dredging-machine mounted on shipboard, the combination of the suction-pipe B B, drag C, and the universal ball-and-socket joint C', having the circular socket *m* and stem *n*, whereby the said drag can adjust its mouth to its work in all directions, vertical, lateral, and rotary, substantially in the manner and for the purpose described.



5. In a pump dredging suction-pipe, drag C, the set-nut and bolt *k*, and spring *l*, in combination with the water-door K, whereby the said water-door can be set and held at any open position that may be required to admit as much or little water as may be, according to the nature of the materials dredged, necessary to cause a free flow of the same through the said drag and its suction-pipe, as and for the purposes set forth.

6. In a pump dredging-machine mounted on shipboard, the suction-pipe box, Fig. 12, having two separate bearings, P P, in a single base, O O, and double separate caps O' O', said separate bearings and caps working in corresponding sunken seats around the suction-pipe B B, formed by raised shoulders *p p p p* on the said pipe, whereby a long stiff rotating bearing is provided for holding the said pipe without liability of being cramped by rolling of the ship, and whereby the caps can be repaired without detention by removing but one of the same at a time, and whereby the said pipe has a double lateral support in the longitudinal direction by means of a double set of shoulders on the said pipe striding the double bearings and double caps, in the manner and for the purposes set forth.

7. In a pump dredging-machine mounted on shipboard, the combination of the supporting elbow-lug I, having its center on the central horizontal line of the suction-pipe B, the goose-neck arm I', caps O' O', and connecting holding-chain *i*, whereby the weight and strain of the said suction-pipe are greatly supported and corresponding vertical relief afforded to the bearing of the said pipe in the side of the ship, in the manner and for the purpose described.

8. In a pump dredging-machine mounted on shipboard, the combination of the supporting elbow-lug I, having its center on the central horizontal line of the suction-pipe B, the goose-neck arm I', caps O' O', connecting holding-chain *i*, vertical arm-supporting chain i^3, and horizontal elbow-supporting chain i^4, whereby the elbow of the said suction-pipe is supported in a lateral forward and vertical upward direction, substantially in the manner and for the purposes described.

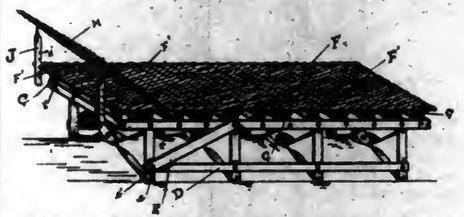
399,252. CAN-OPENER. JOSEPH H. FISHER, Deerfield, assignor to Arthur J. Sands, Chicago, Ill. Filed Dec. 3, 1888. Serial No. 292,452. (No model.)

Claim.—1. The can-opener, the blade whereof is provided with an upper sharpened edge, *c*, and a point, E, blunt upon its upper edge, substantially as set forth.

2. The can-opener consisting of a handle, a blade having an upper cutting-edge and a non-severing point, and a shoulder between the blade and handle adapted to rest upon the top of the can and act as a fulcrum, substantially as specified.

3. The can-opener consisting of a handle, a blade having an upper cutting-edge and a non-severing point, and a shoulder between the blade and handle adapted to rest upon the top of the can and act as a fulcrum, and a side guide, B, substantially as specified.

399,253. TOE-WEIGHT. FRANK W. FLOYD, Detroit, Mich. Filed Aug. 21, 1888. Serial No. 283,209. (No model.)



Claim.—1. In a toe-weight for horses, the combination of a dovetailed tenon-spur concaved to fit the convexed surface of the hoof and provided with screw-holes, screws passed through the lower end of said spur into the hoof, a mortised weight fitted onto the spur, and a screw passed through said weight and spur into the hoof, substantially as described.

2. In a toe-weight for horses, the combination, with the spur B, having its inner surface concave to fit the convex surface of the hoof and provided with screw-holes *b*, an elongated opening, b^2, and beveled edges b^3, of the weight C, provided with a recess, *c*, having its edges beveled to fit the edges of the spur B, an orifice, c^2, and the screw c^3, which passes into the hoof, substantially as described.

3. In a toe-weight for horses, a dovetail tenon-spur with screw-holes at its lower end and an elongated opening, b^2, in combination with a weight having a dovetail mortise to fit the tenon and a screw-hole, c^2, substantially as described.

399,254. COT-BED. EDWIN J. FOSTER, Cleveland, Ohio. Filed June 18, 1888. Serial No. 277,410. (No model.)

Claim.—1. In a cot-bed, the combination of a frame with pairs of legs for supporting the same, each leg consisting of a single piece bent at its point of contact with the floor, so as to form a vertical depending part, which is pivoted to said frame, and an oblique brace portion which extends upward across the frame and is pivoted to the opposite side thereof, the oblique brace portions of each pair of legs being also pivotally secured together at their points of crossing and free to move at their upper ends, substantially as set forth.

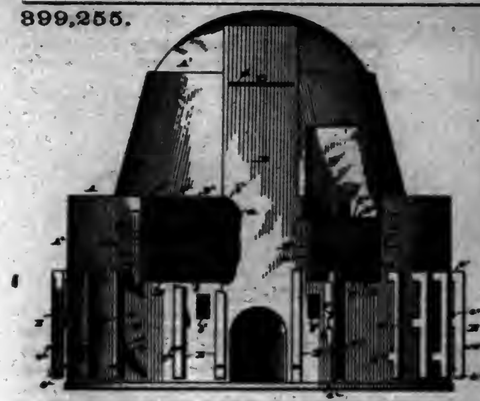
2. In a cot-bed, the combination of a frame with a pair of legs pivoted thereto on opposite sides and locking mechanism engaging one of said legs to prevent folding, each leg consisting of a single piece bent at the point of contact with the floor, so as to form an oblique brace portion, which is attached to the opposite side of said frame, but free to move thereon to allow folding, the brace portions of said legs being pivoted together at their points of crossing, substantially as shown.

3. In combination with the frame of a cot-bed having transverse bars which are provided with protruding ends, supporting-legs arranged in a series of pairs and pivoted on said ends, each leg consisting of a single piece bent at the point of contact with the floor to form an oblique brace portion, which is slotted at its upper end and fits movably on the end of the transverse bar to which said leg is pivoted, the legs of each pair being pivoted on opposite sides of the frame, substantially as set forth.

4. In combination with a cot-bed frame, a series of connected pairs of folding legs, each leg being pivoted thereto at one end, bent at the point of contact with the floor to form an oblique brace portion, pivoted to the companion leg of the pair at the point of crossing and having a slotted pivotal attachment to the opposite side of the frame, allowing motion thereon for folding and unfolding, substantially as set forth.

5. In combination with a cot-bed frame, a series of connected pairs of folding legs and a locking device engaging one of said legs to hold the series against folding, each leg being pivoted to one side of the frame at one end and pivoted at the other end to the other side of said frame, free to move, as described, and consisting of a single piece bent at the point of contact with the floor to form an oblique brace portion, which is pivoted to the corresponding portion of the companion leg of the pair at their point of crossing, substantially as set forth.

6. In combination with a frame having transverse bars which are provided with journals extending beyond the frame on each side, a series of pairs of legs, connected by bars D and provided with locking mechanism to prevent accidental folding, the legs of each pair being pivoted to opposite pivots or journals of the same transverse bar, and each leg being bent to form an oblique brace portion having a slotted attachment to the journal of said transverse bar remote from that journal to which it is pivoted, substantially as shown.



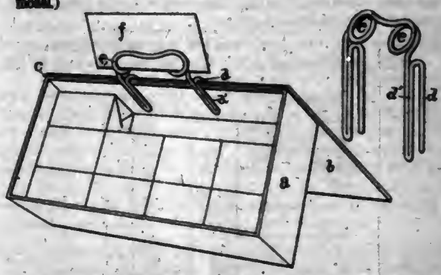
399,255. CONDENSER FOR CHARCOAL-KILNS. JOHN FRIEDRICH, Iron Mountain, Mich. Filed June 27, 1887. Serial No. 242,575. (No model.)

Claim.—1. The combination, with a kiln, of an outer casing surrounding its lower portion, a condensing apparatus located within the chamber between the kiln-wall and outer casing, and connections from the kiln-chamber to said condensing-chamber, as set forth.

2. The combination, with a kiln and an outer casing surrounding its lower portion, of division-plates dividing the chamber between the kiln-wall and casing into several communicating compartments, water-pipes traversing said compartments, and connections, as described, between the interior of the kiln and the chamber between the kiln-wall and casing, substantially as set forth.

3. The combination, with the kiln and the inclosing-casing, of the division-plates *a a' a²*, having openings at alternating ends and water-pipes placed in the chambers or apartments formed by said division-plates, and the flues E, communicating with the condensing-chamber at the top and with the combustion-chamber of the kiln at the lower end, as set forth.

399,255.

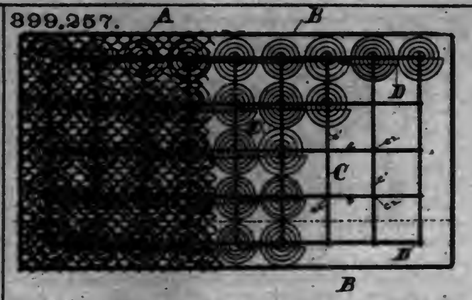


4. The combination, with the kiln and the inclosing-casing forming a condensing-chamber, of the flues connecting with the condensing-chamber at their upper ends, with the atmosphere at their lower ends, and the kiln at intermediate points, whereby communication is established between the kiln-inclosing casing at one end and the combustion-chamber and outside air at the other, substantially as specified.

5. The combination, with the kiln and the casing forming the condensing-chamber, of the connecting-flues communicating with the condensing-chamber at their upper ends and having branch pipes *e'*, communicating with the combustion-chamber of the kiln, and the projection e^3, opening into the outside air, the branch pipes and projections being provided with dampers for controlling the area of the opening of the same, substantially as specified.

6. The combination, with the kiln and the casing forming the condensing-chamber formed by the walls of the kiln and the surrounding casing, and having separate apartments or chambers arranged horizontally around the kiln, and having communication at alternate ends to make a circuitous path through them, of connecting-flues provided with dampers and gates, substantially as and for the purpose specified.

399,256. SHOW-CASE SUPPORTER AND CARD-HOLDER. GEORGE C. FETE, Portland, Me. Filed Nov. 21, 1888. Serial No. 291,501. (No model.)



Claim.—1. The combination, with a box having a cover wider than the depth of the box, of a combined case-supporter and card-holder composed of a single piece of metal having its ends bent to form clamping-jaws to hold the cover against the side of the box and its middle bent into a coil to hold a card, substantially as and for the purpose set forth.

2. The combination, with a box or case having a hinged cover wider than the depth of the case, of the herein-described case supporter and card-holder, composed of a single piece of metal having its ends bent to form the sides of a clamp to hold the hinged cover against the side of the case and its middle bent into a coil to hold a price or advertising card, substantially as and for the purpose hereinbefore set forth.

3. The combination, with a case having a cover wider than the depth of the case, of a combined case-supporter and card-holder made of a single piece of metal, its middle bent into a coil and its ends bent to form jaws to engage the edges of the box or case, one extremity of each jaw being pointed, substantially as and for the purpose set forth.

399,257. SPRING-BED. DANIEL H. GAIL, Cleveland, Ohio, assignor to Edwin J. Foster, same place. Filed Mar. 10, 1888. Serial No. 266,900. (No model.)

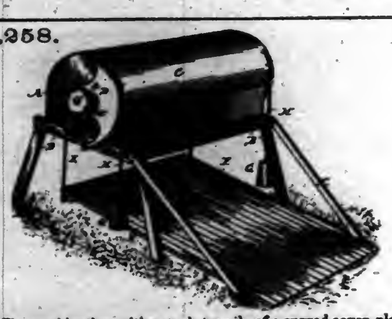
Claim.—1. The combination of a woven-wire mattress and a series of spiral supporting-springs, the upper extremity of said springs being woven into the mattress in a right line, the extremity of one spring engaging with the extremity of an adjacent spring of the series, whereby said extremities form a substantially continuous wire interwoven in the mattress, substantially as set forth.

2. The combination, with a woven-wire mattress, of a series of spiral supporting-springs, the upper extremities of said springs being woven into said mattress in a right line parallel to one of the boundaries of the mattress, the extremity of one spring overlapping the extremity of the adjacent spring of the series, whereby said extremities form a substantially continuous wire interwoven in the mattress, substantially as set forth.

3. The combination, with a frame-work composed of intersecting rods circular in cross-section and crimped at their intersecting points, of a series of springs secured at the points of intersection, one or more of said springs having a double engagement with both the longitudinal and the transverse rods of said frame-work, the double engagement with the transverse rod being on opposite sides of the longitudinal rod, the double engagement with the longitudinal rod being on opposite sides of the transverse rod, substantially as set forth.

4. The combination, with a frame-work composed of intersecting rods crimped at their point of intersection, of a series of springs secured at said intersecting points, one spring passing over the longitudinal rod, thence under the intersecting rod, thence again over the longitudinal rod, and again engaging with the intersecting rod, the adjacent spring of the series having an alternate engagement first around the intersecting rod, thence under the longitudinal rod, over intersecting rod, and again engaging with longitudinal rod, the engagements of the springs with the intersections thus forming a brace one to the other, substantially as set forth.

5. The combination of a woven-wire mattress, a metallic supporting-frame composed of rods circular in cross-section and crimped at their points of intersection, a series of spiral supporting-springs intermediate of the mattress and supporting-frame, said springs respectively located at said intersecting points, the upper extremity of said springs respectively being woven into said mattress in a right line, the upper extremity of one spring engaging with the upper extremity of an adjacent spring, the lower extremities of said springs having a double engagement with each of the two rods forming the point of intersection to which said spring is attached, substantially as set forth.



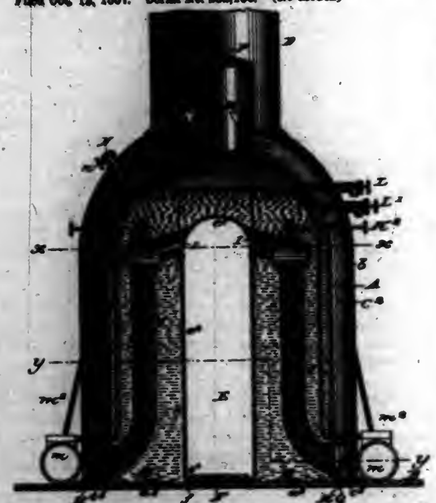
6. The combination of a woven-wire mattress, the strands of which extend transversely of the bed, a metallic supporting-frame composed of a series of rods circular in cross-section and extending transversely and longitudinally of the bed, the rods being crimped at their points of intersection, and a series of spiral springs, each of said springs located at one of said intersecting points, the upper extremity of each of said springs being interwoven in the meshes of said mattress longitudinally of the bed, the lower extremity of each of said springs having an encircling and a secondary bearing on each of the two rods, forming an intersection of said supporting-frame, substantially as set forth.

399,258. FEED-TROUGH. ALBERT C. GETTER, Chicago, Ill. Filed July 28, 1888. Serial No. 281,278. (No model.)

Claim.—1. The combination, with a stock-trough, of a cover, pivoted plates or arms for controlling the movement of said cover, suitable connections attached to said plates or arms near the points at which they are pivoted to said cover, said connections extending downwardly at one side of the vertical plane through said pivot-points, and a treadle or platform attached to said connections, whereby a comparatively slight movement of the treadle or platform will cause the full movement of said cover, substantially as described.

2. The combination, with a stock-trough, of a cover, pivoted plates or arms for controlling the movement of said cover, power-blocks connected with said arms or plates, a treadle or platform, and cables connecting said power-blocks and said treadle or platform, substantially as described.

899,258.



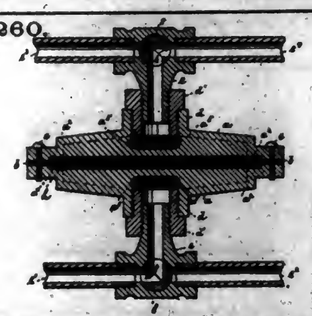
3. The combination, with a stock-trough, of a curved cover, plates or arms for pivotally connecting said lid to the ends of the trough, power-blocks connected with said plates or arms near their pivot-points, a cable passing over said blocks, and a platform connected to said cable, substantially as described.

4. The combination, with a stock-trough, of a cover, pivoted plates or arms connected to said cover, power-blocks connected to said plates or arms near their pivot-points, a treadle or platform connected to said power-blocks, and retracting-cables connected to said cover at a distance from the pivot-points, substantially as described.

5. The combination, with a stock-trough, of a cover, pivoted arms or plates connected to said cover, a treadle or platform, a connection attached to said treadle or platform and attached also to the pivot arms or plates at a distance from their pivot-points, and retracting-cables connected with the cover at a greater distance from the pivot-points of the plates or arms than connections that extend to the treadle, substantially as described.

899,259. STEAM-GENERATOR. ABNER L. GILSTRAP, Macon, Mo. Filed Oct. 13, 1887. Serial No. 252,182. (No model.)

Claim.—1. In a steam-generator, the covering C, flue c^3, walls A, furnace E, annular flue H, and connecting-flues I J, water-feeders Q, braces G, plates K, and base-plate B, all arranged and constructed to operate in the manner described, and for the purposes set forth.



2. In a steam-generator, the combination of the furnace E with the annular flue H and its connecting-flues I J, the flues c^3, and covering C with the walls A, substantially in the manner and for the purposes set forth.

3. In a steam-generator, the combination of the furnace E with the annular flue H and its connecting-flues I J, the walls A, covering C, flue c^3, smoke-stack D, the braces G, the steam connecting-pipes M, the steam-engines m, the escape-pipes m^3, the base-plate B, water-feeders Q, reception-pipe N, the grate F, and the plates K, substantially for the purposes and in the manner set forth and described.

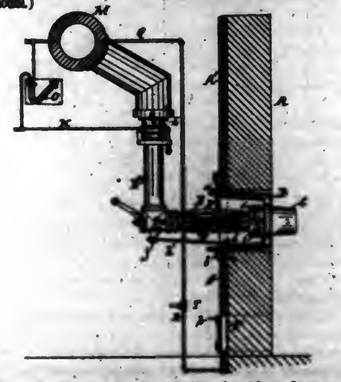
899,260. FILTER. HUGO HARTUNG, Linden, assignor to Ohl & Heather, Newark, N. J. Filed Jan. 2, 1889. Serial No. 295,207. (No model.)

Claim.—1. The combination of disks a, having ribs a' and cavities a^4 on their inner face, with an interposed percolator, h, and with inlet and discharge pipes connected to the disks, substantially as specified.

899,260.

2. The combination of disks a, having radial ribs a' and cavities a^4 on their inner face, with the disks a^3, placed back of the inlet and discharge openings of the disks a, and with perforations a^5, connecting such openings with the cavities a^4 and with percolator h, and with inlet and discharge pipes, substantially as specified.

3. The combination of disks a, having disks a^3, ribs a', perforations a^5, and sockets d, with cocks e, received by said sockets and having plugs f, and with the pivoted frame $g\,g$, engaging said plugs, and with the percolator h, washer b, and binding-screws c, substantially as specified.

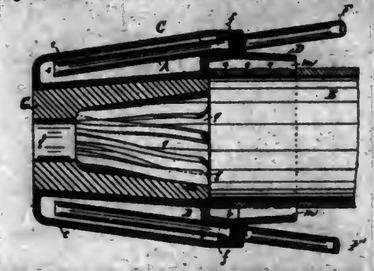


899,261. PANEL-FASTENER. EDWARD HARROUN, Princeton, Wis. Filed Sept. 30, 1887. Serial No. 251,151. (No model.)

Claim.—1. A panel-fastener consisting of a tube having a cap, B, and an opening therethrough, a rod passing through said opening into said tube, a holder on the end of said rod, a spring within the tube encircling the rod having one end bearing against the inside of the cap B, and the other end in positive connection with the other end of the rod, and thus arranged to press the rod inwardly to keep the holder close to the tube and to place a yielding resistance on the same against outward movement, substantially as described.

2. A panel-fastener consisting of a tube, A, a cap, B, brazed thereto, a rod, C, passing into said tube and having an upset head, and a securing-button on said rod, a spring encircling said rod and bearing upon the head a, whereby said rod is kept normally pressed within the tube, and a cap, D, removably secured to the other end of the tube, all substantially as described.

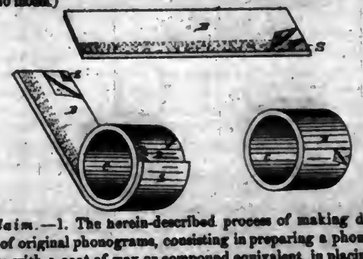
899,262. BLAST APPARATUS FOR BLAST-FURNACES. JOHN M. HARTMAN, Philadelphia, Pa. Filed Mar. 20, 1885. Serial No. 159,548. (No model.)



Claim.—1. The combination, with the blast-furnace and the tuyere, of the belly-pipe E, having a series of radially-projecting ribs along its exterior, substantially as and for the purposes set forth.

2. The combination, with the tuyere and the blast-pipes connected therewith, of a reducer and a gage operated by the pressure of the air-blast within said pipe, situated at a point between the reduced portion of the pipe and the tuyere, substantially as set forth.

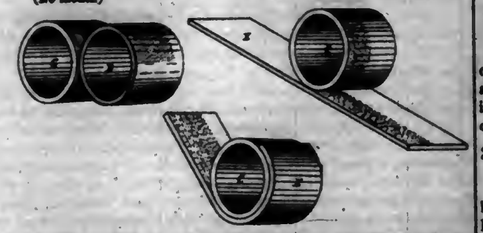
3. The combination, with the tuyere and the blast-pipes connected therewith, of a reducer placed in a portion of the pipe, a small pipe communicating with the blast-pipes on opposite sides of the reducer, and a differential pressure-gage arranged in the said small pipe, substantially as set forth.



4. The combination of the circulating-coil for the crucible-jacket with branch pipes leading from the blast apparatus and suitable cocks whereby the water can be shut off from and the hot blast turned on the said coil, for the purposes set forth.

899,263. TUYERE. JOHN M. HARTMAN, Philadelphia, Pa. Filed Aug. 13, 1885. Serial No. 174,346. (No model.)

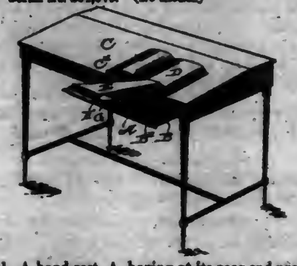
Claim.—The tuyere having a hollow interior for water-circulation in direct contact with the metal thereof, and having a rear portion of brass and a nose of bronze, said nose being integral with said rear portion, substantially as set forth.



899,264. PROCESS OF DUPLICATING PHONOGRAMS. GEORGE H. HERRINGTON, Wichita, Kans. Filed Sept. 21, 1888. Serial No. 285,977. (No model.)

Claim.—1. The herein-described process of making duplicate copies of original phonograms, consisting in preparing a phonograph-cylinder with a coat of wax or compound equivalent, in placing about said cylinder one or more layers of tin-foil, or an equivalent, thus forming a surface upon which to register the original phonogram, in covering said tin-foil having the original register thereon with a coat or covering of either wax, resin, pitch, celluloid, glue, rubber, or their compound or equivalent to form a shield to protect their impressed characters and form, and in removing said shield and tin-foil, and in placing or impressing said shield and tin-foil about a duplicate cylinder, in the manner substantially as and for the purpose specified.

2. The herein-described process of duplicating copies of phonograms, consisting in preparing a phonograph-cylinder with a coating of wax or composition which is adapted to be softened by the influence of heat, in placing layers of tin-foil or an equivalent about said prepared cylinder, thus forming a surface upon which to register the original phonogram, and in removing said layers of foil after the record has been made from the original cylinder and placing them about duplicate cylinders, thus forming duplicate copies of the original phonogram, substantially as and for the purpose specified.



899,265. PROCESS OF DUPLICATING PHONOGRAMS. GEORGE H. HERRINGTON, Wichita, Kans. Filed Sept. 21, 1888. Serial No. 285,978. (No model.)

Claim.—1. The herein-described process of making duplicate copies of original phonograms, consisting in preparing a phonograph-cylinder with a coating of wax or composition which will soften under the influence of heat, thus forming a surface upon which to register the phonogram when said surface is in a soft state, then permitting said recorded surface to harden, in applying a sheet or strip prepared from said wax or composition, while in a soft state from the influence of heat, in contact with said hardened recorded surface of the original phonogram, impressing said sheet or strip with said record, and while in such contact permitting the wax or composition to set, in removing said impressed sheet or strip from contact with the record, thus producing a negative duplicate copy, and in applying duplicate cylinders having a coating of said wax or composition in contact with said negative copy while the coatings of said cylinders are softened from the influence of heat, impressing in their surface a positive duplicate copy of the original phonogram from said negative, substantially as and for the purpose specified.

2. The herein-described process of making duplicate copies of original phonograms, consisting in pressing sheets of wax or composition which is adapted to soften from the influence of heat in contact with the original phonogram while in a soft state, then permitting it to set, thus impressing said sheet with the original record, in removing said sheet or strip from contact with the original record, thus forming a negative duplicate copy, and in applying duplicate cylinders having a coating of said wax or composition in contact with said negative copy while the coatings of said cylinders are softened from the influence of heat, thus impressing in their surface a positive duplicate copy of the original phonogram from the negative record, substantially as and for the purpose specified.

899,266. HAND-REST. ELLE S. HULL, Chicago, Ill. Filed Nov. 27, 1888. Serial No. 291,979. (No model.)

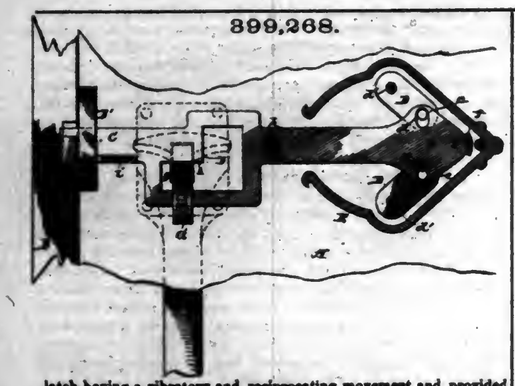
Claim.—1. A hand-rest, A, having at its rear end projections A^2 A^3, to extend beneath the front edge of the table-top, and having notches A^3 on its lower side to receive the front of the drawer of the table, substantially as described.

2. A hand-rest, A, having at its rear end projections to extend beneath the front edge of the table-top, and having notches on its lower side to receive the front of the drawer of the table, and a top, E, hinged by its front end upon the bottom A, and a shifting support for said top E, located between the latter and the bottom A, substantially as shown and described.

3. A hand-rest, A, having at its rear end projections to extend beneath the front edge of the table-top, and having notches on its lower side to receive the front of the drawer of the table, and a top, E, hinged by its front end upon the bottom A, substantially as shown and described.

899,267. METHOD OF CONSTRUCTING WIRE FENCE. WILLEY M. HYDE, Youngstown, Ohio, assignor of one-half to John Bryan Johnston, Meade Center, Kans. Filed Sept. 27, 1888. Serial No. 286,510. (No model.)

Claim.—The method herein described of constructing wire fence, consisting in first crimping the locking-plates and assembling the parts, and, secondly, in simultaneously straightening or flattening the locking-plates and kinking the wires in opposite directions at their point of crossing, substantially as set forth.



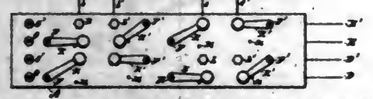
899,268. LATCH. ORIEN A. JEMISON, Lansing, Mich. Filed June 30, 1888. Serial No. 278,095. (No model.)

Claim.—1. The combination, with longitudinally-adjustable latch-bar having a shoulder thereon, of a lifting-lever, the latter being so located that when the bar is adjusted longitudinally to one position the shoulder thereon is in a position to be engaged by the lifting-lever, so as to be lifted thereby, and when in another position the shoulder thereof is beyond the limit of movement of the lifting-lever, substantially as set forth.

2. The combination, with a door and door-frame, of a latch-bar pivoted thereto by means of links, said bar being provided with a slot, a lifting-lever pivoted in the door and adapted to work in said slot, and a keeper secured to the door-frame, substantially as set forth.

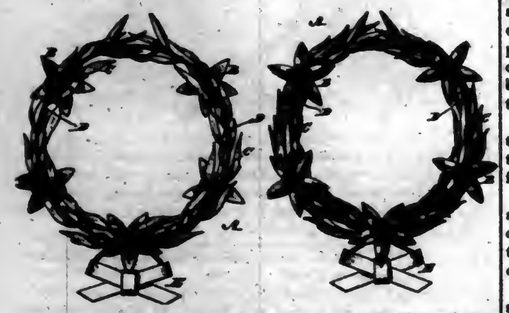
3. The combination, with a keeper having a notch therein, of a

399,268.



latch having a vibratory and reciprocating movement and provided with a flange adapted, when the bolt is moved in one direction endwise, to enter the notch in the keeper, substantially as set forth.

4. The combination, with a door and door-frame, of a latch having a vibratory and reciprocating movement, a keeper secured to the door-frame, a housing-box to cover the pivoted portion of the latch-bar, and a flange on said housing-box to limit the rearward movement of the latch-bar, substantially as set forth.

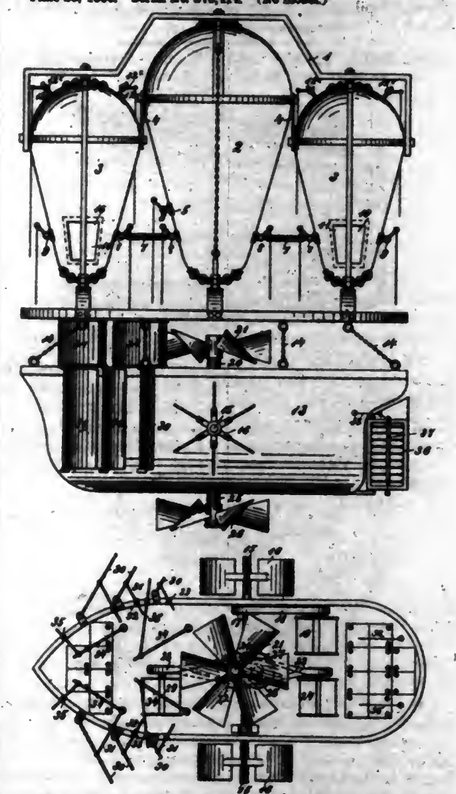


399,269. SWITCH-BOARD. JOHN W. KELLY, Minneapolis, Minn.

Filed Mar. 13, 1888. Serial No. 267,129. (No model.)

Claim.—In a switch-board, the combination, with two or more sets of source conductors, as *b b'* and *c c'*, of two or more sets of distributing-conductors, as D D' and E E', crossing said source conductors on the switch-board, sets of binding posts or contacts, as L L', projecting from said source conductors through the face of the board corresponding in number on each set of source conductors to the sets of distributing-conductors, sets of binding posts or contacts, as F F', projecting from said distributing-conductors through the face of the board in proximity to the sets of said source contacts corresponding in number on each set of distributing-conductors to the sets of source conductors, pivoted contacts, as K K', adapted to connect L L' and F F', or each of them as desired, an independent series of binding posts or contacts, as G G', attached to and corresponding in number to the distributing-conductors, and a removable cable, H, adapted to connect any set of the same together, substantially as described.

399,270. ARTIFICIAL WREATH. ADOLPH KUMPF and HENRY KUMPF, Philadelphia, Pa. Filed Jan. 5, 1889. Serial No. 295,533. (No model.)



Claim.—1. As an article of manufacture, an artificial wreath consisting of flowers and leaves formed of metal coated with paint and a backing of the form of the stem of a vine, substantially as described.

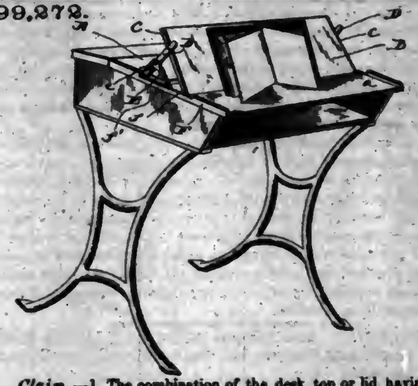
2. An artificial wreath formed of metal with the backing for the flowers having connected with its ends a bow of metal, substantially as described.

3. An artificial wreath formed of painted metallic flowers and leaves and a wire backing of the form of the vine, crossed near its ends and having said ends connected by a metallic ornament, substantially as described.

399,271. BALLOON. CHARLES A. KIDDLE, Philadelphia, Pa. Filed June 28, 1888. Serial No. 278,414. (No model.)

Claim.—1. The combination of a ship, sails pivoted to the sides and top thereof at the bow, rods connected to said sails, eyes through which said rods pass, and set-screws in said eyes for engaging the rods, operating in the manner and for the purpose described.

2. In a balloon, the combination of the gas-envelope, a ship connected therewith, a propeller-wheel above the ship and another below the same, propeller-wheels on the sides of the ship, and adjustable wings at the bow of the ship, substantially in the manner and for the purpose described.

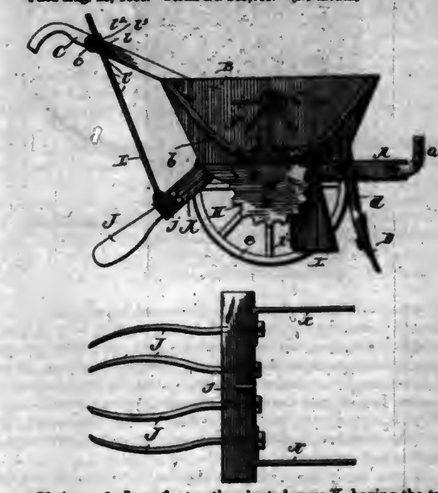


3. In a balloon, a frame, a gas-envelope suspended therefrom, charging-vessels on each side of the balloon suspended from the frame and connected with the balloon, a car or ship connected to the balloon and charging-vessels, a rudder carried by the car formed of a series of slats, a propeller-wheel above the ship and another below the same, propeller-wheels at the sides of the car, and adjustable wings in front of the side propeller-wheels and above the car, said parts being combined, arranged, and operating substantially in the manner and for the purpose described.

4. In a balloon, the ship or car, the wings attached to the top of the ship, the said wings being of different lengths, and the wings attached to the bow of the ship, also of different lengths, substantially as and for the purpose described.

5. In a balloon, the combination, with the gas-envelope, the ship, and the propelling devices, of the adjustable wings secured to the top of the car of different lengths, and the adjustable wings secured to the front or bow of the ship, also of different lengths, arranged and operating substantially in the manner and for the purpose described.

6. A balloon or aerial ship consisting of a balloon, charging-vessels, a ship connected with and depending from said balloon and charging-vessels, propelling devices, substantially as described, carried by the ship, and mechanism, substantially as described, in said ship for operating the propelling devices, a rudder carried by the ship consisting of a series of slats, and adjustable wings arranged at the bow of the ship and of different lengths or sizes, said parts being combined, arranged, and operating in the manner and for the purpose described.



399,272. SCHOOL-DESK. WILLIS LEFFINGOTT, Smith Centre, Kans. Filed Aug. 22, 1888. Serial No. 283,430. (No model.)

Claim.—1. The combination of the desk top or lid having its front portion reduced in thickness, and provided with recessed side strips having racks, the supporting-slab sliding between said strips, the movable bars pivotally connected to the top or lid, and the arms secured to the movable bars and adapted to engage the said racks, said bars and arms adapted to fold in the recessed portions of said strips and to align with the tops thereof, substantially as and for the purpose described.

2. The combination of the desk top or lid having the reduced portion, and provided with the recessed side strips having the racks, the supporting-slab having the re-enforced strips and sliding between said side strips, the movable bars pivotally connected to the top or lid and the supporting-slab, and the arms secured to the movable bars and engaging the said racks to hold the supporting-slab in an elevated position, said bars and arms being adapted to fold in the recessed portion of said side strips and to align with the tops thereof, substantially as described.

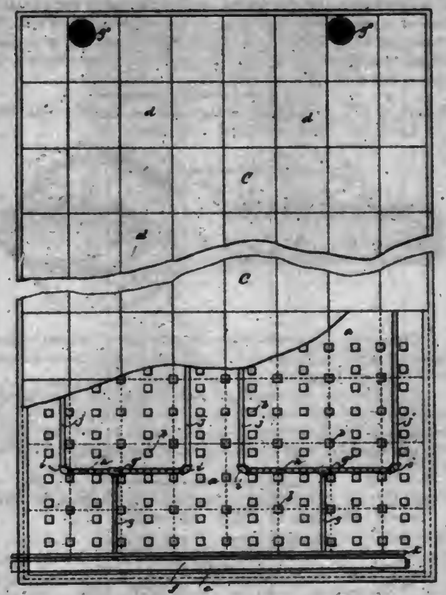
399,273. COTTON-PLANTER. JOHN J. LONG, Cooksville, Miss. Filed Aug. 25, 1888. Serial No. 283,705. (No model.)

Claim.—1. In a planter, the pivoted arms K, having the transverse bar *j*, provided with the blades J, combined with the adjusting-bar L, loosely connected to the bar *j* and adjustably connected to the cross-bar of the handles, as set forth.

2. In a planter, the combination, with the angularly-adjustable frame composed of a transverse bar, and arms having their rear ends secured to the ends of said bar and their front ends pivoted on the rear portion of the hopper, of the bent coverer-blades standing rearward from said transverse bar and arranged in equal numbers on each side of the center thereof, with their edges downward, their convexities outward, and the rear ends standing inward, substantially as specified.

3. In a planter, the combination of the frame composed of the transverse bar *j*, and the arms K, pivoted to the rear part of the hopper, the coverer-blades standing rearward from the bar *j*, with their edges downward, their convexities outward, and their points standing inward, the adjusting-rod L, pivoted at its lower end to the bar *j*, passing through a staple, *l*, on the cross-bar C, and provided with the adjusting-openings *l'*, the pin P, standing from the said bar and engaging said openings, and the spring P, forcing the rod L into engagement, substantially as specified.

399,274. SECONDARY-BATTERY ELECTRODE. ABRAHAM V. MIDDLEKAUFF, New York, N. Y. Filed Dec. 26, 1888. Serial No. 294,644. (No model.)



Claim.—1. The herein-described composite electrode, consisting of a plate, A, perforated to provide chambers *a*, and plates B, located upon the opposite sides of said plate A, and having openings *b*, communicating with the chambers *a* and of less size than said chambers, substantially as described.

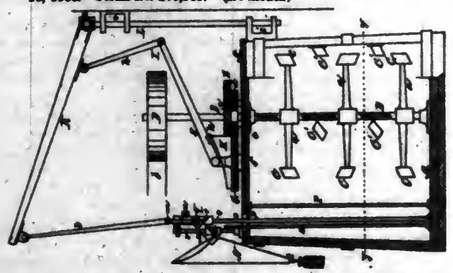
2. The herein-described electrode, consisting of the plate A, perforated to provide chambers *a* and having studs 2, and the plate or plates B, secured to said plate A by said studs 2 and having openings *b*, which communicate with the chambers *a*, but are of less size than said chambers, substantially as described.

3. The herein-described composite electrode, consisting of a plate, A, perforated to provide chambers *a*, and plates B, located upon the opposite sides of said plates A, and having openings *b*, communicating with the chambers *a*, surrounded by inwardly-projecting flanges 5 and of less size than said chambers, substantially as described.

4. The herein-described composite electrode, consisting of a plate, A, perforated to provide chambers *a*, which are separated by walls of different thicknesses in different parts of the plate, and plates B, located upon the opposite sides of said plate A, and having openings *b*, communicating with the chambers *a* and of less size than said chambers, substantially as described.

399,275. BRICK-DRYING APPARATUS. GEORGE B. MERRILL, Lock Haven, Pa. Filed Sept. 15, 1887. Serial No. 249,788. (No model.)

Claim.—1. In a brick-drying apparatus, the combination of a metallic drying-floor made in sections and laid on piles or piers, with clear open air-tight space beneath each floor, and between the piles or piers a system of conducting-pipes beneath said floor, discharging steam into said open space, and a vent or vents, *f'*, extending up through the drying-floor, substantially as described.



2. In a brick-drying apparatus, the combination, with the metallic drying-floor made in sections and laid on piles or piers, having an open space beneath it, and provided with the vent or vents *f'* at the rear end, connecting the space under the drying-floor with the outside atmosphere, of the pipes *f*, for exhaust-steam, and the pipes *k*, for live steam, both connected with pipes arranged beneath said floor, said live and exhaust steam conducting pipes extending above the floor, and there provided with controlling-valves *l*, substantially as and for the purpose set forth.

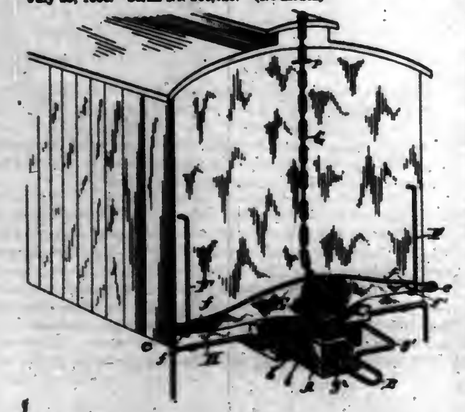
3. In a drying apparatus, the combination, with an inclined con-

crete or cement floor and an iron drying-floor supported above the same on piles or piers, of a system of steam-conducting pipes arranged between the two, substantially as described.

4. A drying apparatus consisting of an inclined concrete or cement floor made in concave inclined sections laid on grouting, an iron drying-floor supported above the same on piles or piers and made in sections fastened securely together and provided with outlet-vents at its extreme end, and a system of steam-conducting pipes leading into the chamber formed between the inclined floor proper and the drying-floor, and provided at a convenient point or points with regulating-valves, substantially as described.

399,276. APPARATUS FOR MIXING LIQUID AND POWDERED SUBSTANCES. BENJAMIN D. MILLIKEN, Somerville, Mass. Filed July 10, 1888. Serial No. 279,586. (No model.)

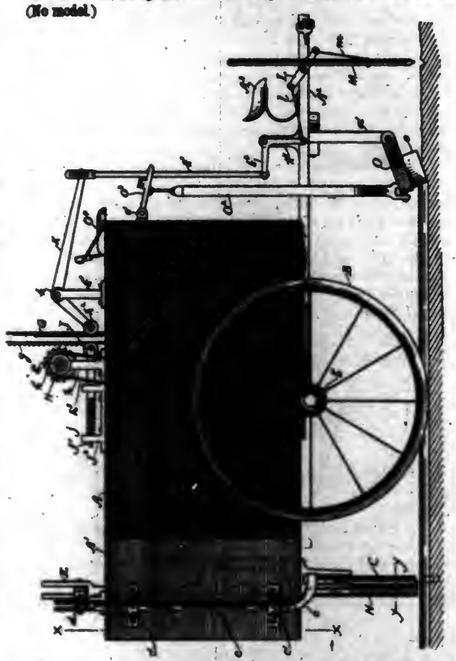
Claim.—The tank A, with a slot, *p*, in its top, a strainer, P, located in the tank, one or more filling-cups, M, pivoted to a reciprocating cross-head, T, a series of levers connected with the cross-head, and one or more spouts, N, in combination with a revolving mixer, a series of toothed gear actuated by the shaft of the same, and a cam, H, secured to one of said gear, one, *g*, of the levers connected with the cross-head being located in the path of said cam and being periodically raised thereby, all constructed to operate substantially in the manner and for the purpose specified.



399,277. LAMP-WICK. AUGUST MUELLER, Kansas City, Mo. Filed Apr. 7, 1888. Serial No. 269,906. (No model.)

Claim.—1. A lamp-wick composed of a pair of tubular sections connected together by separated longitudinal strips, in the manner and for the purpose described.

2. In a tubular lamp-wick, the combination of an upper tubular section adapted to slide upon the center tube of a lamp, a lower tubular section adapted to remain stationary at the base of said center tube, and separated longitudinal strips connecting said upper and lower tubular sections, in the manner and for the purpose set forth.



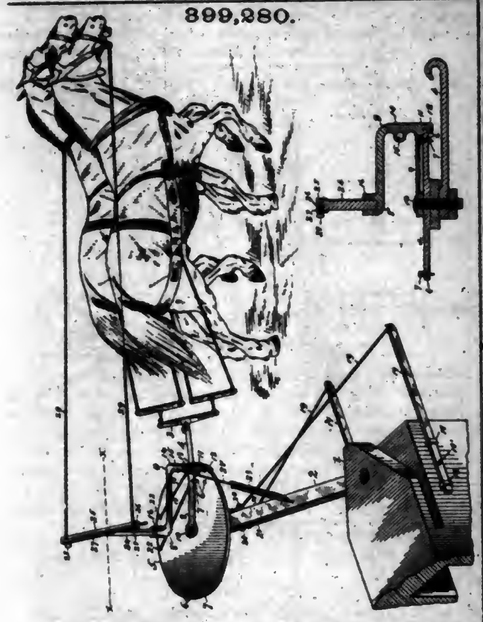
399,278. CAR-COUPLING. DEWITT C. MCCOY, Bushnell, Fla. Filed July 23, 1888. Serial No. 280,729. (No model.)

Claim.—1. In combination, a draw-bar, a coupling-pin, a vertically-movable cross head or bar curved or arched outwardly at its center and extending across the end of a car, an arm projecting forwardly from said cross-bar and carrying the coupling-pin, and vertical yokes secured to the car and embracing the ends of said cross-bar, by which the same is loosely confined to the car and rendered vertically movable, substantially as described.

2. In a car-coupler, the combination of a draw-bar provided with a spring-actuated block, a coupling-pin, a vertically-movable cross-head extending across the end of a car and provided with handles at its ends and with a forwardly-projecting arm carrying the coupling-pin, and vertical yokes secured to the end of the car near the opposite ends of and loosely confining the cross-head to the car to allow the head a suitable vertical movement within the yokes, said cross-head being provided with notches in which the ends of the yokes rest and with pins or projections to prevent longitudinal movement of the same, substantially as described.

399,279. MACHINE FOR IRRIGATING HILLS FOR PLANTS. HANS F. OLSEN, Stoughton, Wis. Filed Sept. 21, 1888. Serial No. 285,902. (No model.)

Claim.—1. The combination, with the tank A, as specified, of the spouts N, valves *f f*, bar F, spring *d'*, bar E, attached to laterally-extended levers connected with drills in operative connection with said spouts, a lever connected with a normally-disengaged rack and pinion, the latter being in operative connection with one of the wheels of the machine, stake M, and a series of levers in operative connection with said rack, whereby the latter may be thrown into engagement with said gear whenever the stake is thrust into the ground, substantially as shown and described.



2. The combination, with the treadles O^2, of the links O^3 and suspended shoes O, flaring outwardly in front and open at the rear whereby the soil may be deposited in hills at each cross-mark, substantially as shown and described.

399,280. DRIVING DEVICE FOR HORSE-POWERS. WILLIAM H. OSBURN, Burrton, Kans. Filed May 24, 1888. Serial No. 274,907. (No model.)

Claim.—1. In an automatic driving device for horse-powers for rebounding-plunger presses and similar machines, the combination of a reversible driver or rein-holder and a sweep provided with means for limiting the throw of said driver, with ropes for reversing said driver at the end of each stroke of said sweep, substantially as described.

2. In an automatic driving device for horse-powers for rebounding-plunger presses and similar machines, a sweep, in combination with a reversible driver or rein-holder mounted thereon, a spring attached to said driver, adjustable stops for limiting its throw, and means for starting its reversing-throw at the end of each stroke of said sweep, substantially as described.

399,280.

3. In an automatic driving device for horse-powers for rebounding-plunger presses and similar machines, a sweep, in combination with a reversible driver having the lines or reins attached thereto, stops for limiting its throw, a spring for drawing it against said stops, and means for reversing it at the end of each stroke of the sweep, substantially as described.

4. In an automatic driving device for horse-powers for rebounding-plunger presses and similar machines, a sweep, in combination with a pivoted driver having a rein-holder attached thereto, stops arranged at diametrically-opposite points of said sweep, a spring for drawing said driver against said stops, and ropes for throwing said driver around at the end of each stroke of said sweep, substantially as described.

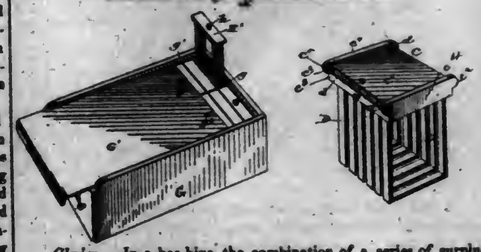
5. In an automatic driving device for horse-powers for rebounding-plunger presses and similar machines, a sweep, in combination with a driver pivoted at the outer end of said sweep and having a rein-holder attached thereto, a crank-arm arranged at right angles to said rein-holder, stops upon the sweep for limiting the throw of said crank-arm to substantially a semicircle, a spring for drawing said crank-arm against said stops, and ropes arranged to alternately throw said crank-arm around at the end of each stroke of the sweep, substantially as described.

6. In an automatic driving device for horse-powers for rebounding-plunger presses and similar machines, a sweep, in combination with a platform mounted thereon and provided with adjustable stops at diametrically-opposite points of its side edges, a driver consisting of a rein-holder, and also of a crank arranged at right angles to said rein-holder, a spring for drawing said crank against said stops, and ropes attached to the end of said crank and passed through perforations formed in the platform at its outer edge and arranged to throw said crank around at the end of each stroke of the sweep, substantially as described.

7. In an automatic driving device for horse-powers for rebounding-plunger presses and similar machines, a sweep, in combination with a platform mounted thereon and formed with perforations in its side edges and with two perforations in its outer edge, a crank pivoted in the center of said platform, an upright rod, a rein-holder arranged at right angles to said crank, stops inserted in the perforations in the side edges of said platform, a spring secured to the end of the crank and also to the sweep, and ropes secured to the end of said crank and passed through the perforations in the outer edge of said platform and adapted to be alternately tightened at the ends of the stroke of the sweep, substantially as described.

8. The combination of the sweep, the spring, the ropes, the circular platform, the driver, the crank pivoted at the center of said platform and provided with the cross-head having eyes or rings for the attachment of said spring and ropes, and formed with the downwardly and inwardly bent flanges or catches fitting around the edge of said platform, substantially as and for the purpose specified.

9. The combination of the sweep, the circular platform mounted upon the end thereof and formed with two series of perforations in its side edges and with two perforations in its outer edge, the crank pivoted at the center of said platform and provided with the flanged cross-head having the eyes or rings, the upright rod, the rein-holder, the stops in the perforations of said platform, the spring secured to the eye or ring on the wrist-pin of said crank, and the ropes secured to the eyes on said cross-head and passed through the perforations in the outer edge of said platform and arranged to be alternately tightened at the ends of the stroke of the sweep, substantially as and for the purpose described.

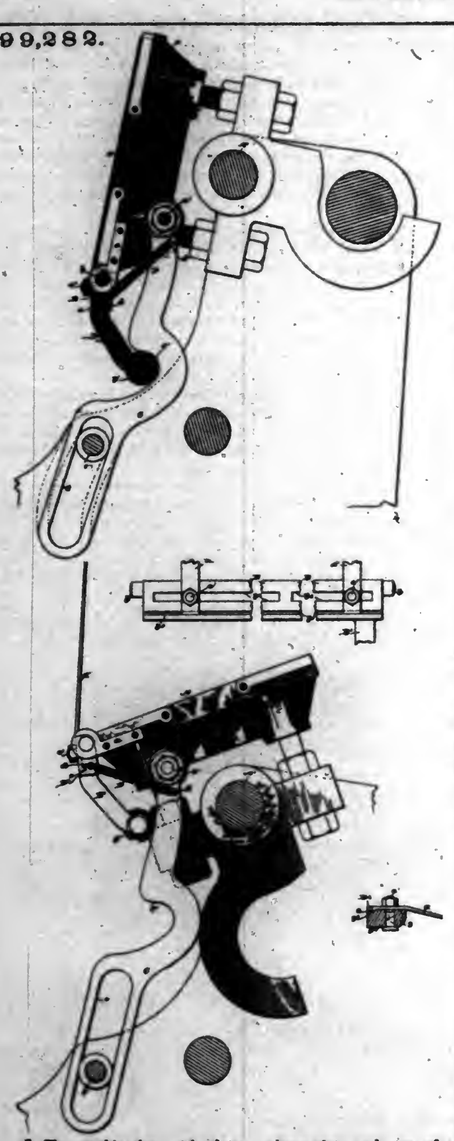


10. The combination of the sweep, the platform having the perforations 6 and 22, the stops in the said perforations, the crank provided with the flanged cross-head having the eyes or rings, the upright rod, the rein-holder, the spring secured to the eye or ring on the wrist-pin of said crank and to the sweep, the guide-pulleys upon said sweep, the removable bars or beams, the bails upon the sides of the press, and the ropes secured to said bars or beams and to the eyes or rings on said crank and passed over said pulleys and up through the perforations 22 in said platform, substantially as described.

11. The rein-holder consisting of the cross-head having a rabbeted outer face, a clamping-bar, and screw-bolts for securing said clamping-bar to said cross-head, in combination with the sweep and means for automatically reversing said rein-holder at the ends of the stroke of said sweep, substantially as described.

12. The rein-holder consisting of the cross-head having a rabbeted outer face, a clamping-bar, and screw-bolts for securing said clamping-bar to said cross-head, in combination with the sweep and means for automatically reversing said rein-holder at the ends of the stroke of said sweep, said means consisting of the platform provided with stops and perforations, the crank, the spring, and the ropes, substantially as described.

399,281. BEE-HIVE. HIRAM PERDYEE, Western Saratoga, Ill. Filed May 29, 1888. Serial No. 275,486. (No model.)



Claim.—In a bee-hive, the combination of a series of surplus comb-frames, D, each having end projections, *d*, with a surplus comb-frame section composed of two end pieces, c^2, and two side pieces, c^3, the latter provided with projecting ends c^5, inner grooves, c^3, and a cover, c^4, adapted to operate in said grooves and hold the frames in position, as specified.

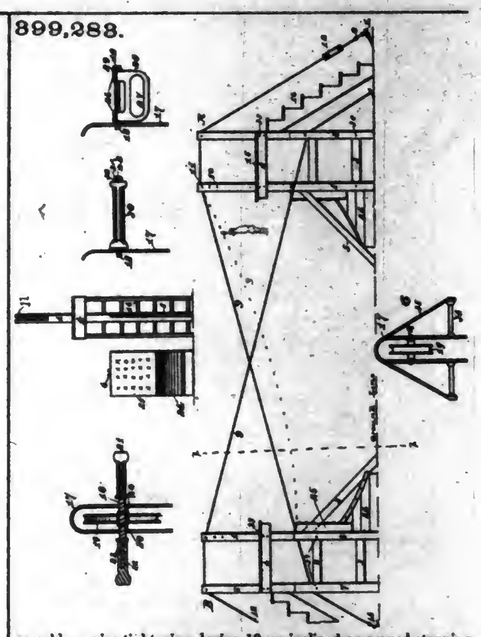
399,282. GRIPPER MECHANISM FOR PLATEN PRINTING-PRESSES. WILLIAM H. PRICE, Jr., Cleveland, Ohio, assignor to Chandler Price, same place. Filed Apr. 21, 1888. Serial No. 271,380. (No model.)

Claim.—1. The combination, with platen, gripper-plate, and arm, of a traveling cam for engaging such gripper-plate arm, the said cam being pivotally connected with and operated by the platen, substantially as set forth.

2. The combination, with platen, grippers, gripper-plate, and arm, of link pivoted to the platen, the lower portion of the link traveling on a stationary support, said link having a cam-face for engaging the gripper-plate arm, whereby the grippers are actuated, substantially as set forth.

899,282.

3. The combination, with platen, gripper-plate, and arm, of a reciprocating vibratory cam for engaging and operating such arm, said cam being pivotally connected with the platen, substantially as set forth.

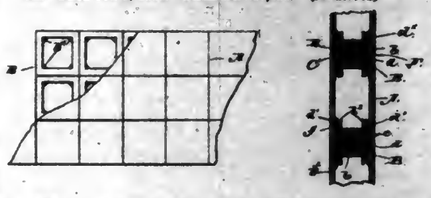


4. The combination, with a platen, gripper-plate, and arm, of a traveling link pivotally connected with and operated by the platen and having a cam-surface for engaging such gripper-plate arm, and a spring connected with the gripper-plate and link for holding the arm in contact with the cam-surface of the link, substantially as set forth.

5. The combination, with grippers and gripper-plate, the former having toes and the latter having a longitudinal groove for receiving such toes, of rib projecting from the face of the gripper-plate in position to engage the end of the grippers, said rib being flush with the rear side of said groove, substantially as set forth.

899,283. AERIAL RAILROAD OR WIRE TRAMWAY AND APPLIANCES THEREFOR. JAMES PRITTER, Denver, Colo. Filed Nov. 6, 1883. Serial No. 290,164. (No model.)

Claim.—1. A tramway for physical exercise, consisting of higher posts at one end, a platform thereat, lower supporting-posts at the other end, an inclined wire or cable stretched over such posts and between the two sets thereof, means for securing the ends of the wire



899,288.

or cable, a wire-tightening device, 12, an inclined or curved stopping-platform, 24, and a padded surface, 25, substantially as set forth.

2. A tramway for physical exercise, consisting of the higher cable-supporting posts at one end, having their upper ends slotted for varying the height of the upper end of the cable, a platform at such end, lower cable-supporting posts at the other end, an inclined wire or cable stretched over such posts, means for securing the ends of the wire or cable, and a wire-tightening device applied to such cable, substantially as set forth.

899,284. WALL FOR HOUSES. WILLIAM R. RAY, Los Angeles, Cal. Filed Oct. 3, 1888. Serial No. 287,096. (No model.)

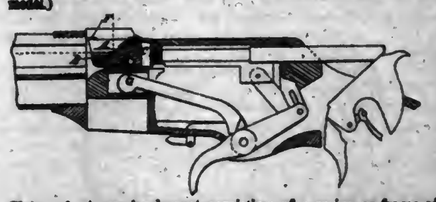
Claim.—1. A supporting-frame for the interior of a wall, molded of any suitable material—such as concrete—into any proper shape to be laid in regular courses, with similar frames and provided with a surrounding peripheral groove to register with the similar grooves in adjoining frames, and receive a suitable binding material—such as cement or mortar—substantially as specified.

2. In the wall of a house or other structure, the interior framing, composed of similar supporting-frames laid in regular courses and provided with registering peripheral acute-angled grooves, a suitable cement within said grooves, and lengths of strap or hoop iron laid at suitable intervals in said registering grooves to bind the courses together, substantially as specified.

3. In a wall, the combination of the hollow supporting-frames, molded of suitable material and in proper shape, provided with surrounding peripheral grooves and laid in regular courses with their grooves registering and filled in with a suitable cement, and incasing-slabs corresponding in area and contour to the supporting-frames and secured thereto with their edges meeting and registering with the joints between said frames, substantially as specified.

4. In a wall, the combination, with the hollow supporting-frames B, provided with the peripheral grooves *b* and the webs *b'* in their interior angles, of the incasing-slabs D, provided with the grooves *d* and the flanges *d'*, the grooves and spaces between the flanges *d'* and supporting-frame being filled with cement or mortar, substantially as specified.

5. The hollow supporting-frames *b*, adapted to be laid in regular courses, with similar frames, and the incasing-slabs A, to close both sides of the frames, as set forth.

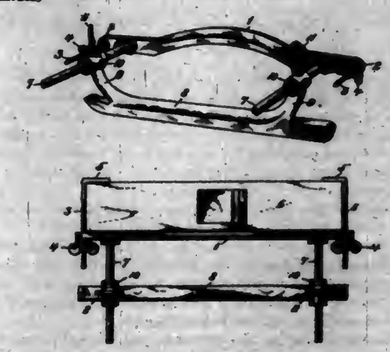


6. In a wall, the hollow supporting-frames B, provided with the webs *b'* on their interior angles, combined with the incasing-slabs A, having the flanges *d'* to bear against the webs *b'*, as set forth.

899,285. BICYCLE. AARON G. ROSE, Greencastle, Ind. Filed Dec. 1, 1888. Serial No. 292,494. (No model.)

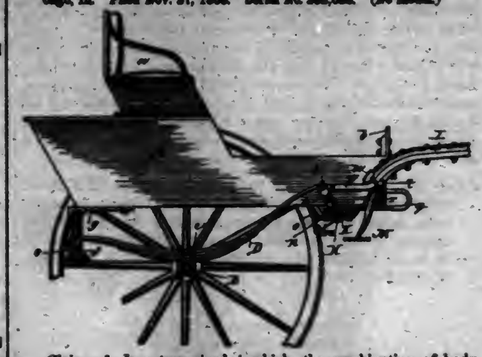
Claim.—The combination, with the fork provided with a vertical slot, D, and the main axle provided with a removable pinion outside the fork, of the stub-axle E, fitting in the slot D and vertically adjustable therein, the stub-axle M, arranged in the said slot and vertically adjustable therein, the power gear-wheel mounted on the stub-axle E and carrying the pedal, and the intermediate spur-wheel mounted on the stub-axle M and meshing with the power-wheel and the pinion, all substantially as and for the purpose specified.

899,286. REFLECTOR FOR INSPECTING GUNS. ANDREW H. RUSSELL, U. S. Army. Filed Aug. 10, 1888. Serial No. 282,469. (No model.)



Claim.—1. A gun implement consisting of a casing or frame of such shape as to fit the receiver of a gun, and a mirror held by said casing at the proper angle to throw light into the bore when the casing is adjusted in the receiver, substantially as described.

2. A gun implement consisting of a bent casing of such form as to fit the receiver of a gun and inclosing the sides of an inclined mirror, a mirror, inclined as described, and clasps to retain the mirror in position, substantially as set forth.

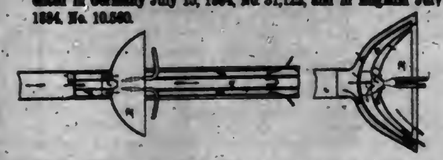


3. The combination, in a gun implement, of a metallic casing shaped to fit the receiver of a gun, an inclosed mirror in said casing, retaining-catches for the mirror, and a finger-piece or catch for removing the implement from the receiver, all substantially as described.

899,287. GAGE ATTACHMENT FOR PLANES. GEORGE H. RUSSELL, Pittsfield, Mass. Filed Oct. 27, 1883. Serial No. 289,304. (No model.)

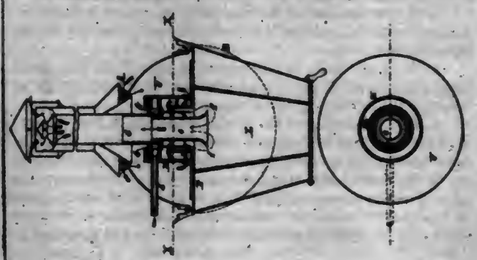
Claim.—The herein-described adjustable gage attachment for planes, consisting of the bar 1, having end perforations, 2, provided with the L-shaped clamping-bolts 3, bent, as at *b*, adapted to embrace a plane at its ends, and having set-nuts 4, and opposite bars, 7, projecting from the bar 1, and the gage-bar 8, having upwardly-disposed arms 9, terminating in perforated bosses 10, for the reception of the bars 7, and having set-screws 11, substantially as specified.

899,288. TWO-WHEELED VEHICLE. LOUIS SCHNEIDER, Chicago, Ill. Filed Nov. 27, 1888. Serial No. 292,082. (No model.)



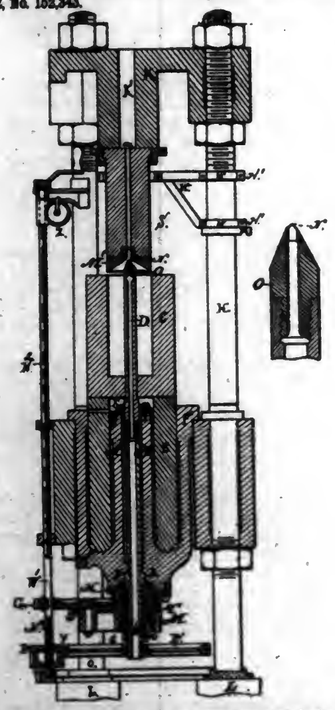
Claim.—1. In a two-wheeled vehicle, the combination of body A, side springs, D, secured upon axle B, transverse spring E, secured under the rear end of body A and coupled with its ends to the rear ends of springs D, rocker-shaft H, pivoted under the forward end of body A and having end cranks, *h*, coupled with the forward ends of springs D, and crank *m*, having swivel-nut *n*, engaging screw *o*, projected through the body A of the vehicle, to be adjusted from above by means of a swiveled lever, *p*, or by an equivalent device, all substantially as described, for the purpose specified.

2. In a two-wheeled vehicle, the combination, with the above-claimed elements, of loops *q*, secured to or under the forward end of body A and forming guides for a bar, *r*, and spring-bars *s* and *s'*, secured to the top and bottom of such bar *r*, the ends of which being coupled to the thills to hold them yieldingly in line with the body A, all substantially as set forth.



3. In a two-wheeled vehicle, the ends of thills I, pivotally coupled to any part of the vehicle-body, in combination with loops *q*, holding a bar, *r*, with springs *s s'*, secured against the top and bottom of the same for yieldingly holding it centrally therein, and with the eyed ends of said bar *r* being adjustably coupled to the thills by vertical screws *v*, secured by nuts *y y*, all substantially as set forth, for the purpose specified.

899,289. GAS-LAMP. FREDERICK SIEMENS, Dresden, Saxony, Germany. Filed July 12, 1886. Serial No. 207,810. (No model.) Patented in Germany July 15, 1884, No. 31,122, and in England July 24, 1884, No. 10,560.



Claim.—The combination of the burner set inclosed by a glass or globe, the bell-reflector R, within which the burner is placed, the mouth *r*, through which the products of combustion pass, and which deflects the air upon the flame, the channels *a a'*, through which the products of combustion pass to the chimney, the channel *b*, in which the ascending air is heated and caused to issue into the upper part of the reflector to supply the flame, and a small aperture, a^3, for the passage of a portion of the hot products of combustion to start the chimney-draft, as and for the purpose described.

899,290. REGENERATIVE GAS-BURNER. FREDERICK SIEMENS, Dresden, Saxony, Germany. Filed Oct. 20, 1886. Serial No. 217,505. (No model.) Patented in France Oct. 23, 1886, No. 178,187; in England Oct. 26, 1886, No. 13,701; in Belgium Oct. 26, 1886, No. 74,901; in Italy Nov. 26, 1886, XLI, 81; in Spain Jan. 10, 1887, No. 6,891, and in Austria-Hungary Apr. 4, 1887, No. 42,048 and No. 9,415.

Claim.—In a gas-lamp, the combination of a horizontal partition constructed of material having a reflecting-surface, a lower compartment closed on all sides by glass, an upper compartment to which air is admitted through shielded perforations, a metal cylinder open at its bottom and having formed upon its top an annular gas-chamber, a metal ring projecting upward from the partition-plate, a central trumpet-mouthed flue made of refractory material, a series of small tubes projecting downward from the gas-chamber between the said ring and the said flue, and a chimney from which the products of combustion escape through shielded perforations at the top of the upper compartment, as and for the purposes described.

399,291. HYDRAULIC PRESS FOR COVERING ELECTRICAL CONDUCTORS WITH SOFT METAL. WERNER SIEMENS, Berlin, Germany, assignor to Siemens & Halske, same place. Filed Aug. 20, 1884. Serial No. 141,880. (No model.) Patented in Germany Nov. 23, 1882, No. 23,176; in Belgium Nov. 23, 1882, No. 59,636, and in France Nov. 23, 1882, No. 152,343.

Claim.—1. In a hydraulic press for covering electrical conductors with soft metal, an annular cylinder having a central space for the reception of the mandrel, and the mandrel having an upper part, D, which screws into the lower part, D', as and for the purpose described.

2. In a hydraulic press for covering electrical conductors with soft metal, the combination of a plunger, rotated in a plane perpendicular to the direction of the mandrel, with a mandrel capable of being raised and lowered, as and for the purpose described.

3. The combination of the nipple movable in relation to the mandrel, the mandrel, and the perforated plunger, as and for the purpose described.

4. In an apparatus for making insulated telegraph cables and wires, the combination of the hinged plunger S, capable of horizontal movement, and the chamber C, as and for the purpose described.

5. The combination of the mandrel D, the chamber C, and the hinged plunger S, capable of horizontal rotation, as and for the purpose described.

6. The combination of the annular cylinder F, the chamber C, the annular piston E, and the mandrel passing axially through the chamber, as and for the purpose described.

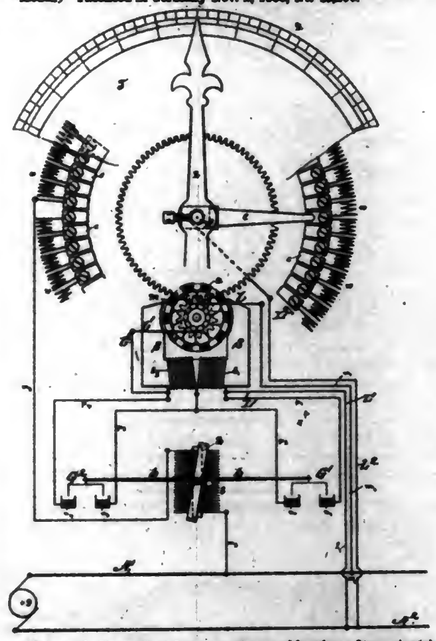
7. The combination of the annular cylinder F and the tube for the reception of the cable or wire passing axially through the cylindrical space in the center of cylinder, as and for the purpose described.

8. The combination of the plunger, having a central passage or opening therein corresponding in form to the desired exterior form of the cable or conductor, with a vertically-adjustable mandrel provided with an adjustable point, as and for the purpose described.

9. The combination of the plunger S, capable of being rotated about the column H, the cross-head K, provided with a perforation, K', and the lead-chamber C, as and for the purpose described.

10. The combination of the mandrel, the perforated plunger, and the nipple N, as and for the purpose described.

11. The combination of the chamber C, provided with a hole for the passage of the mandrel, the piston E, supporting the cylindrical chamber, and the cylinder F, as and for the purpose described.



12. In a hydraulic press for covering electrical conductors with soft metal, the combination of the upright column H, the rotatable plunger S, the bearings H' H', and the braces H^3, as and for the purpose described.

13. In a hydraulic press for covering electrical conductors with soft metal, the combination of the shaft W', provided with a gear, G, the wheel G', and the toothed nut M, the tube T, and the lower part of the mandrel having a shoulder, B, as and for the purpose described.

14. In a hydraulic press for covering electrical conductors with soft metal, the combination of the shaft W^3, provided with a gear, P, the wheel P', the lower section of the mandrel D', and the upper section of the mandrel D, which is received into the lower section, as and for the purpose described.

15. The combination of the six-edged guide-piece F and the mandrel constructed in two sections, one of which screws into the other, as and for the purpose described.

399,292. ELECTRICAL MEASURING AND CONTROLLING APPARATUS. WILHELM SIEMENS, Berlin, Germany, assignor to Siemens & Halske, same place. Filed Dec. 2, 1887. Serial No. 256,208. (No model.) Patented in Germany Nov. 2, 1886, No. 40,290.

Claim.—1. In an electric meter, the combination of two electrical circuits, an electromotor, the field and armature coils thereof forming a part of one of the said circuits, means actuated by the other or second circuit for controlling the said motor, and resistances adapted to be included in or excluded from the second, thereby changing the amount of current passing through the second circuit, while the current in the first circuit remains unchanged by the insertion or exclusion of the said resistances, as and for the purpose described.

2. In an electric meter, the combination of a measuring and regulating circuit, an electromotor, the field and armature coils thereof forming a part of the measuring-circuit, means included in the regulating-circuit for controlling the movements of the armature of the motor, and resistances adapted to be included in or excluded from the regulating-circuit, varying the current thereof, while the current in the measuring-circuit remains unaffected thereby, as and for the purpose described.

3. In an electric meter, the combination of a measuring and regulating circuit, a motor the field and armature coils of which are included in the measuring-circuit, a contact-arm rotated thereby, resistances traversed by the said arm, and means included in the regulating-circuit for changing the polarity of the magnetic field of the said motor, whereby the contact-arm is caused to include or exclude the said resistances from the said regulating-circuit, varying the current thereof, while the current in the measuring-circuit remains unaffected thereby, as and for the purpose described.

4. In electrical measuring and controlling apparatus, the combination of two electrical circuits, an electromotor included in one of the said circuits, a magnet, E, excited by the current of the other circuit and adapted to regulate the said motor, and resistances adapted to be included in and excluded from the same circuit as excites the magnet E by means of the said motor, as and for the purpose described.

5. In electrical measuring and controlling apparatus, the combination of two electrical circuits, an electromotor included in one of the said circuits, resistances adapted to be included in the other circuit thereby, a magnet, E, excited by the current of the same circuit and a lever provided with contact-points and adapted to be moved by the said magnet E, whereby the motor may be regulated, as and for the purpose described.

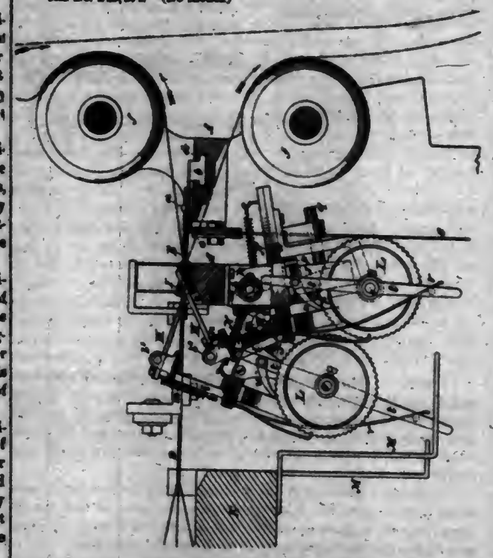
6. In electrical measuring and controlling apparatus, the combination of two electrical circuits, an electromotor, coils surrounding the legs of the magnet thereof and included in one of the said circuits, resistances adapted to be included in the other of the said circuits by the said motor, and means included in the same circuit with the resistances, whereby the supply of electricity to the said leg-coils may be evenly or unevenly distributed, as and for the purpose described.

7. In electrical measuring and controlling apparatus, the combination of two circuits, an electromotor, coils surrounding the legs of the magnet thereof and included in one of the said circuits, resistances adapted to be included in or excluded from the other circuit, a magnet, E, included in the same circuit with the resistances, and a lever of insulating material having conductive stirrups attached to the ends thereof, whereby the electricity may be supplied to either or both of said leg-coils of motor, as and for the purpose described.

8. In electrical measuring and controlling apparatus, the combination of two electrical circuits, an electro-magnet actuated by one of the said circuits, means actuated by the other of the said circuits for regulating the electricity supplied to the said motor, resistances, and a conductive arm adapted to be moved by the said motor, whereby the resistances are included in or excluded from the same circuit that actuates the means for regulating the motor, as and for the purpose described.

9. In an apparatus for regulating the flow of electricity, the combination of a magnet, E, having an oblique position, a core therein provided with eccentric heads, a ring mounted upon an axis of rotation, and an insulating-arm having conductive stirrups upon the ends thereof mounted upon the said axis of rotation, as and for the purpose described.

10. In an apparatus for regulating the flow of electricity, the combination of a magnet, E, having an oblique position, a core therein having an eccentric head upon each end thereof, a ring mounted upon an axis of rotation and provided with an adjustable weight, and insulating-arm having conductive stirrups upon the ends thereof mounted upon the said axis of rotation, as and for the purpose described.



11. In an electrical indicating and controlling apparatus, the combination of two circuits, an electromotor included in one of the said circuits, the shaft of the armature of the said motor gearing with another shaft, a contact-lever and pointer attached thereto, a dial, and resistances which are included in the other of the said circuits by the rotation of the motor, as and for the purpose described.

12. In an apparatus for the measurement of height, the combination of two electrical circuits, a wheel, R, adapted to be rotated as the said height to be measured varies, a contact-lever, C, mounted upon the said wheel, resistances c' c', adapted to be included in one of the said circuits, means included in the said circuit adapted to control an electro-magnet, a contact-lever, C, and resistances adapted to be included in the said circuit by the movement of the arm, a pointer, and a dial traversed thereby, and an electric motor actuated by the other of the said circuits and controlled by the said means provided therefor, and adapted to move the said contact-lever, as and for the purpose described.

13. In apparatus for the measurement of physical magnitude, the combination, with a measuring and a regulating circuit of electricity, of a set of resistances adapted to be included in or excluded from the said regulating-circuit, whereby the amount of current passing therethrough varies as the magnitude to be measured, a second set of resistances, a motor included in the said measuring-circuit, and of means included in the said regulating-circuit for controlling the motor, whereby it is caused to include or exclude the said second set of resistances in or from the said regulating-circuit, as and for the purpose described.

14. In an apparatus for the measurement of physical magnitude, the combination, with a measuring and a regulating circuit of electricity, of a set of resistances, a slide-contact moving thereon as the magnitude to be measured varies, whereby the resistances are included in or excluded from the said regulating-circuit, thereby changing the quantity of electricity passing therethrough, a second set of resistances, a motor included in the said measuring-circuit, and a magnet included in the regulating-circuit for controlling the motor, whereby it is caused to include or exclude from the said regulating-circuit a sufficient number of the second set of resistances to keep the current passing therethrough constant, as and for the purpose described.

399,293. KNIFE-SHARPENER FOR DOUBLE-PILE FABRIC LOOMS. ROBERT SIMON, Weehawken, N. J. Filed July 27, 1887. Serial No. 245,604. (No model.)

Claim.—1. The combination of the reciprocating cutter B with the sharpener I and means, substantially as herein described, for moving said sharpener by degrees into the path of the knife, so that said knife will pass over a different part of the stone after each cut in the fabric, as set forth.

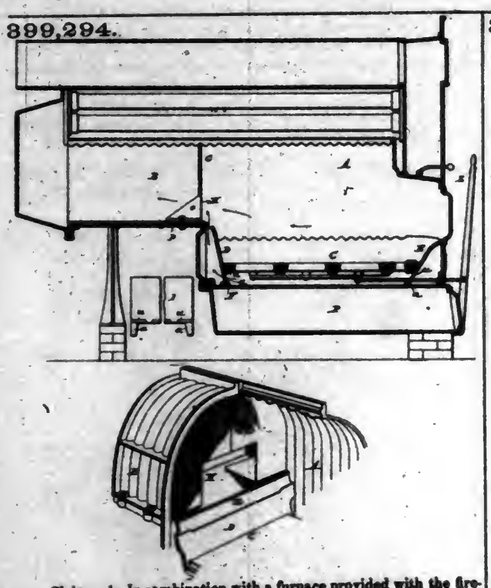
2. The stationary frame G, combined with the slide F, means for intermittently moving the same, the lever H, and with the sharpener I, carried by said lever, substantially as described.

3. The slide F, carrying the lever H, combined with said lever and with means for intermittently moving the said slide, and with the sharpener I, substantially as described.

4. The pivoted lever H and sharpener I, combined with means, substantially as described, for supporting said lever and for moving said lever intermittently, as set forth.

5. The slide F and a spring for moving the same, the frame G, lever H, the sharpener I, and pin p, in combination with the cam J, and with means, substantially as described, for moving said cam, as set forth.

6. The combination of the slide F, lever H, the sharpener I, spring N, pin p, cam J, worm s and worm-gear r, ratchet-wheel L, lever t, and pawl u, for moving the same, the lever t being adapted to be actuated from the batten E, substantially as described, and for the purposes set forth.



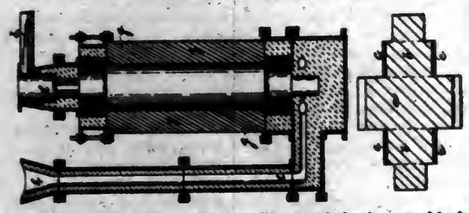
7. The combination of the batten having a lever-actuator, the slide F, and the movable hose-carrier H, carried by said slide, with the reciprocating knife B, and with a cam, worm r and s, ratchet-wheel L, pawl u, and lever t, intermediate between said batten and said hose-carrier, for moving the same by the batten, as specified.

8. The combination, in a loom, of the reciprocating knife B with two movable hose-carriers, H H, and mechanism, substantially as described, for moving both hose-carriers from time to time, so that the knife will pass over a different part of the hose after each cut in the fabric, substantially as described.

9. The slide F and movable hose-carrier H, carried thereby, combined with the knife B and the rest or support a^4 for said hose-carrier, and with a cam connected with the slide F, and a lever, and intermediate mechanism connecting the lever with the cam to shift the position of said hose-carrier, so that the knife will pass over a different part of the hose after each cut in the fabric, and with the batten for actuating the lever, as specified.

399,294. FURNACE AND GRATE THEREFOR. ISAAC D. SMEAD, Toledo, Ohio. Filed Nov. 12, 1887. Serial No. 254,967. (No model.)

399,294.

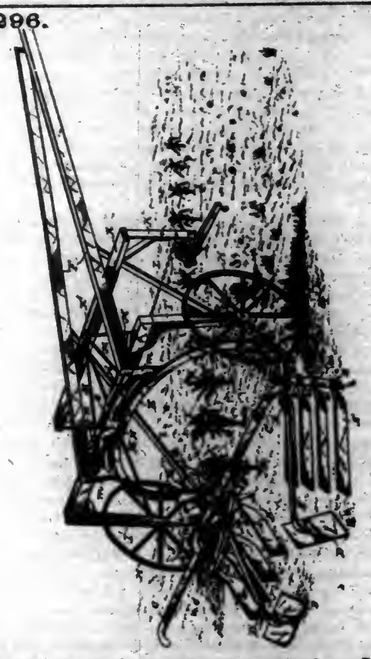


Claim.—1. In combination with a furnace provided with the fire-box A and the combustion-chamber B, and provided with suitable grate-supports and a grate, the removable diaphragm G, provided with an opening, H, all arranged substantially as shown and described, whereby the furnace can be adapted to burn either hard or soft coal at will.

2. In combination with the furnace having the fire-box A, provided with supports for a low-down grate to burn soft coal, the removable grate supports or plates E D, adapted to support the grate at a higher elevation, substantially as shown and described.

3. In combination with a furnace, substantially such as described, constructed to burn soft coal, the removable perforated diaphragm G, the removable grate-supports E D, and a grate adapted to be supported thereby, all constructed for joint operation, substantially as shown and described.

399,295. ROLL AND PINION. ROBERT C. TOTTEN, Allegheny, Pa. Filed Jan. 11, 1888. Serial No. 296,096. (No model.)



Claim.—1. A roll or pinion for rolling metals, having a steel body and a thin shell or facing of chilled cast-iron upon the necks or journals of the roll, substantially as and for the purposes set forth.

2. A roll for rolling metals, having a steel body and a thin shell or facing of chilled cast-iron upon the necks or journals, and upon the working-surface of the roll, substantially as and for the purposes set forth.

399,296. CULTIVATOR. AUGUSTUS C. TOWER and JUSTUS D. TOWER, Mendota, Ill. Filed July 23, 1887. Serial No. 245,613. (No model.)

399,296.

Claim.—1. A cultivator provided with two independently-movable gangs of knives pivoted in the ends of an arch rigidly connected to the tongue and a pair of traction-wheels pivoted at a point in advance of the wheels, whereby the direction of the wheels and knives may be changed by pressure upon either gang of knives independently of the direction of movement of the team, substantially as described.

2. In a cultivator, the combination, with the plow-beams B, of a pair of spring-metal arms, D', connected at their forward ends to said beams, and a clod-crushing plate, D, suspended from the rear end of each arm, substantially as described.

3. In a cultivator, the combination, with the plow-beams B, of a pair of arms, D', adjustably connected at their forward ends to the beams by bolts *f*, passing through slots *f'* in said beams, and a clod-crushing plate suspended from the rear end of each arm, substantially as described.

4. In a cultivator, the combination, with the plow-beams B, of a pair of backward-extending arms, D', connected at their forward ends to said beams, and a clod-crushing plate, D, suspended from the rear end of each arm by a hanger, D^2, attached to the arm by a bolt and nut, *i*, substantially as and for the purpose set forth.

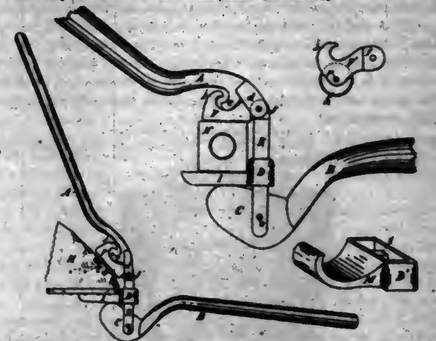
5. In a cultivator, the combination of a pair of plow-beams, a gang of knives secured to each plow-beam, and means for changing the inclination of the gang to fit the surface of ground, consisting of the slotted and corrugated convex plate *d*, the corrugated concave plate *e*, fitting over the same, and the bolt *c* and its nut *d'*, all arranged substantially as described and shown.

6. In a cultivator, the combination of a pair of plow-beams, a gang of knives secured to each plow-beam, and means for adjusting each gang horizontally in the path of a circle, consisting of the plate *d*, with a slotted extension, *d'*, and a bolt, *d''*, passing down through the slot into the knife-head, substantially as described.

7. In a cultivator, the combination of an arch or bow, E, provided with yokes F on its ends, and a pair of plow-beams, B, pivoted at their front ends in said yokes by means of a pin, F', passing through a socket on the end of the beam, substantially as and for the purpose set forth.

8. In a cultivator, the combination of an arch or bow, E, provided with yokes F on its ends, and a pair of plow-beams, B, pivoted at their forward ends in said yokes by means of a pin, F', passing through a socket on the end of the beam, and each laterally adjustable upon its pin F' by means of a set-screw, *k*, passing through its end socket, substantially as described and shown.

9. In a cultivator, the combination of an arch or bow, E, with yokes F on its ends, a pair of plow-beams, B, pivotally and adjustably connected to said yokes, a forked tongue, F, rigidly connected at its rear ends to said arch or bow, and a pair of stay-rods, *l l*, extending from the tongue F down into the yokes F, substantially as described and shown.

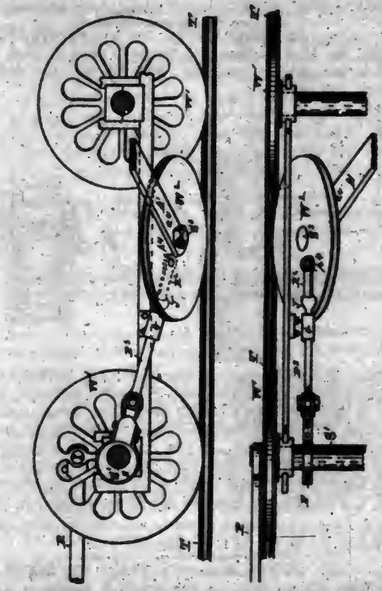


10. In a cultivator, the combination, with the tongue F and the rigidly-connected arch or bow E, provided at its center on top with the notch *n'*, of the independently-working axle I, provided with the drop-latch N, substantially as and for the purpose set forth.

11. In a cultivator, the combination of a pivoted axle, I, provided with curved tracks *n' n'*, and a rigid forked tongue, F, provided with friction-rollers at the points where it crosses the axle, substantially as described and shown.

12. A cultivator-knife having its rear lower point in line with the center line of the shank, substantially as and for the purpose set forth.

13. A cultivator-knife with its blade made separate from the shank and adjustably connected thereto for the purpose of retaining or adjusting its rear lower point in line with the center line of the shank, while said shank may be rotated in its holder, substantially as and for the purpose set forth.



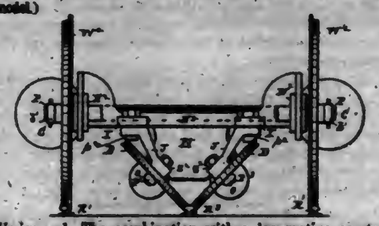
399,297. COMBINED TOOL. GEORGE H. TUCKER, Brownville, Me. Filed May 7, 1888. Serial No. 273,082. (No model.)

Claim.—1. A tool consisting of the combination of the upper handle, A, with projecting cam *c* and hinge *d*, the guide-bars B B, and serrated upper jaw, F, pivotally connected with said upper handle, the casing D, with laterally-projecting shelf or jaw I, and the lower handle, B, with cam C, operating the casing D and jaw I, substantially as shown, and for the purpose described.

2. As a new article of manufacture, a tool consisting of two handles or levers pivotally connected to the opposite ends of guide or connecting bars, each handle having a respective cam at or near its pivotal connection, a sliding jaw operated by the lower handle and moving on the connecting guide-bars, and an upper jaw pivoted at the upper end of the guide-bars and containing a curved or horn-like projection extending over the end of the cam on the upper handle, substantially as shown and described.

399,298. TRACTION MECHANISM FOR SELF-PROPELLING VEHICLES. HARRY L. VAN ELS, Albany, assignor of two-thirds to Oscar B. Van Els, Troy, and John MacCormack, Albany, N. Y. Filed Feb. 27, 1888. Serial No. 265,453. (No model.)

Claim.—1. The combination, with a car or locomotive truck provided with wheels to support the weight of the car or locomotive upon a rail-track, of arms pivotally connected to said truck and extended rearwardly therefrom, and traction or driving wheels arranged on the outward end of said arms constructed to receive power and to make a tractional engagement with the sides of the rail-track, substantially in the manner as and for the purposes set forth.



2. The combination, with the truck of a car or locomotive that is provided with wheels to support the latter upon the rail-track and to receive power for the propulsion of the truck, of supplemental drivers or traction-wheels constructed to receive power and arranged to engage with the sides of the rail-track and mounted upon the rear end of arms that are pivotally connected to the truck, substantially in the manner as and for the purposes set forth.

3. In a traction mechanism for moving locomotives or street-cars upon a rail-track, the combination of traction-wheels arranged to support the weight of the locomotive or street-car and to have propelling-power applied thereto from their frictional engagement with the tops of the rails, arms pivotally connected to the car or locomotive truck and extended therefrom on an angle, and supplemental traction wheels or drivers arranged upon the rearwardly-extended ends of said arms so as to make a tangent engagement with the sides of the rails, substantially in the manner as and for the purposes set forth.

4. In a mechanism for moving cars or locomotives along and over a rail-track, the combination of traction-wheels arranged to support the weight of the car or locomotive upon the tops of the rails, arms pivoted to the car or locomotive truck-frame, which arms at their front ends where extending their pivotal connection with the truck are connected by an intermediate spring and extended rearwardly from where pivoted upon an angle, and traction or driving wheels constructed to engage with the sides of the track and arranged on the rearward extension of said arms, substantially as and for the purposes set forth.

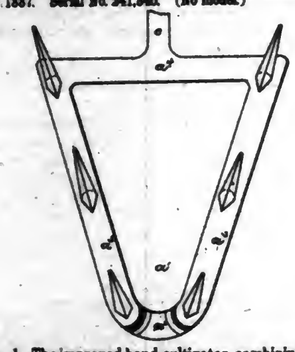
5. In a traction mechanism for moving locomotives or street-cars upon a rail-track, the combination of traction-wheels arranged to support the weight of the locomotive or street-car upon the tops of the rails and to have propelling-power applied thereto, arms that are pivotally connected on their ends with the car-truck and therefrom oppositely extended on an angle toward the track, and supplemental traction-wheels or drivers arranged on the rearward angular extension of said arms, said supplemental traction-wheels or drivers being constructed to receive power and to engage with the sides of the rail, substantially as shown and described.

399,299. TRACTION MECHANISM. HARRY L. VAN ELS, Albany, assignor of two-thirds to Oscar B. Van Els, Troy, and John MacCormack, Albany, N. Y. Filed Oct. 30, 1888. Serial No. 289,542. (No model.)

Claim.—1. The combination, with a locomotive or street-car truck having wheels to support the weight of the locomotive or car upon a two-rail track, of a center rail and traction-wheels or drivers operated to make a tractional engagement with the opposite sides of said center rail by the same mechanism that operates said traction-wheels or drivers for propulsion, substantially in the manner as and for the purposes set forth.

2. The combination, with a locomotive or street-car truck having wheels for supporting the weight of the locomotive upon a two-rail track and operated to engage with said two-rail track for propulsion, of a center rail and supplemental traction-wheels or drivers operated to make a tractional engagement with the opposite sides of said center rail by the mechanism operating them for propulsion, substantially in the manner as and for the purposes set forth.

3. The combination, with a locomotive or street-car truck having wheels to support the weight of the locomotive or street-car upon the rail of a two-rail track, of a center rail, and traction-wheels or drivers arranged upon each side of said center rail that are operated to make a tractional engagement with the opposite sides thereof by the power operating them for propulsion, with each of said traction-wheels or drivers mounted upon an arm that at its front end is pivoted to the truck and therefrom extended rearwardly to receive the traction-wheel axles, substantially as and for the purposes set forth.

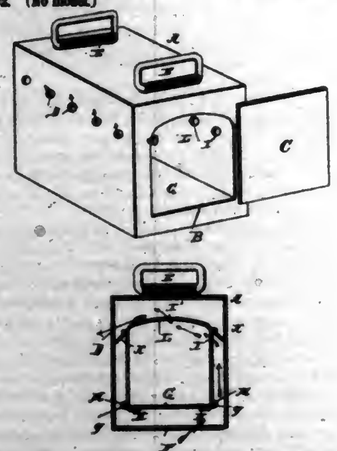


4. The combination, with a locomotive or street-car truck having wheels to support the weight of the locomotive or street-car upon a two-rail track and operated to make a tractional engagement therewith for propulsion, of a center rail, supplemental traction-wheels or drivers operated to engage with the opposite sides of said center rail, and arms each of which at their front ends are pivoted to the truck and therefrom extended rearwardly to support the axles of the said supplemental drivers or traction-wheels, substantially as and for the purposes set forth.

5. The combination, with a locomotive or street-car truck having wheels to support the weight of the locomotive or street-car upon the rails of a two-rail track, of a center rail and traction-wheels or drivers making a tangent contact with the opposite sides of said center rail, and each of said drivers or traction-wheels mounted upon the

rear end of an arm which at its front end is pivoted to the truck and therefrom extended on an angle to receive the axles of the said drivers or traction-wheels, substantially in the manner as and for the purposes set forth.

6. The combination, with a locomotive or street-car truck having wheels to support the weight of the locomotive or street-car upon the rails of a two-rail track, of a center rail, arms that are each separately pivoted to the truck at their front ends and therefrom rearwardly projected on an angle, and a traction-wheel or driver mounted upon the rear end of each of said arms, with each of said traction-wheels or drivers making a tangent engagement with the opposite side of said central rail, substantially in the manner as and for the purposes set forth.



899,800. HAND-CULTIVATOR. KARL VOIGT, Newark, N. J. Filed June 20, 1887. Serial No. 241,840. (No model.)

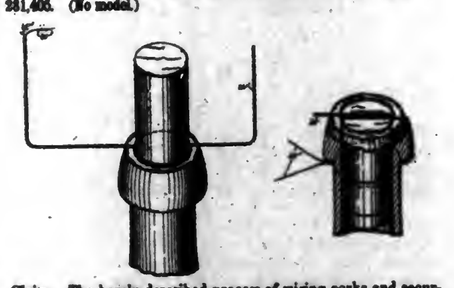
Claim.—1. The improved hand-cultivator, combining a triangular frame, its two opposite sides provided with rearwardly-curved teeth, and their meeting ends curved or arched to form recess a^3, and the cross-bar or third side provided with a handle-connection and a handle, substantially as set forth.

2. The combination, with a single handle, of a three-sided frame, a^3 a^4 a^4, at the center of one side of which is formed a handle-connection to receive the handle, the other two sides of which are provided with backwardly-turned teeth and are united at the angle opposite said handle-connection, the said teeth being disposed away from said angle to form a plant-passage beneath the frame at the said angle in line with the said single handle, substantially as set forth.

899,801. OVEN FOR VAPOR-STOVES. GEORGE M. VOLTZ and CHARLES H. SHULTS, St. Joseph, Mo. Filed Apr. 20, 1888. Serial No. 271,292. (No model.)

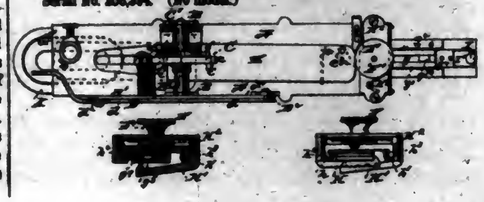
Claim.—1. An oven for vapor-stoves having the outer shell provided with openings D, the lining L, arranged within the outer shell and forming an intermediate space between it and the outer shell, and having openings I in its side and openings I' in its top, and deflectors adapted to open and close the intermediate space upon each side of the said lining L and cause the heat to pass into the oven through the side or around and over the top of the oven, substantially as described.

2. A portable oven having the shell A, provided with openings D, the lining arranged within the shell and having the openings I in its sides and the openings I' in its top, and the deflectors hinged to the lining and adapted to open or close the intermediate space, and also the openings I, to cause the heat either to pass through said openings I or to pass around the top of the oven, substantially as described.



3. A portable oven having the shell A, provided with the openings D, the lining L, arranged within the oven and having the openings I in its sides and the openings I' in its top, and inclined deflectors arranged in the spaces between the walls of the shell and the sides of the lining, having their upper edges above the openings I, substantially as described.

899,802. VALVE. ELIJAH WARE, Omaha, Nebr. Filed Nov. 1, 1888. Serial No. 289,737. (No model.)

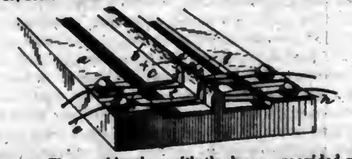


Claim.—In a valve, the combination of a casing having two distinct inclosed ports or passages of segmental configuration whose central integral walls have an opening therein for the entrance of the key, and forming stops, a flat valve-plate with two segmental openings therein adapted to be mounted in a suitable seat above the inclosed ports or passages, and provided with an integral stem which depends downward into the central opening between the central integral walls of the said inclosed ports or passages, a key adapted to enter said central opening and engage with the lower end of the stem, having reduced sides adapted to bear against one of the side walls of each of the inclosed ports when the valve-plate is opened or shut, thereby to cause an exact registration, and a coiled spring inserted between the key and the valve-casing around the stem to cause the valve-plate to be retained in its seat, substantially as described.

899,803. PROCESS OF CORKING AND WIRING CORKS TO BOTTLES. SOL WILE, Rochester, and HENRY LA CAMME, Syracuse, N. Y.; said La Camme assignor to said Wile. Filed July 30, 1888. Serial No. 281,405. (No model.)

Claim.—The herein-described process of wiring corks and securing the same to the bottle in the operation of corking the bottle, for the purpose of providing a draw or pull with which to withdraw the cork to open the bottle, the same consisting in first compressing the cork, then driving the compressed cork for a part of its length into the neck of the bottle, then applying the wire to the cork and forcing the cork home into the bottle, then bending the wire over the top of the cork and bottle and around the neck of the bottle, and, finally, twisting the free end of the wire onto the standing end secured to the cork, substantially as and for the purpose set forth.

899,804. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. HENRY J. WILLIAMS, New York, N. Y., assignor to the Harris Button Hole Attachment Company, same place. Filed Nov. 30, 1887. Serial No. 256,204. (No model.)



Claim.—1. In a button-hole attachment for sewing-machines, the combination, substantially as hereinbefore set forth, of the bed-plate, the feed-plate having a longitudinal slot, g, at its rear end, the toothed rack above the slot and around its edge, the driving-pinion engaging with the rack, the guide-blocks at each end of the slot, and the hooks hinged to the bed-plate and engaging with opposite sides of the feed-plate, for the purpose specified.

2. In a button-hole attachment for sewing-machines, the combination, substantially as hereinbefore set forth, of the bed-plate, the feed-plate, the toothed rack on the feed-plate, the driving-pinion engaging therewith, means for driving the pinion, and the hooks hinged to the bed-plate and engaging with opposite sides of the feed-plate for holding the pinion in engagement with the rack.

3. In a button-hole attachment for sewing-machines, the combination, substantially as hereinbefore set forth, of the bed-plate, the feed-plate, the toothed rack on the feed-plate, the driving-pinion engaging with the rack, the hooks hinged to the bed-plate and engaging with opposite sides of the feed-plate, the block having an inclined lower face, g^6, secured to the feed-plate for disengaging the hooks at one extremity of the longitudinal movement of the feed-plate, said feed-plate being provided with a curved or rounded end to allow the hooks to disengage themselves at the other extremity of its longitudinal movement.

899,805. LIGHTNING-ARRESTER. CHARLES H. WILSON, Columbus, Ohio, assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 19, 1887. Serial No. 255,593. (No model.)

Claim.—1. The combination, with the base a, provided with the bead b, of lightning-arrester springs arranged in rows on opposite sides of said bead and suspended by fusible wires passing over the bead, and common ground connections or stripe c d, substantially as described.

2. In a lightning-arrester, the springs f h, connected together and suspended by a fusible wire passing over a screw-head, g, in combination with the underlying contact-pieces c d, the tension of spring h being greater than the tension of spring f, to insure the closing of spring h upon its underlying connecting-piece d when the connecting-wire is fused or elongated, substantially as described.

3. In a lightning-arrester, the combination, with springs adjusted to press toward underlying contact-strips, in combination with said contact-strips, an insulating-piece separating said strips, and a fusible wire connecting said springs and passing over said insulating-piece to hold said springs normally suspended, substantially as described.

899,806. FOUNTAIN-PEN. PAUL E. WIRT, Bloomsburg, Pa. Filed Mar. 16, 1888. Serial No. 267,423. (No model.)

Claim.—1. In a fountain-pen, the pen-body formed with one or more longitudinal capillary grooves or ducts, which extend back to the heel thereof, as set forth.

2. In a fountain-pen, the pen-body formed with one or more longitudinal capillary grooves or ducts, which extend back to the heel thereof, and the tongue-piece or lip at the front terminal of said ducts or grooves, as set forth.

3. In a fountain-pen, the pen-body formed substantially W-shaped in cross-section, so as to provide longitudinal capillary grooves or ducts, which extend throughout the length of the pen back to the heel thereof, as set forth.

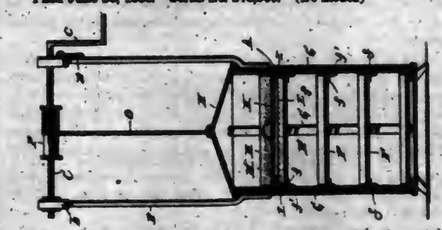
4. In a fountain-pen, the pen-body formed with longitudinal capillary grooves or ducts d for the passage of ink, and the central duct or channel, e, forming the air-passage, as set forth.

5. A fountain-pen in which capillary attraction is produced solely by the use of a pen the body of which is formed with one or more capillary grooves or channels or ducts, which extend back to the heel thereof, and a tongue-piece communicating with the ducts to draw the ink therefrom to the nibs of the pen, as set forth.

6. A fountain-pen having its pen-body provided with one or more capillary ducts or channels, which extend back to the heel of the pen and which of themselves attract the ink from the reservoir, as set forth.

7. A fountain-pen having its pen-body provided with one or more capillary ducts or channels, which extend back to the heel of the pen, and a tongue-piece formed integral with the pen-body and communicating with the ducts or channels, as set forth.

8. In a fountain-pen, the pen-body provided with one or more longitudinal capillary ducts or channels, which extend back to the heel of the pen, so that the channels communicate with the interior of the pen reservoir or holder, so as to draw the ink therefrom, and a tongue-piece communicating with the front termini of the ducts or channels and lying over the back of the pen above the nibs, as set forth.



9. A fountain-pen body provided with longitudinal capillary ducts or channels, which communicate with the ink-reservoir, so as to attract the ink from the reservoir, and the tongue-piece to draw the ink from the ducts or channels down to the nibs of the pen, as set forth.

10. In a fountain-pen, the body provided with longitudinal capillary grooves or ducts, which communicate with the ink-reservoir, so as to attract the ink from the reservoir, and the tongue-piece formed integral with the pen-body and lying over the nibs of the pen and communicating with the front termini of the grooves or ducts, as set forth.

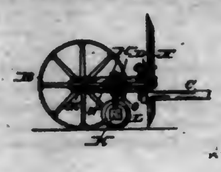
11. In a fountain-pen, the pen-body formed with one or more longitudinal capillary ink-conducting grooves or ducts and one or more longitudinal ducts or channels for the passage of air.

12. A fountain-pen in which capillary attraction is produced solely by the use of a pen the body of which is provided with one or more capillary ink-conducting grooves or ducts or channels extending longitudinally back to the heel of the pen and adapted to attract the ink from the reservoir to the nibs of the pen, as set forth.

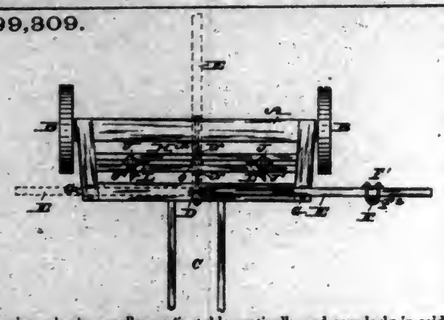
899,807. REFRIGERATOR. JOHN H. WITHROW, Oak Harbor, Ohio. Filed June 20, 1888. Serial No. 278,069. (No model.)

Claim.—In a refrigerator, the combination, with the receiver adapted to be arranged below the surface of the ground, of the elevator comprising the parallel shelves F F, held in position by the side straps, G G, the cap N, affixed to the upper ends of the straps and adapted to fit over the upper end of the receiver when the elevator is lowered, and the reservoir H, arranged between the straps G, below the cap N, and provided with a removable shelf or partition, K, arranged on suitable brackets, I I, whereby separated chambers L and M are formed, substantially as and for the purpose specified.

899,808. WHISK-BROOM. JOHN WRIGHT, Hoosick Falls, N. Y. Filed Nov. 28, 1888. Serial No. 291,667. (No model.)



Claim.—1. The combination, with a broom, of a shield and handle-cover, and of a suspension device connected with the handle-core, and serving to maintain the shield and handle-cover in position, substantially as specified.



2. The combination of the broom A, having the core A', the shield B, having the swell B^2, cover C, cap D, and suspension device E, seated in the core, substantially as specified.

899,809. MARKER, FURROWER, AND COVERER. EDWIN WYCOFF, Camden, N. J. Filed Sept. 7, 1888. Serial No. 284,797. (No model.)

Claim.—1. In a marker, furrower, and coverer, a frame having lugs or uprights, a marker pivoted to the frame and retained in place by said uprights, a slotted cross-bar in the frame, threaded shanks

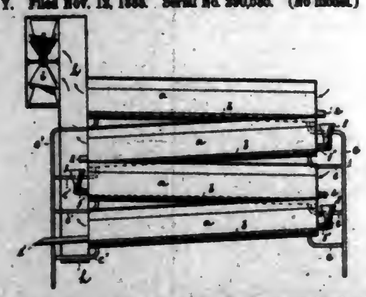
399,309.

carrying wheels or rollers adjustable vertically and angularly in said slotted bar, and a clamping-rod passing through said frame and slotted bar, substantially as and for the purpose described.

2. In a marker, furrower, and coverer, a frame, a slotted bar arranged transversely in the frame, threaded shanks in said slotted bar, studs on the shanks forming axles for the covering and furrowing wheels, clamping-nuts on the threaded shanks for binding against the slotted bar for retaining said shanks in their adjusted positions, a block arranged in the slotted bar, a rod passing through the frame, bar, and block, and nuts on said rod for binding against the slotted bar, all arranged and adapted to serve substantially as and for the purpose described.

3. In a marker, furrower, and coverer, a frame, a transverse slotted bar carried thereby, shanks carrying wheels adjustable vertically and angularly in said slotted bar, nuts on said shanks for retaining the same in the adjusted positions, and a rod passing through the frame, and slotted bars having clamping-nuts thereon, all arranged and adapted to serve substantially as and for the purpose set forth.

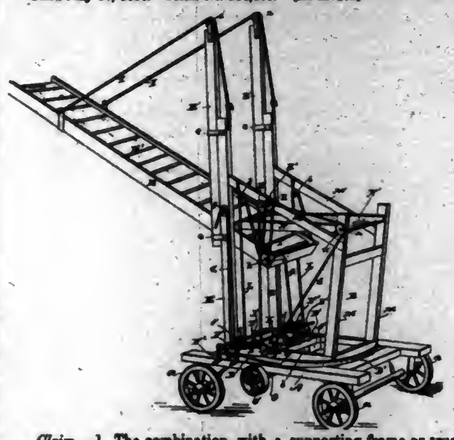
399,310. METHOD OF SEWING. GEORGE A. XANDER, Hamburg, and JOHN G. XANDER, Reading, Pa. Filed May 28, 1888. Serial No. 276,207. (No model.)



Claim.—1. The method of forming separate lock-stitches, consisting in passing a thread through the material at three points, so as to form a central loop and pulling both ends of the thread through said loop, substantially as set forth.

2. The method of forming separate lock-stitches, consisting in passing a thread through the material from one side thereof in a series of three loops and pulling both ends of thread through the central loop, substantially as set forth.

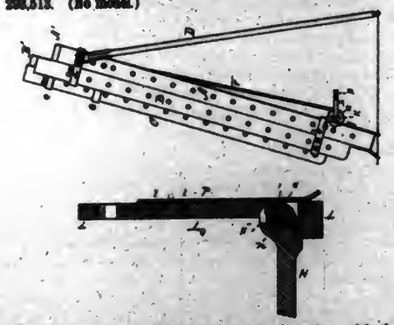
3. The method of stitching herein set forth, which consists in forming two loops, reversing their position, pulling the end of the thread which forms the first loop through the second, forming a third loop, passing it through the second, and tightening the knot.



4. The method herein set forth of forming a series of lock-stitches, which consists in forming two loops, reversing their position, pulling the end of the thread which forms the first loop through the second, forming a third loop, passing it through the second, tightening the knot, cutting the thread, and moving the material into position for the next stitch.

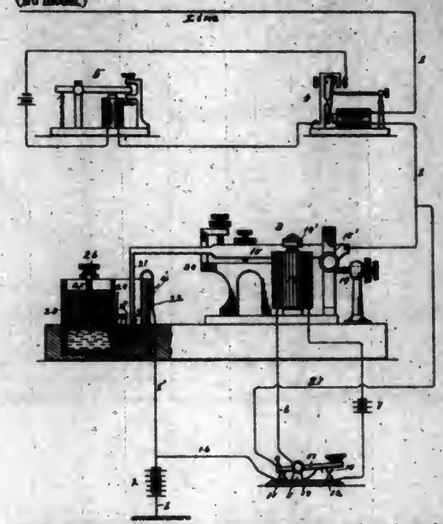
399,311. EVAPORATING APPARATUS. MAX ARB, New York, N. Y. Filed Nov. 12, 1888. Serial No. 290,595. (No model.)

Claim.—The combination of a series of communicating inclined troughs having double bottoms, covers, and steam inlet and discharge pipes, with open walls at one end and with a vapor-collecting chamber at the other end, into which the several troughs open, and with a fan-wheel within said vapor-collecting chamber, substantially as specified.



399,312. STRAW-STACKER. ROBERT S. ARBOGAST, Selma, Ind. Filed July 17, 1888. Serial No. 280,173. (No model.)

Claim.—1. The combination, with a supporting frame or truck and a turn-table mounted thereon, of suitable supports secured to one end of said turn-table and having adjustable extensions mounted thereon, a shaft mounted on the turn-table and provided with a crank-handle and a pawl and ratchet, ropes secured at one end to said shaft and their other ends to the lower ends of the extensions, pulleys mounted on the upper ends of the supports, over which said ropes pass, a main conveyer-trough provided with an endless conveyer, mechanism for operating said conveyer, ropes secured at one end to the upper outer end of the conveyer-trough and at their other ends to the supports, pulleys mounted on the upper ends of the extensions, over which said ropes pass, a second shaft mounted on the turn-table and provided with a crank-handle and a pawl and ratchet, ropes secured at one end to said shaft and at their other ends to the lower inner end of the main conveyer, and suitably-supported pulleys, over which said ropes pass, all constructed, arranged, and operating substantially as shown and described.



2. The combination of the supporting frame or truck A, the turn-table B, mounted thereon, the supports E E, having the adjustable extensions F' F', the shaft F, mounted on the turn-table and provided with the windlasses F' F', the ropes G G, secured to the windlasses at one end and at their other ends to the lower ends of the extensions F' F', and passing over the pulleys *g g*, the main conveyer-trough H, having the endless conveyer H', the ropes I I, secured at one end to the outer end of the trough H and at their inner ends to the supports E E, and passing over the pulleys *i i* on the top of the extensions F' F', the shaft K, mounted on the turn-table and provided with the windlasses K' K', the ropes L L, secured at one end to the inner end of the main conveyer-trough and at their other ends to the windlasses K' K', and the supports M M, and stationary receiving-table N, secured to said supports and projecting over the lower inner end of the conveyer-trough H, and having the endless conveyer N', all constructed, arranged, and operating substantially as shown and described.

399,313. FOLDING CRANK FOR EXTENSIBLE LADDERS. PHILIP S. BRADFORD, Bridgewater, Mass. Filed Dec. 13, 1888. Serial No. 293,513. (No model.)

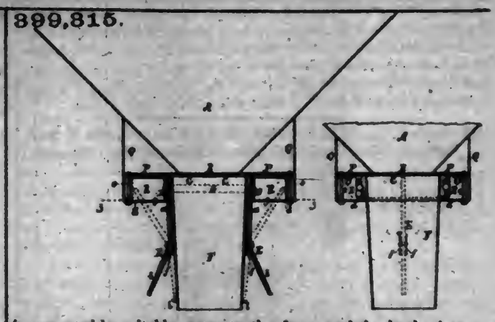
Claim.—In an extensible ladder, the combination, with the hoisting mechanism thereof, of a crank mechanism consisting, essentially, of the main arm L, handle N, pivoted to said main arm and provided with the notches or depressions N' N'', and the spring P, secured at one end to said main arm L, and provided near its free end with a projection, P', adapted to drop into said notches, substantially as and for the purpose described.

399,314. TELEGRAPH SYSTEM. WILLIAM DORSHEIMER, North East, assignor of two-thirds to Samuel A. Davenport, Erie, and Charles A. Hitchcock, North East, Pa. Filed July 9, 1888. Serial No. 279,448. (No model.)

Claim.—1. The combination, in a system of telegraphy, of a main-line circuit and ordinary relays and sounders with continuous-current telegraphic-transmitting mechanism consisting of a circuit making and breaking device, an oscillating lever in the main-line circuit supporting and operating a movable metallic electrode tipped with non-conducting material and operating in a conductive fluid in the main-line circuit in unison with the circuit making and breaking device, so that when the electrode is down the metallic portion thereof is immersed in said fluid, and when up the metallic portion of the electrode is withdrawn from the fluid, leaving only its non-conductive tip therein, substantially as and for the purpose set forth.

2. In a system of telegraphy, the combination, with a main-line circuit and ordinary relays and sounders, of a transmitter for sending contiuous currents to line, consisting of a finger-key, local battery-circuit, electro-magnet armature having a pendent metallic electrode with a tip of non-conducting material, and a cup containing a conductive fluid forming part of the main-line circuit, substantially as herein set forth.

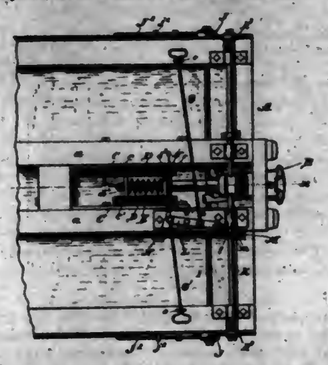
3. The combination, in telegraphic-transmitting mechanism, of a circuit making and breaking device with a movable metallic electrode tipped with non-conducting material and a cup of conductive fluid in a main-line circuit in which said electrode operates so as to immerse the metallic portion thereof in the fluid and withdraw the same therefrom (leaving only the non-conducting tip thereof in said fluid) in unison with the circuit making and breaking key, substantially as and for the purpose set forth.



4. The combination of the cup containing a conductive fluid, the reservoir or feed-cup communicating therewith, and the plunger with the armature-lever, the metallic electrode having a non-conductive tip, and the electro-magnet co-operating with the armature-lever, substantially as and for the purpose set forth.

399,315. SCALE-PAN. FRANK H. BURRILL and GEORGE G. BURRILL, Concord, Mass. Filed Nov. 23, 1888. Serial No. 291,635. (No model.)

Claim.—1. The scale-pan substantially as described, it comprising the pan A, provided with the educt B, the frame Q, and perforated plate P, secured to each other and to the pan and provided with the guides O, the slides C, arranged to move in the guides and provided with the turned-down portions D, the springs G, to close the slides, the tube F, provided with the flange, slotted as described and held in contact with the frame by screws, and the levers E, pivoted to the said tube, to move the slides so as to open the educt B, all essentially as set forth and represented.



2. The scale-pan comprising the pan A, provided with an educt, B, of the frame Q and perforated plate P, secured to each other and to the pan and provided with guides O, the slides C, adapted to be moved in said guides, the springs G, the levers E, fulcrumed to the tube F, the said tube F having a slotted flange, *d*, by which said tube

399,315.

is connected by suitable means to the frame, and the hooks *i*, connected to the tube, all essentially as set forth and represented.

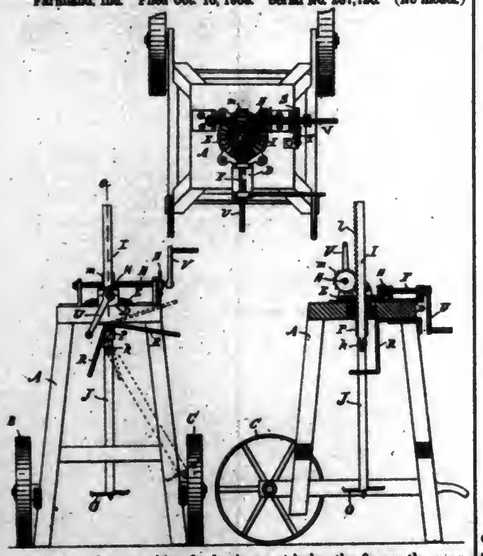
399,316. CAR-COUPLING. GEORGE W. DECKER, Willowmoc, N. Y. Filed Sept. 18, 1888. Serial No. 285,722. (No model.)

Claim.—1. In a car-coupling, the combination of the fixed castings, an oscillating carrier mounted in the castings to turn a limited distance therein, a draw-head mounted in said carrier to rock therewith and capable of a limited endwise movement in said carrier independent of the rocking movement of the latter, and a cushion-spring for retarding the endwise movement of the draw-head, substantially as and for the purpose described.

2. In a car-coupling, the combination of the fixed castings having the segmental flanges, the oscillating carrier having the parallel connected sides provided with the carred ends, which fit snugly in the segmental flanges, and the sliding bridge-piece fitted between said parallel sides, a draw-head fitted in the fixed and sliding bridge-pieces of said carrier, and a cushion-spring interposed between the fixed and sliding bridge-pieces, substantially as described.

3. In a car-coupling, the combination of an oscillating carrier, a draw-head carried thereby, fixed castings in which said carrier is mounted to be capable of a limited vertical play, and manually-operated devices for raising or depressing the free end of the draw-head, substantially as described.

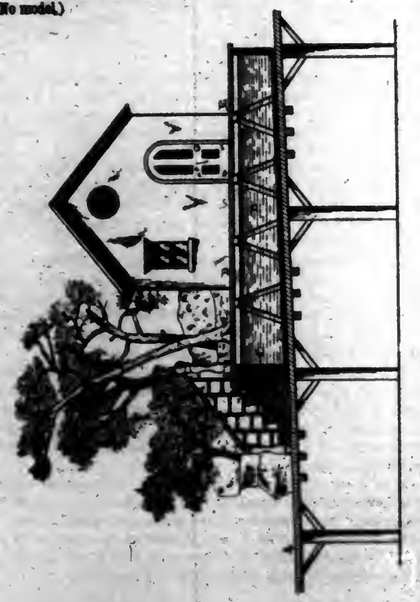
4. In a car-coupling, the combination, with a draw-head capable of a limited vertical play, of a rock-shaft having a cam or spiral arm and a notched disk, a spring-controlled latch adapted to engage the disk, and an operating-rod connected to the latch, substantially as and for the purpose described.



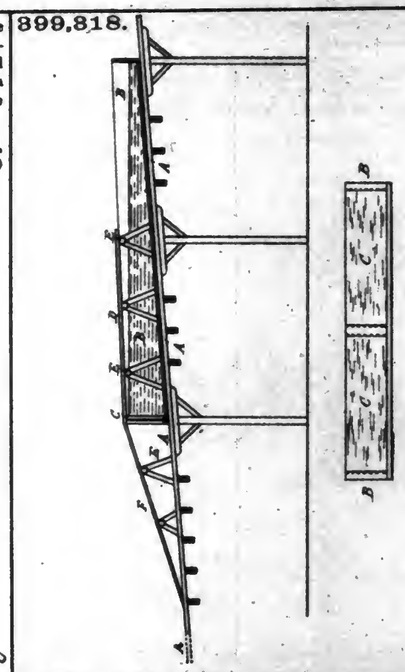
5. In a car-coupling, the combination of an oscillating carrier mounted between fixed castings, an endwise-movable draw-head carried by said carrier and retarded by a cushion spring, a rock-shaft having means for moving the draw-head vertically, and manually-operated devices for locking said rock-shaft and to hold the draw-head in its adjusted position, substantially as described.

6. In a car-coupling, the combination of a draw-head, a rock-shaft having a spiral arm and notched disk, the detachable levers adapted to be fitted in recesses in the car-beams and concealed from view by a plate, a pivoted toothed latch, a spring connected thereto, and operating-rods pivoted to the latch on opposite sides of its fulcrum, substantially as described.

7. In a car-coupling, the combination of a draw-head having a spring-controlled slide operating therein, a coupling-pin, a pivoted spring-pressed lever connected to the pin, a rock-shaft having a tappet-arm for raising said lever and pin, and the operating-levers each coupled to the shaft to be capable of a limited movement thereon without rocking the same, substantially as described.



8. In a car-coupling, the combination of a draw-head, a slide operating therein, a coupling-pin, a lever connected to the pin, a rock-shaft having a tappet-arm for lifting the lever and pin, and provided at its ends with fixed slotted disks, and the levers each pivoted to a disk which is loosely fitted on the shaft and has a pin adapted to ride in the slot of one of the fixed disks, substantially as described.



399,317. POST-HOLE-BORING MACHINE. HARVEY H. DIGGS, Farmland, Ind. Filed Oct. 10, 1888. Serial No. 287,720. (No model.)

Claim.—In a machine for boring post-holes, the frame, the gear-wheel mounted on said frame and having an angular central opening, the auger, the auger-shaft formed of two sections hinged together, one of which sections fits said opening in the gear-wheel, so as to slide longitudinally therein and rotate therewith, the cog-teeth in one side of said section, the pinion arranged to intermesh with said cog-teeth, the shaft arranged to rotate and to form a sliding support for said pinion, and the bent lever mounted on the frame and arranged to engage the lower section of the auger-shaft, all combined and arranged to co-operate substantially as specified.

399,318. THEATRICAL STAGE. JOHN DOUGLASS, London, County of Middlesex, England, assignor to Hal. S. Taylor, Brooklyn, and James R. Nugent, New York, N. Y. Filed July 23, 1887. Serial No. 245,477. (No model.)

Claim.—1. In a theater in which the auditorium is wholly on one side of the stage, the combination of the main stage of the theater with a water tight tank provided with a temporary removable flooring adapted to form a secondary stage, substantially as described, and for the purposes set forth.

2. The combination, with the main stage of a theater, of a navigable body of water extending into one or both of the wings, suitable means floating upon the water for conveying to and fro before the audience one or more of the persons assuming the characters in the play, and a temporary removable flooring covering part or all of the tank, substantially as described.

3. The combination, with the main stage of a theater, of a water-tight tank, which latter occupies a portion of said stage and is adapted to be floored over, as described, and when so floored over forms with the unoccupied portion of said stage the acting-stage of the theater, substantially as described, and for the purposes set forth.

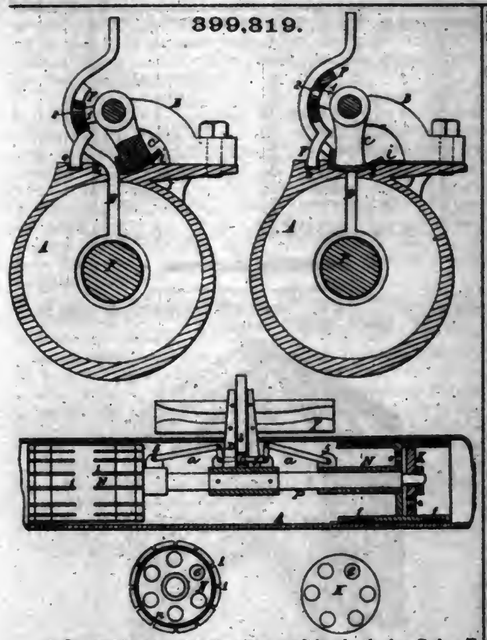
4. The combination of the main stage of a theater with a portable tank capable of holding water and means whereby it may be temporarily floored over to form a second stage, substantially as described, and for the purposes set forth.

5. The combination, with a main theatrical stage, of a water-tight tank provided with a glass front and adapted to be placed upon the said main stage, and provided with a removable flooring adapted to form a second stage, substantially as described, and for the purposes set forth.

6. The combination of a main theatrical stage, a water-tight tank adapted to be placed upon said main stage and temporarily floored over, so as to form a second stage, and a supplemental stage connecting the said second stage with the main stage, substantially as described, and for the purposes set forth.

7. In combination with the main stage of a theater, a portable water-tight tank adapted to be placed upon the said main stage and provided with a removable flooring adapted to form a second stage, substantially as described, and for the purposes set forth.

8. The combination of the main stage A, tank B, flooring D, and supports E E, arranged substantially as described, and for the purposes set forth.

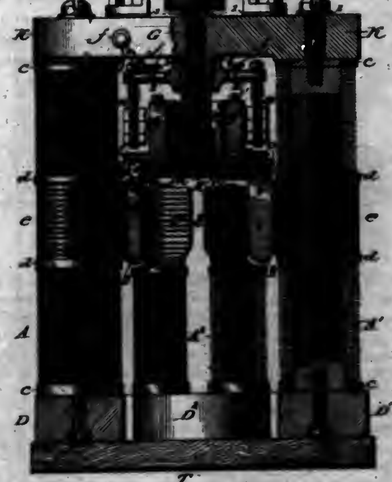


399,319. PNEUMATIC RAILWAY. GEORGE L. DU LANEY, Philadelphia, Pa. Filed Aug. 8, 1887. Serial No. 246,448. (No model.)

Claim.—1. The air-chamber A, when constructed with a curved valve-seat, *z*, flange I, and longitudinal groove *o*, as shown, and for the purpose specified.

2. The vibratory valve C, provided with the pad *i*, and having the series of spiral springs, as set forth, and having a radial arm, 1, provided with a frictional roller, all substantially as shown and described.

3. In combination, the tube A, bracket B, and valve C, as shown and described, and for the purpose specified.



399,319.

4. In combination with the piston and heads, the bar D, bar F, frictional roller 2, radial arm 1, and valve C, as and for the purpose specified.

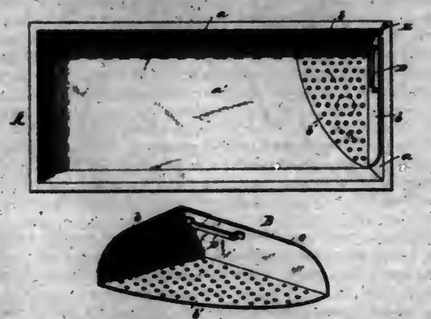
5. In combination, the rod P, the adjustable head N, and disk K, the head and disk having perforations *e* therein not in line or non-registering with each other, as and for the purposes set forth.

399,320. DYNAMO-MACHINE. GEORGE L. DU LANEY, New York, N. Y. Filed Aug. 22, 1888. Serial No. 283,479. (No model.)

Claim.—1. In a dynamo-machine, the combination, with the base-ring and the bridge-piece K, of the cores secured between said base-ring and bridge-piece and provided with the collars *d d* and *e e*, the coils wound upon the ends of the cores between the collars, and the pole-pieces *c c*, built up of sections, substantially as and for the purpose set forth.

2. In a dynamo-machine, the revolvable vulcanite disk R, for carrying the armature, provided with wedge-shaped vertical slots V in its periphery and with the channels for the wires, substantially as and for the purpose set forth.

3. In a dynamo-machine, the combination, with the revolvable disk R, provided with vertical wedge-shaped slots V in its periphery, of the armature-ring built up of sections provided with projections fitting into the slots in the said disk and a band for holding said segments in position, substantially as set forth.



4. In a dynamo-machine, the combination, with the revolvable disk R, provided with vertical wedge-shaped slots V in its periphery, of the armature-ring built up of sections provided with flanges on one side having projections at one end of them fitting into the said slots, the coils wound upon the said sections, and an insulated metallic band shrunk upon the periphery of the disk for holding the said sections in position, substantially as set forth.

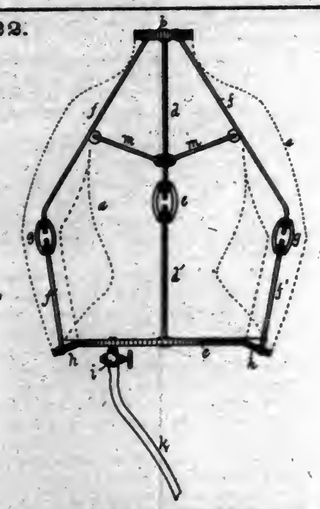
5. In a dynamo-machine, the combination, with the revolvable disk R, provided with wire-channels *n* and *h*, of the armature-ring depending from the disk, the commutator-bars *g*, secured to the upper surface of the disk and provided with binding-screws *l* and *l'*, and the armature-coils having their opposite ends passed through the said channels in the disk and secured to the commutator-bars by the binding-screws, substantially as and for the purpose set forth.

6. In a dynamo-machine, the combination, with the outer field-magnets, A A', provided with the pole-pieces *c c*, built up of thin sections, the end coils, and the collars at each end of the coils, substantially as set forth, of the revolvable armature-ring between the said pole-pieces and the inner electro-magnets, A^2, provided with pole-pieces inside the said armature-ring and built up of thin sections and secured to the cores, substantially as and for the purpose set forth.

7. In a dynamo-machine, the combination, with the field-magnets A A', provided with pole-pieces *c c* and coils, as set forth, of the bridge-piece K, secured to the upper end of the field-magnet cores and provided with a long hub projecting centrally between them, the armature-disk R, secured to a shaft journaled in said hub, the armature-ring depending from said disk between the pole-pieces, the commutator-bars secured to the upper side of said disk, and the cross-head secured on the outside of said hub and provided with depending bars and with brushes bearing against the said commutator-bars, substantially as and for the purpose set forth.

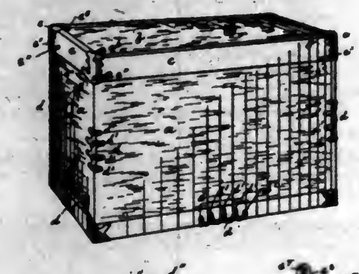
399,321. SINK-CLEANER. WILLIAM V. RENOUD, Chicago, Ill. Filed Sept. 21, 1888. Serial No. 286,263. (No model.)

Claim.—1. A combined strainer and cleaning-scoop for sinks, consisting of a single piece of sheet metal with sides conforming in shape to one corner of a sink, and having a perforated bottom to cover the outlet-pipe, substantially as and for the purposes described.



2. A combined strainer and cleaning-scoop for sinks, consisting of a single piece of sheet metal with sides conforming in shape to one corner of a sink, and having a perforated bottom to cover the outlet-pipe, and a suitable handle attached to the inner surface of one of its sides, substantially as shown and described.

3. A combined strainer and cleaning-scoop for sinks, consisting of a single piece of sheet metal with sides conforming in shape to one corner of a sink, and having a perforated bottom to cover the outlet-pipe, and a suitable handle attached to the inner surface of one of its sides, in combination with a sink, substantially as set forth.



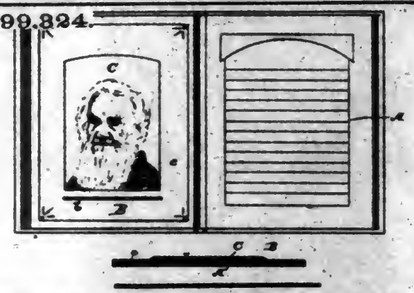
399,322. INFLATABLE DRESS-FORM. ANNA M. SELWYNN, Decatur, Ill. Filed Jan. 19, 1888. Serial No. 296,897. (No model.)

Claim.—The inflatable form *a* of uniformly-elastic material, the closures *b c h h*, the rods *d d'*, secured to the closures *b* and *c*, respectively, and reversely threaded at their ends, the reversely-threaded turn-buckle *e*, rods *f f'*, connected with closures *b* and *h h*, respectively, and reversely threaded at their ends, the reversely-threaded turn-buckles *g g*, braces *m m*, air-admitting tube *k*, and valve *i*, all in combination, as set forth.

899,322.

899,323. TRUNK-TRIMMING. HENRY E. GILSON, Somerville, Mass. Filed Apr. 6, 1888. Serial No. 269,877. (No model.)

Claim.—1. In a trunk or similar receptacle, the metallic angle-clamp herein shown and described, the same consisting of a body bent to conform to the angular edge of the trunk, and having at varied distances from the vertex of said angle a series of openings or apertures adapted to receive rivets which pass through the wall of said trunk at different distances from the angle and in separate lines of strain, substantially as described.



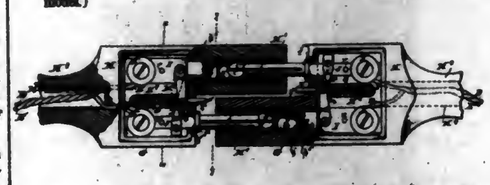
2. In a trunk or other similar receptacle, the combination, with the body or top thereof, of angle-clamps each consisting of a body portion bent to embrace the angle of the part to which it is applied, said body portion having arms or prongs varying in length, said arms being provided at their ends with apertures to receive rivets entering the adjacent walls at varying distances from the angle formed by said walls, whereby said rivets act upon the parts to which they are attached in different lines of strain, substantially as described.

3. In a trunk or other receptacle, a metallic corner-piece and valance-clamp combined and formed in one piece of metal, the same consisting of an angular body shaped to embrace the corner and overlie the top, and having a downwardly-projecting portion, *d*, provided with arms *d'*, their lower edges curved below the edge of the top, said arms having terminal openings *d²*, the whole being formed in one integral piece of metal, substantially as described.

899,324. ALBUM. OWEN J. GRIFFITHS, Chicago, Ill. Filed Mar. 23, 1888. Serial No. 268,280. (No model.)

Claim.—A picture-album having leaves, each of which has a sight-opening at one side or face of a size adapted to a picture corresponding in size to the capacity of the album and having its opposite side closed and formed of a hard-finished paper, substantially as set forth.

899,324.



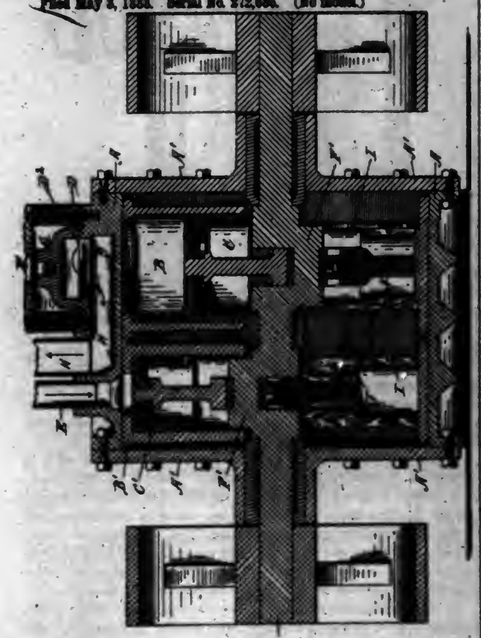
899,325. ALBUM. OWEN J. GRIFFITHS, Chicago, Ill. Filed Nov. 2, 1888. Serial No. 289,801. (No model.)

Claim.—1. A book constituting a family-record photograph-album, having photograph-receiving leaves, blank leaves of prepared calendered paper thinner than the photograph-receiving leaves, arranged opposite thereto and especially adapted to receive descriptive matter relating to the photographs, and leaves for a family-record arranged at the end of the book, the whole being bound together, substantially as described.

2. A book constituting a family-record photograph-album, having photograph-receiving leaves, blank leaves of prepared calendered paper thinner than the photograph-receiving leaves, arranged opposite thereto and especially adapted to receive descriptive matter relating to the photographs and leaves for a family-record, and an ancestral or genealogical chart arranged together at the end of the book, substantially as described.

899,326. COUPLING FOR ELECTRIC CIRCUITS. ALBERT C. GRIGGS, Wilmington, Del. Filed Jan. 3, 1888. Serial No. 260,208. (No model.)

Claim.—1. As an electric-circuit-coupling device, the L-shaped box H H', in combination with a conductor, I, secured in it and having an open tubular end, *i*, extending through the arm H', a conductor, J, with projecting split end and enlarged head *j'*, and clamps secured to said conductor, whereby electric wires may be secured in contact with them, all substantially as specified, and for the purpose of making a coupling with a similar coupling device.



2. As an electric-circuit-coupling device, the L-shaped box H H', in combination with a conductor, I, secured in it and having an open tubular end, *i'*, extending through the arm H', a conductor, J, with projecting split end, enlarged head *j'*, and collar *j³*, adapted to make a neat fit in tube *i*, and clamps secured to said conductor, whereby electric wires may be secured in contact with them, all substantially as specified, and for the purpose of making a coupling with a similar coupling device.

3. As an electric-circuit-coupling device, the L-shaped box H-H', in combination with a conductor, I, secured in it and having an open tubular end, *i*, extending through the arm H', a conductor, J, with projecting split end and enlarged head *j'*, a rod, N, projecting through the front end of the part H, a spring, O, connected with said rod, as specified, a tongue, M, electrically connected with one of the conductors in the box, and mechanism connecting said tongue with the rod N, whereby as said rod moves in or out said tongue is moved to make temporary contact with the second conductor, substantially as and for the purpose specified.

4. As an electric-circuit-coupling device, the L-shaped box H H', in combination with a conductor, I, secured in it and having an open tubular end, *i*, extending through the arm H', a conductor, J, with projecting split end and enlarged head *j'*, a rod, N, projecting through the front end of the part H, a spring, O, connected with said rod, as specified, and a tongue, M, in electric contact with one of the conductors in the box, said tongue being pivoted at one end to the box or conduit, pivoted also on the rod N, and having a projecting end arranged to make temporary contact with the second conductor as the rod N moves in or out, all substantially as and for the purpose specified.

5. As an electric-circuit-coupling device, the L-shaped box H H', in combination with a conductor, I, secured in it and having an open tubular end, *i*, extending through the arm H', a conductor, J, with projecting split end and enlarged head *j'*, a rod, N, projecting through the front end of the part H, a spring, O, connected with said rod, as specified, a tongue, M, in electric contact with one of the conductors in the box, said tongue being pivoted at one end to the box or conduit, pivoted also on the rod N, and having a projecting end, and a tongue, L, secured in electric contact with the second conductor and arranged so as to make temporary contact with the projecting end of pivoted tongue M as the rod N is moved in or out, all substantially as and for the purpose specified.

899,327. VIBRATING ENGINE. DEXTER D. HARDY, Chicago, Ill. Filed May 3, 1888. Serial No. 272,606. (No model.)

Claim.—1. In a vibrating engine, the combination of two cylinders having different calibers, one of said cylinders having steam therein constantly, the other receiving and exhausting steam by its own movement, whereby the steam-ports are opened and closed, substantially as stated.

2. In a vibrating engine, the combination of the cylinder B', opening directly into the pipe E, leading from the steam chest or boiler, the cylinder B, having a caliber greater than that of the cylinder B', the exhaust-port *g*, the exhaust-passage H, and the steam-ports *d* and *d'*, whereby steam is received and exhausted intermittently by the movement of said cylinder B, and the pistons C' and C, moving in said cylinders, respectively, and connected with the main shaft by cranks placed thereon diametrically opposite to each other, substantially as and for the purposes stated.

3. In a vibrating engine, the combination of the steam-chest D, the valve-seat D², the system of steam-ports *d* and *d'*, passing through said valve-seat and opening into the end of the cylinder B opposite to the main shaft, at a distance from each other greater than the caliber of said cylinder, and the slide-valve G, having a cavity in its base shorter than the distance between said steam-ports, said slide-valve being designed to produce by its movement, either by hand or automatically, a reversal of the action of the engine, substantially as stated.

4. A vibrating engine consisting of two or more vibrating cylinders, said cylinders being of different calibers, with steam constantly in the cylinder of less caliber, and having single-acting pistons journaled directly to the cranks F' F, at equal angular distances apart on the main shaft F, the casing A, inclosing said cylinders, pistons, and cranks, and the slides I and cross-heads J, substantially as set forth.

899,328. DYNAMO-ARMATURE. JOHN A. HAYES, San Francisco, Cal. Filed May 2, 1888. Serial No. 272,608. (No model.)

Claim.—1. In a dynamo-electric machine or motor, a ring-armature consisting of the combination of armature-coils wound upon rectilinear iron plates, and arc-shaped plates laminated and connecting the first-named plates.

2. In a dynamo-electric machine or motor, a ring-armature consisting of the combination of separable laminated sections, and coils wound upon alternate sections.

3. In a dynamo-electric machine or motor, a ring-armature consisting of the combination of radial supports provided with holes, insulated arc-curved iron plates arranged in sets which are respectively located at each of said supports, pairs of non-magnetic disks located between the said sets of iron-plates, separated rectilinear iron plates connecting the members of each pair and extending between the arc-curved plates, and bolts or similar retaining devices passing through the arc-curved iron plates and through the extensions of the iron plates which connect the members of the pairs of non-magnetic plates and into the holes in said radial supports.

4. In a dynamo-electric machine or motor, a ring-armature consisting of the combination of coils provided with cores of laminated insulated rectilinear iron plates, arc-curved extensions upon the plates and containing holes, laminated insulated arc-curved iron plates whose ends fit among the said extensions and whose ends contain holes, and bolts or similar retaining devices passing through the arc-curved iron plates, and other bolts passing through said holes, and all the bolts being secured to radial supports around a suitable hub, the bolts being surrounded by insulating-tubes.

5. In a dynamo-electric machine or motor, a ring-armature consisting of the combination of alternate arc-curved and rectilinear insulated iron plates and arc-curved extensions upon the said rectilinear plates, fitting among the said arc-curved plates, the said combination being attached to a central hub, and the said rectilinear plates being provided with coils of conducting-wire, such as copper.

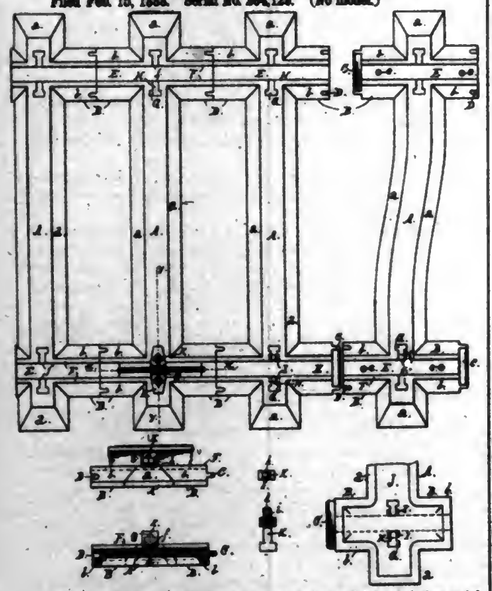
6. In a dynamo-electric machine or motor, a ring-armature consisting of the combination of alternate arc-curved and rectilinear insulated iron plates, arc-shaped extensions upon some of the said rectilinear plates fitting among the ends of the said arc-curved plates, one set of bolts, insulated, passing through the arc-curved plates, a second set of bolts passing through the ends of the arc-curved plates and through the said extensions, and a suitable central support receiving the ends of all the screws.

7. In a dynamo-electric machine or motor, a ring-armature consisting of the combination of separable sections of laminated iron plates, and coils wound upon alternate sections, which are provided with polar extensions projecting among the plates of the immediately adjacent sections.

8. In a dynamo-electric machine or motor, an armature-coil whose core consists of a set of separated iron plates connecting non-magnetic plates, and projecting through them to form polar extensions.

899,329. COMMUTATOR FOR DYNAMO-ELECTRIC MACHINES AND ELECTRIC MOTORS. BENJAMIN HOTCHKISS, New York, N. Y. Filed May 11, 1888. Serial No. 273,854. (No model.)

399,329.



Claim.—1. The combination, in a dynamo or electric motor, of a rotary commutator and a rotary brush having the plane of the bars of the commutator and a plane taken through the axis of the brush at its point of contact with the commutator oblique or diagonal to each other, substantially as and for the purpose herein described.

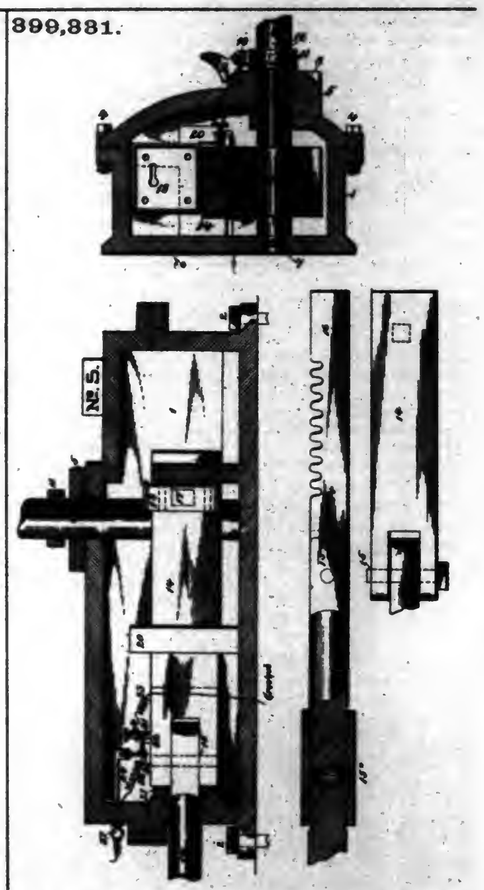
2. In a dynamo or electric motor, the combination, with the rotary commutator, a rotary brush, and a rocker-arm for carrying said brush, of a spring for pressing the rotary brush in the direction of the line of the axis of the commutator for and into continuous contact with the commutator, substantially as and for the purpose herein set forth.

3. In a dynamo or electric motor, the combination, with the main shaft and the rotary commutator thereon, of a rocker-arm, a rotary brush carried by the rocker-arm, and a spring for pressing the said brush in the direction of its own axis into contact with the commutator, substantially as and for the purpose set forth.

399,330. RAILROAD-TIE. AMOS K. HOFFNEIER, Lancaster, Pa. Filed Feb. 16, 1888. Serial No. 264,129. (No model.)

Claim.—1. A cross-tie having an arm formed integral therewith and projecting from the sides to form additional bearings for the rails, the ends of the cross-ties projecting beyond the arms, substantially as and for the purpose shown.

2. The combination, with the tie having the perforations G and slots H, of the angle-plates and the bolts provided with the grooves *k*, connected by the eyes *i*, substantially as and for the purpose described.



3. The combination, with a tie having perforations to receive the head of the bolt and clamps for securing the rails in position, of bolts provided with grooves *k*, connected by eyes *i*, substantially as set forth.

399,331. ELECTRIC RAILWAY SWITCH AND ALARM. WILLIAM S. HULL, Sheffield, Ala., and JAMES C. ANDERSON, Charleston, S. C. Filed May 21, 1888. Serial No. 274,886. (No model.)

Claim.—1. In a railway-switch, a lock for securing the operating parts in a desired position, having a bolt, 17, bearing a contact-point, and a second contact-point so placed as to touch the first when the bolt is in the locking position, in combination with an electric alarm and a circuit connected therewith and with the two contact-points, substantially as described.

2. The combination, with the switch-bar of a railway-switch, of a case inclosing said bar, and having therein a lock for securing said bar in a desired position, contact-points on the bolt and case of said lock, and an electric circuit terminating in said points, substantially as described.

399,331.

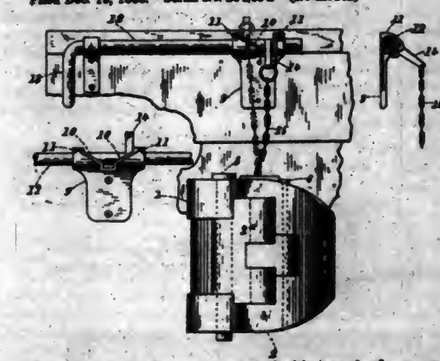
3. The combination, with the switch-bar of a railway-switch, of a case inclosing the same and its operating mechanism and carrying an electrical contact-point arranged in a circuit and a companion contact-point mounted on the switch-bar and electrically connected with the ground, substantially as specified.

4. In a railway-switch, a lock for securing the operative parts in a desired position, having a casing, a bolt, 17, bearing a contact-point, and a second contact-point so placed on the inside of said casing as to touch the first contact-point when the bolt is in locking position, in combination with a slot in said casing for the reception of a key, said slot so directed as only to admit of the removal of the key when the bolt is shot, and an electric alarm and circuit connected therewith and with the two contact-points, substantially as described.

5. In combination with a railway-switch, circuit making and breaking devices arranged in circuit with an electrical magnet, a signal-plate carrying a pivoted armature, and an audible alarm connected with said armature and with a contact-point thereon, and a spring for completing the circuit of the audible signal when the armature is otherwise uninfluenced, substantially as specified.

6. The combination, with the railway-switch, of the case 1, having the cover 2, provided with the boss 5, perforated for a bearing for the switch-mast 6, and having notches 8, the collar 11, the dog 9, the pinion 13, switch-bar 14, and the lock 18, substantially as specified.

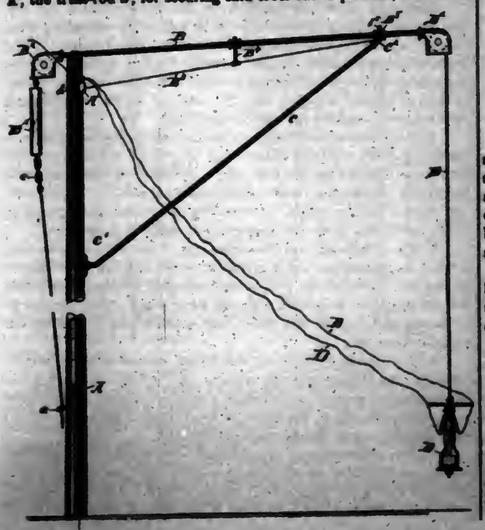
7. The combination, with a railway-switch operating-bar and mast, of a case inclosing the bar and having guides for the same, and a lock for securing the bar in a desired position within the case, substantially as specified.



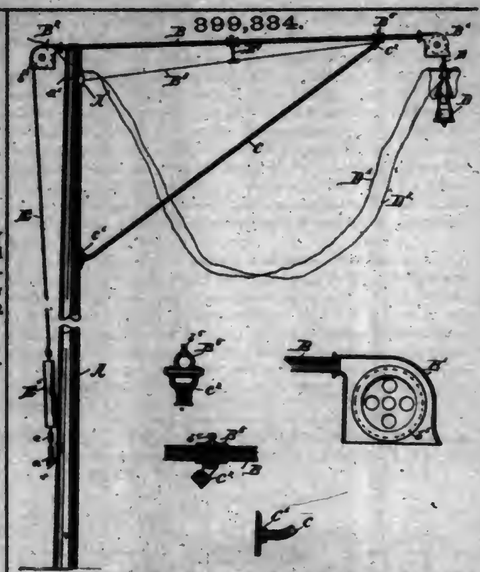
8. The combination, with a railway-switch and its operating-bar, of a case provided with a lock, a detent secured to the case of the lock and adapted to take into a recess formed on the edge of the bolt when the latter is thrown from the case, and a key adapted to throw the detent out of connection with the bolt, and the latter being slotted to retain the key from withdrawal from the lock when the bolt is in an unlocked position, substantially as specified.

399,332. FRINGE FABRIC. WALDEMAR W. JAENKE, Chicago, Ill. Filed Aug. 13, 1888. Serial No. 283,067. (No specimens.)

Claim.—The improved fringe fabric which consists, substantially as described, of the heading or gimp A, the hanger-loops secured thereto, and the tassels consisting of the combined yarn-strands passing through and looped around the hanger-loops and bound just below said loops by warp-threads passing around the tassels and fastened at each side thereof by weft-threads in the ordinary manner.



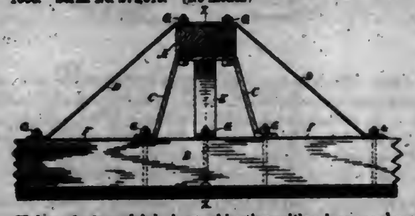
399,333. CAR-COUPLING. FREDERICK JOHNSON, Buffalo, N. Y. Filed Dec. 19, 1888. Serial No. 294,054. (No model.)



Claim.—A device for operating the locking-catch of a car-coupling, consisting of a stationary cam-plate, 9, having an inclined camway opening between the bearings, in combination with an uncoupling-bar mounted in said bearings so as to permit both a turning and a longitudinal movement, and provided with an arm for operating it, and an arm, 14, rigidly connected to and projecting out from the uncoupling-bar and connected by a chain to the locking-catch of a car-coupling, whereby a simultaneous longitudinal and turning movement of the uncoupling-bar will lift the arm 14 as it moves up the inclined camway and hold it and the locking-catch in their upward position until it is necessary to release them, substantially as described.

399,334. MAST-ARM. C. MARTIN KELLER, Columbus, Ind. Filed Mar. 10, 1888. Serial No. 266,899. (No model.)

Claim.—1. The combination of the mast A, having a cross-bar, A', the truss-rod *a'*, for securing said cross-bar in position, the arm B,

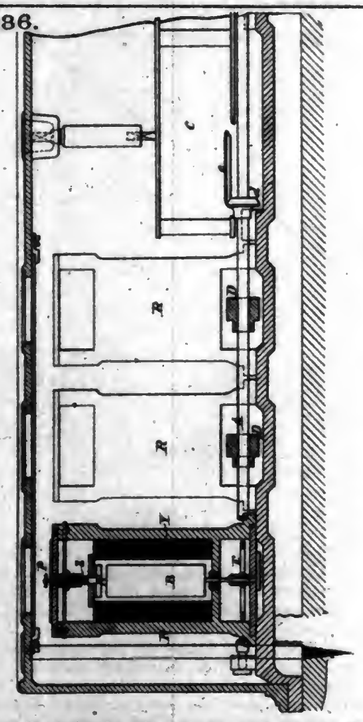


399,334.

mounted near one end on the top of said mast, as shown, and provided with housings B^2 and B^3 on its ends, in which are journaled the sheaves b' and b^3, the brace C, secured at one end to the mast and at the other end connected to the adjustable sleeve B^4 on the arm B, the stay-wires B^5, running from near the forward end of said arm to the ends of the cross-bar A' on the mast A, the truss-arms B^6, interposed between said stay-wires and said arm midway of its length, the lamp D, the rope E, running from said lamp over the sheaves b' and b^3 to alongside the mast, and means for attaching it in position, substantially as set forth.

2. The combination of the mast A, having a cross-bar, A', a truss-rod, *a'*, securing said cross-bar in position, an arm, B, stay-wires B^5, running from a point on said arm to the ends of the cross-bar A', the brace C, connected at one end to the mast and at the other to the arm, the latter connection of which is adjustable, the lamp D, suspended upon the end of the arm, and a rope, E, running from said lamp over sheaves and through said arm to a point alongside the mast, said rope being of just sufficient length that it will reach to the point where it is to be fastened when said lamp is in elevated position, substantially as set forth.

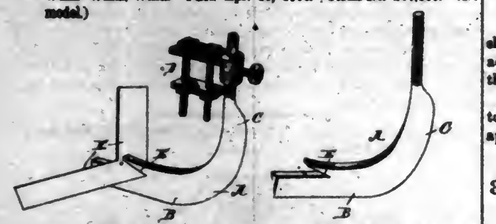
399,335. SLEIGH. LEWIS KELLEY, Bowne, Mich. Filed May 21, 1888. Serial No. 274,619. (No model.)



Claim.—1. In a sleigh, in combination with a beam and runner, strips of bar-iron, each bent at an obtuse angle at four points, substantially as described, each having horizontal middle portions rigidly attached to the upper and under sides, respectively, of the beam, extending downward and outward and attached to the runner, and a brace attached to the runner and extending upward and inward and attached to the beam, substantially as described.

2. In a sleigh, in combination with a beam and runner, strips of bar-iron C, D, and E, substantially as described, connecting and attached to said beam and runner, and a strip of band-iron, F, substantially as described.

399,336. ELECTRIC MOTOR. EDWARD P. H. H. LAUCKERT, Charlton, County of Kent, assignor to Siemens Brothers & Company, (Limited,) Westminster, England. Filed Oct. 5, 1888. Serial No. 287,344. (No model.) Patented in England Dec. 21, 1887, No. 17,502, and in France Sept. 25, 1888, No. 196,196.



Claim.—In apparatus for indicating the time during which electricity is used, the combination of clock-work, electro-magnetic clutches driven thereby, indices, and coils, through which a current of electricity passes during the time to be measured, exciting the elec-

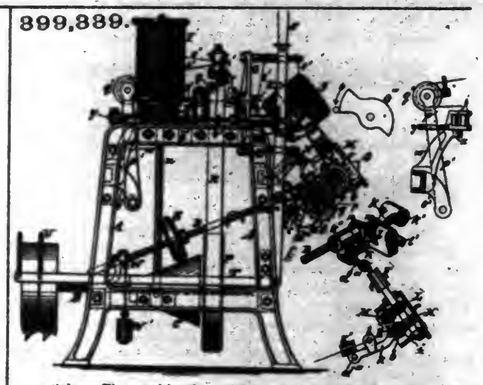
399,336.

tro-magnetic clutches, and causing them to engage and move the said indices, as and for the purposes described.

399,337. SELF-CLEANING WEED-CUTTER. FREDERICK B. LUX, Walla Walla, Wash. Filed Apr. 16, 1888. Serial No. 270,880. (No model.)

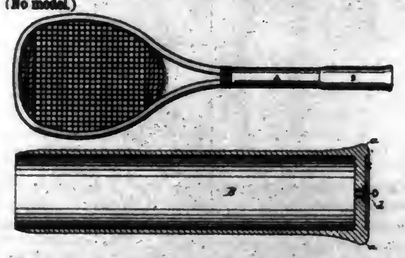
Claim.—The improved weed-cutter consisting of the curved cutter A, having the vertical portion C and the horizontal portion B, the front edge of the vertical portion and the lower edge of the horizontal portion being both cutting-edges, and the flat V-shaped horizontal knife rigidly secured at its apex to the upper edge of the horizontal portion of the cutter at the rear end of the same, as specified.

399,338. BUTTON-STRIP FOR GARMENTS. HENRY W. LYON, Bridgeport, Conn. Filed Jan. 17, 1888. Serial No. 296,669. (No model.)



Claim.—The combination, with a fabric strip having at the rear edge a hollow bead and provided with interior cross-pockets which intersect said bead, of a continuous cord threaded through said bead and extended through said pockets in the form of loops which project beyond the front edge of the strip, said loops being threaded with the eyes of the buttons, substantially as shown, and for the purpose set forth.

399,339. TWINE-BALLING MACHINE. ISAAC P. MEEKS, Brooklyn, N. Y., assignor to John Loyd, same place. Filed June 1, 1886. Serial No. 303,966. (No model.)



Brief.—The invention consists in improvements upon the machine shown in Letters Patent No. 262,412, dated August 8, 1882, the special object being to adapt the machine for use for a considerable number of sizes of balls and twines.

399,339.

Claim.—The combination, with the inclined shaft D, of the spindle F, head *e*, the yoke *f*, fly G, brackets *h* and *k*, cam O, stop N, worm-gear K, worm *i*, shaft *b*, worm or endless screw L, the cam-shaft M, bracket *a*, shaft *l*, gears *m n*, and interchangeable gears *o*, *p*, and *r*, for changing the speed of the spindle F on its longitudinal axis in balling twines of different sizes or diameters, substantially as and for the purpose set forth.

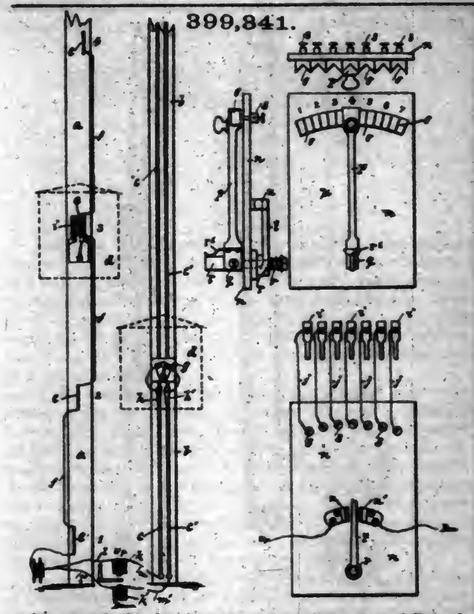
399,340. RUBBER SLEEVE FOR TENNIS-RACKETS. ROBERT W. MORGAN, New York, N. Y. Filed May 4, 1888. Serial No. 272,831. (No model.)

Claim.—1. The sleeve B for the handle of tennis-rackets, the said sleeve consisting of the cylindrical portion having the thickened end adapted to fit against the end of the handle and forming a body for the cushion-shoulder *a*, substantially as shown and described.

2. The sleeve B, of rubber or other soft material, having an apertured end, combined with the backing-plate C, also provided with an aperture, substantially as and for the purposes set forth.

399,341. ELECTRICAL APPLIANCE FOR STOPPING AND STARTING ELEVATORS. RONALD P. MCPEELY and HENRY V. POTTER, Pittsburg, Pa. Filed Dec. 12, 1887. Serial No. 257,711. (No model.)

Claim.—1. In an electric elevator, the combination of the continuous contact-strips connected in circuit with valve-controlling magnets, the spaced broken contact-strips, a switch-board carried by the elevator-car and having brushes normally bearing against said continuous strips, a series of brushes adapted to contact with the spaced broken strips, and a switch movably mounted on the switch-board, substantially as and for the purpose described.

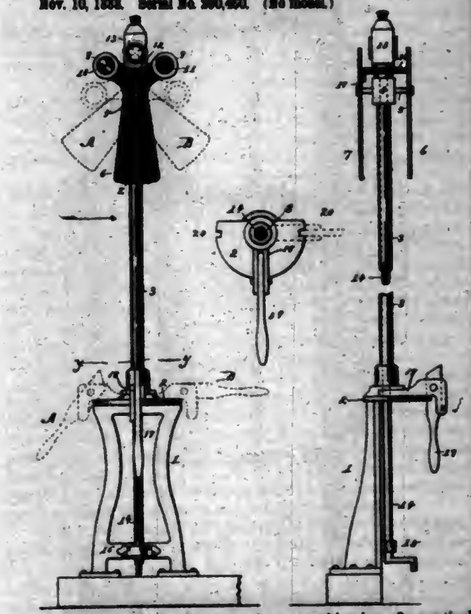


2. The combination of the continuous metallic contact-strips connected in circuit with valve-controlling magnets, a switch-board carried by an elevator-car and normally in contact with said continuous strips, the interrupted contact-strips also connected in circuit with said magnets, and a switch for reversing the current through either of the continuous strips and magnets, substantially as described.

3. The combination of the continuous contact-strips, valve-controlling magnets connected in circuit with said strips, a switch-board having two contact-posts, *u u'*, brushes normally bearing on said continuous strips and connected with said posts, and a switch adapted to be moved into contact with either post, substantially as and for the purpose described.

4. The combination of the continuous contact-strips, a switch-board having brushes normally pressing against the continuous strips, the interrupted spaced contact-strips, a series of brushes each adapted to contact with one of the series of interrupted strips, and a switch, substantially as and for the purposes described.

5. The combination of the series of interrupted spaced contact-strips *c*, connected in circuit with one another and having the breaks therein, a switch-board having a series of contacts, *o*, a series of brushes, *i*, each adapted to contact with one of the series of interrupted strips

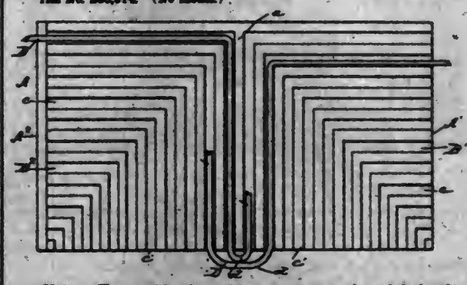


399,341.

and connected with the contacts *o*, and a switch, substantially as described.

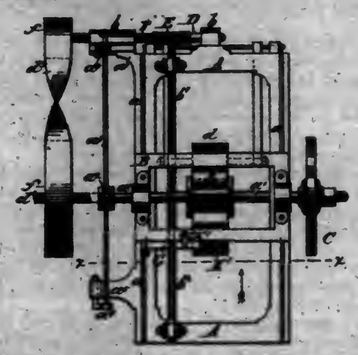
6. The combination of a switch-board having a series of contacts, *o*, and the contact-posts *u u'*, a switch pivotally mounted on said board and capable of lateral movement thereon to adjust its free end against either of the contacts *o* and the posts *u* or *u'*, a series of brushes, *i*, connected with the posts, the continuous and interrupted strips *c c'*, and *e*, and the valve-controlling magnets, substantially as described.

399,342. RAILWAY-SWITCH SIGNAL. HENRY M. NORTON, Louisville, Ky., assignor of one-half to Edward R. Morris, same place. Filed Nov. 10, 1888. Serial No. 290,402. (No model.)



Claim.—1. In a railway-signal, the combination of a vertical post, a signal-blade, 6, having the diagonal arms 8 9, provided with lenses arranged on opposite sides thereof and pivoted on the post at a point between said diagonal arms, a fixed lantern arranged at one side of the signal-blade and in the vertical plane of the pivot thereof, and mechanism for moving said signal-blade to an inclined position on either side of the post, and thereby adjusting one or the other of the lenses of said blade in line with the lens of the lantern, substantially as described, for the purpose set forth.

2. In a railway-signal, the combination of a vertical tubular post, the two signal arms or blades 6 7, carried by a common horizontal shaft which passes centrally therethrough, and each signal-blade having two reversely-inclined arms, 8 9, each provided with a colored lens, a stationary lantern on the post arranged between the two signal-arms in the vertical plane of the pivot thereof, and a vertical shaft geared directly with the signal-blades for positively moving the latter to an inclined position at either side of the post and adjusting one or the other of the two lenses carried by each blade in line with the lenses of the lantern, substantially as and for the purpose set forth.

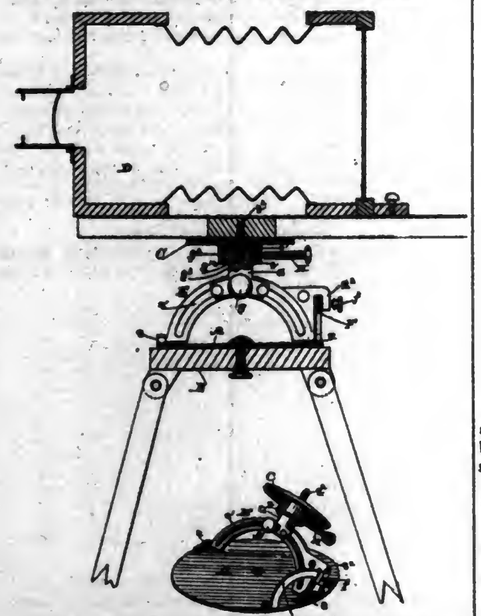


3. In a railway-signal, the combination of a fixed stand, 1, having the vertical tubular post 3 fixed thereto, a horizontal transverse shaft journaled on the post at the upper end thereof, the signal-blades each having the diverging lens-holding arms 8 and 9, fixed on said shaft at a point between the arms thereof, a lantern fixed between said arms in the vertical plane of the horizontal shaft, a vertical shaft, 14, passing through the tubular post and geared at its upper end directly to one of the signal-blades, and a lever, 18 19, fixed to the vertical shaft, substantially as described.

399,343. UNDERGROUND ELECTRIC-WIRE CONDUIT. WILLIAM L. PERRETT and THOMAS LITTLE, Pittsburg, Pa. Filed Jan. 16, 1888. Serial No. 260,914. (No model.)

Claim.—The combination, with an underground conduit for electric wires, of a plate of sufficient size to fit wholly within said conduit, said plate being provided on its face at opposite sides of its center with right-angle grooves, one branch of each groove being in line with the interior of the conduit and the other branch of each groove extending at right angles thereto to the longitudinal edge of the plate, whereby a conductor extending through the conduit may pass through a right-angle groove at each side of the center of the plate, and thus expose a portion of said conductor beyond the edge of said grooved plate, substantially as set forth.

399,344. MACHINE FOR FITTING THE ENDS OF BAND-SAWS. JAMES M. PETERSEN, Clinton, Iowa. Filed June 16, 1888. Serial No. 277,202. (No model.)



Claim.—1. In a machine for fitting the ends of a band-saw preparatory to brazing them together, the combination of the wheel C, mounted on the reciprocating shaft *a'*, having the annular groove a^6, the bar a^5, placed in the annular groove and supported in the oscillating bearings a^4, the worm-shaft D, the worm-gear E, mounted in position to engage the worm-shaft, and the bar F, pivoted to the gear-wheel and connected with the bar a^5, substantially as and for the purposes described.

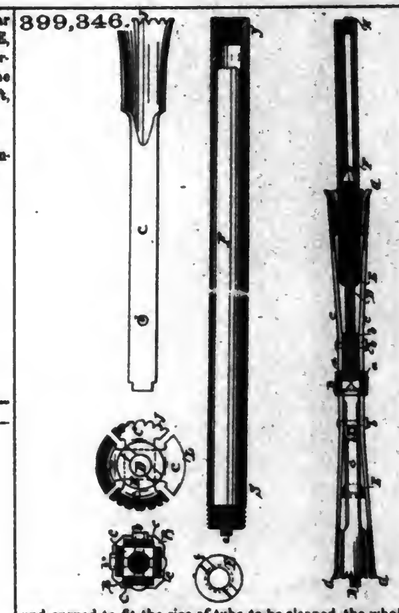
2. In a machine for fitting the ends of a band-saw, the combination of the reciprocating carriage B, the reducing-wheel C, mounted

on a shaft, a', having its bearings on the carriage, the oscillating bar a^3, connected with the shaft a', the worm-shaft D, the gear-wheel E, mounted on the threaded shaft b', the bar F, pivoted to the gear-wheel and connected with the bar a^3, and the bar G, pivoted to the frame, and having a threaded notch, c, placed over the threaded shaft, substantially as and for the purposes described.

399,845. CAMERA-ADJUSTER. HENRY R. FOEHLMAN, San Francisco, Cal. Filed Nov. 7, 1888. Serial No. 290,348. (No model.)

Claim.—1. In a camera-adjuster, a slotted curved bracket hinged to the tripod and adapted to be turned from a vertical to a horizontal position, in combination with a plate secured to the camera, said plate being adjustable longitudinally in the slotted curved bracket, substantially as herein described.

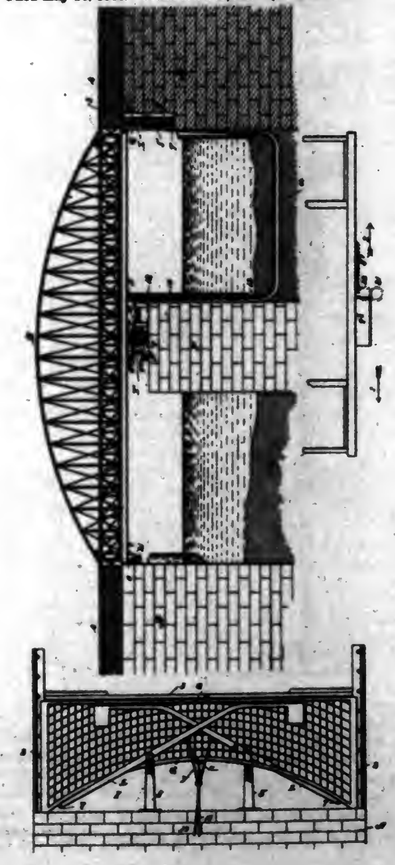
2. A camera-adjuster for connecting the camera with the tripod, comprising a hinged slotted curved bracket to be secured to the tripod and adapted to be turned from a vertical to a horizontal position, a standard fitted to and adjustable longitudinally in the slotted bracket, and a plate to be secured to the camera and journaled on the standard, whereby it may have an axial movement, substantially as herein described.



3. A camera-adjuster for connecting the camera with the tripod, consisting of a plate to be secured to the tripod, a plate to be secured to the camera, and intermediate adjustable connections, comprising a slotted curved bracket hinged to the tripod-plate, a standard carried by and movable longitudinally on the slotted bracket, and an axial-pivot-connection between the standard and the plate to be secured to the camera, substantially as herein described.

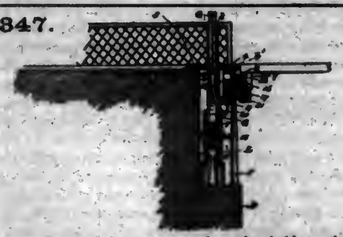
4. A camera-adjuster consisting of the plate to be secured to the tripod, the curved slotted bracket hinged to the plate, the set-screw and fixed guide-rack for holding the bracket in position where adjusted, the standard fitted to and movable longitudinally on the slotted bracket, and set-screw for holding the standard where adjusted, the plate secured to the camera and axially pivoted to the top of the standard, and the set-screw for holding the plate where adjusted, substantially as herein described.

5. In a camera-adjuster, the combination of the plate to be secured to the tripod, the curved slotted bracket, the standard mounted and adjustable on the bracket, said standard having a cylindrical head with a central socket, the plate C, having in its upper surface a screw for securing it to the camera, and on its lower surface an annular flange fitting over the head of the standard, and a central pin fitting in the socket of said head, substantially as herein described.



399,846. TUBE SCRAPER AND CLEANER. JARED POOLMAN, Passaic, N. J. Filed Oct. 17, 1888. Serial No. 288,267. (No model.)

Claim.—A tube-cleaner composed of several full longitudinal sections of steel, each full section being composed of two half-sections, one end of each half-section being drawn or tapered down, broadened,

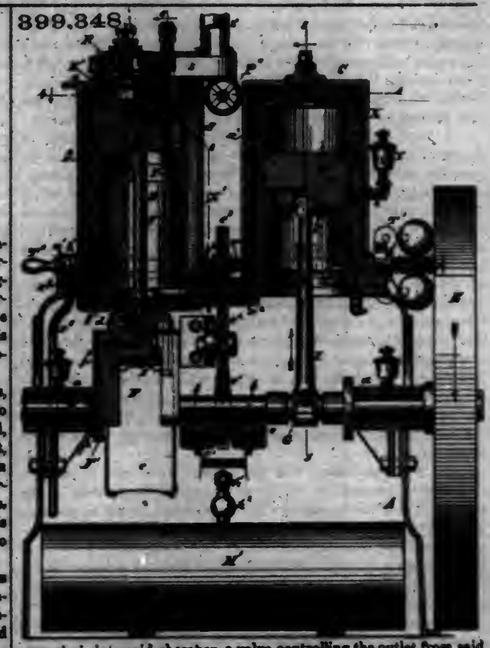


and curved to fit the size of tube to be cleaned, the whole being combined together and with the central stock, A, and screw-stem D, substantially as described.

399,847. SWING-BRIDGE. MARIUS A. REDDING, New York, N.Y. Filed May 26, 1888. Serial No. 275,250. (No model.)

399,847.

Claim.—1. As an improvement in swing-bridges, the combination, with the bridge and its abutments, of gates held in suitable vertical ways or guides connected with the abutments, counterbalancing-levers placed on each side of the gate, and suitable mechanism interposed between the gates and the bridge, so that by the motion of the bridge the said gates are raised to close the street when the bridge is opened and lowered to open the street when the bridge is closed, substantially as specified.



2. The combination of the swing-bridge provided with racks, suitable pinions fixed to shafts, said pinions being held in position to be engaged by the said racks when the bridge is opened and closed, vertically-movable gates held in suitable guideways in the abutment, counterbalancing-levers connected with suitable stanchions placed in the abutment and supporting the gates, and suitable connections interposed between the shaft of the pinions and the gates and its levers, whereby when the bridge is opened and closed the motion thereof is utilized and applied through the racks, pinions, and connections to open and close the gates, substantially as specified.

3. The combination of the vertically-movable gate, the two sets of double levers L L', said levers being fulcrumed in suitable stanchions and having their upper ends weighted and their lower end connected by a bar, 7, on which the bottom rail of the gate rests, and by which the gate is supported, the swing-bridge provided with racks that engage and operate the mechanism by which the gate is raised and lowered, and chains and ropes that connect the said mechanism with the levers and with the gate, substantially as specified.

4. The combination of the vertically-movable gates supported by counterbalancing-levers, the swing-bridge provided with a turn-table having suitable racks formed upon it, a pinion provided with a shaft and supported in position to engage the racks of the turn-table when the bridge is opened and closed, a sprocket-wheel on the shaft of the pinion, a chain placed on said sprocket-wheel, and wire ropes extending down through the pier, under the river-bed, through a suitable pipe, and up in the abutment to the gate, one of said ropes being connected with the levers and the other with the gate, substantially as specified.

5. The combination, with the vertically-movable gate, of the grooved columns 2 2, provided with rollers, the plate 3, placed transversely of the abutment, over the recess I, and inside the columns 2 2, and the plate 4, placed outside of the side columns and over the recess and supported by brackets and stanchions b', substantially as specified.

399,848. HYDROCARBON-ENGINE. GEORGE M. RICHARDS, New Brunswick, N. J. Filed Mar. 31, 1888. Serial No. 269,190. (No model.)

Claim.—1. In a motor-engine, the combination, with the power-cylinder and its piston, its inlet and exhaust valves, a source of compressed air, and a compressed-air passage leading thence to the power-cylinder and controlled by the inlet-valve, of an oil-commingling chamber communicating with said passage, having its bottom or floor formed with a slight upward incline toward the outlet to the cylinder and arranged to be traversed by the air flowing toward said outlet, a source of oil, and an oil-duct leading to said commingling-chamber.

2. In a motor-engine, the combination, with the power-cylinder and its piston, its inlet and exhaust valves, a source of compressed air, and an air-passage leading thence to the power-cylinder and controlled by the inlet-valve, of an oil-commingling chamber arranged to be traversed by the compressed air in its passage, having its bottom or floor formed with an upward incline toward the outlet of the cylinder and provided with a deflector for causing the air to circulate in said chamber; a source of oil, and an oil-duct leading to said chamber.

3. In a motor-engine, the combination, with the power-cylinder and its piston, its inlet and exhaust valves, a source of compressed air, and an air-passage leading thence to the power-cylinder and controlled by the inlet-valve, of an oil-commingling chamber covered by said air-passage at its top and having an outlet through its bottom to the cylinder, a valve for closing said outlet, adapted when lifted to act as a deflector for causing the air to circulate outwardly and inwardly in said chamber, a source of oil, and an oil-duct leading to said chamber.

4. In a motor-engine, the combination, with the power-cylinder and its piston, a source of compressed air, and an air-passage leading thence to the power-cylinder, of a commingling-chamber communicating with said passage, a valve controlling the admission of compressed air into said chamber, a valve controlling the outlet from said chamber to the cylinder, a source of oil, and an oil-duct leading to said commingling-chamber, whereby the oil in said chamber is vaporized by the circulation of air therethrough and controlled by said valves.

5. In a motor-engine, the combination, with the power-cylinder and its piston, its inlet and exhaust valves, a source of compressed air and an air-passage leading thence to the power-cylinder and controlled by the inlet-valve, a source of oil communicating with said air-passage, whereby the air may absorb oil on its way to the cylinder, and an oil chamber or groove having an absorbent filling and communicating with said source of oil, of a restricted air-inlet duct extending from said air-passage through said oil-chamber to the power-cylinder, adapted to admit a reduced flow of air through said absorbent filling while the inlet-valve is closed, whereby the injection of combustible vapor into the cylinder during the exhaust-stroke is insured for the maintenance of ignition therein.

6. In a motor-engine, the combination, with the power-cylinder and its piston, its inlet and exhaust valves, a source of compressed air and an air-passage leading thence to the power-cylinder and controlled by the inlet-valve, and a source of oil communicating with said air-passage, whereby the air may absorb oil on its way to the cylinder, of an oil chamber or groove having an absorbent filling, an air-passage through said oil-chamber to the cylinder, and a valve and valve-gear constructed to admit a momentary charge of compressed air into said oil-chamber at intervals in order to drive the oil into and through the absorbent filling therein.

7. The combination, with the power-cylinder and its piston, its inlet and exhaust valves, a source of compressed air and an air-passage leading thence to the cylinder, and a source of oil communicating with said air-passage, whereby the air may absorb oil on its way to the cylinder, of an oil chamber or groove having an absorbent filling, an air and oil chamber communicating with said oil-chamber through perforations, and into which the oil is injected, a valve for admitting air from said air-passage into said oil and air chamber, an air-passage through said oil-chamber to the cylinder, and a valve-gear constructed to open said valve momentarily at intervals in order to admit a charge of compressed air into said oil and air chamber and cause the same to drive the oil through said perforations into said oil-chamber and into and through the absorbent filling therein.

8. The combination, with the power-cylinder and its piston, its inlet and exhaust valves, a source of compressed air and an air-passage leading thence to the power-cylinder, and a source of oil communicating with said air-passage, whereby the air may absorb oil on its way to the cylinder, of an oil chamber or groove having an absorbent filling and communicating with the cylinder, an air and oil chamber into which oil is injected and which communicates with said oil-chamber through perforations, a restricted air-inlet extending from said air-passage into said air and oil chamber, adapted to admit a reduced flow of air through said absorbent filling and into the cylinder

to maintain ignition therein during the exhaust-stroke, a valve for admitting air from said air-passage into said air and oil chamber, and a valve-gear constructed to open said valve momentarily at intervals in order to admit a charge of compressed air into said air and oil chamber and cause the same to drive the oil through said perforations into said oil-chamber and into and through the absorbent filling therein.

9. The combination, with the power-cylinder and its piston, a source of compressed air and an air-passage leading thence to the power-cylinder, a commingling-chamber traversed by said air-passage, an oil chamber or groove having an absorbent filling communicating with the power-cylinder and communicating through perforations with said commingling-chamber, a source of oil discharging into said commingling-chamber, and a restricted air-inlet from said air-passage into said commingling-chamber, adapted to admit a reduced flow of air through said absorbent filling and into the cylinder to maintain ignition during the exhaust-stroke, of a main and supplemental air-inlet valve, the one adapted to control the flow of compressed air into said commingling-chamber and the other to control its flow from said commingling-chamber to the cylinder, and a valve-gear constructed to open said main inlet-valve at each stroke in advance of said auxiliary valve and thereby to admit a momentary charge of compressed air into said commingling-chamber to drive the oil through said perforations into said oil-chamber and into and through the absorbent filling therein.

10. The combination, with the power-cylinder and its piston, a source of compressed air and an air-passage leading thence to the power-cylinder, a commingling-chamber traversed by said air-passage, an oil chamber or groove having an absorbent filling and communicating with said commingling-chamber and the cylinder, a source of oil discharging into said commingling-chamber, and a restricted air-inlet from said air-passage into said commingling-chamber, of a main air-inlet valve adapted to control the flow of compressed air into said commingling-chamber and having a valve-stem, a valve-gear constructed to move said stem to open and close said valve, and a supplemental valve adapted to control the flow of air from said commingling-chamber to the cylinder and connected to said main valve by a mechanical connection providing some lost motion, whereby the main valve opens before and closes after the supplemental valve.

11. The combination, with the power-cylinder and its piston, its inlet and exhaust valves, a passage for compressed air controlled by the inlet-valve, and an ignition-chamber between the inlet-valve and said cylinder and communicating with the latter through a contracted opening, of a plate or diaphragm in said ignition-chamber adjacent to the outlet therefrom adapted to be heated by the flame therein and to aid in maintaining ignition.

12. In a motor-engine operating by the combustion of hydrocarbon vapor in its power-cylinder, the combination, with the power-cylinder, its inlet and exhaust valves, a valve-gear for operating them, a device connected with said valve-gear for rendering the latter impotent to open said inlet-valve, a lighting-port communicating with the power-cylinder and opening to the exterior thereof, and a gate or valve for closing said port, of a handle connected with and adapted to close said gate, and a connection between said handle and said device for rendering impotent the valve-gear, operating substantially as described, to render the valve-gear operative and open the inlet-valve by the act of closing said lighting-port gate, whereby the starting of the engine is rendered automatic.

13. In a motor-engine operating by the combustion of hydrocarbon vapor in its power-cylinder, the combination, with the power-cylinder, its inlet and exhaust valves, a valve-gear for operating them a valve-closing device connected with said valve-gear for holding the inlet-valve temporarily closed during the igniting of the vapor to start the engine, a lighting-port communicating with the power-cylinder and opening to the exterior thereof, and a gate or valve for closing said port, of a handle connected with and adapted to open and close said gate, and a mechanical connection between said handle and said valve-closing device adapted when moved to close said gate to simultaneously throw said valve-closing device out of operation and thereby open the inlet-valve by the act of closing the lighting-port.

14. In a motor-engine operating by the combustion of hydrocarbon vapor in its power-cylinder, the combination, with the power-cylinder, its inlet and exhaust valves, a source of compressed air and an air-passage leading thence to the power-cylinder, a lighting-port communicating with the power-cylinder and opening to the exterior thereof, a gate or valve for closing said port, and a valve-closing device adapted to close temporarily a valve controlling the passage of compressed air or vapor into the power-cylinder, of a handle for closing said lighting-port gate, and a connection between said handle and said valve-closing device adapted to transmit to the latter the movement of the handle when closing said gate, and thereby to throw said device out of action and consequently to effect the admission of compressed air or vapor to the cylinder, whereby such admission is effected automatically by the act of closing the lighting-port.

15. In a motor-engine, the combination, with the power-cylinder, its inlet and exhaust valves, a valve-gear for operating them, a valve-closing device connected with said valve-gear for holding the inlet-valve temporarily closed during the igniting of the vapor to start the engine, a lighting-port communicating with the power-cylinder and opening to the exterior thereof, and a gate or valve for closing said port, of a handle connected with and adapted to open and close said gate, and also connected with and adapted to operate said valve-closing device, the said connections being arranged, on the movement of said handle in one direction, to first throw said valve-closing device into action to close the valve and subsequently open the lighting-port gate, and on the movement of the handle in the opposite direction to first close the lighting-port and subsequently open the inlet-valve.

16. In a motor-engine, the combination, with the power-cylinder, its inlet and exhaust valves, and a valve-gear for operating them, comprising a lever through which movement is communicated to the inlet-valve, a valve-closing device engaging the fulcrum of said lever and constructed, when actuated, to move said fulcrum and thereby close the valve, whereby the valve-gear is rendered impotent to open said valve, a lighting-port communicating with the power-cylinder and opening to the exterior, and a gate for closing said port, of a handle connected with and adapted to operate said gate, and also connected with and adapted to operate said valve-closing device, whereby the opening or closing of the lighting-port and the closing or opening of the inlet-valve are effected by a single stroke of said handle.

17. The combination, with the power-cylinder, its lighting-port, its inlet-valve, and a valve-gear for operating said valve, comprising a rock-lever, a movable standard to which said rock-lever is fulcrumed, a sliding wedge or cam engaging said standard and adapted by its movement to raise or lower the latter and thereby to open or close the inlet-valve, and a gate for closing said lighting-port, of a hand-lever for operating said gate arranged to encounter said wedge in its movement of closing said gate and thereby drive in said wedge and throw open the inlet-valve.

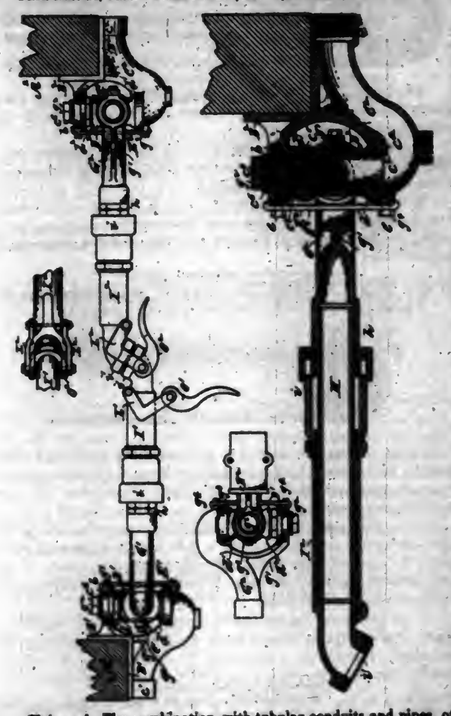
18. The combination, with the power-cylinder, its lighting-port, a gate for closing said port, the inlet-valve, and a valve-gear for operating said valve, comprising a rock-lever, f', of an adjustable standard, A', for moving the fulcrum of said lever, a wedge, B', acting on said standard, a hand-lever, K", for opening and closing said gate, and means for engaging said lever with and disengaging it from said wedge, consisting of a hooked arm, w, on the one part, a shoulder, w^3, and a spring-mounted hook, w', on the other part, operating substantially as described.

19. In a motor-engine operating by the combustion of hydrocarbon vapor, the combination, with a cylinder constructed with a water space or jacket in its walls and water inlet and outlet passages communicating with said jacket at one end of the cylinder, of a tube within said jacket leading from one of said passages and extending through the jacket and opening at or near the opposite end thereof, whereby a circulation of water from end to end of the jacket is assured.

399,849. CAST CHILLED REAMER. JAMES A. SHERMAN, Buffalo, N. Y. Filed Jan. 2, 1889. Serial No. 295,130. (No model.)

Claim.—1. As an improved article of manufacture, a cast-iron chilled reamer for iron working having a body provided with longitudinally-projecting cutting-teeth the edges of which are ground sharp along the advance edges and the bottom thereof, an interior bore, and recesses in its face, as and for the purpose set forth.

2. The cast-iron chilled reamer hereinbefore described, consisting of the body A, having the taper bore B, the oppositely-located recesses C in the face of said body, and the laterally-projecting cutting-lips D, the latter being provided with the rounded cutting-edges E, relieved in the manner as and for the purpose set forth.

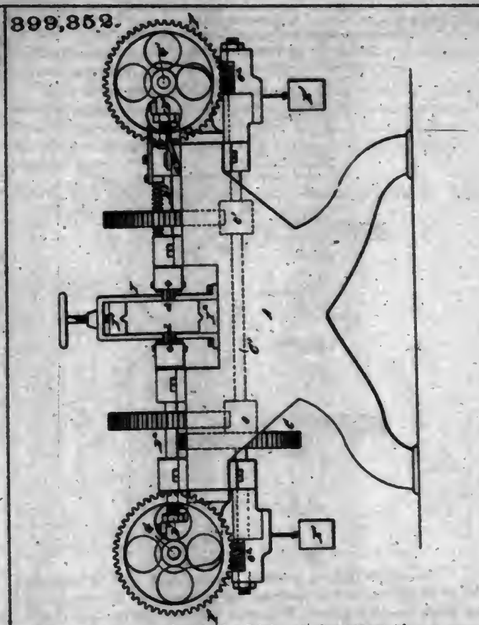


399,850. DENTAL DISK-HOLDER. HENRY H. SIMON, New York, N. Y. Filed Dec. 17, 1888. Serial No. 293,809. (No model.)

Claim.—1. The disk-holder for dental engines, consisting of the shank A, having upon its outer end the disk E and flange G, a portion of the disk being removed, forming an opening, F, at which the operating-disk is exposed, combined with the shank C, adapted to enter the tool-holder of the engine, and means for holding the disk in position, substantially as and for the purposes set forth.

2. The holder for disks of dental engines, consisting of the shank A and disk E, having the flange G and being cut away at F, combined with the central shank, C, and screw H, the operating-disk being held between the head of the screw and the end of the shank C, substantially as set forth.

399,851. PIPE-COUPLING. WILLIAM H. H. SMITH, Brooklyn, N.Y. Filed Nov. 21, 1888. Serial No. 291,447. (No model.)



Claim.—1. The combination, with tubular conduits and pipes, of approximately T-shaped pipe-sections having portions extending at right angles to each other, two of said portions communicating with the tubular conduits and with the pipes in different planes, and two of said portions being recessed at the ends, and retaining-screws engaging in said recesses, substantially as specified.

2. The combination, with an oscillating pipe-section, of a seat in which it is fitted at one end, a screw entering a cavity at its other end, a bearing-piece fitting the screw and cavity, and a spring between the bearing-piece and the screw, substantially as specified.

3. The combination, with the oblique-ended pipes I' I², of L-shaped links pivotally connected to one of said pipes and a bifurcated lever pivotally connected to said L-shaped links and having eccentric ends, substantially as specified.

399,852. REAMING-MACHINE. HARRISON H. TAYLOR, Detroit, Mich., assignor to the Michigan Radiator and Iron Manufacturing Company, same place. Filed Aug. 8, 1888. Serial No. 282,274. (No model.)

Claim.—1. The combination, with a supporting-bed, of a rotatable and reciprocatory reamer-spindle provided with a reamer-tool, a driving-shaft geared with said spindle, a cam to force the spindle to the work, and a worm-gear to operate the cam, substantially as set forth.

2. In a reaming-machine, the combination, with a supporting-bed, of a driving-shaft geared with a shaft, C', and a reamer-spindle geared with shaft C', said spindle having a reciprocatory movement upon said bed, substantially as described.

3. In a reaming-machine, the combination of the supporting-bed and driving-shaft, a shaft, C', geared with the driving-shaft, a reamer-spindle provided with a reaming-tool geared with the shaft C', said latter shaft provided with a worm, a worm-gear meshing with said worm, and a cam driven by said worm-gear to reciprocate the reamer-spindle, substantially as described.

4. The combination, with a supporting-bed, of a pair of reamer-spindles having a reciprocatory movement thereupon toward and from each other, and a driving-shaft geared with a shaft, C', said shaft C' geared with the reamer-spindles, substantially as set forth.

5. The combination, with a supporting-bed, of a pair of rotatable reciprocatory reamer-spindles, a driving-shaft geared with said spindles and a cam-shaft geared with the driving-shaft to force the reamer-spindles respectively to the work, substantially as set forth.

6. The combination, with a supporting-bed, of a pair of retracting reamer-spindles having a rotating and reciprocating engagement upon said bed, of a driving-shaft geared with said spindles, and a cam to feed the spindles forward to their work, substantially as set forth.

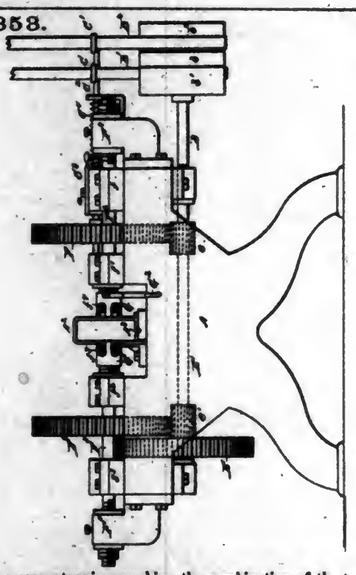
7. The combination, with a supporting-bed, of a pair of rotatable and reciprocatory reamer-spindles located end to end to admit the work between them, a driving-shaft geared with said spindles, cam-shafts geared with the driving-shaft to feed the spindles to the work, and an automatic retracting device, substantially as set forth.

8. The combination, with beds A A, of a pair of rotatable and reciprocatory reamer-spindles located upon each bed, said beds having an adjustable connection the one with the other, substantially as described.

9. The combination, with supporting-beds A A, of a pair of reamer-spindles engaged upon each bed, a driving-shaft geared with each pair of spindles, and cam-shafts G G' to feed the spindles to the work, said shafts respectively geared with the driving-shaft, substantially as set forth.

10. The combination, with a supporting-bed, of a rotary and reciprocatory reamer-spindle, a driving-shaft geared with a shaft, C', feeding mechanism to feed the spindle to the work, said feeding mechanism and spindle geared with said shaft C', and a retracting device to restore the spindle to its normal position, substantially as described.

399,853. SCREW-TAPPING MACHINE. HARRISON H. TAYLOR, Detroit, Mich., assignor to the Michigan Radiator and Iron Manufacturing Company, same place. Filed Aug. 8, 1888. Serial No. 282,275. (No model.)



Claim.—1. In a screw-tapping machine, the combination, with a supporting-bed, of rotatable reciprocatory shafts or spindles, said spindles provided with taps and tightening-heads upon their adjacent ends, substantially as described.

2. In a screw-tapping machine the combination, with a supporting-bed, of rotatable and reciprocatory spindles provided with taps and tightening-heads, one of said heads made reciprocatory, substantially as described.

3. In a screw-tapping machine, the combination, with a supporting-bed, of rotatable reciprocatory spindles journaled thereupon and provided with taps and tightening-heads to embrace the work, one of said heads having a screw-threaded engagement upon the bed, whereby it may be moved to and from the work, substantially as described.

4. In a screw-tapping machine, the combination, with rotatable reciprocatory tap-spindles, of a driving-shaft geared with said spindles, a clutch-rod, C², a latch to engage one end of said clutch-bar, and a sliding block to raise said latch and release said clutch-bar, the said sliding block being operated by one of the gears upon the tap-spindles, substantially as set forth.

399,353.

5. In a screw-tapping machine, the combination of the tap-spindles F^1 F^2, having a screw-threaded engagement upon the supporting-bed of the machine, a shaft, E', geared with said spindles, and a driving-shaft geared with the shaft E', substantially as described.

6. In a screw-tapping machine, the combination, with suitably-journaled taps, of tightening-heads for clamping the work between said taps, substantially as set forth.

7. In a screw-tapping machine, the combination, with suitably-journaled taps, of tightening-heads for holding the work in position, said taps working through said heads, substantially as set forth.

8. In a screw-tapping machine, the combination, with the tightening-heads having a screw-threaded engagement with their supports, of suitably-journaled taps working through said heads, substantially as set forth.

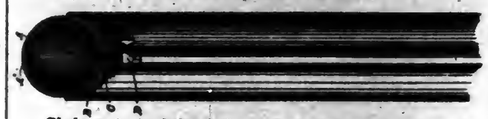
9. In a screw-tapping machine, the combination, with rotatable reciprocatory tap-spindles, of a driving-shaft geared with said spindles, a clutch-rod, C^2, a spring-actuated latch to engage one end of said clutch-rod, a sliding block to raise said latch and release it from said clutch-rod, and a pin or arm having an adjustable engagement with said sliding block, the said sliding block operated by a gear upon the tap-spindles, substantially as set forth.

399,354. VEHICLE-WHEEL TIRE. AMOS W. THOMAS, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,639. (No model.)

Claim.—1. A tire having the tread portion made thicker than the felly-facing portion, in combination with a felly and means, substantially as described, for permitting of the inflation of the tire, substantially as and for the purposes set forth.

2. A hollow tire having a re-enforce applied to the tread portion, in combination with a felly and a cock secured into said felly and tire, substantially as and for the purposes set forth.

399,355. WHEEL-TIRE. AMOS W. THOMAS, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,640. (No model.)



Claim.—1. A hollow tire of rubber or other material of uniform thickness, but with the tread portion thereof made tougher than the felly-facing portion, substantially as and for the purposes set forth.

2. An inflatable tire of rubber or other material of uniform thickness, but with the tread portion thereof tougher than the felly-facing portion, and provided with projections, substantially as and for the purposes set forth.

3. An inflatable tire having the tread portion thereof made tougher than the felly-facing portion, in combination with a felly having said tire secured thereto, substantially as described.

399,356. WHEEL-TIRE. AMOS W. THOMAS, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,641. (No model.)

Claim.—1. An inflated tire composed of two or more tubes closely fitted or nested within each other, substantially as and for the purposes set forth.

2. An inflated tire composed of two or more tubes closely fitted into or nested within each other and free to creep the one with respect to the other, substantially as described.

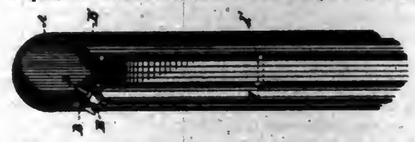
3. An inflated tire composed of two or more tubes closely fitted into or nested within each other, and the outer tube made wholly or in part of tougher material than the inner tube or tubes, substantially as described.

399,357. WHEEL-TIRE. AMOS W. THOMAS, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,642. (No model.)

Claim.—1. An inflatable tire composed of a sheet of flexible material, having the sides thereof enlarged and firmly held in grooves or countersunk channels formed in the sides or edges of a felly, substantially as described.

2. An inflatable tire composed of flexible material, having the sides enlarged, in combination with a felly having grooves or channels in the sides or edges thereof to receive the enlargements of the tire, and a tube with a cock secured into said felly, substantially as and for the purposes set forth.

3. An inflatable tire composed of flexible material, having enlarged sides or edges which engage in the grooves of a duplex felly, and means, substantially as described, for firmly holding said tire in position therein, substantially as and for the purposes set forth.



399,358. WHEEL-TIRE. AMOS W. THOMAS, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,643. (No model.)

Claim.—1. An inflatable tire sprung onto or into the felly and held by a band or bands of pliable material cemented or vulcanized to said tire or felly, or both, substantially as shown and described.

2. An inflatable tire sprung into a grooved felly and held therein by means of a pliable or elastic band or bands cemented or vulcanized to the tire and caused to circumscribe the surface of said felly, substantially as shown and described.

399,359. RIM AND TIRE FOR WHEELS. AMOS W. THOMAS, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,644. (No model.)

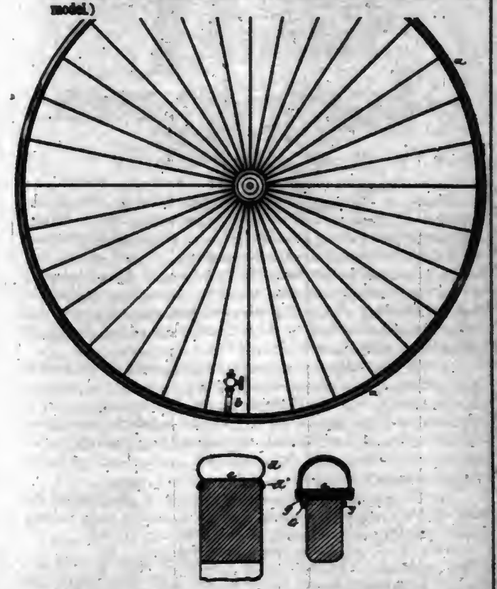
Claim.—1. A hollow flexible tire, in combination with a two-part felly, means, substantially as described, for clamping the tire to said felly, and a device for inflating said tire, substantially as and for the purposes set forth.

2. An inflatable tire, in combination with a two-part felly, a rim, and means for clamping said rim, tire, and felly together, substantially as shown and described.

3. A hollow flexible tire having the edges thereof firmly held together, in combination with a two-part felly and means for clamping said tire firmly between said felly, substantially as and for the purposes set forth.

399,360. WHEEL TIRE AND FELLY. AMOS W. THOMAS, Philadelphia, Pa. Filed June 30, 1888. Serial No. 278,645. (No model.)

Claim.—The combination of the non-inflatable flexible tire A, a rim interposed between the sides of said tire, rings B and B', and means, as described, for clamping said rim and rings to the sides of said tire, substantially as shown and described.

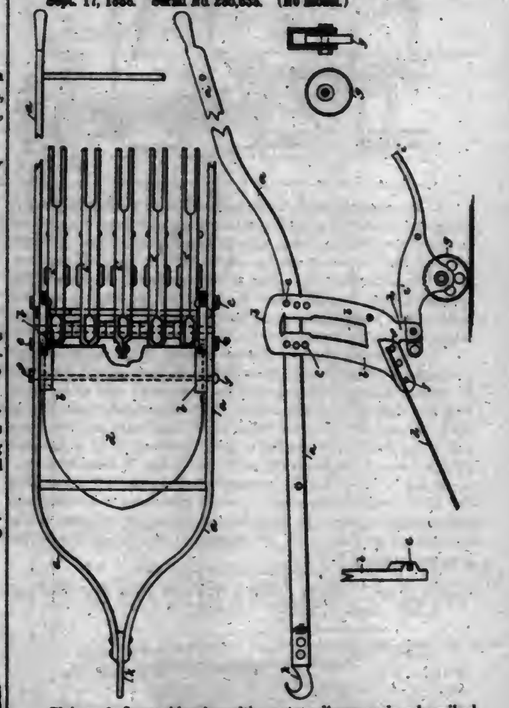


399,361. WHEEL TIRE AND FELLY. AMOS W. THOMAS, Philadelphia, Pa. Filed July 14, 1888. Serial No. 279,967. (No model.)

Claim.—1. A flexible or elastic hollow tire provided with ribs formed integral therewith and firmly secured in a felly adapted to receive said tire, and a tube with a cock extending through the body of said felly and tire, substantially as and for the purposes set forth.

2. An inflatable tire provided with ribs and a web, in combination with a two-part felly adapted to receive said tire, and means, as described, for securing the ribs of said tire in said felly and clamping the web thereof between the parts of said felly, substantially as and for the purposes set forth.

399,362. VEHICLE-WHEEL. AMOS W. THOMAS, Philadelphia, Pa. Filed Dec. 14, 1887. Renewed Feb. 1, 1889. Serial No. 298,419. (No model.)



Claim.—1. A wheel provided with an inflatable tire having the sides or edges thereof secured between the double walls of the flanges of a rim or felly, substantially as and for the purposes set forth.

2. A wheel provided with an inflatable flexible tire having the sides thereof pinched and secured between the walls of flanges formed with a rim or felly and the flanges projecting inwardly from the periphery of said rim or felly, substantially as and for the purposes set forth.

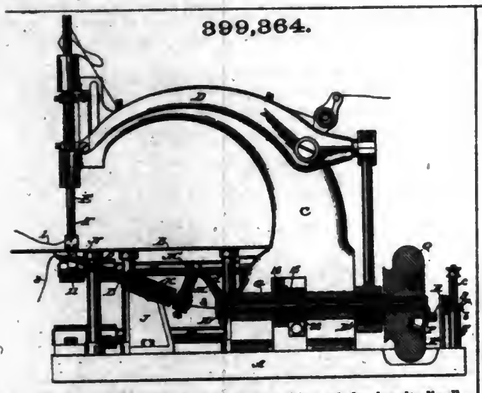
3. A wheel provided with an inflatable flexible tire having the sides or edges secured between the walls of flanges mounted on a filling consisting of segments of wood or other material arranged between the rim and hoop of the wheel and said segments flanged so as to abut against one side of the rim, and means, as described, for securing the same to the wheel, substantially as described, and for the purposes set forth.

4. A wheel provided with a tire composed of a web of flexible material having the sides or edges secured between the walls of flanges formed with a rim and a tube provided with a cock for permitting of the inflation of said tire, substantially as described, and for the purposes set forth.

399,363. POTATO-DIGGER. ISLAS VANCE, Washington, Pa. Filed Sept. 17, 1888. Serial No. 285,632. (No model.)

Claim.—1. In combination with a potato-digger such as described, the separator consisting of a series of bars or sections, *i*, hinged at their forward end and each supported by a small wheel, *g*, arranged eccentrically in a manner that when the machine is in motion each section *i* is given a rapid vertical motion, as and for the purpose described.

2. In a potato-digger, the combination, with a shovel, of a separator consisting, essentially, of a series of horizontal bars hung at their forward ends beneath the rear end of the shovel, and each having a ground-wheel eccentrically hung thereon, substantially as and for the purpose described.



3. In a potato-digger, the combination of the depending hangers, an inclined shovel fixed thereto, and a series of horizontal bars arranged side by side and pivoted at their forward ends in the hangers beneath the rear end of the shovel, each of said bars having a ground-wheel eccentrically hung thereto for reciprocating said bars at irregular intervals in vertical planes, substantially as and for the purpose described.

399,364. SEWING-MACHINE. CHARLES W. WEBB, Brooklyn, assignor of one-half to Charles Kruse, New York, N. Y. Filed Dec. 8, 1887. Serial No. 257,310. (No model.)

Claim.—1. The combination, with the reciprocating needle in a sewing-machine, of a looper which has a rotary movement about its longitudinal axis and a simultaneous reciprocating movement in the direction of said axis, and which is formed with a longitudinal perforation extending through it, substantially in the manner and for the purpose herein set forth.

2. The combination, with the reciprocating needle in a sewing-machine, the main rotating shaft actuating the same, and a looper-shaft and looper mounted to rotate and reciprocate upon its longitudinal axis in front of the end of said main shaft and to traverse the path of the needle, of an arm projecting radially from the end of the main shaft outwardly at an angle therewith, and a crank-arm upon the proximate end of the looper-shaft coupled to said radial arm by a universal joint, substantially in the manner and for the purpose herein set forth.

399,864.

3. The combination, in a sewing-machine, of the longitudinally-perforated rotating shaft G, the longitudinally-perforated looper-shaft L, rotating and reciprocating upon its longitudinal axis at an angle with said shaft G, the mechanism, substantially as described, for actuating the looper-shaft by means of the rotation of the shaft G, the longitudinally-perforated looper N, carried by the shaft L, and the reciprocating needle T, traversing the line of movement of the looper, substantially in the manner and for the purpose herein set forth.

4. The combination, in a sewing-machine, of the longitudinally-perforated rotating shaft G, the longitudinally-perforated looper-shaft L, rotating and reciprocating upon its longitudinal axis at an angle with said shaft G, the crank-arm M upon the inner end of said looper-shaft, the outwardly-inclined radial arm I, fitted upon the proximate end of the shaft G and coupled to said crank-arm M by a universal joint, the curved longitudinally-perforated looper N, fitted to the opposite end of looper-shaft L, a reciprocating needle, T, traversing the line of movement of the looper to intersect the same, and mechanism, substantially as described, for actuating the needle by means of the rotation of the shaft G, all substantially in the manner and for the purpose herein set forth.

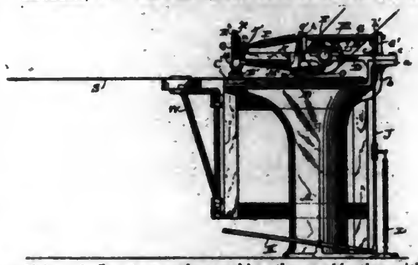
399,865. SKATE. JAMES A. WHELPLEY, Keene, N. H. Filed Apr. 2, 1888. Serial No. 269,270. (No model.)

Claim.—1. The toe-plate B, formed of a single piece of metal and provided with a hole, *g*, channel *k*, depression *i*, and holes *j j*, in combination with the piece H, runner A, and key I, substantially as shown and described.

2. A toe or heel plate provided with a depression, *i*, and holes *j j*, in combination with a runner having upwardly-projecting pieces provided with recesses *e* and notches *d*, and the nut I, substantially as and for the purpose set forth.

3. The lever D, provided with a straight slot, *p*, and two slots, *q q*, set at an angle to each other, the regulating screw-threaded bar F, bolt K, and adjustable heel-clamp G, in combination with the toe-clamps E E, provided with studs *n*, toe-plate B, provided with curved channel *k*, bolt J, upon which the lever D is free to turn, and also to travel longitudinally, and heel-plate C, provided with a slot, *m*, substantially as and for the purposes set forth.

4. The regulating-bar F, provided with a thumb-piece, *w*, in combination with the lever D, whereby the bar F is prevented from turning when the lever is locked, substantially as set forth.



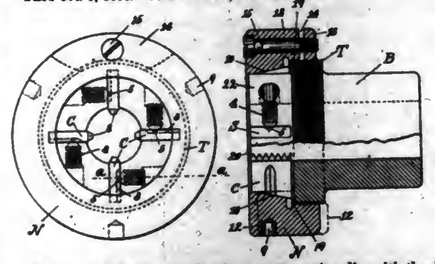
5. The piece H, in combination with the runner A, provided with the hooked recess *b*, and toe-plate B, provided with the hole *g*, substantially as and for the purpose set forth.

6. Toe or heel clamps provided at their upper edges with spurs that are upset in the process of stamping out the blank, substantially as set forth.

7. The toe-plate B, provided with the channel *k*, said channel being bent on a slight curve transversely of the skate, in combination with the toe-clamps D, bent to correspond thereto, substantially as and for the purpose set forth.

8. The actuating-lever D, provided at its forward end with a straight slot, through which is passed a bolt to secure it to the toe-plate, so that it is free to turn, and also to travel longitudinally, and also provided with two slots set at an angle to each other for operating the toe-clamps, the rear end of the lever being formed saddle-shaped to lock it onto the runner, substantially as shown and described.

399,866. SAW-HAMMERING MACHINE. ROBERT WHITEHILL, Milwaukee, Wis. Filed Mar. 6, 1888. Serial No. 266,310. (No model.)



Claim.—1. In a hammering-machine, the combination, with the hammer-shank, of a cam for lifting the hammer, a supporting-collar connected thereto, and means for shifting the cam and supporting-collar, substantially as described.

2. In a hammering-machine, the combination, with the hammer of a tapering cam for lifting and releasing it, a collar for supporting the hammer when at rest, and means for shifting the cam and collar simultaneously, substantially as and for the purpose set forth.

3. The combination, with the hammer, of the tapering cam, a spanner suitably connected therewith, a rock-shaft from which the spanner depends, and a treadle and spring for operating the rock-shaft, substantially as and for the purpose set forth.

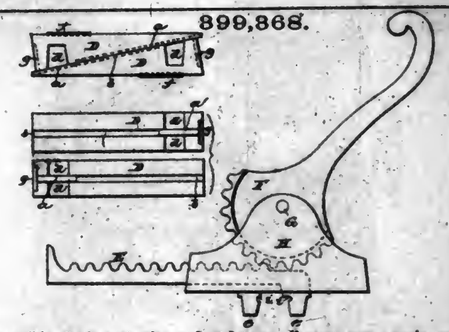
4. The combination, with the hammer, of the tapering cam and connected collar, a driving-shaft to which the cam is splined, and a spanner, rock-shaft, treadle, and spring for shifting the cam and collar, substantially as described.

399,867. SCREW-CUTTING DIE. JAMES R. WOODBRIDGE, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. Filed Oct. 5, 1888. Serial No. 287,343. (No model.)

Claim.—1. The combination, in a screw-cutting die, with the die-body formed cylindrical at its forward end and having therein radially-disposed chaser-receiving slots and having a screw-thread rearward of said slots, of chasers contained in said slots, and an annular ring having an internal thread fitting the thread on said die-body, having a cylindrical bearing fitting the cylindrical forward end of said die-body, and having a conical portion between said cylindrical and threaded portions for taking the outward thrust of the chasers, all substantially as described.

2. The combination, in a screw-cutting die, with the die-body B, having the cylindrical forward part, 22, the thread T, and carrying the chasers C in the radial slots S, of the chaser-adjusting ring N, threaded to engage with the thread T, and having the inclined surface 10, for receiving the thrust of the chasers, and the cylindrical surface 20, bearing on said surface 22, substantially as described, and for the purpose specified.

3. The combination, in a screw-cutting die, of the threaded die-body and the chaser-adjusting ring having the slot 14, and a binding-screw extending across said slot, as set forth.



399,868. PRINTER'S QUOIN. MATHEW W. BERRYMAN, New York, N. Y., assignor to M. Nichols Johnson, same place. Filed June 11, 1883. Serial No. 97,633. (No model.)

Claim.—1. Printers' duplicate quoins whose inclined meeting faces present wide bearings and are provided with longitudinal guiding-ribs adjacent to their heads, and with corresponding guiding and retaining grooves extending longitudinally from such rib toward the thinner extremities of such duplicates.

2. Printers' duplicate wide-bearing quoins whose inclined meeting faces are each provided with a narrow longitudinal guide-rib adjacent to their heads, and a corresponding longitudinal guiding and retaining groove extending from such rib toward the other extremity, each head being provided with a recessed hold for a lever-key.

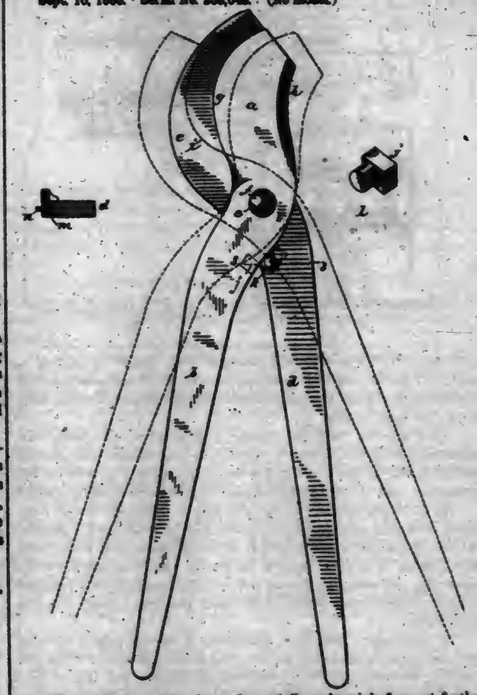
3. A printer's quoin provided with a base-grip consisting of a compressible elastic projecting pad set into or adherent upon a quoin and partially covering its base, substantially as described.

399,868.

4. In a printer's key for locking up recessed duplicate quoins, a lever carrying a segmental cogged periphery at one end articulating with a correspondingly-cogged longitudinal rack-bar, carrying on its under side a lug working in a slotted guide-frame, also provided with a corresponding lug on its under side, and all substantially constructed in the manner and for the purposes described.

5. In a locking-up device for securing printers' forms, the combination of mutually guided and guiding quoin parts acting by means of short head-ribs and long longitudinal mutually-guiding grooves extending toward their other extremity upon their meeting faces, together with a lever-key adapted to locking and unlocking the same by means of articulating lugs upon such key and receiving-recesses upon such quoins, all substantially as described.

399,869. CAR-AXLE LUBRICATOR. THOMAS B. BISHOP, Clifton, N. J. Filed Oct. 22, 1888. Serial No. 288,702. (No model.)



Claim.—1. In a car-axe lubricator, the combination, with the axle-box and the axle therein, of a stretching-plate having a concavity in its top and a flat surface on each side of said concavity, a continuous web passing over the top of said plate and the bottom of the box, the axle bearing on that portion of the web within the concavity in the plate, and a spring bearing at the bottom on the web and at the top against the plate, whereby the web is kept smooth under the axle.

2. In a car-axle lubricator, the combination, with the axle-box and the axle therein, of a stretching-plate slotted, as described, and having a concavity in its top and a flat surface on each side of said concavity, a continuous web passed through said slots and over the top of the plate, and also over the bottom of the box, the axle bearing on that portion of the web within the concavity in the plate, and a spring bearing at the bottom on the web and at the top against the plate, for the purpose stated.

3. In a car-axle lubricator, the combination, with the axle-box and the axle therein, of a stretching-plate of the full width of the interior of the box, slotted, as described, and having a concavity in its top and a flat surface on each side of said concavity, a continuous web, of the width of the part to be lubricated, passed through said slots and over the top of the plate, and also over the bottom of the box, the axle bearing on that portion of the web within the concavity in the plate, and a spring bearing at the bottom on the web and at the top against the plate, whereby the web is kept straight and smooth under the axle.

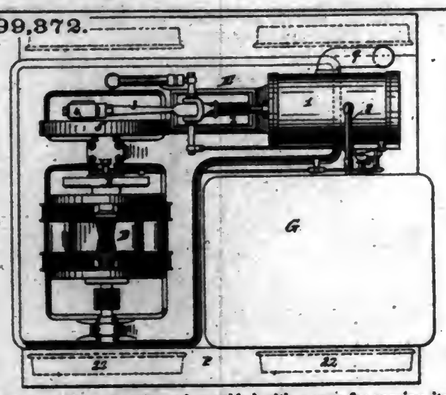
4. In a car-axle lubricator, the combination, with the box and axle, of a stretching-plate for the web, a continuous web passing over the top of said plate and over the bottom of the box, and a coil-spring provided with a hook for hooking up a number of the coils, the said spring pressing at the bottom on the web and at the top against the plate, as set forth.

399,870. PRUNING IMPLEMENT. ADAM BURR, Mercer, Pa. Filed Sept. 10, 1888. Serial No. 285,042. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the cutting-jaw, its handle, the opposite jaw formed with a concave seat and a handle, the pivot-pin connecting the two jaws, the gage-blocks, their eccentric shanks seated in sockets in the handles and adjustable therein, and the set-screws engaging with the shanks for firmly securing the shanks in their sockets.

399,871. ASH-SIFTER. GEORGE W. BOWN, Philadelphia, Pa. Filed June 27, 1888. Serial No. 278,262. (No model.)

Claim.—1. The improved sifter herein described and shown, consisting of the casing A, having the bearings *a* and provided with the latch D, pivoted at *d* and provided with a slot, *d'*, the ring C, having trunnions journaled in bearings *a*, the spring-catches secured between their ends to the ring C and extended at such ends, whereby to engage the pan and sieve, and the pan and sieve, all substantially as set forth.



2. The sifter herein described, comprising the sieve having a shoulder or catch, *g*, the pan having handles F', the ring C, formed to fit over the pan below the handles F', and having the clamps E, engaging the shoulder or catch *g*, the trunnions on ring C, and the casing having bearings for said trunnions, substantially as set forth.

399,872. ELECTRIC-RAILWAY SYSTEM. CHARLES S. BRADLEY, Yonkers, N. Y. Filed Aug. 9, 1888. Serial No. 282,286. (No model.)

Claim.—1. The combination of a prime mover provided with means for automatically regulating its consumption of energy proportionally to the load and dependent thereon and a dynamo-electric generator driven thereby and provided with means for varying its potential, both located on a moving vehicle, and an electric motor energized by said generator and constituting the propelling device for said vehicle.

2. The combination of a prime mover provided with means for automatically regulating its consumption of energy proportionally to the load and dependent thereon and a shunt-wound dynamo-electric

399,372.

generator driven thereby and provided with means for varying its potential, both located on a moving vehicle, and a series-wound electric motor energized by said generator and constituting the propelling device for said vehicle.

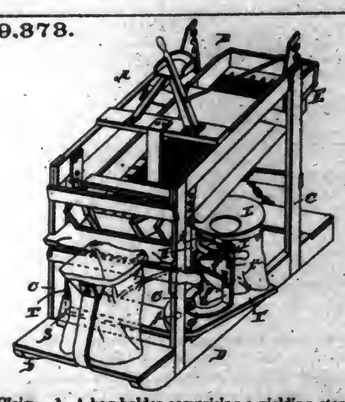
3. A wheeled vehicle or car carrying a prime mover and a dynamo-electric generator driven thereby, in combination with another vehicle having as its motive power an electric motor energized by said generator, said vehicles being coupled together in a suitable manner.

4. A wheeled vehicle or car carrying a prime mover and a dynamo-electric generator driven thereby, said generator being adapted for the regulation of its potential, in combination with another vehicle having as its motive power an electric motor energized by said generator, and means on the latter vehicle for regulating the potential of the said generator, both vehicles being coupled together in a suitable manner.

5. An electric locomotive comprising a wheeled vehicle carrying two independent prime movers, two independent dynamo-electric generators, respectively driven by said prime movers, and two or more electric motors constituting the immediate motive power of said vehicle, in combination with switching mechanism adapted to connect any motor with either of said dynamo-electric generators.

6. A wheeled vehicle or car carrying, first, a gas-engine provided with means for automatically regulating its consumption of energy proportionally to the load; secondly, means of supplying the same with gas or vapor, and, thirdly, a dynamo-electric generator having means of varying the strength of its field magnetism and driven by said gas-engine, in combination with an electric motor energized by said generator and constituting the propelling-power of said vehicle.

7. A wheeled vehicle or car carrying, first, a gas-engine; secondly, means of supplying the same with gas or vapor, and, thirdly, a dynamo-electric generator driven by said gas-engine, in combination with a second vehicle or car carrying an electric motor energized by said generator and constituting the motive power, both vehicles being coupled together.



8. A wheeled vehicle or car carrying a gas-engine, provided with means for automatically regulating its consumption of energy proportionally to the load and dependent thereon, means for supplying the same with gas or vapor, and a dynamo-electric generator driven by said gas-engine, and having means of varying the strength of its field magnetism, both engine and generator being maintained in continuous rotation while in transit, in combination with an electric motor energized by said generator and constituting the propelling-power of said vehicle, and suitable connections for closing the circuit of the dynamo through the motor at will.

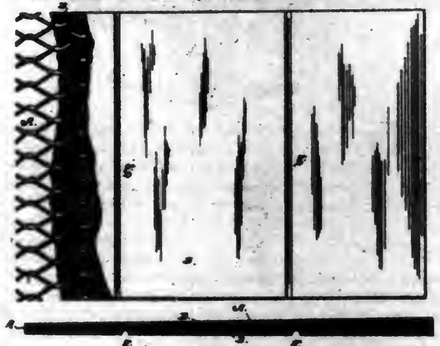
9. An electric locomotive comprising a wheeled vehicle carrying two or more independent gas-engines, a gas-supply therefor, and two or more independent dynamo-electric generators, respectively driven by said gas-engine, and two or more electric motors constituting the immediate motive power of the locomotive, and arranged in combination with switching devices adapted to connect any motor with either generator and transfer one generator as motor into the circuit of the other generator for the purpose of starting its engine.

10. In a plant for the generation and utilization of electrical energy, the combination of a prime mover, a dynamo-electric generator, and an electric motor energized thereby, both said dynamo-electric generator and motor having each a dynamic capacity in excess of that of the prime mover, whereby the maximum effort of the prime mover may be exerted either in tractive force or speed on the part of the electric motor.

399,373. BAG-HOLDER. JAMES M. BRADSHAW and WILLIAM R. MIER, Bastonville, Cala. Filed Aug. 16, 1888. Serial No. 282,895. (No model.)

399,373.

Claim.—1. A bag-holder comprising a yielding standard having a longitudinal slot at its upper end, an angular head, a bolt passed through the head and the slot in the standard to adjustably secure the head to the standard, and a lever supported at a slight distance from the said standard and carrying bag-retaining prongs, as set forth.



2. A bag-holder comprising a support, a yielding standard arranged a slight distance from said support, a lever mounted on said support, and bag-retaining prongs carried by said lever, as set forth.

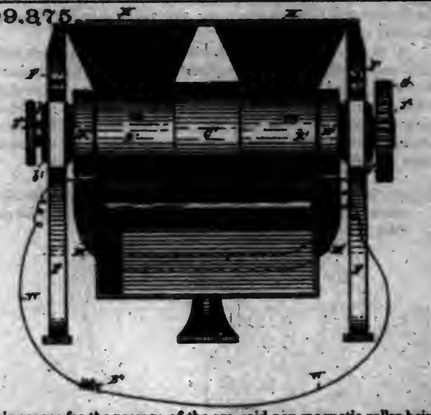
3. A bag-holder comprising a yielding standard, a vertically-adjustable support arranged a slight distance from the yielding standard, a lever mounted on said support, bag-retaining prongs carried by said lever, and a spring having one end secured to said support and its other end bearing against the under side of the lever, as set forth.

4. The combination of the horizontally-swinging base, the standards erected thereon, the plate H, adjustably secured to said standards, the lever pivoted to said plate, and the bag-retaining prongs carried by said lever, as set forth.

5. The combination of the standards G G, the plate H, secured to said standards and adjustable vertically thereon, the guides i' i^2 on said plate, the lever pivoted on the plate and projecting through the guide i^2, and the bag-retaining prongs carried by the lever and extending through the guide i', as set forth.

399,374. ARTIFICIAL SLATE. CALVIN BROWN, San Francisco, Cal., assignor of one-half to John H. Miller, same place. Filed Jan. 7, 1888. Serial No. 260,052. (No model.)

Claim.—1. As a new article of manufacture, an artificial slate consisting of an interstitial metallic web and a covering of set plastic material, as set forth.



2. As a new article of manufacture, an artificial slate consisting of an interstitial metallic web and coverings of set plastic material on both sides tapered from one end to the other, as set forth.

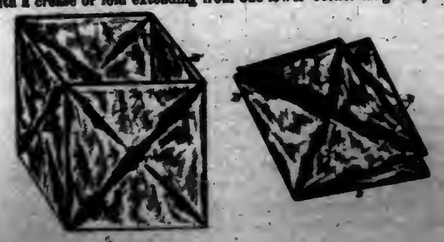
3. As a new article of manufacture, an artificial slate consisting of an interstitial metallic web and a covering of set plastic material on both sides, one side having transverse grooves therein, as set forth.

399,375. MAGNETIC SEPARATOR. JAMES A. BURDEN, Troy, N. Y. Filed Jan. 18, 1888. Serial No. 260,726. (No model.)

Claim.—1. In an apparatus for separating magnetite from a non-magnetic gangue, the combination, with an iron roller that is made in two parts and having an intermediate coupler of non-magnetic material, said iron roller at its outer ends being within the excited field of an electro-magnet and provided with journals and insulated journal-bearings, and having an insulated pulley at one end, of a non-magnetic roller arranged by the side of the metal roller, with an intervening space for the passage of the ore, said non-magnetic roller being provided with journaled ends having bearings and constructed to receive motion, and with a pulley and belt to transmit the same to the insulated pulley of the metal roller, substantially in the manner as and for the purposes set forth.

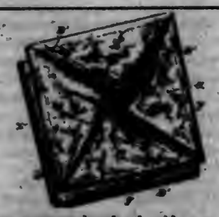
399,375.

2. In an apparatus for separating magnetite from a non-magnetic gangue, the combination, with an iron roller that is made in two parts having an intermediate non-magnetic coupler, said iron roller at its outer ends being within the excited field of an electro-magnet and provided with journals having insulated bearings, with an insulated pulley at one end, of a non-magnetic roller arranged by the side of the iron roller with an intermediate passage for the ore, said non-magnetic roller being provided with journaled ends and bearings and constructed to receive motion, and with a pulley and belt to transmit power to the iron roller-pulley, a chute arranged beneath the metal roller, and a chute arranged beneath the non-magnetic roller, substantially in the manner as and for the purposes set forth.



3. In an apparatus for separating magnetite from a non-magnetic gangue, the combination, with an iron roller made in two parts connected by a non-magnetic coupler, said iron roller at its outer ends being within the excited field of an electro-magnet and provided with journals having insulated bearings with an insulated pulley at one end, of a non-magnetic roller arranged by the side of the iron roller with an intermediate space for the passage of the ore, and being provided with journaled ends having bearings, an actuating-gear at one end and a pulley and belt connecting with the pulley of the iron roller at the other end, a chute leading from the iron roller, and a chute leading from the non-magnetic roller, which latter chute is provided with an interiorly-placed exhaust-fan, substantially as and for the purposes set forth.

4. The combination, with the iron roller R', made in two parts, connected by a non-magnetic coupler, C', and having the end journal, J', of the electro-magnet M', having its pole ends adjacent to the outer ends of the roller, and slotted at its pole ends for the side insertion of the roller-journals, insulated bearings for said journals outside of where passing through the electro-magnet, and stoppers S', made to close said slots where not occupied by the journals, as and for the purposes set forth.



399,376. POCKET-BOOK. RALDY A. GAPENARY, Washington, D. C., assignor of one-half to J. Reed Littell, same place. Filed Nov. 26, 1888. Serial No. 291,894. (No model.)

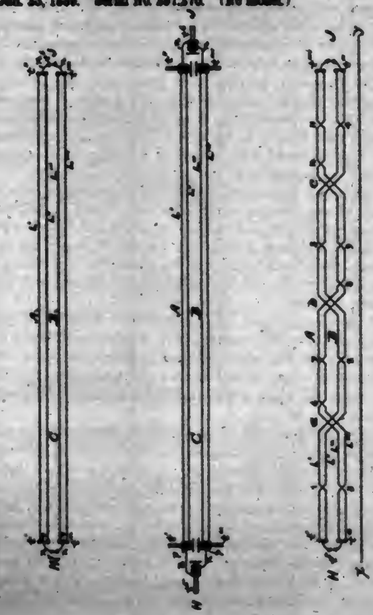
Claim.—1. A pocket-book of the class described comprising the bottom portion and connected sides projecting from the same, each side being relatively creased or folded diagonally from one lower corner to the opposite top corner, substantially as and for the purpose set forth.

2. A pocket-book of the class described comprising the bottom portion and sides projecting from the same, each side being provided with a crease or fold extending from one lower corner diagonally to

399,376.

the opposite upper corner, whereby the sides are adapted to fold and overlap one another above the bottom, and with a crease extending diagonally at right angles to the main crease and adapted to enhance the flexibility of the sides in opening or closing, substantially as set forth.

3. A pocket-book having the bottom and relatively creased sides adapted to fold and form double overlaps, substantially as set forth, whereby outward pressure of the coin locks the overlaps more securely in position.

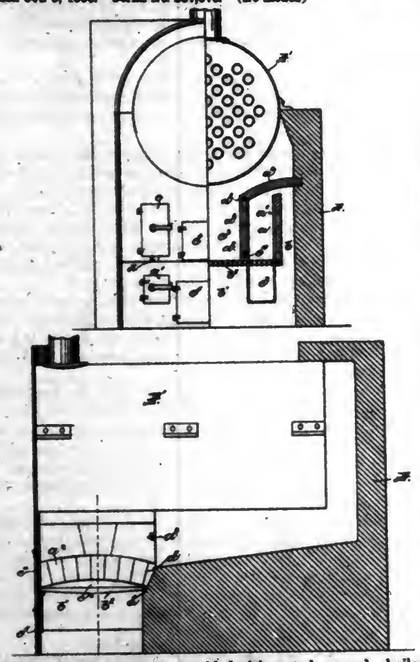


4. An angular pocket-book of the class described having the bottom and sides, each side being diagonally creased and adapted to fold downwardly and inwardly over the bottom, so that each side diagonally covers one-half the bottom portion, with the lower half of the side forming the under lap and the upper half of the side forming the upper lap, and one half of each side projecting over the adjoining half of the next side, whereby double overlaps for retaining the coin are formed, substantially as and for the purpose set forth.

5. In a pocket-book of the class described, the combination of a bottom piece and the side portion forming the sides and provided with the projecting edge extending around and projecting inwardly at the bottom, to which edge the bottom piece is secured, substantially as set forth.

6. In a pocket-book of the class described, the combination of the side portion forming the sides and provided with a projecting edge extending around and projecting inwardly at the bottom, the outer bottom piece secured to said edge forming the outer surface of the bottom, and the corresponding inner bottom piece secured inside the pocket-book and forming the inner surface of the bottom, substantially as set forth.

7. In a pocket-book of the class described, the combination of the outer bottom piece, *a*, secured inside the pocket-book, the inner bottom piece, *a'*, and the side portion forming the sides and constructed of a double strip of leather or other flexible material and having a projecting edge at the bottom received between the outer and inner bottom pieces, *a* and *a'*, the sides being diagonally creased, substantially as and for the purpose set forth.



399,377. ELECTRIC CIRCUIT. JOHN J. CARTY, New York, N. Y., assignor to the American Bell Telephone Company, Boston, Mass. Filed Jan. 23, 1889. Serial No. 297,370. (No model.)

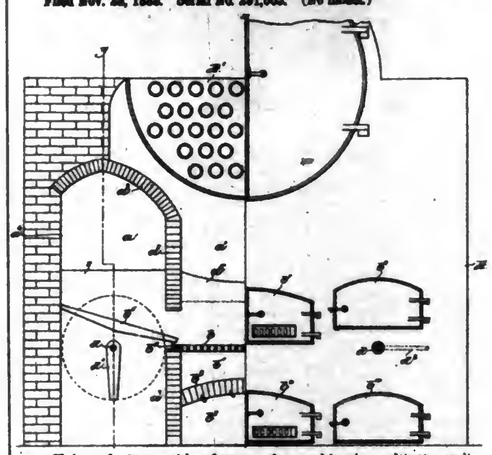
Claim.—1. In a telephone system, an electrical circuit consisting of two pairs of main lines, the lines composing each pair being transposed at intervals, and said pairs being transposed at intervals.

2. An electrical circuit or system of circuits consisting of two pairs of main lines, the outgoing and return conductors of each pair being transposed at intervals, and said pairs being transposed at intervals, in combination with electrical instruments for producing currents in each pair and an electrical instrument for producing currents in all of the lines, substantially as described.

399,378. COKING-FURNACE. GATES A. CLARK, Rochester, N. Y., assignor to Clark's Coking and Smokeless Furnace Company, same place. Filed Oct. 3, 1888. Serial No. 287,078. (No model.)

Claim.—1. The furnace A, provided with grate-bars, and a boiler supported by said furnace, combined with coking-ovens *a*, composed of the inner wall, a^7, forming with the wall of the furnace the passage *a*, and the outer wall forming with the grate-bars a passage, c^{10}, and with a door or opening in the furnace-wall substantially in line with the said passage, substantially as and for the purpose specified.

2. The furnace A, provided with grate-bars, and a boiler supported by said furnace, combined with coking-ovens *a*, composed of the inner wall, a^7, forming with the wall of the furnace the passage *b*, the outer wall formed by the slabs a^8 and arch a^9, of refractory material, and the top a^4, and the arch a^5, forming with the grate-bars a passage, c^{10}, substantially as and for the purpose specified.



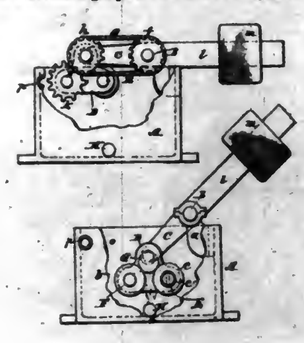
3. The furnace A, provided with stationary grate-bars, and a boiler supported by said furnace, combined with a coking-oven having its wall adjacent to the combustion-chamber of the said furnace made to form with the stationary grate-bars a passage, c^{10}, and a flue or passage located within said furnace and connecting the said coking-oven with the ash-pit of the furnace below the said grate-bars, as and for the purpose specified.

4. A furnace provided with a combustion-chamber, a coking-chamber, a partition-wall separating said chambers and having a normally-open passage-way connecting said chambers, and a flue or passage-way located within the said furnace and leading from the coking-chamber below the grate of the combustion-chamber, substantially as described.

5. In a coking-furnace, a combustion-chamber and its grate-bars, combined with a communicating coking-chamber having one wall constructed to leave a passage near the top or arch of the coking-chamber and constitute between the said wall and the wall of the furnace a flue through which to lead the volatile products generated from the coal in the coking-furnace to a point below the grate-bars of the combustion-chamber, the wall separating the coking-chamber from the combustion-chamber being provided at its lower end with an open passage, c^{10}, through which the coke may be discharged from the coking-chamber into the combustion-chamber, and a door or opening in the furnace-wall substantially in line with the said open passage, substantially as and for the purposes set forth.

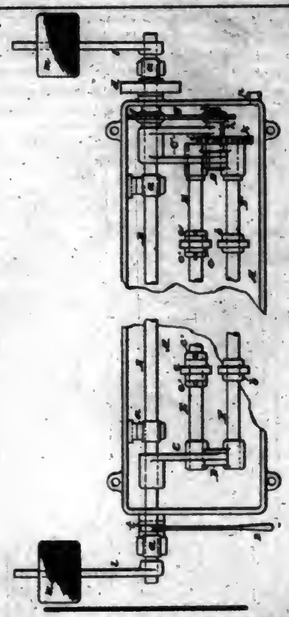
6. The furnace A, provided with stationary grate-bars, and a boiler supported by said furnace, combined with a coking-oven having its wall adjacent to the combustion-chamber of the said furnace provided with a passage, c^{10}, and with stationary grate-bars in said coking-oven, and a flue or passage located within the said furnace and connecting the said coking-oven with the ash-pit of the furnace below the said grate-bars, as and for the purpose specified.

399,379. COKING-FURNACE. GATES A. CLARK, Rochester, N. Y., assignor to Clark's Coking and Smokeless Furnace Company, same place. Filed Nov. 22, 1888. Serial No. 291,603. (No model.)



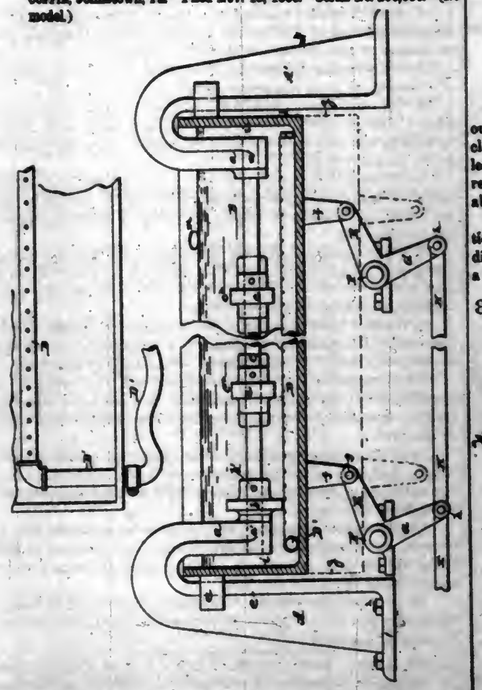
Claim.—1. In a coking-furnace, the combination, with the walls of the furnace and the walls a^6 a^7, forming the side walls of a coking-oven within said furnace, of a bridge-wall, a^3, provided with a passage communicating with the fire-box below the grate, the said bridge-wall forming with a wall of the furnace an exit-flue for the coking-oven communicating with the passage in the bridge-wall, substantially as described.

2. In a coking-furnace, the combination, with the walls of the furnace and the walls a^6 a^7, forming the side walls of a coking-oven within said furnace, of a bridge-wall, a^3, provided with a passage communicating with the fire-box below the grate, and a roof for said passage extended into the ash-pit, the said bridge-wall forming with a wall of the furnace an exit-flue for the coking-oven communicating with the passage in the bridge-wall, substantially as described.



399,380. PROCESS OF TOUGHENING STEEL AXLES. JOHN COFFIN, Johnstown, Pa., assignor to The Cambria Iron Company, of Pennsylvania. Filed Mar. 10, 1888. Serial No. 266,827. (No model.)

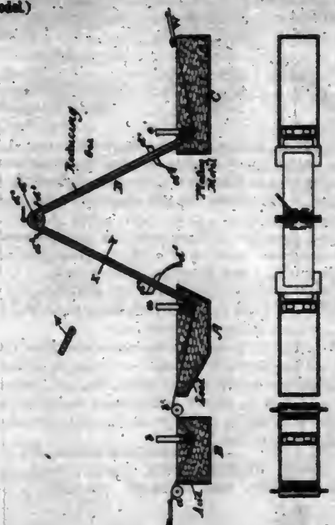
Claim.—1. The within-described process of toughening steel axles, consisting of cooling off a forged axle, then reheating it, then placing it on rotating devices that revolve it, and simultaneously with its revolution spraying jets of cold water or other cooling-liquid on the axle through its entire length, and finally removing the axle while it has sufficient contained heat to render it uniformly of a low red color in the dark.



2. The within-described process of toughening steel axles, consisting in cooling off a forged axle, then reheating it, then rapidly rotating the axle, and simultaneously with its revolution spraying jets of cold water or other cooling-liquid on the axle through its entire length.

399,380.

399,381. APPARATUS FOR TOUGHENING STEEL BARS. JOHN COFFIN, Johnstown, Pa. Filed Nov. 13, 1888. Serial No. 290,690. (No model.)

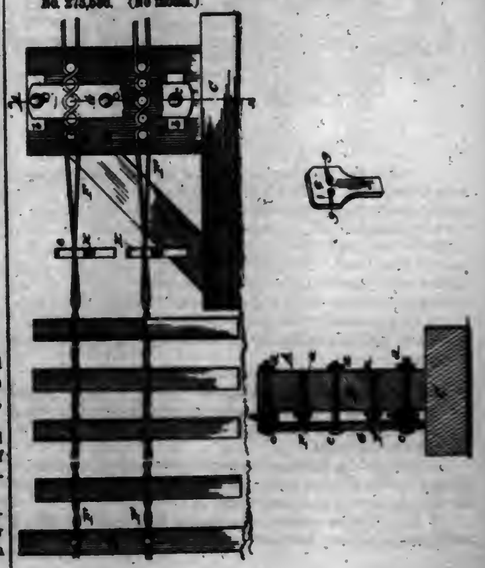


Claim.—1. The combination, with a frame and a cradle carried thereby for supporting the article to be toughened, and mechanism for rotating the article, of a water-container located below the cradle, and devices for elevating the container.

2. The combination, with a frame, a stationary cradle supported thereby, and devices for rotating the article carried by the cradle, of a water-container located under the cradle, and mechanism for raising the container up to the cradle, substantially as set forth.

3. The combination, with a frame and a stationary cradle carrying a rotating mechanism, of a vertically-movable bosh of water beneath the rotating mechanism, and means for raising this bosh until the rotating mechanism is submerged by the water therein, substantially as set forth.

4. The combination, with a supporting-frame and a stationary cradle carrying an axle-rotating mechanism, of a vertically-movable bosh, means for raising the latter until its contained water submerges the axle on the revolving mechanism, and a spray-pipe to cause jets to impinge upon the axle, substantially as set forth.



399,382. PROCESS OF CONTINUOUSLY ANNEALING AND PLATING WIRE. JOHN COFFIN, Johnstown, Pa., assignor to The Cambria Iron Company, of Pennsylvania. Filed July 26, 1888. Serial No. 281,304. (No model.)

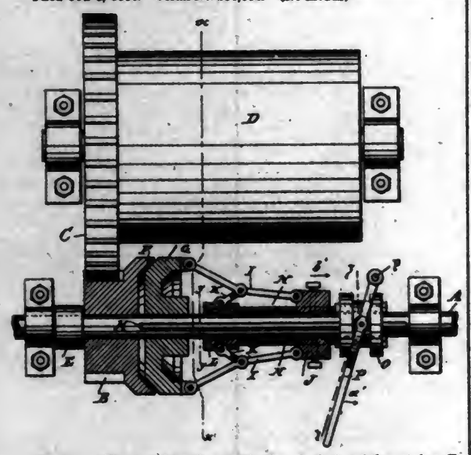
Claim.—1. The process of annealing and plating wire by continuous operation, consisting in passing the wire, first, through a suitable cleaning-bath of acid; second, through an annealing-bath of red-hot lead or other medium; third, through a sealed conduit filled with reducing-gas, and, fourth, through a bath of molten zinc or other suitable plating-metal, substantially as and for the purpose set forth.

2. The process of annealing and plating wire by continuous operation, consisting in passing the wire through an annealing-bath, thence directly through a conduit filled with reducing-gas, and thence through a bath of plating-metal, substantially as and for the purpose set forth.

399,383. TENSION DEVICE FOR USE IN MAKING FENCES. GARRIE D. COMER, Keiter's Store, Va. Filed May 11, 1888. Serial No. 273,586. (No model.)

Claim.—The improved wire-tension device, consisting of the vertical standard B, having a broad base, C, to which it is rigidly secured, the removable guard-plate G, rigidly secured to said standard in vertical and parallel position, spacing-blocks *b*, interposed between the plate and standard, and the pins *a*, inserted through the standard and projecting from its face in two horizontal rows arranged between the upper and lower ends of the guard-plate, as shown and described.

399,384. FEED-GAGE FOR PRINTING-PRESSES. LUTHER COLBURT, Oak Park, Ill. Filed Jan. 6, 1888. Serial No. 260,019. (No model.)



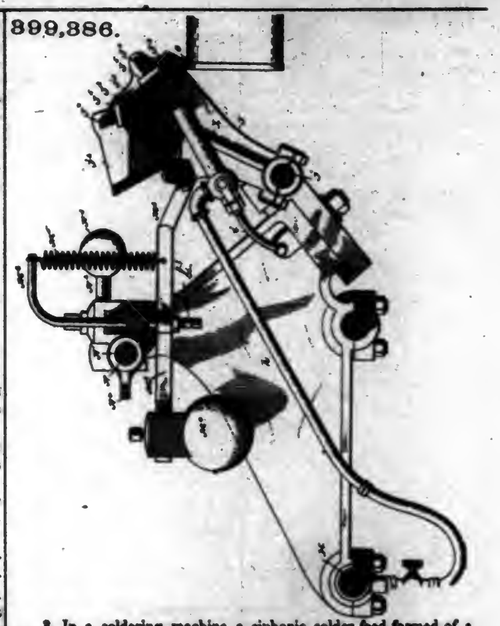
Claim.—1. A gage for printing-presses, comprising a head or gage and integral elastic portions provided integrally with engaging-points adapted to be inserted in the tympan-sheet to fix the position of the gage by the reaction of said elastic portions, substantially as described.

2. In a gage for printing-presses, the combination of the head or gage portion *a*, flexible bars *b* and *b'*, and laterally-extending points connected with said bars, substantially as set forth.

3. In a gage for printing-presses, the combination of the head or stop *a*, side bars, *b* and *b'*, laterally-extending points *d* and *d'*, and central guide-bar, *c*, substantially as set forth.

4. In a gage for printing-presses, the combination, with the gage-body having flexible side bars armed with engaging-points, of a guide-bar, *c*, adapted to puncture the tympan-sheet, and so serve as a guide, that the gage may be secured with relation to the tympan-sheet at any desired point within the length of said guide-bar, substantially as described.

399,385. FRICTION-CLUTCH. DANIEL T. DENTON, Soudan, Minn. Filed Oct. 1, 1888. Serial No. 286,532. (No model.)



Claim.—The combination, with the shaft A, of the pinion B, loose thereon and provided with the friction-flange F, the friction clutch-wheel G, mounted to slide on the shaft, the fixed collar J on the shaft, provided with apertures parallel with the shaft, the sliding collar L on the shaft between wheel G and collar J, the toggle-links K, connecting the toggle-links at their joints with the collar L, the sliding collar O, the rods extending therefrom through the apertures in collar J to the collar L, a tongue-and-groove connection between said shaft, the wheel G and collars, and the shifting-lever for operating collar O, substantially as set forth.

399,386. SOLDERING-MACHINE. EDWARD J. DOLAN, Philadelphia, Pa., assignor, by mesne assignments, to the Bureau Can and Manufacturing Company, of Delaware. Filed Sept. 18, 1888. Serial No. 285,730. (No model.)

Claim.—1. A soldering-instrument consisting of a number of separate bodies affording capillary interstices for the passage of molten solder, substantially as described.

2. In a soldering-machine, a solder-feed formed of a plurality of wires, substantially as described.

399,386.

3. In a soldering-machine, a siphonic solder-feed formed of a plurality of wires, substantially as described.

4. A solder-feeder consisting of a number of separate bodies arranged in the form of a siphon and affording capillary interstices for the passage of molten solder, substantially as described.

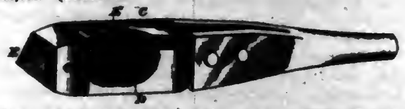
5. In a soldering-machine, a capillary siphonic solder-feed formed of a plurality of wires compressed, substantially as described.

6. The combination, with the solder-holder, of a plurality of wires, a plate for holding said wires against said holder, and means for holding said plate upon the wires and holder, substantially as and for the purpose specified.

7. The combination, with the solder-holder and the longitudinal bars above the same, of the plate, the wires between said plate and the holder, and keepers for holding said plate in position, substantially as described.

8. The combination, with the solder-holder and the longitudinal bars above the same, of the plate, the plurality of wires between said plate and holder, and the wedges between the bars and plate, substantially as and for the purpose specified.

9. A solder-feeder formed of a plurality of separate bodies, affording capillary interstices for the passage of molten solder, with one end forming the point of the soldering-iron, substantially as described.

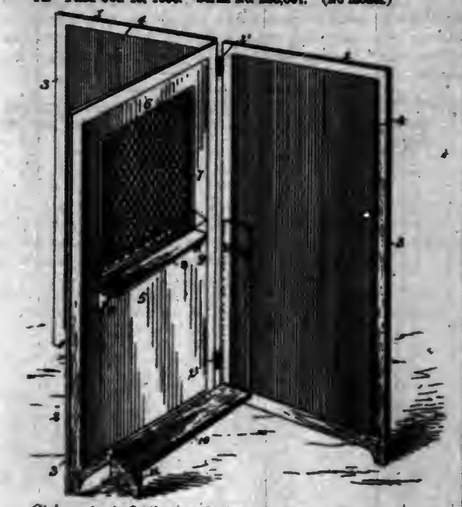


10. A combined siphonic solder-feeder and iron formed of a plurality of separate bodies arranged near each other and affording capillary interstices for the passage of the molten solder, substantially as described.

11. In a soldering-machine, a solder-holder and a solder-feeder composed of a plurality of wires arranged in the form of a siphon, one end of the said wires forming the point of the soldering-iron, substantially as described.

12. In a soldering-machine, the solder-holder, combined with a soldering-iron consisting of a plurality of wires having one end in said holder and the other end extending to the position of the parts to be soldered, substantially as described.

13. In a soldering-machine, a combined capillary solder-feeder and iron formed of a plurality of tinned wires, substantially as and for the purpose described.

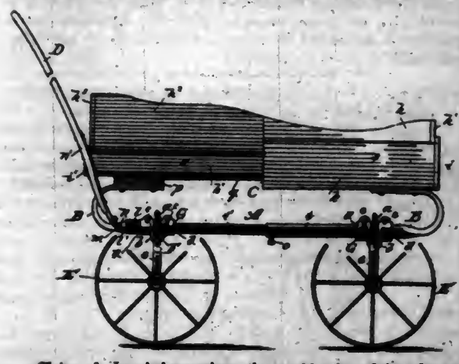


399,387. HAND SOLDERING-IRON. EDWARD J. DOLAN, Philadelphia, Pa., assignor, by mesne assignments, to the Bureau Can and Manufacturing Company, of Delaware. Filed Oct. 13, 1888. Serial No. 288,001. (No model.)

Claim.—1. A hand soldering-iron composed of a head, a handle, and a plurality of separate metallic bodies forming an absorbent core and projecting beyond said head, substantially as described.

2. As a new article of manufacture, the herein-described hand soldering-iron, comprising, in combination, a handle, a head provided with a central chamber open at the end of the iron, and a series of parallel wires held within the chamber, the ends of the wires being extended beyond the open end of the chamber and formed into a soldering-point, substantially as and for the purpose described.

399,388. FOLDING CONFESSIONAL. JAMES J. DUNN, Meadville, Pa. Filed Oct. 15, 1888. Serial No. 288,067. (No model.)



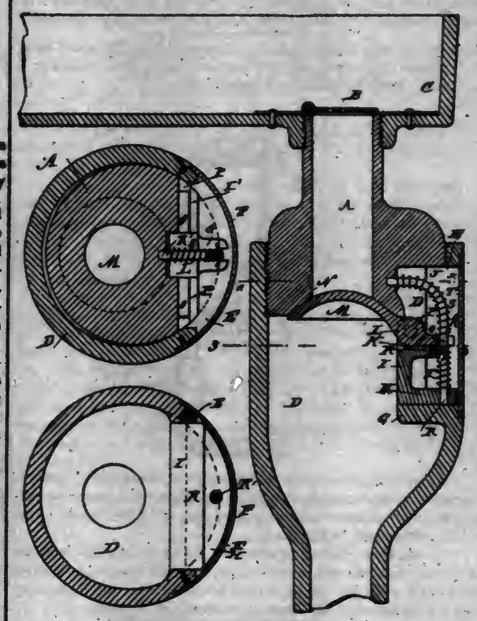
Claim.—1. A folding confessional consisting in a middle screen having a window or opening in its upper part and the outer screens hinged to the same vertical edge of the middle screen, substantially as set forth.

2. A religious confessional consisting of a series of screens hinged together to be folded up and set up on end in unfolded position, one of the screens forming an intervening screen having a confessional window or opening, a foldable hand-rest attached to the screen beneath the window, and on the opposite side beneath the window a folding hand-rest for the confessor, and a foldable kneeling-stool beneath the hand-rest attached to the confessional, substantially as shown and described.

3. A religious confessional consisting of screens 1 1 and 2, connected together by hinges 2', the screens 1 1 being formed of frames 3, having a light material stretched over them, and the screen 2 being formed of a frame, 3, having a rigid panel, 5, an opening, 6, covered by a grating, 7, foldable hand-rests 8, hinged to screen 2 beneath opening 6, and having depending foldable bracket-supports 9 hinged to their ends, and a kneeling-stool consisting of board 10, hinged at one end to screen 1 to fold up against the latter, and having a foldable hinged leg or support, 11, the screens, hand-rest, and kneeling-stool being foldable together, substantially as shown and described.

399,389. BABY-CARRIAGE. WILLIAM H. DUHN and HARRIETT H. DUHN, Chicago, Ill., assignors of one-half to Charles S. Harmon, same place. Filed Nov. 27, 1888. Serial No. 292,057. (No model.)

Claim.—1. In a baby-carriage, the combination of the telescoping side bars, A, telescoping body C, mounted thereon, and crank-shaped axles F, adjustable to raise and lower the wheels with respect to the body, substantially as described.



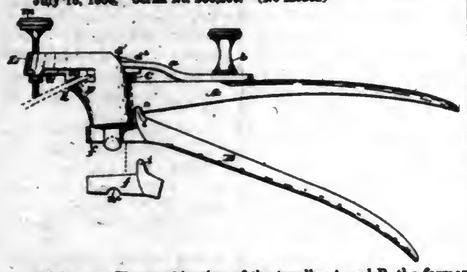
2. In a baby-carriage, the combination, with the telescoping side bars and body, of the jointed handle D, attached to the vehicle outside the lateral confines of the side bars, whereby it may fold over outside the confines of the body, substantially as described.

3. In a baby-carriage, the combination of the telescoping side bars, A, having curved extensions B, telescoping body C, mounted on the extensions B, and crank-shaped axles F, adjustably connected to the side bars, substantially as described.

4. In a baby-carriage, the combination, with the telescoping side bars of the telescoping and folding body C, mounted thereon, and comprising the forward box, *c*, having the guides *r*, sides *k*, and end *i*, extensions *k' k'*, hinged to the sides *k*, and foot-piece *g*, hinged to a part, *k'*, and the rear box, *c'*, having the tongues *q*, sides *k'*, and end *i*, extensions k^2 k^2, hinged to the sides *k'*, and rear piece, *g'*, hinged to a part, k^2, substantially as described.

5. In a baby-carriage, the combination, with the carriage-body, of an axle, F, mounted revolubly in bearings transversely of the vehicle and provided toward opposite ends with crank-shaped extensions *e*, whereby the hubs of the wheels when mounted thereon are out of line with the main part of the axle and may be raised and lowered with reference to the body of the vehicle by turning the axle in its bearings, and a fastening device for securing the axle against turning when desired, substantially as described.

399,390. GAS-CHECK FOR WATER-PIPES. HENRY R. HARRISON, New York, N. Y. Filed June 15, 1888. Serial No. 277,203. (No model.)



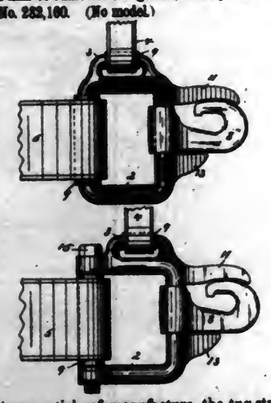
Claim.—1. A trap of the character described constructed with a closed side chamber, J, having a transverse slot, K, in its inner wall, and provided with a flap-valve, M, having a pivot-hub, L, adapted to turn in while closing the slot K, substantially as shown and described.

2. A trap of the character described formed of an upper pipe-section, A, having a downward extension, I', provided with open bearings P, a lower pipe-section, D, having a side opening, E, and rest G, an internal flap-valve pivoted in the bearings P, and removable filling-block I, interposed between the rest G and extension I', substantially as shown and described.

3. A trap of the character described provided with a closed side chamber, J, having a transverse slot, K, in its inner wall, and a lip, R, at the bottom of the slot K, and a flap-valve, M, having a pivot-hub, L, mounted in said slot, and a bearing-arm, Q, adapted to the lip R, substantially as described.

4. The combination, with a trap-body provided with a side chamber, J, separate from the interior, and having a slot, K, in its inner wall, of an internal flap-valve, M, pivoted to turn in while closing the slot K, and having an outward-projecting arm, Q, a fixed guide, E', on which the arm Q works, and a valve-operating spring on the guide E', substantially as described.

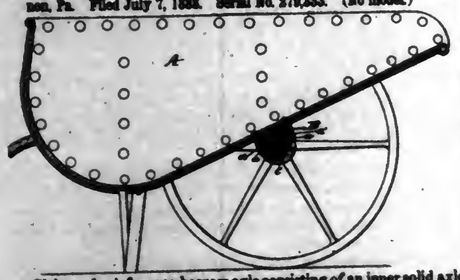
399,391. SAW-SETTING DEVICE. ADOLPH EPPINGER, LEVI L. DEWEESE, CHARLES W. KOONS, and WILLIAM H. METZGER, Canton, Ohio, said Koons and Metzger assignors to said Ellinger and Deweese. Filed July 16, 1888. Serial No. 280,299. (No model.)



Claim.—1. The combination of the handles A and B, the former having the groove *c*, adapted to receive the rib *i* upon the latter, the die *d'*, provided with the extension d^2 and the link *g*, the anvil provided with the beveled portion *k*, the gage *a*, and the spring C, substantially as and for the purpose set forth.

2. The combination of the handles A and B, the anvil D, formed integral with the handle A and provided with the aperture *h*, the die *d'*, the link *g*, and the sliding gage K, provided with the beveled heads *a*, substantially as and for the purpose specified.

3. The combination of the handles A and B, the anvil D, provided with the beveled portion *k*, the die *d'*, the link *g*, the gage-screw *m*, and the lock-lever O, substantially as and for the purpose specified.

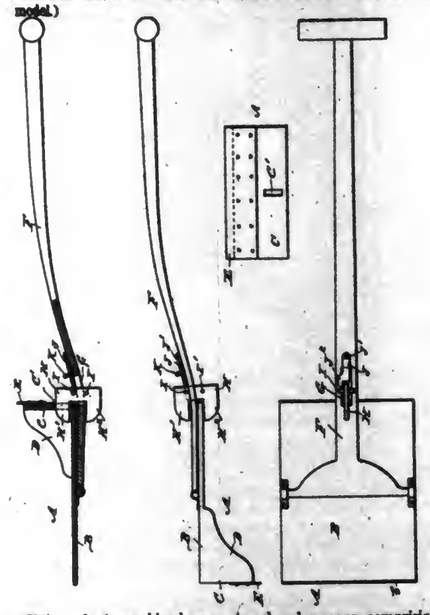


399,392. HARNESS-HOOK. EDWARD ELLIOTT, Stillwater, Minn., assignor of one-half to James P. Fitzgerald, same place. Filed Aug. 7, 1888. Serial No. 282,160. (No model.)

Claim.—1. As an article of manufacture, the tug-strap hook, as described, consisting of the frame, the hook 8, swiveling on said frame, and the horn 11 upon said frame projecting over the opening in the hook, substantially as described.

2. In a device of the class described, the combination of the frame 2, the hook 8, swiveled on said frame, the horn 11 upon said frame projecting over the opening in said hook, and the bolt 15, forming the front member of said frame, substantially as set forth.

399,393. FURNACE-FILLING BARROW. THOMAS FAILER, Lebanon, Pa. Filed July 7, 1888. Serial No. 279,333. (No model.)



Claim.—1. A furnace-barrow axle consisting of an inner solid axle secured to one hub and a tubular axle secured to the opposite hub, in combination with a surrounding sleeve having axle-boxes secured thereto, substantially as described.

2. A furnace-barrow axle consisting of an inner solid axle secured to one hub, a tubular axle secured to the opposite hub, and a surrounding sleeve, all of which extend across the barrow, in combination with axle-boxes secured to the barrow and provided with detachable covers, substantially as described.

3. A furnace-barrow axle consisting of an inner solid axle secured to one hub, a tubular axle secured to the opposite hub, and a surrounding sleeve having collars on each end, in combination with hubs having recesses in their inner ends, substantially as described.

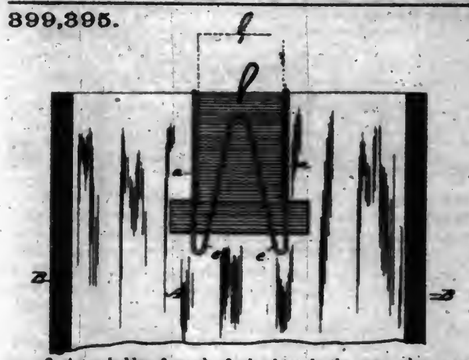
4. A furnace-barrow axle consisting of an inner and an outer axle secured, respectively, to opposite hubs, and a sleeve, all of which have bearings in the hubs of the wheels of the barrow, in combination with axle-boxes for securing the axle to the barrow, substantially as described.

399,394. SNOW SHOVEL AND SCRAPER. LYDIA FAIRWEATHER, Richmond Hill, N. Y. Filed Jan. 12, 1888. Serial No. 296,122. (No model.)

Claim.—1. A combined snow shovel and scraper, comprising a scoop provided on its end with a scraper, and a handle on which said scoop is pivoted and locked in place, substantially as shown and described.

2. A combined snow shovel and scraper, comprising a scoop, a scraper held on one end thereof, a handle on which the said scoop is pivoted, and means, substantially as shown and described, for locking the scoop in place on the handle, as set forth.

3. A combined snow shovel and scraper, comprising a scoop, a scraper held on one end thereof, a handle on which the said scoop is pivoted, and a key for locking the said scoop on the said handle, substantially as shown and described.



4. A combined snow shovel and scraper, comprising a scoop, a scraper held on one end thereof, a handle on which the said scoop is pivoted, a key for locking the said scoop on the said handle, and a latch for locking the said key in place on the said handle and scoop, substantially as shown and described.

399,395. TAG-HOLDER AND TAG. MARTIN L. FOSSE, Superior, Nebr. Filed Oct. 29, 1888. Serial No. 289,338. (No model.)

Claim.—1. The combination, with a tag provided with wings, of a tag-holder of substantially a W shape, the wings of said tag entering between the inner and outer arms of the W-shaped tag-holder, and the outer arms being provided with penetrating-points, substantially as specified.

399,395.

2. A tag-holder formed of wire bent in the same plane, comprising the outer arms, *a a*, and the inner arms, *c c*, said inner arms approaching each other, and said outer arms having formed therewith the penetrating-points *f f*, substantially as specified.

399,396. SHARE-STRAINER FOR DRUMS. ELWOOD R. FRY, Brooklyn, N. Y. Filed Aug. 13, 1888. Serial No. 282,561. (No model.)

Claim.—1. The combination of the snares of a drum with a hinged lever carrying an adjustable clamp for the snares, and a catch to retain the lever in the closed position, substantially as described.

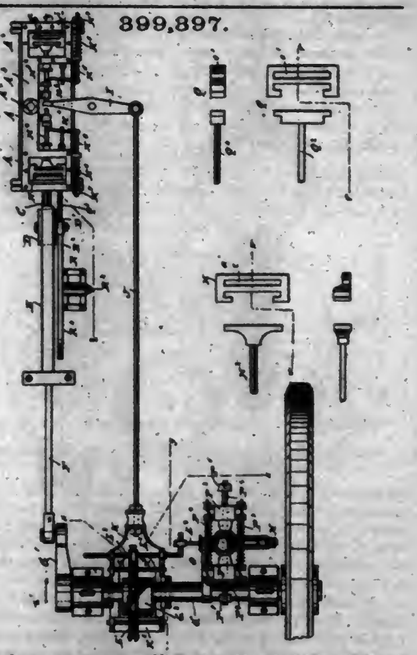
2. The combination of the snares of a drum with a hinged bridge-lever, over which the snares can be stretched, an adjustable clamp carried by the lever, and a catch to retain the lever in the closed position, substantially as set forth.

3. The combination of the snares of a drum with a hinged bridge-lever having a grooved edge for the snares, an adjustable clamp carried by the lever, and a catch to retain the lever, substantially as described.

4. The combination of the snares of a drum and a hinged bridge-lever, with a clamp carried by the lever, an adjusting-screw for the clamp, and a catch for the lever, substantially as specified.

5. The combination of the snares of a drum and a bridge-lever, with an adjustable clamp consisting of plates carried by the lever, the securing-screws of the said plates being on the inner side, as and for the purpose set forth.

399,397. VALVE-GEAR. EDWIN GARDT, Dayton, Ohio, assignor to himself and Wilber Heathman, same place. Filed June 26, 1888. Serial No. 278,407. (No model.)



Claim.—1. The combination, with the rotary cam, of a longitudinally-sliding valve-operating frame and a transversely-sliding frame thereon embracing a cam, substantially as set forth.

2. The combination, with a shaft having a fixed cam provided with a spiral ridge, of a longitudinally-sliding valve-operating frame under the cam at right angles to the shaft, and provided with a curved frame extending over the cam and having front and rear friction-wheels for the cam to engage, substantially as set forth.

3. In a valve-gear, the combination, with a spiral cam secured to the main driving-shaft, of a frame mounted to slide transversely and carrying friction-wheels acted on by the said spiral cam, a second frame carrying the said first-named frame and connected with the steam-inlet valves, and a governor operated from the main driving-shaft and controlling the transverse motion of the said first-named frame, substantially as shown and described.

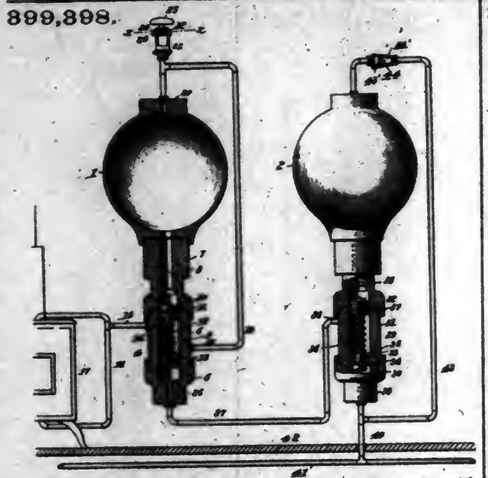
4. In a valve-gear, the combination, with a main driving-shaft and a spiral cam secured to the said main driving-shaft, of a frame mounted to slide transversely and carrying friction-rollers acted on by the said cam, a second frame, mounted to slide longitudinally, carrying the said first-named frame and connected with the steam-inlet

399,397.

valves, and a governor operated from the said main driving-shaft and controlling the transverse movement of the said first-named frame, substantially as shown and described.

5. In a valve-gear, the combination, with steam-inlet valves and a lever for controlling the said inlet-valves, of a frame held to slide and connected with the said lever, a second frame held to slide transversely on the said first-named frame, and a governor for controlling the transverse movement of the said second frame, substantially as shown and described.

6. The combination, with the crank-shaft, the cylinder, its piston, steam-chests, inlet slide-valves having stems extending toward each other, and exhaust-valves connected by a rod, of the cross-head connected to the piston-rod of said cylinder and operated by said crank, a cam on the crank-shaft, a lever extending between the two stems of said inlet-valves and oscillated by said cam, a rocking lever actuated by said cross-head, a rod connected to said lever and to the rod connecting the exhaust-valves, and a governor for changing the relation of the inlet-valve-operating frame with respect to the cam, substantially as set forth.



7. In a valve-gear, the combination, with a main driving-shaft, of a spiral cam secured on the said main driving-shaft, friction-wheels acted on by the said spiral cam, a frame mounted to slide transversely and carrying the said friction-wheels, a second frame carrying the said first-named frame and mounted to slide longitudinally, being also connected with the steam-inlet valves, a rod secured to the transversely-sliding frame, a link pivotally connected with the said rod, and a bell-crank lever pivotally connected by one arm with the said link, its other arm being acted on by the governor, substantially as shown and described.

8. In a valve-gear, a main driving-shaft, a governor operated from the said main driving-shaft, and a spiral cam secured on the said main driving-shaft, in combination with friction-wheels operated on by the said cam, a frame mounted to slide transversely and carrying the said friction-wheels, a second frame mounted to slide longitudinally and carrying the said first-named frame, being also connected with the steam-inlet valves, a rod secured on the said transversely-sliding frame, a link pivotally connected with the said rod, and a bell-crank lever pivotally connected by one arm to the said link, its other arm being acted on by the said governor, substantially as shown and described.

399,398. APPARATUS FOR EXTINGUISHING THE FIRES IN RAILWAY-CAR STOVES. ROBERT H. GILMOUR and FORTUNATUS G. KELLOGG, Huntington, Ind. Filed Feb. 23, 1888. Serial No. 264,891. (No model.)

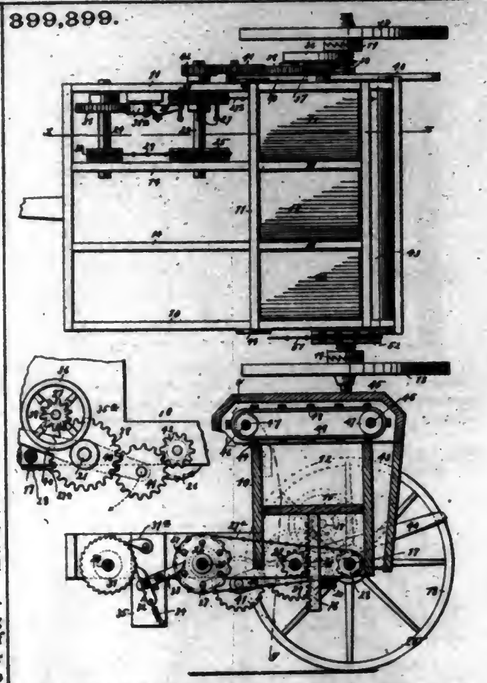
Claim.—1. An apparatus for extinguishing fire in car-stoves, consisting of a main pipe through which air is supplied under pressure, an air chamber and cylinder with reacting piston and valve, pipe-con-

899,898.

sections leading from the main pipe to cylinder, an air-chamber with an outwardly-closing self-acting valve located in air-chamber pipe-connection, a chamber to contain water or chemicals, and a cylinder having a reacting piston and valve, and pipe-connections leading from said cylinder to the first-named cylinder, to the water-chamber, and to a car-stove, substantially as described.

2. In an apparatus for extinguishing fire in car-stoves, an air-chamber, a cylinder communicating with the air-chamber and having a piston with reacting spring and valve normally closing one end of said cylinder, a main air-pipe through which air is admitted under pressure connecting with the closed end of the cylinder and with the air-chamber, the air-chamber connection having a reacting-valve, a chamber for containing water or chemicals communicating with the cylinder having a piston with a reacting spring and valve normally closing one end of the cylinder, and pipe-connections leading from said cylinder to air-chamber cylinder, to water-chamber, and to a car-stove, substantially as described.

3. In an apparatus for extinguishing fire in a car-stove, the combination of a water-chamber, a cylinder communicating therewith and adapted to be connected to a stove, a valve in said cylinder, an air-chamber, a cylinder communicating with said air-chamber, a valve in said cylinder, a pipe connecting the two cylinders, an air-supply pipe connected to the cylinder of the air-chamber, a pipe leading from the air-supply pipe to the top of the air-chamber, and an automatic reacting valve in the pipe leading from the air-supply pipe to the air-chamber, substantially as described, whereby when the compressed-air supply is cut off the air in the air-chamber will enter the water-chamber and force its contents into the stove, as set forth.



4. In an apparatus for extinguishing fire in car-stoves, a chamber for containing water or chemicals, having a cylinder communicating with its lower end provided with an upwardly-moving piston and valve with reacting spring, and having pipe-connections with the car-stove and with the top of the water-chamber above the piston-head, an air-chamber having a cylinder communicating with its lower end provided with a downwardly-moving piston and valve with reacting spring, a pipe-connection beneath the piston-head leading to the lower end of the water-chamber cylinder, a main pipe for the supply of compressed air, and a branch pipe connecting the said main pipe leading to the lower end of the air-chamber cylinder and to the upper end of the water-chamber, and an outwardly-closing reacting valve closing the connection between the top of the air-chamber and the main air-pipe, substantially as described.

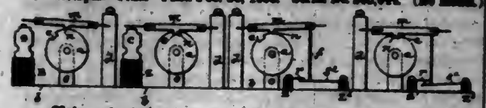
5. In an apparatus for extinguishing fire in car-stoves, the combination of the following elements, viz: the water-chamber 1, having the cylinder 4, with reacting piston 9 and valve 10, the pipe-connections 15 and 16, leading to the stove 17, pipe-connections 19, leading to the upper end of air-chamber 2, and pipe-connection 27, leading to cylinder 29, air-chamber 2, having cylinder 29, with reacting piston 35 and valve 34, pipe 40, connecting with lower end of cylinder 29, branch pipe 43, connecting pipe 40 with the upper end of air-chamber 2, and having reacting valve 44, and the main compressed-air-supply pipe 41, connecting with pipe 40, substantially as described.

899,899. FERTILIZER-DISTRIBUTER. CHARLES GERAVIS, Mount Lebanon, N. Y. Filed Aug. 21, 1888. Serial No. 283,363. (No model.)

Claim.—1. In a machine for distributing fertilizer, the combination, with a hopper provided with a series of transverse compartments, followers held to vertically reciprocate in said compartments, and

899,899.

racks attached to the under surface of the said followers, of a shaft, pinions secured to the said shaft engaging said racks, a cover hinged to the said hopper, endless belts connected by slats rotating in said cover above and in connection with the upper surface of the hopper, and means, substantially as shown and described, for rotating the said belt and the said pinion-shaft, as and for the purpose specified.



2. In a fertilizer-distributer, the combination, with a hopper divided into a series of transverse compartments, followers vertically reciprocating in said compartments, racks secured to the under surface of the said followers, and a shaft provided with pinions engaging the said racks, of a chute secured to the rear of the hopper, open at the top and bottom, and of a height equal to that of the hopper, a cover closing the upper ends of the hopper and chute, shafts journaled in said cover, endless belts carried by said shafts, connected by spaced strips, and means, substantially as shown and described, for rotating the shafts in the cover and the pinion-shaft, whereby the fertilizer is brought into engagement with the endless belts and conveyed thereby to the chute, as set forth.

3. The combination, with a frame, an axle journaled in said frame, provided with a clutch-section, and drive-wheels journaled upon the axle provided with an engaging clutch-section, a hopper supported upon said frame, divided into a series of compartments, followers reciprocating in said compartments, racks attached to the under surface of the said followers, a shaft journaled in the frame, carrying pinions engaging with the said racks, and means, substantially as shown and described, for rotating the said pinion-shaft, of a chute formed at the rear of the hopper of equal height and width, a cover hinged to the hopper, parallel spaced shafts journaled in said cover, endless belts carried by the said shafts, provided with connected slats, a sprocket-pinion secured to the outer end of one of the said shafts, a sprocket-wheel attached to the axle, and a sprocket-belt connecting the said sprocket wheel and pinion, substantially as shown and described.

4. The combination, with a frame, an axle journaled in said frame at the rear, drive-wheels attached to the said axle by a clutch, a hopper secured to the frame, divided into compartments, followers reciprocating in said compartments, racks attached to the under side of the said followers, and a notched bar guiding the said racks, of a shaft journaled in the frame in advance of the axle, carrying pinions meshing with the said racks, a short drive-shaft journaled in advance of the pinion-shaft, provided with a pinion upon the outer end, a pin-carrying sprocket-wheel secured to the said shaft, connected by a chain belt with a sprocket-pinion upon the axle, a second short shaft belted to the said short drive-shaft, a ratchet-wheel attached to the forward short shaft, a lever pivoted to the side of the frame, engaging the pins of the said sprocket-wheel, a dog pivoted to the said lever, bearing against the ratchet-wheel, and means, substantially as shown

and described, for throwing the pinion-shaft in and out of connection with the short drive-shaft, as and for the purpose specified.

899,400. ELECTRIC-CIRCUIT PROTECTOR. WIRT R. HARVEY, Memphis, Tenn. Filed Feb. 28, 1888. Serial No. 265,644. (No model.)

Claim.—1. A circuit-protector for telegraphic and analogous electrical circuits, consisting of a clock mechanism, in combination with an electro-magnet controlling its operation and a normally-open shunt around the key, including in its circuit a switch controlled by said clock mechanism, as described, whereby the key will be automatically shunted when the main line is left open at any point, substantially as described.

2. A circuit-protector for telegraphic or analogous circuits, consisting of a normally-open shunt connected to the front and back contacts of the operator's key, in combination with a clock mechanism having a switch mechanism for closing said shunt when set in motion, said clock mechanism being held out of action by an electro-magnet so long as the line remains closed, substantially as described.

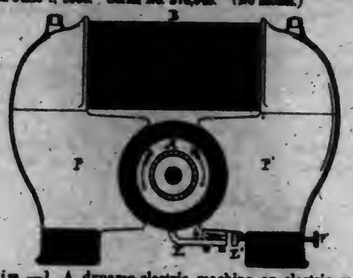
3. A circuit-protector for telegraphic and analogous circuits, consisting of a normally-open shunt around the point to be protected, with switch mechanism for closing the shunt, and a clock mechanism held out of action with the switch for controlling the operation of the switch mechanism, substantially as described.

4. A circuit-protector for keeping a circuit closed at a given point, consisting of a normally-open shunt around the point to be protected, in combination with a switch connected to a mechanical motor for operating it, and an electro-magnet for connecting said motor with the switch and permitting the switch to automatically close the shunt, said electro-magnet being under the control of the operator at both the home and distant stations, substantially as described.

5. A circuit-protector for keeping a telegraphic or analogous circuit closed at a given point, consisting of a normally-open shunt around the point to be protected, in combination with a switch for closing the shunt and an electro-magnet under the control of the main-line current for regulating the operation of the switch, substantially as described.

6. A circuit-protector for breaking an earth-circuit in a telegraphic or analogous circuit, consisting of an earth-wire having a circuit-breaker normally closed between the switch-board and the earth, in combination with a mechanical motor for breaking said earth-wire at said point and an electro-magnet for connecting said motor with the switch when de-energized, whereby when the line is grounded by an operator at a station said ground will after a predetermined time be automatically broken, substantially as described.

7. A circuit-protector for telegraphic or analogous circuits, consisting of a normally-open shunt around the point to be protected, in combination with a switch for closing said shunt, a motor for operating said switch, and an electro-magnet for holding said motor normally out of operative connection with the switch, whereby, when the circuit is left open at the point to be protected for a predetermined time, said shunt will be automatically closed and the main circuit maintained intact, substantially as described.



8. A circuit-protector for telegraphic or analogous circuits, consisting of the following combination of parts: a normally-open shunt around the point to be protected, a switch for closing said shunt, a spring-impelled motor for actuating said switch, an electro-magnet for holding said motor out of operative connection with the switch, and a second normally-open shunt about the same point, said second shunt being open at a point between a fixed contact-point and the spring which impels the motor, substantially as described.

9. A circuit-protector for telegraphic or analogous circuits, consisting of a normally-open shunt about the point to be protected, in combination with a spring-impelled motor and an electro-magnet holding said motor out of operative connection with the switch, said shunt, when closed, including in its circuit a fixed point and the spring of the motor, the parts being arranged as shown, so that when the motor is wound up the shunt is open, and when run down it is closed, substantially as described.

10. A protector for telegraphic or analogous circuits, consisting of a shunt about the point to be protected, said shunt being open when the circuit is closed through said point, in combination with a switch for closing said shunt, a mechanical motor for actuating said switch, and an electro-magnet located in a derived circuit from the sounder or local battery for holding said motor out of action with the switch, whereby, after the main circuit has remained open a predetermined time, the shunt is automatically closed about said point, substantially as described

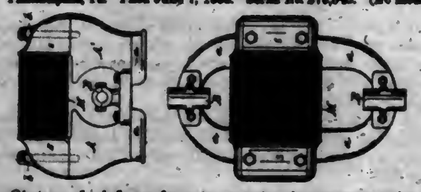
11. A circuit-protector for telegraphic or analogous circuits, consisting of a normally-open shunt around the point to be protected, in combination with a switch and spring-impelled motor for closing said shunt, and a second shunt normally open between the spring of the motor and a fixed point, with an electro-magnet for holding said motor out of operative connection with the switch, whereby the point to be protected is shunted by the first shunt after the circuit has been left open a predetermined time and again permanently shunted by the second shunt until the motor is wound up, substantially as described.

899,401. PREVENTION OF SPARKING IN DYNAMO-ELECTRIC MACHINES AND ELECTRIC MOTORS. DANIEL HIMMAN, Philadelphia, Pa., assignor to the Higham Electric Light Company, Rockland, Me. Filed June 7, 1888. Serial No. 276,243. (No model.)

Claim.—1. A dynamo-electric machine or electric motor in which the armature and field-magnet currents are constant or vary simultaneously and having a magnetic conducting-bar not an electro-magnet adjacent to a pole-piece of the field-magnet and acting on the short-circuited armature-coils.

2. A dynamo-electric machine or electric motor having a magnetic conducting-bar acting on the armature-coils, which are being short-circuited by the commutator-brushes during the rotation of the armature, and means for adjusting the resistance of the magnetic circuit passing through the said bar.

3. A dynamo-electric machine or electric motor having a magnetic conducting-bar acting on the short-circuited armature-coils, and an adjustable piece adjacent to the field-pole and movable toward and from the said conducting-bar, as and for the purpose set forth.

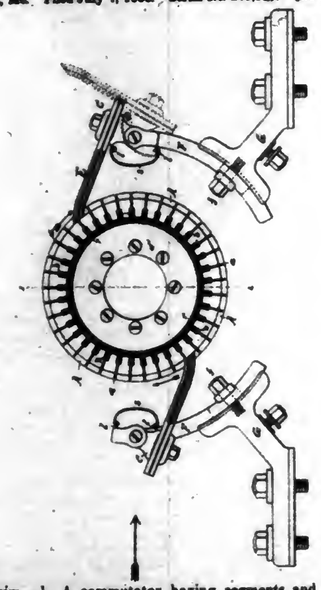


899,402. PREVENTION OF SPARKING IN ELECTRIC GENERATORS AND MOTORS. DANIEL HIMMAN, Philadelphia, Pa., assignor to the Higham Electric Light Company, Rockland, Me. Filed June 7, 1888. Serial No. 276,244. (No model.)

Claim.—1. A dynamo-electric machine or electric motor having a magnetic conducting-bar acting upon the short-circuited armature-coils, a helix upon the said bar, and coils upon the field-magnet connected to the said helix, but not connected with the field-magnet coils or working-circuit.

2. A dynamo-electric machine or electric motor having a magnetic conducting-bar acting upon the short-circuited armature-coils, a helix upon the said bar, and coils C' upon the field-magnet connected to the helix C, which is wound contrary to the coils C'

899,408. DYNAMO-ELECTRIC MACHINE. DANIEL HIMMAN, Philadelphia, Pa. Filed June 7, 1888. Serial No. 276,245. (No model.)



Claim.—1. A frame for a dynamo-electric machine or electric motor having a horizontal field-magnet core resting upon and secured to the pole-pieces between which the armature revolves.

2. A dynamo-electric machine or electric motor having a horizontal field-magnet core resting upon and secured to pole-pieces, the line of separation between the core and pole-pieces being below the coils of the field-magnet winding.

3. A dynamo-electric machine or electric motor having pole-pieces, with extended bases curved at their outer adjacent ends toward each other, and supporting non-magnetic bearings for the armature-shaft.

399,404. DYNAMO-ELECTRIC MACHINE. DANIEL HIGHAM, Philadelphia, Pa., assignor to the Higham Electric Light Company, Rockland, Me. Filed July 7, 1888. Serial No. 279,315. (No model.)

Claim.—1. A commutator having segments and intermediate insulating-blocks with air spaces or slits extending down into the intermediate insulating-blocks, and clamping-rings not covering the ends of the slits, as and for the purpose set forth.

2. A commutator having segments with insulating-blocks and air-spaces, and clamping-rings not covering the ends of the air-spaces, as and for the purpose described.

3. A commutator-brush composed of two strips having the bearing ends of the individual members or points of different widths, as and for the purpose set forth.

4. The combination of a commutator, with a pair of commutator-brushes set out of line for bearing upon independent portions of the commutator, substantially as set forth.

399,405. SLED-BRAKE. CLARENCE E. HOLLEY, Fort Fairfield, Me., assignor, by direct and mesne assignments, of two-thirds to Harlan Jerome Palmer and L. K. Cary & Co., same place. Filed June 21, 1888. Serial No. 277,854. (No model.)

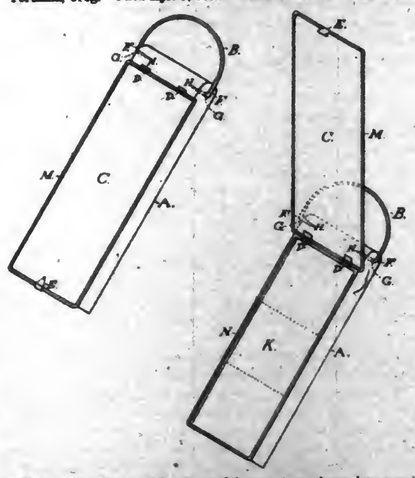
Claim.—1. The combination of the endwise or longitudinally movable plate or bar having connection with the longitudinally-movable tongue, with the brakes having a whiffletree-like or cross-bar connection with the longitudinally-movable bar or plate, substantially as and for the purpose set forth.

2. The sled-brake comprising the central or longitudinal endwise movable plate or bar and the proximate whiffletree-like connection or cross-bar between said plate and the brakes, substantially as set forth.

3. The sled-brake comprising the longitudinal plate or bar actuating the brakes and having a stepped slotted forward end, and the sliding tongue or pole having a pendent stud or projection engaging said stepped slotted end of the longitudinal bar or plate, substantially as specified.

4. The sled-brake comprising the longitudinal endwise-movable plate or bar actuated by the tongue or pole and having connection about at its mid-length with a cross-bar about at its center, which cross-bar is provided at its ends with apertured plates, and the elbow-lever brakes having their upper ends entering the apertures of the end plates of said cross-bar, substantially as set forth.

5. In a sled-brake, the combination, with the endwise-movable plate or bar having a slotted stepped forward end and carrying about at its middle a cross-bar having apertured end plates which receive the upper ends of the brake-levers, of the sliding tongue having applied to its reduced rear end or extension a casting or plate provided with a stud or projection entering the slotted stepped forward end of the endwise-movable plate, and the whiffletree provided with the hook-clips, substantially as specified.

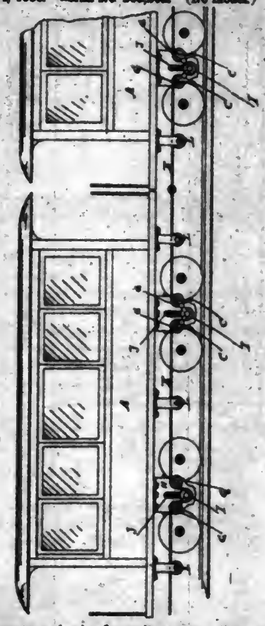


399,406. DENTIST'S LATHE. NEWTON W. HOLT, Bennington, Vt. Filed Aug. 22, 1888. Serial No. 283,503. (No model.)

Claim.—1. The horizontal circular lathe-head A, provided with radial spindle seated in radial bearings in the edge of the rim of the head, each carrying on its inner end one member of a clutch, in combination with a driving-pulley, and the other member of said clutch pivoted on the column upon which the head revolves, the spindles being arranged so that by revolving the head their axes may successively be brought into line with the axis of the driving-pulley, substantially as specified.

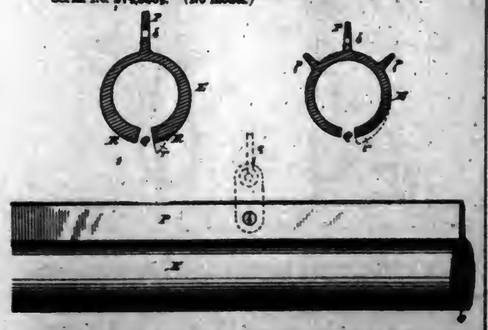
2. The combination of standard A, carrying clutch-pulley P, pivoted, as shown, with the revolving head A, carrying a series of radial spindles, each of which carries a clutch member to co-operate with the pulley-clutch, and the latch-bolt L, for locking the head in any desired position, substantially as shown, and for the purposes set forth.

399,407. COVER FOR SHIPPING-RECEIPTS. DANIEL K. HOWE, Portland, Oreg. Filed Apr. 5, 1888. Serial No. 269,704. (No model.)



Claim.—1. The combination, with a casing adapted to receive a pad, provided with aligning apertures, of a spring-bail provided with inwardly-projecting spurs entering the apertures of the casing and engaging the pad to retain the same in the casing, as and for the purpose set forth.

2. The combination, with a covering for receiving a pad provided with a hinged lid and aligning apertures, of a spring-bail having inwardly-projecting spurs entering the said apertures and engaging the pad, substantially as herein shown and described.



3. The combination, with a casing, A, having a hinged lid, C, and aligning apertures G, of the pad K, provided with the bail L, and the spring-bail B, having the inwardly-projecting spurs H, substantially as herein shown and described.

399,408. CAR-BRAKE. HENRY W. HOWELL, Jr., Elizabeth, N. J. Filed Feb. 24, 1888. Serial No. 265,302. (No model.)

Claim.—In a steam-brake for railway-cars, in combination with the friction-clutch, drum S, and cable W, extending from car to car, the steam-cylinder P, and shifting-lever R, to operate the friction-clutch to apply the brakes, and spring T, to disengage the friction-clutch to release the brakes, the stationary friction-pulleys G and movable pulley I, to operate the shoes C, and slotted bracket to support and guide the roller I in its up and down movements, substantially as herein set forth.

399,409. CONDUCTOR FOR ELECTRIC RAILWAYS. RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed Mar. 16, 1888, Serial No. 267,267. Divided and this application filed May 18, 1888. Serial No. 274,230½. (No model.)

Claim.—1. An electric-railway working-conductor consisting of a tube having a longitudinal slot, and also having the thickness of its metal greater as the slot is approached from either side.

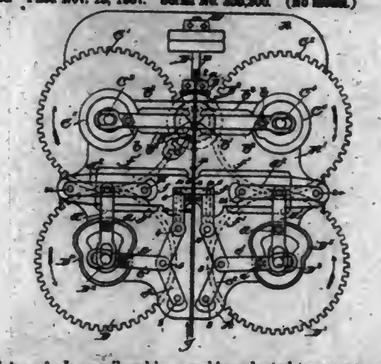
2. A working-conductor for an electric railway, consisting of a slotted tube having one or more longitudinal ribs upon its outer surface, and in which the metal of the tube becomes thicker as the slot is approached.

3. A working-conductor for an electric railway, consisting of a slotted tube having one or more longitudinal ribs upon its outer surface, and in which the metal of the tube becomes thicker as the slot is approached.

4. A working-conductor for an electric railway, consisting of a slotted tube having one or more longitudinal ribs upon its outer surface and diametrically opposite to the slot, and in which the metal of the tube becomes thicker as the slot is approached.

5. A working-conductor for an electric railway, consisting of a slotted tube in which the thickness of the metal on one side of the slot is greater than that on the other side.

6. A working-conductor for an electric railway, consisting of a slotted tube having a long central and two short lateral longitudinal ribs upon its outer surface on the side away from the slot.

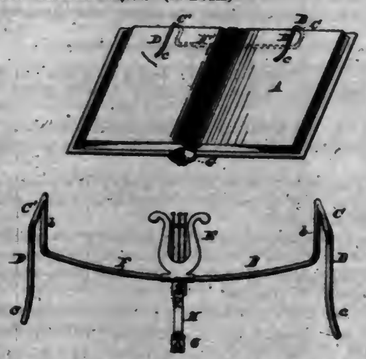


7. A working-conductor for an electric railway, consisting of slotted tube rolled in one piece having a smooth interior surface of continuous metal in cross-section and a longitudinal rib projecting from its outer surface away from the slot.

8. A working-conductor for an electric railway, consisting of a slotted tube of metal forming a band of continuous metal from slot to slot and a rib exterior to said band of continuous metal and formed integral therewith.

9. A working-conductor for an electric railway, consisting of a slotted tube having one of its outer edges of the slot projecting beyond the other.

10. A working-conductor for an electric railway, consisting of a slotted tube having one of its outer edges of the slot projecting beyond the other and having one or more longitudinal ribs upon its outer surface.



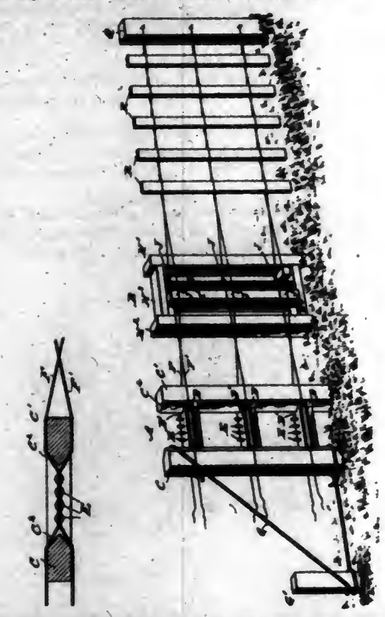
399,410. NAIL-MACHINE. EDWARD P. HYER, Boston, Mass., assignor to The McKay & Copeland Lasting Machine Company, Portland, Me. Filed Nov. 15, 1887. Serial No. 255,200. (No model.)

Claim.—1. In a nail-making machine adapted to operate upon a wire, the clamping-jaws, and the upsetting-jaws to grasp the wire near the clamping-jaws, and means to move one set of the said jaws toward the other to upset the wire grasped between them to form the head of a nail, combined with the independent pointing-dies to act on the upset wire after it has been released by the clamping-jaws and fed forward, and with means to actuate the said pointing-dies, whereby the headed blanks yet connected together are pointed, substantially as described.

2. In a nail-making machine, the clamping-jaws *f*, having the guiding portions 6, combined with the upsetting-jaws *c*, adapted to slide thereon, substantially as described.

399,411. LEAF-HOLDER FOR BOOKS. JOSEPH HYLAND, Buffalo, assignor of one-half to R. P. Sullivan, Eagle Village, N. Y. Filed Dec. 6, 1888. Serial No. 292,967. (No model.)

Claim.—1. A leaf-holder for books, substantially as described, consisting, essentially, of a single piece of spring-wire having the curved back-piece F, upwardly-bent members *b b*, cross-pieces C C, and downwardly-projecting tangs D D, the latter having the curved ends *c c*, as described, for the object stated.



2. As a new and improved article of manufacture, a leaf-holder for books, consisting, essentially, of a holder having a curved back-piece, F, provided with the bearing-piece E, upwardly-pointing mem-

bers *b b*, cross-pieces C C', and downwardly-projecting tangs D D, as and for the purpose stated.

3. In book-holders, the combination, with the back-piece B, having the bearing-piece E, provided with the lug *e*, of the elastic strap H and the hook G, as described, for the purpose set forth.

399,412. FENCE-MACHINE. GEORGE W. JOHNSON, Dallas, Oreg.

Filed May 16, 1888. Serial No. 274,089. (No model.)

Claim.—1. In a fence-machine, a tension device comprising two upright posts connected with each other by bars, each having a row of pins, and an apertured bar held to slide on the said posts and fitting over the said pins, substantially as shown and described.

2. In a fence-machine, the combination, with a frame, of rods held to slide transversely, pins having ears secured to the said rods, links pivotally connected with the said rods, shafts mounted to turn on the said frame and connected with the said link, crank-arms formed on the said shafts, a rod connecting the said crank-arms, and a lever pivoted on the said frame and connected with the said rod, substantially as shown and described.

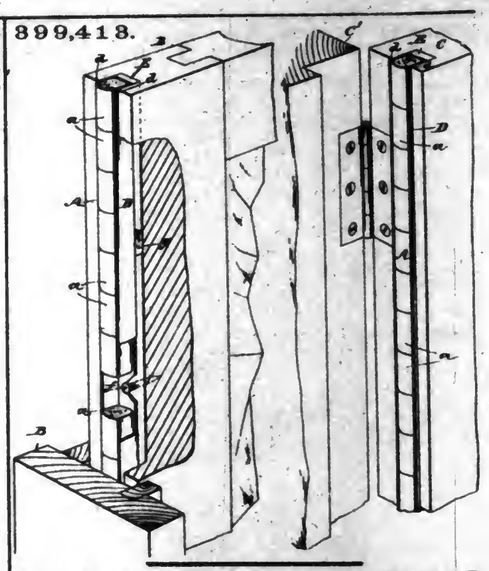
3. In a fence-machine, the combination, with a frame having grooved cross-bars, the rods I I', held to slide in said grooved cross-bars and provided with the pins J J', having eyes J^2 J^3, the shafts N N', links L L' L^2 L^3, connecting the rods I I' to the shafts N N', and means for operating the said shafts, substantially as herein shown and described.

399,413. WEATHER-STRIP. JOHN E. JOHNS, New York, N. Y.

Filed June 7, 1887. Renewed Sept. 1, 1888. Serial No. 284,367. (No model.)

Claim.—1. As a new article of manufacture, a weather-strip having a compressible and anti-friction surface of cork, substantially as described.

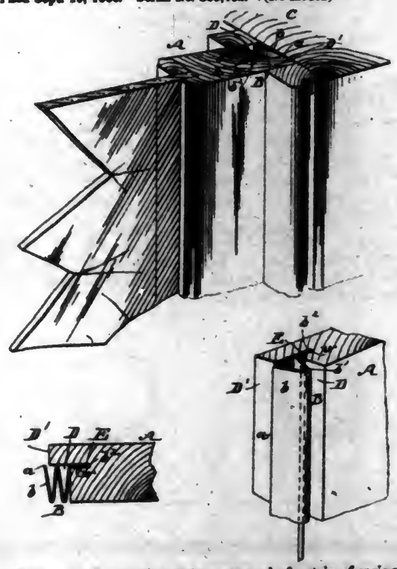
2. The combination, with a door or window, of a weather-strip composed of blocks of cork applied to the edge of the window or door, substantially as described.



3. The combination, with a door or window, of a weather-strip composed of short blocks of cork applied to the door or window, with the ends of the grain at right angles to the edge of the window or door, substantially as described.

4. As a new article of manufacture, a weather-strip composed of a casing, D, and blocks of cork *a*, held therein, substantially as described.

5. The window-sash B, formed with a groove, E, and provided with the cushions *g*, in combination with the casing D, provided with the packing *a* and held in the groove E, substantially as described.



399,418.

399,414. WEATHER-STRIP. JOHN E. JOHNS, New York, N. Y.

Filed Sept. 19, 1888. Serial No. 285,782. (No model.)

Claim.—1. The weather-strip composed of a strip of spring metal bent to form the diverging members *b b'*, substantially as described.

2. A weather-strip composed of a narrow strip of spring metal bent to form the diverging members *b b'*, and the flange b^2, substantially as described.

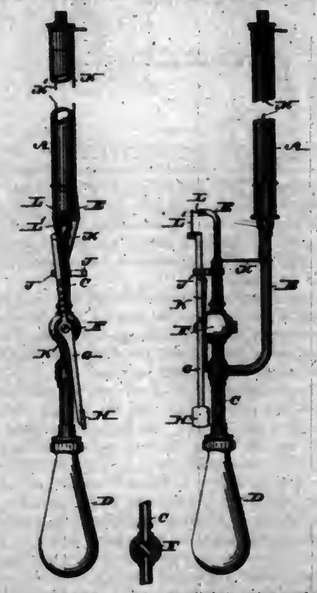
3. The sash A, rabbeted to form the flange D' and space D, in combination with the weather-strip B, formed of a strip of metal folded to form diverging members *b b'*, substantially as described.

4. The sash A, rabbeted to form the flange D' and space D, and slotted at E, in combination with the weather-strip B, formed of a strip of metal bent to form diverging members, and the flange b^2, substantially as described.

399,415. FOLDING BOOK-CASE. PHILIP KAUFFMANN, Springfield, Mo. Filed Nov. 19, 1888. Serial No. 291,196. (No model.)

Claim.—1. In a folding case, the combination of a permanent shelf with permanent end pieces and folding end pieces mounted upon the permanent end pieces to move toward each other and the shelf, said folding pieces being provided with means for removably connecting one or more shelves thereto, substantially as specified.

2. In a folding case, the combination of a shelf, A, permanent end



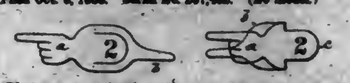
399,415.

pieces B B, folding end pieces F F, removable shelves H, and tie-rod I, substantially as specified.

3. In a folding case, the combination of a permanent shelf and end pieces with a strip, E, connecting the front and rear ends of said end pieces, and folding end pieces mounted upon the permanent end pieces to move toward each other and the permanent shelf, said folding pieces being provided with means for removably connecting one or more shelves thereto, substantially as specified.

399,416. ELECTRIC GAS-LIGHTER. EDWARD KNOBLOCH, Philadelphia, Pa. Filed Oct. 17, 1888. Serial No. 288,333. (No model.)

Claim.—1. An igniting device for lighting cigars, cigarettes, &c., consisting of a pendant, in combination with a gas-cock having an operating-lever carrying a movable electrode, and a burner-tip carrying a fixed electrode, the lever having a retractile spring for holding said cock closed and the electrodes out of contact.



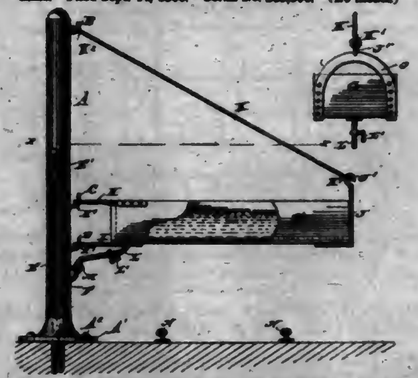
2. An igniting device for lighting cigars, cigarettes, &c., consisting of a non-conducting pipe attached to a pendant and carrying a fixed and a wiping electrode, in combination with two insulated wires running one inside and the other outside of the pipe, said wires being attached, respectively, to the fixed and wiping electrodes, substantially as described.

3. A pendent igniting device having a burner and two electrodes, one fixed and the other movable, the former attached to the burner of the pendant and the latter attached to a lever carried by the gas-cock and lying in the plane of the body of the pendant, and having a retractile spring for holding the gas-cock normally closed and the electrodes out of contact, substantially as described.

4. In a pendent device for lighting cigars, &c., a cock-actuating lever lying substantially in the plane of the pendant, and having a spring under stress for holding the cock normally closed, and carrying a wiping-electrode at its free end, with a fixed electrode carried by the burner-tip, but insulated therefrom, and electrical connections, as described, the whole being so arranged that when the lever is actuated gas is allowed to flow and a spark is created, whereby ignition ensues, substantially as described.

399,417. INDEXING BOOK-MARK. JOHN LANE, Brooklyn, N. Y.

Filed Oct. 8, 1888. Serial No. 287,402. (No model.)



Claim.—1. A book-mark or indicator formed of one piece of metal folded over between its extremities upon itself so as to form a pair of spring-lips, one of said lips having a backward extension or flap, for the purpose described.

2. A book-mark or indicator formed of a single piece of metal folded over between its extremities upon itself, thus forming two lips which spring toward each other, one of said lips being made up of two extensions, said extensions being located on opposite sides of the fold, substantially as described.

3. A book-mark or indicator formed of one piece of metal folded over between its extremities so as to form a pair of spring-lips, one of said lips having a backward extension or flap provided with a letter, figure, or other indicating character.

399,418. WATERING-TROUGH. GEORGE W. LAWDEN, Clinton, Mass. Filed Sept. 14, 1888. Serial No. 285,208. (No model.)

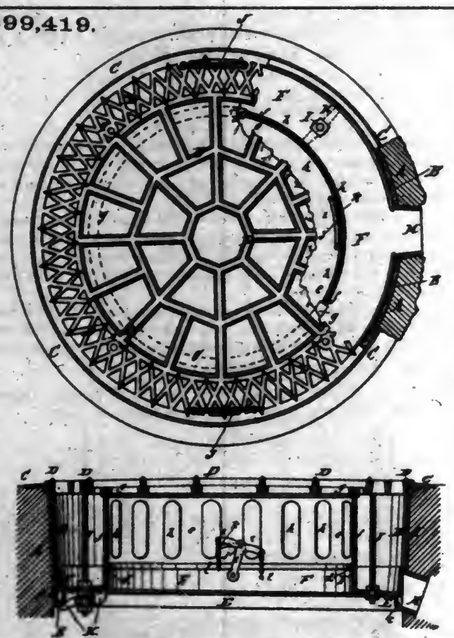
Claim.—1. In a watering-trough, the combination, with a standard adapted to be arranged adjacent to a railroad-track, of a water-supply pipe projecting from the standard, and a trough hinged at one end to the said standard, substantially as described, whereby provision is made for swinging the trough under the supply-pipe for filling it, and then swinging it across the track, as set forth.

2. In a watering-trough, the combination of a hollow standard, a water-supply pipe projecting through the standard, a trough hinged to the standard, and a discharge-pipe leading from the trough to the standard and provided with a swivel-joint, substantially as described.

3. In a watering-trough, the combination, with a standard provided with pivot-pins, of a trough provided at its inner end with arms having eyes to receive the two lowermost pivot-pins, a yoke secured to the outer end of the trough, and a brace-rod engaging the yoke and the uppermost pivot-pin, substantially as herein shown and described.

4. A watering-trough comprising a hollow standard, a water-supply pipe projecting through the standard and provided with a cock, a trough having its inner end hinged to the standard, a brace-rod hinged to the outer end of the trough and to the standard, and a discharge-pipe leading from the trough through the standard and provided with a swivel-joint and a cock, substantially as herein shown and described.

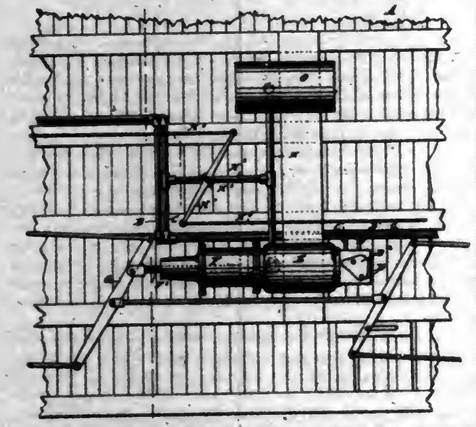
5. In a watering-trough, a standard provided with a trough hinged thereto, a hinged brace-rod connecting said standard and trough, a supply-pipe for filling the trough, and a discharge-pipe provided with a swivel-joint, substantially as shown and described.



6. The combination, with a standard, of a watering-trough hinged thereto, a hinged brace-rod for said trough, and a discharge-pipe provided with a swivel-joint, the hinge-points of said trough and brace-rod and the swivel-joint of said discharge-pipe being all in a vertical line, substantially as shown and described.

399,419. VAULT LIGHT AND VENTILATOR. THEOPHILUS W. LAPELL, New York, N. Y. Filed Feb. 14, 1885. Renewed Mar. 8, 1887. Again renewed Oct. 24, 1888. Serial No. 289,021. (No model.)

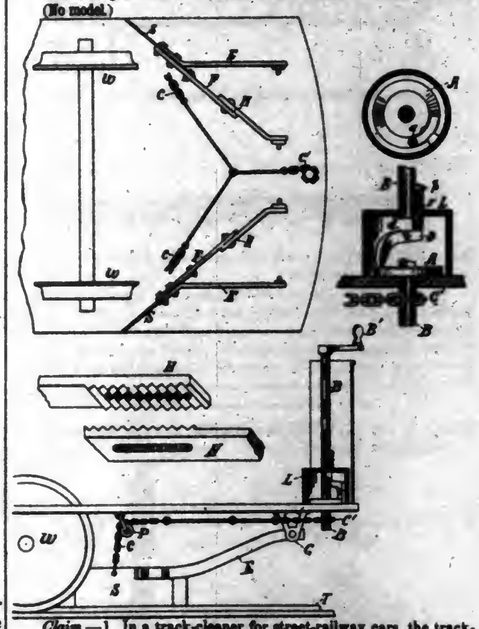
Claim.—1. In a vault light and ventilator, the combination, with the grating D and the inner flange of the channel-plate F, of the stationary apertured plate *e*, having curved slot *h*, the correspondingly-apertured movable plate *f*, the three-armed lever *i*, and its chains *l*, substantially as herein shown and described.



2. In a vault cover and ventilator, the grating D, made, substan-

399,419.

tially as herein shown and described, with open-work near the outer edge of the cover in the parts over the water-receiving channel-plate and with the other parts adapted to receive glass plates, as set forth.



399,420. AIR-BRAKE. JOSEPH S. LAPISH, American Fork, Utah. Filed Aug. 4, 1888. Serial No. 282,007. (No model.)

Claim.—1. In an air-brake, an operating-pipe and an air-supply pipe, both connected with the main reservoir and under the control of the engineer, in combination with a valve-chest connected by branch pipes with the said air-supply pipe and the said operating-pipe, an auxiliary air-supply connected with the said air-chest, and a brake-cylinder connected with the brake mechanism, and also with the said valve-chest, a second auxiliary reservoir connected with the first-named reservoir, a pipe connecting said auxiliary reservoir with the said operating-pipe, a valve held in the said pipe to connect the operating-pipe with or disconnect it from the said auxiliary reservoir, and a coupling held at each end of the car and adapted to operate the said valve, substantially as shown and described.

2. In a car-brake, the combination, with two auxiliary reservoirs located on each car and connected by a pipe, of an operating-pipe connected with the said auxiliary reservoirs, a valve located in the connection between the said operating-pipe and the said auxiliary reservoirs, and a coupling located between two adjoining cars and provided with two parts, of which one is connected by a rod with the said valve to actuate the same in case of the breaking apart of the two cars, substantially as shown and described.

399,421. STREET-RAILWAY-TRACK CLEANER. JAMES A LEWIS, Binghamton, N. Y. Filed Feb. 15, 1888. Serial No. 264,154. (No model.)

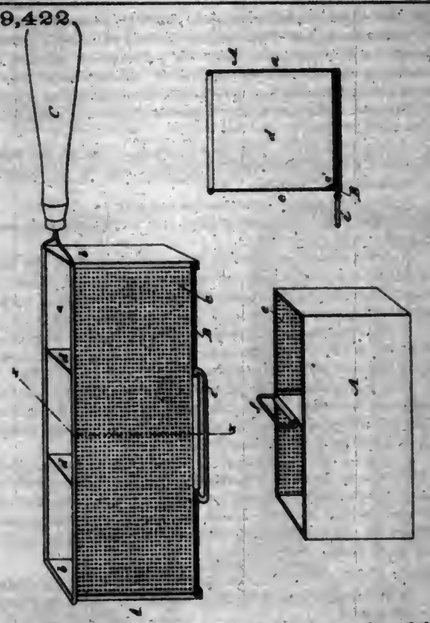
Claim.—1. In a track-cleaner for street-railway cars, the track-scrapers S, suspended by chains running over pulleys and which are connected together near the shaft upon which they wind up, in combination with brace-bars E and F, for holding the scrapers in position, the inner brace-bar, F, having a toothed and slotted splice by which the sweep of the cleaner may be extended or contracted, substantially as shown and described.

2. In a track-cleaner for street-railways, the combination, with track-scrapers, of bars or braces, between the forward ends of which the track-scrapers are clamped, and hangers depending from the bottom of the car and having the rear ends of the bars or braces pivoted thereto, substantially as shown and described.

3. In a track-cleaner for street-railways, the combination, with track-scrapers, bars, or braces, between the forward ends of which the track-scrapers are clamped, and hangers depending from the bottom of the car and having the rear ends of the bars or braces pivoted thereto, of a suspending-chain, as C, for each of the scrapers, running over a pulley secured to the car-bottom and extending diagonally toward each other, a chain, such as C', connecting the rear extremities of the chains C, and a vertical shaft upon which chain C winds, all substantially as and for the purposes herein set forth.

4. In a track-cleaner for street-railways, the combination, with track-scrapers, of bars or braces situated in pairs, between the forward ends of which the track-scrapers are clamped, and the inner bar of each of which pairs has a toothed and slotted splice, substantially as and for the purposes herein set forth.

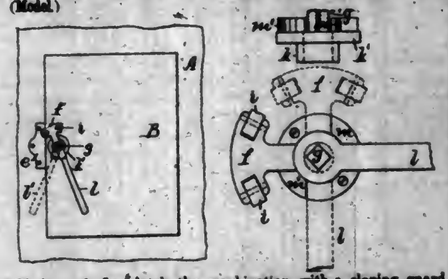
5. In a track-cleaner for street-railways, track-scrapers and means for suspending the same, in combination with bars or braces for holding the scrapers in position, situated in pairs, the inner bar of each of which is formed in two parts and with intermeshing teeth at the point of junction, and also with an elongated slot, and a pin or bolt extending through the said slot and adapted to clamp the two portions of the inner bar together.



399,422. EGG-POACHER. WILLIAM H. LITTLETON, Clayton, Mich. Filed Mar. 23, 1888. Serial No. 268,231. (No model.)

Claim.—1. In an egg-poacher, the combination, with the body A, formed of the imperforate back *a*, imperforate ends *b*, the perforated side *c*, and the inwardly-projecting clearing-lip *c'*, of the removable bottom B, having its upper face adjacent to the clearing-lip *c'* substantially as specified.

2. An egg-poacher having a sliding bottom and a transverse scraping-lip extending inwardly from the lower edge of that side of the poacher under which the bottom slides to the upper face of said bottom, whereby the egg will be loosened from the bottom as it is withdrawn, substantially as set forth.



3. An egg-poacher consisting of an oblong frame having a sliding bottom completely closing its lower end, and imperforate parti-

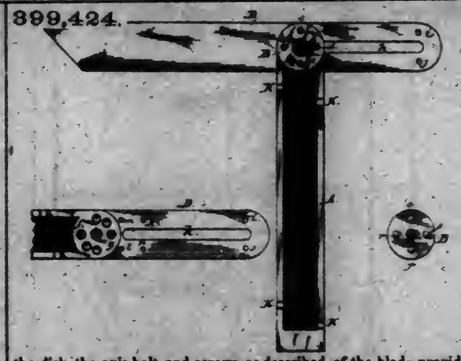
399,422

tions extending transversely across said body and upper face of the sliding bottom, one side of the body being foraminated, substantially as set forth.

399,423. LATCH. PAUL L. MALTBIE, Newark, N. J., assignor to Lewis D. Maltbie, same place. Filed Aug. 20, 1888. Serial No. 283,180. (Model.)

Claim.—1. In a latch, the combination, with a sloping guard affixed upon the inner side of the door-frame, of a head pivoted upon a spindle extended through the door and provided with handles upon the inner and outer sides of the door, set at an angle with each other and projecting downwardly to operate by their weight to hold the latch in its normal position, substantially as shown and described.

2. In a latch, the combination, with a sloping guard affixed upon the inner face of the door-frame, of a head pivoted upon a spindle extended through the door and provided with rollers in its opposite corners and with a curved seat intermediate to the rollers to bear upon the guard, and a handle upon the spindle at each side of the door to turn the head, as and for the purpose set forth.



3. In a latch, the combination, with a sloping guard affixed upon the inner face of the door-frame and having a beveled lip extending inside the door-opening, of a head pivoted upon a spindle and provided with rollers in its opposite corners, and with a curved seat intermediate to the rollers to bear upon the guard and having its outer corners beveled, as described, and a handle upon the spindle at each side of the door to turn the head, as and for the purpose set forth.

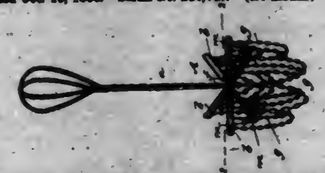
4. In a latch, the combination of a symmetrical guard, *c*, having inclined lip *c'*, the head pivoted upon a spindle and provided with rollers in its opposite corners, and a square spindle fitted to the head, with a handle adjustable upon one end of the spindle to opposite angles with the head, as and for the purpose set forth.

399,424. TRY-SQUARE AND BEVEL. CHARLES F. MERRIFIELD, Bernardstown, Mass. Filed Nov. 6, 1888. Serial No. 290,123. (No model.)

Claim.—1. The combination, with the stock of the square, having an open slot for the blade, radially-opposite holes, and an axis-hole,

399,424.

the disk, the axis-bolt, and screws, as described, of the blade provided with a long slot and conical indentations and the clamping-nut for the bolt, as and for the purpose specified.

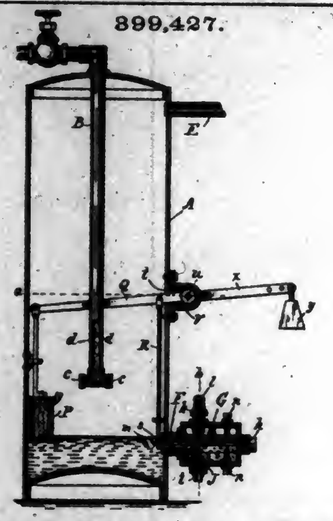


2. In a try-square and bevel, the slotted stock provided with bolt-openings, in combination with a disk provided with fixed screws and a bolt and the indented blade provided with a slot, as and for the purpose set forth.

399,425. WASHING-MACHINE. GERSHOM A. MILLER, Butler, Pa. Filed Oct. 22, 1888. Serial No. 288,733. (Model.)

Claim.—As an improvement in washing-machines, the combination of the tub B, the steam-chest C secured thereon, the sliding lid in the upper portion of the steam-chest, and the rotary beater consisting of a metallic bar having its ends journaled in the sides of the tub and its intermediate portion bent reflexly to form a series of arms, which extend on opposite sides of the axis of the beater, as specified.

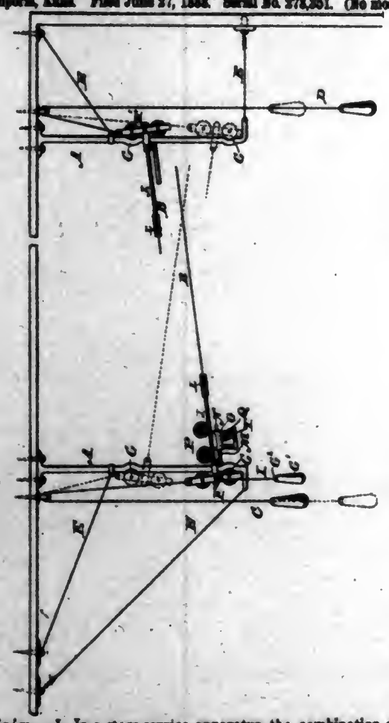
399,426. DISH-WASHER. WILLIAM D. MILLER, Florence, Mass. Filed Oct. 10, 1888. Serial No. 287,749. (No model.)



Claim.—A metallic dish-washer consisting of a series of wires having their intermediate portions bent and twisted upon themselves to form a handle and having their end portions extending radially to form legs, each leg having the return-bend and fastening *f* to form the closed eye *m*, and the series of chains directly connected with said eye-legs and pending therefrom, substantially as and for the purpose described.

399,427. APPARATUS FOR SEPARATING LIQUIDS FROM NATURAL GAS. WILLIAM MOORE, Kokomo, Ind. Filed May 21, 1888. Serial No. 274,499. (No model.)

Claim.—In an apparatus for separating liquids from natural gas, the combination, with the reservoir, the tubular casing detachably secured thereto so as to connect with the interior thereof, and having a discharge-opening, the valve arranged to close said opening, and



399,427.

the lever arranged to operate said valve, of a vertically-adjustable fulcrum consisting of a pair of set-screws mounted in opposite sides of the tubular casing and arranged to embrace the lever between them.

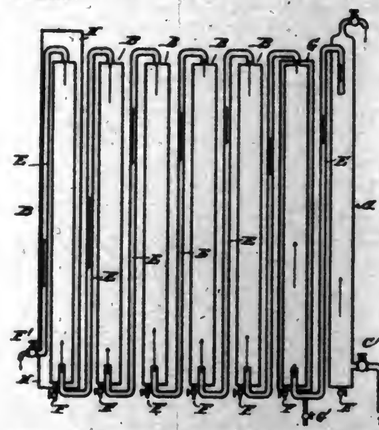
399,428. CASH-CARRIER APPARATUS. CHARLES W. MCCORMICK, Emporia, Kans. Filed June 27, 1888. Serial No. 278,261. (No model.)

Claim.—1. In a store-service apparatus, the combination of a track movable vertically at each end, so as alternately to incline in opposite directions, a vertically-movable trolley to which each end of the track is secured, a vertical track for each trolley, provided with stops and holders for the trolleys, and pull-cords and pulleys to independently raise each end of the movable track, the length of the track being so regulated that the act of raising one end of it reduces its tension and releases the other end, which drops to place, substantially as set forth.

2. In a store-service apparatus, a track movable vertically at both ends, so as to incline it in opposite directions, in combination with an independent pull-cord for elevating each end of the track, a trolley at each end of the track, to which the pull-cords for elevating are attached, a vertical track for each trolley, provided with stops for automatically fastening both trolleys, one above and the other below, by lifting one trolley and shifting the incline of the track, substantially as set forth.

3. The combination, with the wire track, of the car, the endless pull-cord I, doubled upon itself, as described, and the sliding holder L', substantially as set forth.

4. In a store-service apparatus, the combination of a bumper, M, and the adjustable curved spring-plates N N with the adjusting screw N², substantially as set forth.



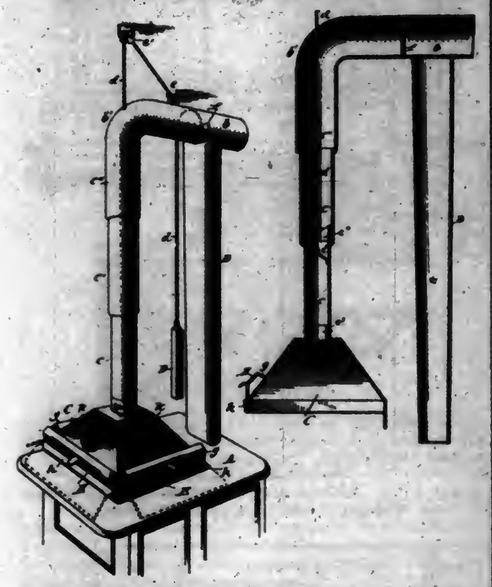
5. In a store-service apparatus, the combination, with a wire track and its car, of a lifting-trolley, an endless propelling-cord, I, and a car stopping and retaining mechanism, all adapted to be raised and lowered simultaneously with the wire track, substantially as set forth.

6. The combination of a bumper and curved plates with the car having the bar O, cut away on each side, at P, to form curved recesses for the reception of the curved plates, substantially as set forth.

7. In a propelling device of a store-service apparatus, the combination of the hollow arms J J, the pulleys L L K K, the wire track B, the propelling-cord I, and the sliding holder L', with the bumper M and the plates N N, substantially as described.

8. In a car of a cash-carrier, the combination of the tapered cup T, cut away, as shown, to form recesses, with a reversely-tapered cap, Q, having side openings, R, and springs S, curved, as described, and arranged to bear inwardly against the upper wall of the recesses, whereby the cup is tightly held and prevented from rattling, substantially as set forth.

399,429. PURIFIER FOR WATER OR OTHER LIQUIDS. THOMAS H. MCCULLOCH, Omaha, Nebr. Filed May 28, 1888. Serial No. 275,230. (No model.)



Claim.—1. The combination, with a series of settling-tubes, A B, the first tube, A, having an inlet-pipe, C, at its lower end and an outlet at its upper end, of the pipes E, connecting said tubes, the upper end of each said pipes communicating with the interior of a tube at its upper end and the lower side of the adjacent tube, the last pipe extending out of the top of last tube and having a discharge-cock, substantially as set forth.

2. In a purifier for water and other liquids, the combination of a series of settling-tubes, the first tube of said series extending above the top of the adjacent tube, the upper end of said first tube being provided with a pipe for discharging the floating substance, a series of connecting-pipes having open ends connecting said settling-tubes, the upper end of each of said pipes communicating with the interior of a tube, so as to receive the water that may rise to the upper end of said tube, the lower end of each pipe communicating with the lower side of the adjacent tube, substantially as specified.

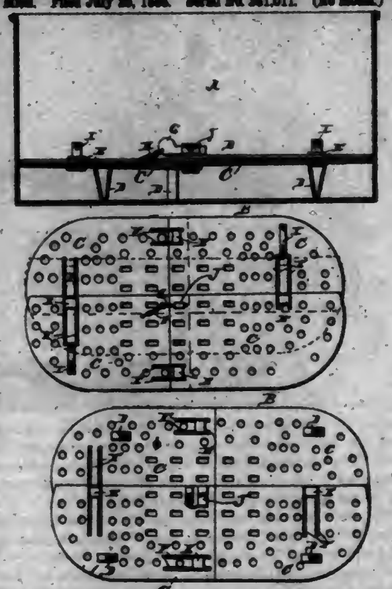
3. In a purifier for water and other liquids, the combination of a series of settling-tubes, and a series of connecting-pipes having open ends connecting said settling-tubes, the upper ends of each of said pipes communicating with the interior of a tube, so as to receive the water that may rise to the upper end of said tube, the lower end of each pipe communicating with the lower side of the adjacent tube, one or more of the tubes being provided with a casing, so as to leave a space between said tube and casing, substantially as specified.

4. In a purifier for water and other liquids, the combination of a series of settling-tubes and a series of connecting-pipes having open ends connecting said settling-tubes, the upper end of each of said pipes communicating with the interior of a tube, so as to receive the water that may rise to the upper end of said tube, the lower end of each pipe communicating with the lower side of the adjacent tube, one of the settling-tubes being provided with an opening or pipe for the induction of water, and an opening or pipe in one of the said tubes for the discharge of purified water, substantially as specified.

399,430. STOVE-HOOD. HERMANN NEW, Jefferson City, Mo. Filed Apr. 14, 1888. Serial No. 270,627. (No model.)

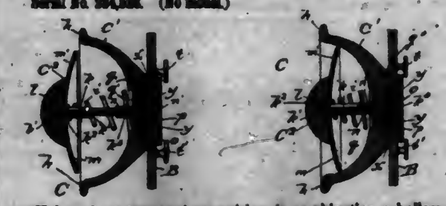
Claim.—The hood constructed with edge grooves, A, in combination with the independent wings E, constructed in hook form at their upper edges, as described, whereby the lower edges of said wings may be supported in the grooves when in open position, and the hooked edges of the wings may hang in the grooves when in closed position, as set forth.

399,431. COFFEE-POT. EDWARD T. NEWLIN, Brooklyn, N. Y. Filed Dec. 30, 1887. Serial No. 259,400. (No model.)



Claim.—1. In a pot, the combination, with a spring-tripod and a strainer, of an elastic split ring having a segmental piece of smaller diameter rigidly secured in one of its ends, and a tubular opening in its opposite end, in which said piece is placed and is adapted to work, substantially as described.

2. In a coffee-pot, a strainer-support consisting in a tripod formed of a series of elastic arms converging and united at their lower ends, free at their upper ends, and bowed outwardly between their ends, substantially as set forth.



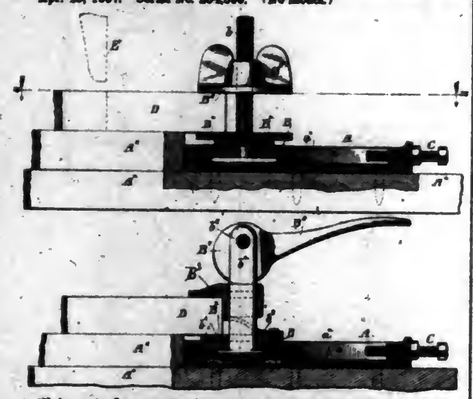
3. The combination, with a coffee-pot provided with a socket on its bottom, of a spring-tripod adapted to fit into said socket, and a strainer sustained on said tripod, substantially as set forth.

399,432. WASH-BOILER. MALINDA K. OSBORN, Maple Rapids, Mich. Filed July 25, 1888. Serial No. 281,011. (No model.)

Claim.—The combination of the perforated sections or members provided with slots, the bails secured to the adjacent members and engaging said slots, the staple inserted through the registering perforations of all the sections, and the key engaging said staple, as set forth.

399,433. TRUSS. ALVA OWEN, Chicago, Ill. Filed Sept. 4, 1888. Serial No. 284,522. (No model.)

Claim.—1. A truss-pad comprising, in combination, a hollow retainer, C, having an expanded rim, A, and a plate, B, upon which the retainer C is secured and movable, and a yielding retainer, C', having a projection, l, extending from near the center of the hollow retainer, and a stop, w', surrounding the base of the projection, whereby, in case of displacement of the said projection, the viscera, wherever they shall protrude, may enter the hollow retainer, substantially as described.

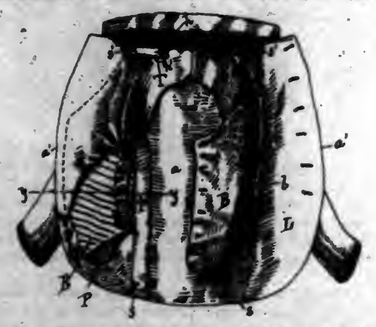


2. A truss-pad comprising, in combination, a concave retainer, C, provided with a sleeve, n, and a retainer, C', comprising a plate, m, and projection l, secured together upon a rod, k, confined toward one end within the sleeve n and having limited longitudinal play therein, and a spring, i, surrounding the rod k and confined between the retainers C and C', substantially as described.

399,434. HORSE-DETACHER. GEORGE T. PARKER, Glasgow, Ky. Filed June 26, 1888. Serial No. 278,498. (No model.)

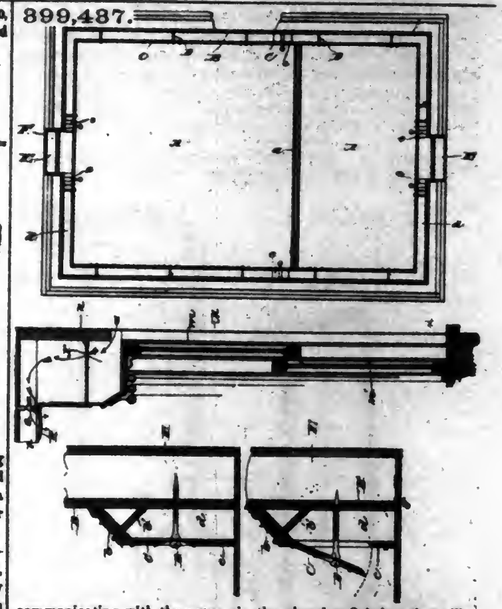
Claim.—The improvement in holdbacks, substantially as herein described, consisting of the body having hook a and mortise G, and provided in the side walls of each mortise with grooves g, the dog D, provided with the lateral pivot-lugs f entering the grooves g, and the presser engaging dog D, substantially as set forth.

399,435. MORTISING-MACHINE. FRANCIS V. PHILLIPS, Chicago, Ill., assignor to the Chicago Sash Pulley Company, same place. Filed Apr. 15, 1887. Serial No. 234,899. (No model.)



Claim.—1. In combination, the horizontal table for supporting the work, the slotted plate having guideways, a movable part fitted to said slotted plate and adapted to engage with the material, and a stop supported by the plate in direct line with the movable part, for limiting its movement, substantially as described.

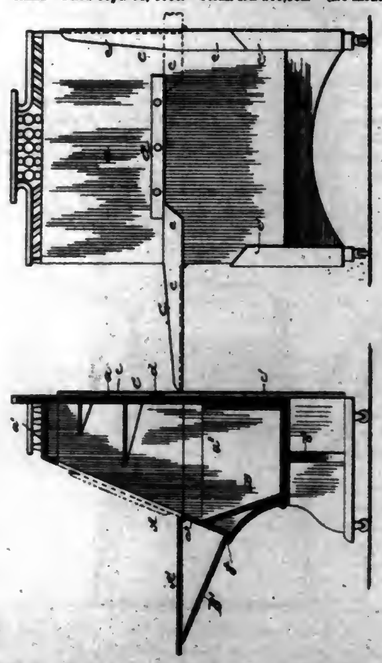
2. The combination, in a mortising-machine, of a stationary work-supporting table, a slotted guide-plate secured thereto, a slides, as B, engaging said guide-plate and movable thereon, a clamp carried by the slide B for engaging the material to be operated upon, and an adjustable stop passing through the end of the slotted guide-plate in the path of the slide B, whereby the movement of the work is limited, all substantially as described.



3. In combination, a table for supporting the work, a cutting-tool, guideways on said table, a movable plate adapted to said guideways, a clamp carried by said movable plate for engaging the top of the work, and a spar, b^4, on said plate adapted to engage with the work, all substantially as described.

399,486. COMBINED COAT AND VEST. SAMUEL R. REINHARD Baltimore, Md. Filed Nov. 13, 1888. Serial No. 290,794. (No model.)

Claim.—The within-described combination-garment, having a back, *a*, front pieces, *a' a'*, each provided with a lining, L, at the inner edge of which is an opening to form plackets of pockets P, and vest-sections B, provided with extending button-holed tabs T, all in combination with slots *t'* of the lining L above the armhole of the garment, substantially as described and illustrated, as and for the purpose indicated.

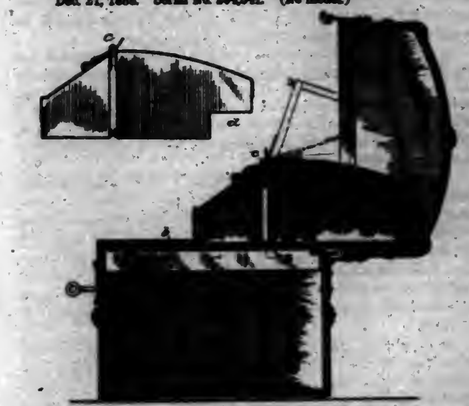


399,487. VENTILATING MECHANISM. RICHARD A. REW, Manitou, Minn. Filed Mar. 29, 1888. Serial No. 268,730. (No model.)

Claim.—1. The combination, in a house-ventilator, of the wall having the vertical escape-flue E, the mop-board arranged at a slight distance from the inner side of the wall on the floor, the molding *b*, connecting the upper side of the mop-board with the wall, and thereby forming a chamber, *d*, communicating with the lower end of flue E, the door or valve C, hinged at its upper edge to the mop-board and fitting snugly in an opening in the same, and the adjusting screw or bolt D, having its inner end engaging an opening in the side of flue E, and having its outer end swiveled in the door or valve, substantially as described.

2. The combination, with the window-frame having the upper and lower sashes, of the chamber N in the upper part of the frame communicating with the outer air, the chamber Q below the ceiling and having the air-perforations *q* in its lower side, said chamber Q communicating with chamber N, substantially as described.

399,488. KITCHEN-CABINET. CHARLES R. ROGERS, St. Peter, Minn. Filed Sept. 11, 1888. Serial No. 285,162. (No model.)

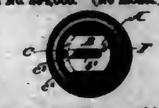


Claim.—1. The case or closure having at its sides hinged shelves or leaves provided at their rear edges with strips extended beyond the sides, along the back of the case or closure, said case or closure having a stop or cleat upon its back, which engages with the extensions of said strips, substantially as and for the purpose set forth.

2. In a kitchen-cabinet, the combination, with a case provided with a cleat across its back and with a molding along the lower part of its rear edges, of shelves hinged to the sides of the case and provided on their rear edges with rearwardly-projecting strips adapted to engage alternately the cleat and the molding, substantially as herein shown and described.

3. The herein-described kitchen-cabinet, consisting of a case provided with the cleat *d* and the molding *d'*, the hinged front portion, A', the board B', hinged to the front A' and serving both as a prop and a pawl, and the shelves C, hinged to the sides of the case and provided with rearwardly-projecting strips for engaging alternately the cleat and molding, as specified.

399,489. TRUNK. HENRY W. ROMPTREE, Richmond, Va. Filed Dec. 21, 1888. Serial No. 294,341. (No model.)



Claim.—1. The combination, with a trunk, its hinged lid or cover, and supporting-strips for the tray fixed to the ends of the trunk, of a tray sustained upon these strips and adapted to slide horizontally back on said supports so as to protrude into the hinged cover, substantially as described.

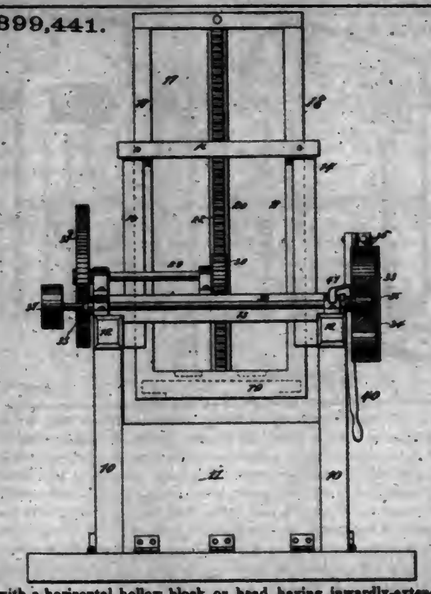
2. The combination, with a trunk, its hinged lid or cover, and supporting-strips for the tray fixed to the ends of the trunk, of a tray sustained upon these strips and made in two hinged sections and adapted to slide horizontally back on said supports so as to protrude into the hinged cover, substantially as described.

3. The combination of the trunk having its rear edge, *a*, cut down or reduced in height, the supporting end strips, C, having their upper edge higher than the rear edges of the trunk, and provided with anti-friction rollers, and the tray made in two hinged sections and arranged upon the rollers on the strips to slide horizontally back into the lid of the trunk when raised.

399,440. BOTTLE-STOPPER. JONAS J. SANDS, Merton, Wis. Filed Dec. 18, 1888. Serial No. 294,005. (No model.)

Claim.—1. The combination, with a vessel having an orifice to be stopped, provided with opposite interior shoulders, of a stopper-holder composed of two interlocked parts which slide upon each other, whereby the holder may be expanded to engage the shoulders of the orifice and retracted to disengage them, substantially as described.

2. A stopper-holder composed of the connected sliding parts B and C and provided with centrally coincident slots which overlap each other at their ends, whereby the parts may be expanded by outward pressure on the ends of the slots to engage the shoulders of the orifice to which the holder is to be applied, substantially as described.



3. The connected and relatively sliding parts B and C, adapted to engage the shoulders of a bottle-neck or other vessel-orifice, one of said parts being provided with the hole or slot c^2 for the admission of a point for the contraction of the holder, substantially as described.

399,441. TRAMPER ATTACHMENT FOR COTTON-PRESSES. AUGUST SCHRADE, Giddings, Tex. Filed July 13, 1888. Serial No. 279,767. (No model.)

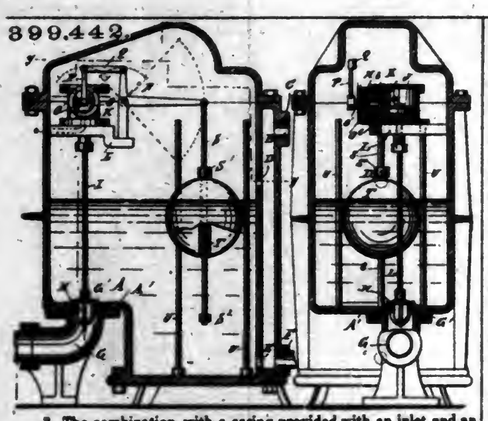
Claim.—1. The combination, with a press, a plunger box or slide secured to said press, and a plunger reciprocating in said box or slide and provided with an attached block or head and central uprights having a racked outer surface, of a horizontal shaft at each side of the plunger box or slide provided with a pinion adapted to engage the said racked surface of the uprights, and means, substantially as shown and described, for rotating the said shafts, as and for the purpose specified.

2. The combination, with a press, a plunger box or slide secured to said press, a plunger reciprocating in said box or slide, provided

399,441.

with a horizontal hollow block or head, having inwardly-extending lower marginal flanges, uprights secured to said plunger-block at the center, and a rack secured to the outer face of the said uprights, of a horizontal shaft journaled at each side of the plunger box or slide, and pinions keyed to said shafts adapted to engage the said racks, substantially as and for the purpose specified.

3. The combination, with a press, a plunger box or slide secured to said press, a plunger reciprocating in said box or slide, a horizontal hollow block or head secured to said plunger, provided upon its under face with an inwardly-extending marginal flange, an upright centrally secured at each side of the plunger-block, and a rack secured to the outer faces of the said uprights, of a horizontal shaft journaled at the front and rear of the plunger slide or box, a pinion secured to said shafts engaging said racks, gear-wheels secured to the outer ends of the said shafts, an adjustable drive-shaft provided with a friction-pulley at one end, a second parallel shaft provided with a pinion engaging the said gear-wheels, and a grooved balance-wheel secured to the latter shaft, adapted to receive the friction-pulley upon the drive-shaft, substantially as and for the purpose specified.

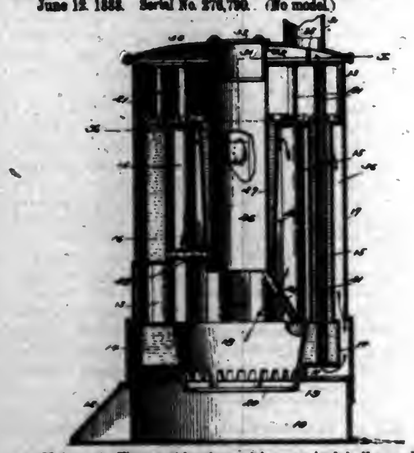


4. The combination, with a press, a plunger box or slide secured to said press, a plunger reciprocating in said box or slide, a horizontal hollow block or head secured to said plunger, provided upon its under face with an inwardly-extending marginal flange, an upright centrally secured at each side of the plunger-block, and a rack secured to the outer faces of the said uprights, of a horizontal shaft journaled at the front and rear of the plunger slide or box, a pinion secured to said shafts engaging said racks, gear-wheels secured to the outer end of the said shafts, an adjustable drive-shaft provided with a friction-pulley at one end, a second parallel shaft provided with a pinion engaging the said gear-wheels, a balance-wheel provided with an inwardly-projecting peripheral flange and an inwardly-projecting hub adapted for engagement with the friction-pulley of the drive-shaft, a brake-lever adapted for engagement with the periphery of the balance-wheel, and means, substantially as shown and described, for adjusting the drive-shaft, as and for the purpose specified.

399,442. DRAINAGE-TRAP. JOHN SHAW, Sr., Bayonne, N. J. Filed Sept. 24, 1888. Serial No. 286,194. (No model.)

Claim.—1. In a drainage-trap, the combination, with a cylinder provided with a valve-chest and inlet and outlet ports, of a piston held to travel in the said cylinder, an outlet-valve supported on the said piston, a valve held to swing in the said valve-chest and operating over the said ports, and a float operating the said valve, substantially as shown and described.

2. In a drainage-trap, the combination, with a casing provided with an inlet and an outlet, of a valve seated in the said outlet, a piston supporting the said valve, a cylinder containing said piston and provided with a valve-chest and inlet and outlet ports, a valve held in the said valve-chest and operating over the said ports, a rod connected with the said valve and provided with collars, and a float traveling on the said rod between the said collars, substantially as shown and described.



399,442.

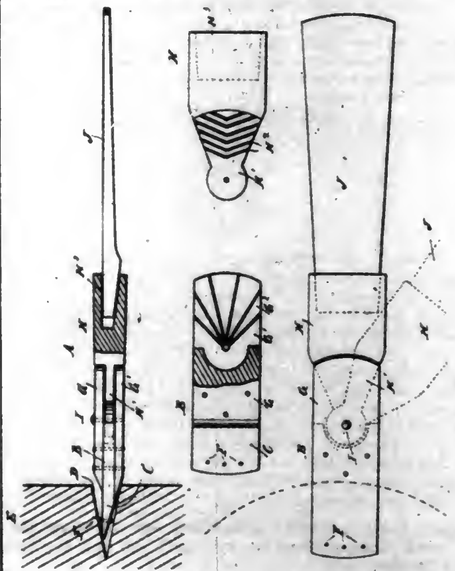
3. The combination, with a casing provided with an inlet and an outlet pipe, of a valve seated in the said outlet-pipe and opening inward in the said casing, a piston-rod supporting said valve, a piston connected with the said piston-rod, a cylinder containing said piston and provided with inlet and outlet ports, and also with a valve-chest, a valve held to turn in the said valve-chest and operating over the said ports, a bell-crank lever connected with the said valve, a rod pivotally connected with the said bell-crank lever and provided with collars, and a float held to travel on the said rod between the said collars, substantially as shown and described.

4. The combination, with a casing provided with an inlet and an outlet pipe, of a valve seated in the said outlet-pipe and opening inward in the casing, a piston-rod supporting said valve, a piston connected with the said piston-rod, a cylinder containing said piston and provided with inlet and outlet ports and also with a valve-chest, a valve held to turn in the said valve-chest and operating over the said ports, a bell-crank lever connected with the said valve, a rod pivotally connected with the said bell-crank lever and provided with collars, and a float held to travel on the said rod between the said collars, and guide-rods held in the said casing for guiding said float, substantially as shown and described.

399,443. BOILER. GEORGE F. SPENCER, Thompson, Pa. Filed June 12, 1888. Serial No. 276,790. (No model.)

Claim.—1. The combination, with a vertical boiler and its fire-pot and a smoke-box above the boiler, of a jacketed fuel-magazine extending down through smoke-box and the top of the boiler into the combustion-chamber and having a movable or sliding direct-draft section within the smoke-box, the space within the jacket communicating with the interior of the boiler, substantially as set forth.

2. The combination, with the vertical casing having a smoke-box in its top, a fire-pot, and flues leading from the space above the fire-pot downward and then upward into the smoke-box, of a fuel-magazine leading down through the smoke-box into the combustion-chamber and provided with a removable section within the smoke-box, whereby by removing said section a direct draft through the magazine from the fire-pot to the smoke-box will be formed, substantially as set forth.

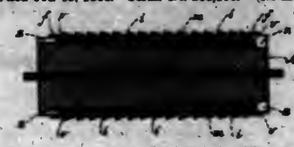


3. The combination, with the vertical casing having a smoke-box in its upper end, the boiler in said casing consisting of upper and lower water-chambers, tubes connecting them, concentric fire-tubes passing through the water-tubes and both water-chambers, the lower ends of the fire-tubes leading from a space within the casing below the lower water-chamber and their upper ends discharging into the smoke-box, and baffle-plates for causing the draft to pass from the upper part of the combustion-chamber downward to the lower ends of the fire-tubes, of a jacketed magazine extending down through the smoke-box and upper water-chamber, with its jacketed space communicating with the interior of the boiler and having a removable section within the smoke-box, by removing which a direct draft through the magazine will be formed, substantially as set forth.

4. In a boiler, the combination, with a lower water-chamber surrounding the fire-pot, an upper water-chamber, water-tubes connecting the upper and lower chambers, and fire-tubes passed through the water-tubes and water-chambers, of a fuel-magazine surrounded by a water-jacket connected with the lower water-chamber and baffle-plates partially closing the space intervening the several water-tubes, substantially as shown and described.

5. In a boiler, the combination, with a lower water-chamber surrounding the fire-pot, a base supporting said chamber, an upper water-chamber, water-tubes connecting the upper and lower chambers, fire-tubes passing through the water-tubes and said chambers, and baffle-plates partially closing the space intervening the water-tubes, of a fuel-magazine surrounded by a water-jacket connected with the lower water-chamber and a casing surrounding the chamber and water-tubes supported upon the base, substantially as shown and described.

6. In a boiler, the combination, with a lower water-chamber surrounding the fire-pot, an upper water-chamber, water-tubes connecting the upper and lower chambers, fire-tubes passing through said chambers and water-tubes, and baffle-plates partially closing the space intervening the water-tubes, of a fuel-magazine surrounded by a water-jacket connected with the upper and lower water-chambers, a casing surrounding the water-receptacle provided with an offtake-flue, and a segmental deflecting-plate attached to the upper water-chamber beneath said flue, all combined to operate substantially as shown and described.



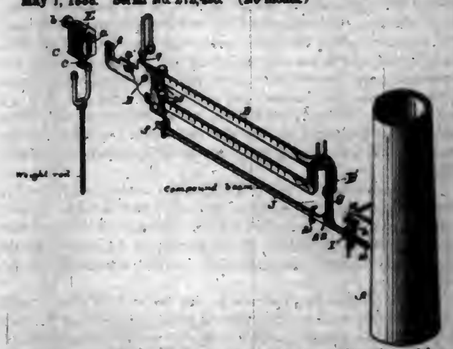
399,444. FOOT-BOARD FOR WOOD-CHOPPERS. AARON L. STEVENS, Little Falls, Wash. Filed Mar. 8, 1888. Serial No. 266,611. (No model.)

Claim.—1. In a wood-chopper's foot-board, the combination, with the broad flat arm adapted at its forward end to enter a transverse notch in a tree and having a horizontally-forked inner end, of the head H, having a forwardly-projecting tenon pivoted within said forked end to swing horizontally in the plane of the arm, and the flat board J in the plane of the arm and head, whereby the operator may step from the board to the arm when it is necessary for him to change the relative position of the board, substantially as set forth.

2. In a foot-board for wood-choppers, the combination, with an arm adapted to be secured in a notch of the tree and provided near its outer end with a roughened surface, of a head pivotally secured to the outer end of the said arm, and also provided with a roughened surface in contact with the roughened surface of the said arm, and a board secured to the said head, substantially as shown and described.

399,445. ROLL FOR LOOM-TEMPLES. BENJAMIN D. STEVENS, Burlington, Vt., assignor to himself and Benjamin H. Cheever, Lowell, Mass. Filed Oct. 15, 1888. Serial No. 288,106. (No model.)

Claim.—1. A loom-temple roll provided with a series of longitudinal grooves having inclined bottoms and serrated plates disposed therein, an edge of each of said plates being inclined to conform to the bottom of said grooves, substantially as set forth.



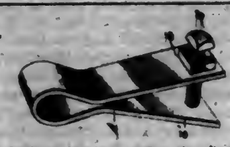
2. The combination of a roll having a series of grooves in its body provided with inclined bottoms, serrated plates disposed therein and having correspondingly-inclined edges, whereby they may be adjusted vertically when moved longitudinally, and rings for securing said plates in position in said grooves, substantially as described.

3. A roll provided with a series of longitudinal grooves having inclined bottoms, plates fitted to slide in said grooves, the outer edges of said plates being provided with teeth or points and the inner edges inclined to conform to the bottoms of said grooves, and adjunctive mechanism for detachably securing the plates in position, whereby the teeth or points may be adjusted vertically in relation to the surface of the roll as the plates are moved longitudinally, substantially as set forth.

4. The combination of a roll having reduced ends and provided with a series of longitudinal grooves having inclined bottoms, plates provided with beveled ends and fitted to slide in said grooves, the outer edges of said plates being serrated and the inner edges inclined to conform to the bottoms of the grooves, and rings adjustably disposed on the reduced ends of the roll in engagement with the beveled ends of the plates, substantially as and for the purpose set forth.

5. In combination, the body A, having reduced ends and provided with grooves *z*, having longitudinally-inclined bottoms, in combination with the serrated plates *m*, provided with beveled ends *v*, and having their inner edges inclined to conform to the bottoms of said grooves, and the rings *f*, disposed on the reduced ends of said body and adapted to engage the ends *v* of said plates and secure the same in position in said grooves, substantially as described.

399,446. WEIGHING-SCALE. WILLIAM H. STEWART, Kansas City, Mo., assignor of one-half to William S. Whittaker, same place. Filed May 1, 1888. Serial No. 272,490. (No model.)

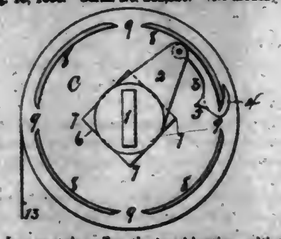


Claim.—1. The main beam of a scale, in combination with an additional beam hung below and fulcrumed to the main beam, said additional beam being provided with a shank at its outer end, and a movable block which is located on said shank and carries a pivot.

2. In a weighing-scale, the main beam B, in combination with additional beam J, hung below it, link *g*, which fulcrums the lower beam to the upper movable block, I, carrying pivot *h*, located on outer end of beam J, and a stationary bracket or surface which is engaged by pivot *h*.

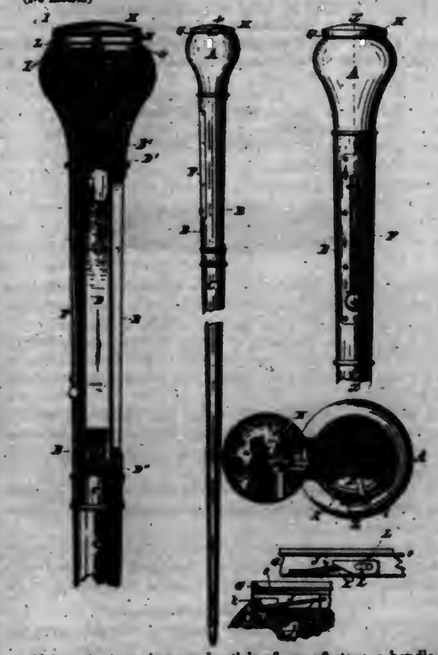
399,447. ANTI-RATTLER FOR THILL-COUPLINGS. FRED P. STILES, Sparta, Wis. Filed Nov. 2, 1888. Serial No. 289,301. (No model.)

Claim.—1. The herein-described anti-rattler, composed of the strip bent in an inverted-U shape and having a set-screw passed through



399,447.

one of its limbs and adapted to bear on its other limb to force the two limbs apart to take up wear, substantially as described.



2. The hereinbefore shown and described anti-rattler, composed of an untempered strip of metal bent to an inverted-U shape, and the set-screw arranged at the separated ends of the limbs passing through one of the said limbs and adapted to bear on the other limb, to force the two limbs apart to take up wear, substantially as described.

399,448. CURTAIN-ROLLER. ALVAH SWEETLAND, Syracuse, N.Y. Filed Aug. 13, 1888. Serial No. 282,630. (No model.)

Claim.—In a curtain-roller, the combination, with the roll proper, a plate provided with a rectangular central hub the corners of which constitute shoulders, and multiple-curved flanges opposite the straight sides of the hub with spaces or openings between them opposite and equal in number to the corners or shoulders of said rectangular hub, of a stationary spindle, a stationary arm upon the spindle, a pawl, 3, having a hooked end, 4, providing a deep notch for the effectual engagement with the ends of said flanges, said pawl being pivoted to the arm, and an inclined-face lug, 5, at the back of the pawl opposite the hook 4, whereby with the rotation of the roll said lug is engaged by any one of said shoulders and the hook of the pawl thrown into engagement with one of said flanges, substantially as shown and described.

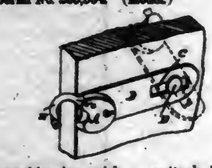
399,449. HANDLE FOR UMBRELLAS, WALKING-CANES, &c. WILLIAM TAYLOR, Buffalo, N.Y. Filed Aug. 4, 1888. Serial No. 282,017. (No model.)

Claim.—1. As an improved article of manufacture, a handle for a walking-cane, umbrella, parasol, fishing-pole, and the like, consisting

of a head, A, having the compass with its cover H, the hollow body portion B, provided in its bore with the storm-glass D, and the slotted aperture E, and the thermometer F, the whole being combined and arranged in a manner as and for the purpose stated.

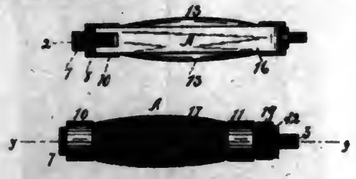
2. The combination, with the head A, of the shell G, having the cover H, the central pin, M, magnetic needle I, and the lifter J, provided with a suitable handle, L, as and for the object set forth.

3. In handles for canes, umbrellas, and the like, the combination, with the central portion, B, having a core, C', of a storm-glass, D, retained in position by the elastic cushions D' D'', said portion B having a longitudinal slot, E, as and for the object stated.



399,450. EYEGLASS-POLISHER. EDWARD R. THORPE, New York N. Y., assignor to himself and Harry Robinson, same place. Filed Nov. 2, 1888. Serial No. 290,362. (No model.)

Claim.—1. A polisher consisting, essentially, of an outer backing or body of flexible material and an inner sheet of polishing material, the sheet of polishing material being connected to the backing or body, substantially as described



2. A polisher consisting, essentially, of an outer backing or body, a sheet of polishing material, as chamois, and an interposed layer of viscid material, substantially as described.

399,451. HASP-LOCK. WILLIAM TIFFANY, Creswell, Oreg. Filed Apr. 30, 1887. Serial No. 235,534. (Model.)

Claim.—The combination, with a padlock having a pivoted shackle, of the sheet-metal plate B, having a longitudinal slot, C, at one end adapted to engage over a stud or similar device on the door, and secured at its other end to the body of the lock and forming a back for the same, the said lock being so arranged that its shackle projects beyond the end of the plate, substantially as specified.

399,452. GUN-CLEANER. CHARLES TOMLINSON, Syracuse, N. Y., assignor to Harvey McMurchey, same place. Filed Dec. 20, 1888. Serial No. 294,162. (No model.)

Claim.—1. In a gun-cleaner, a wire-cloth tube, in combination with expansible springs mounted in a frame-work, and means for expanding or contracting the springs, substantially as described.

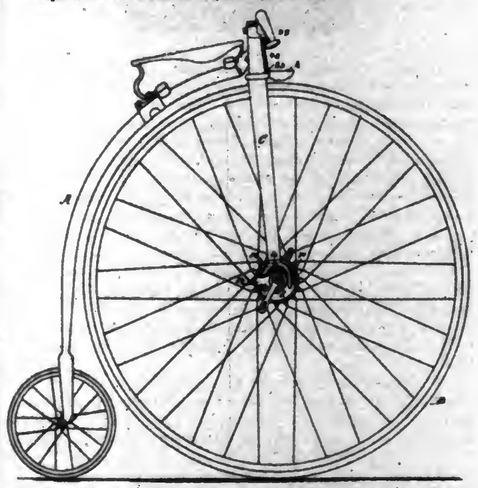
2. A gun-cleaner consisting of spring side pieces mounted in a frame, the frame mounted upon the body of the cleaner, a take-up spring within the frame, and a tension-nut, in combination, substantially as described.

3. A gun-cleaner consisting of spring side pieces mounted in a frame, the frame mounted upon the body of the cleaner, and a tension-nut, in combination with a wire-cloth tube drawn longitudinally over the spring side pieces.

4. In a gun-cleaner, a wire-cloth tube fitting over and in combination with an elastically compressible and expansible body, substantially as described.

5. In a gun-cleaner, a wire-cloth tube fitting over and in combination with an elastically compressible and expansible body, and means for regulating the expansion and compression, substantially as described.

399,453. VEHICLE-WHEEL. GEORGE T. WARWICK, Springfield, Mass. Filed Sept. 3, 1888. Serial No. 284,437. (No model.)



Claim.—The wheel-rim 5, having the tubular spoke-holding nut 6, and the spoke 4, having thereon the tubular nut 8 within said nut

399,458.

6, combined with a rubber thimble interposed between said nuts, on which said inner nut bears, substantially as set forth.

399,454. BICYCLE. GEORGE T. WARWICK, Springfield, Mass. Filed Sept. 3, 1888. Serial No. 284,438. (No model.)

Claim.—1. In a velocipede, the combination, with a fork-leg provided with a yoke having an extension provided with a pivotal bearing-socket, 54, of the wheel-spindle and the bearing-box embracing same, having an extension by its outer end pivotally hung in said socket, and a spring interposed between the top of said bearing-box and the said yoke above said box, the said pivotal connection between the yoke and the bearing-box extension being in a line at about right angles to the line of compression of said spring, substantially as described.

2. In a velocipede, the combination, with a fork-leg provided with a rigidly-attached yoke having an extension provided with a pivotal bearing-socket, 54, and terminating in the extension-bearing 55, substantially as described, of the wheel-spindle and the bearing-box embracing same, having an extension by its outer end pivotally hung in said socket, and a spring interposed between the top of said bearing-box and the said yoke above said box, the said pivotal connection between the yoke and the bearing-box extension being in a line at about right angles to the line of compression of said spring, and the adjusting-screw 56, passing through said bearing 55 against the side of the said bearing-box, substantially as and for the purpose described.

3. The combination, with the bearing-box and the fork-leg having the yoke connected with and spring-supported from said box, substantially as described, and provided with the extension 52 in front of the said box, having the slot 63, of the guiding-pin 64, secured on the edge of said box and passing through said slot, substantially as described.

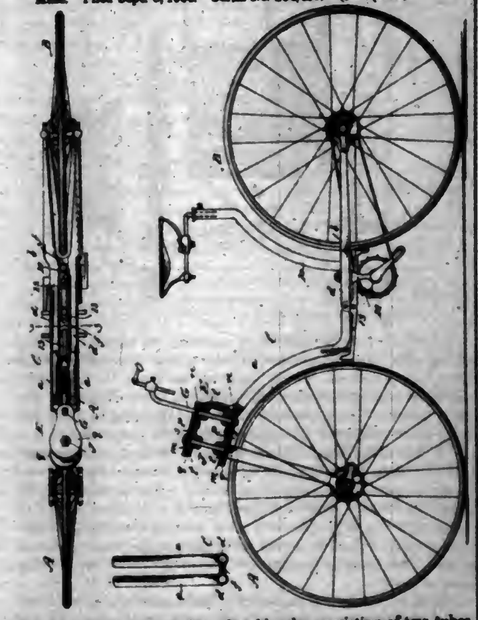
4. The combination, with the bearing-box and the wheel-spindle *f*, provided with the annularly-grooved journal-collar 65, of the ring-shaped ball-case fitting in said bearing-box and about said journal-collar, having the internal annular groove formed in segments having their matching ends in planes inclining to the sides of the case, whereby the lines of juncture at the grooved walls cross same obliquely, and the hardened balls *m*, substantially as and for the purpose described.

5. The combination, with the wheel-spindle having the hub fixed thereon, and the journal-collar 65, and the bearing-box suitably supported at its inner end embracing and bearing on the periphery of said journal-collar, of the dust-cap 73 between the end of the hub and the ends of the journal-collar and bearing-box, and covering the circular line of contact between said collar and box, substantially as and for the purpose described.

6. The combination, with the wheel-spindle having the externally-grooved journal-collar or enlargement thereon, the bearing-box, and the annular internally-grooved ball-case peripherally surrounding the

said journal-collar, of the inclosing-cap 74, screwing into the bearing-box, with its inner face in a plane at right angles to the axis of the said spindle and ball-case, and lying against and covering the circular line of contact between the inner periphery of the ball-case and the outer periphery of the journal-collar at the outer end thereof, substantially as described.

7. The combination, with the wheel-spindle having the journal-collar thereon and the bearing-box and ball-case therein surrounding the journal-collar, of the inclosing-cap 74, screwing into the bearing-box, having a rabbet, 75, and the supplemental dust-plate 76 therein, covering the circular line of contact between the journal-collar and the ball-case at the outer end thereof, substantially as shown and described.



8. The combination, with the fork-head having the vertical socket 90 therein and the brake-shoe and pivoted carrying-arm therefor, of the pivoted brake-lever 85 and the connecting-rod by its lower end pivoted to an intermediate portion of the brake-carrying arm, having an offset bracket, to which the brake-lever is connected by its end, and a spring to lift said connecting-rod, substantially as described.

9. Improved pivotal connections between levers and the parts to which they are connected, consisting of a rabbet formed in the stock of one of the adjacent surfaces around the pivotal pin, and a bushing of compressible material inserted in said rabbet to exert a transverse pressure between the parts, whereby the swinging part may be held against its pivot-head, and a washer interposed between the outer end of the bushing and the surface of the adjacent part and surrounding the pivot, substantially as and for the purpose described.

10. The combination, with the slotted fork-head and the backbone connected to and capable of swinging thereon, of a dust-guard having rigid ear-pieces secured to the neck of the backbone, said dust-guard entirely surrounding the fork-head and covering the slot therein

11. The combination, with the slotted fork-head and the backbone swinging thereon, of the semicircular dust-guards 106, encircling said fork-head, having at their rear edges the ear-pieces 107, and the bolt 108, passing through the said ear-pieces and said backbone, as shown.

399,455. SAFETY-BICYCLE. GEORGE T. WARWICK, Springfield, Mass. Filed Sept. 3, 1888. Serial No. 284,439. (No model.)

Claim.—1. A frame for safety-bicycles, consisting of two tubes ranging in parallelism and joined together, curved at their forward end portion to form the backbone for the forward wheel, and to the rear of which they extend horizontally and form suitable carrying-supports for other parts of the machine, as described, and the rear-wheel fork, substantially as and for the purpose described.

2. In a bicycle, the combination, with the forward and rear wheels, which are of substantially the same diameters, and a fork carrying the front wheel provided with a vertically-extending spindle-bearing for rotation in the stationary head of the bicycle, and a separate vertically-extending handle-bar spindle, also bearing for rotation in said head, of a motion-reducing connection on and between the said handle-bar and fork spindles, whereby on the rotation of the former a rotation of less extent is imparted to the latter spindle, substantially as and for the purpose described.

3. In a bicycle, the combination, with a suitable head-frame and the front fork having a spindle-bearing for rotation in said head, provided with a spur-gear, of the handle-spindle bearing for rotation in said head-frame provided with a spur-gear of less diameter than the one on the fork-spindle, and an intermediate pinion between and engaging said spindle-gears, substantially as and for the purpose described.

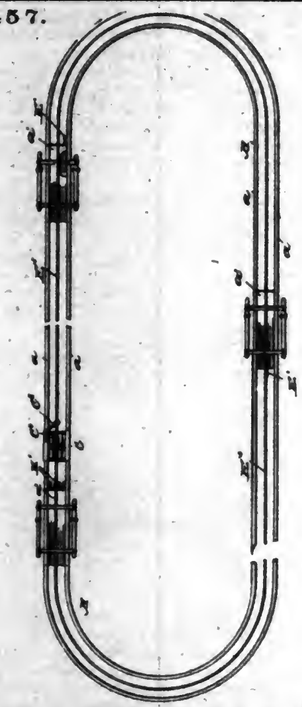
4. In a bicycle, the combination, with a suitable head-frame and the front fork having a spindle-bearing for rotation in said head, provided with a spur-gear, of the handle-spindle bearing for rotation in said head-frame, provided with a spur-gear of less diameter than the one on the fork-spindle, and an intermediate pinion between and engaging said spindle-gears, the said frame being provided with a rabbeted chamber, into which said gear-wheels are disposed, and a cap for inclosing the same, substantially as described.

399,456. BALL-BEARING FOR VELOCIPEDES. GEORGE T. WARWICK, Springfield, Mass. Filed Sept. 3, 1888. Serial No. 284,440. (No model.)

Claim.—1. In an improved ball-bearing, the combination, with the legs of the fork and the axle non-rotatable thereon, of two normally-separated and movable bearing-collars on the axle having a ball-groove in and between their adjacent separated ends, a rotatable adjusting-sleeve interposed between said collars and axle having a screw engagement with said collars, a wheel-hub receiving therein said bearing-collars, having an annular ball-groove therein, and bearing-balls between said hub and collars, substantially as described.

2. An improved ball-bearing consisting of the combination, with an axle, substantially as described, of two normally-separated but movable bearing-collars carried on the axle having a ball-groove in and between their adjacent separated ends, one of said collars having an engagement with said axle, a rotatable adjusting-sleeve interposed between said collars and axle having a screw-connection with said collars, whereby they are approached and separated, a wheel-hub receiving therein said bearing-collars having an annular ball-groove therein, and bearing-balls between said hub and collars, substantially as set forth.

3. An improved ball-bearing consisting of the combination, with an axle, of two normally-separated but movable bearing-collars carried on the axle having a ball-groove in and between their separated ends, one of said collars having an engagement with said axle, a rotatable adjusting-sleeve interposed between said collars and axle having a screw-connection with said collars, whereby they are approached and separated, a turning washer applied to the outer end of said sleeve, a wheel-hub receiving therein, said bearing-collars having an annular ball-groove therein, and bearing-balls between said hub and collars, substantially as set forth.



4. In combination, the wheel-hub 3, having therein an annular ball-groove, the axle 2, having a projecting pin or pins, 5, the exteriorly-screw-threaded sleeve 6, rotatable on said axle, the normally-separated bearing-collars 7 and 8 on said sleeve having a screw engagement therewith and a ball-groove in their separated ends, said collars 7 having a slotted engagement with said pins 5 in the axle, a turning washer, 12, engaging with the end of said sleeve, bearing-balls between said hub and collars, and a locking-nut, 4, screwed on the end of said axle, substantially as set forth.

399,457. CASH-CARRIER APPARATUS. NELSON WEBER, Jr., Long Island City, N. Y. Filed Sept. 5, 1888. Serial No. 284,605. (No model.)

Claim.—1. In a carrier apparatus, the combination, with a compartied carriage having a series of latches or retainers each normally effecting a closure of a single compartment, of separate trips at each station in the path of the carriage, the trip of each station being out of line with those of the remaining stations and in the line of a single compartment of the carriage, substantially as described.

2. In a carrier apparatus, a carriage divided longitudinally into sections corresponding to the different stations and a series of latches each of which normally effects a closure of a single section of the carriage, in combination with a trip-block at each station in the path of

399,457.

one of said latches, a trip-standard in alignment with said trip-block and acting to eject a pocket or holder as the said block trips the latch, and an arm for temporarily holding the pockets to be taken up by the carriage, the trips and take-ups of each station being wholly out of line with the corresponding devices of the remaining stations and in line with a section of the carriage, substantially as described.

3. A carrier apparatus comprising a carriage and a cash pocket or holder therefor, the carriage being divided into longitudinal compartments and longitudinally slotted at the bottom wall, and the pocket formed with a head and adapted to said compartment to lie wholly within the plane thereof, and thus not project into the plane of the remaining compartments of the carriage, substantially as described.

4. In a carrier apparatus in which the carriage automatically takes up and discharges the cash pockets or holders, a take-up and carrier mechanism, comprising a carriage divided longitudinally into compartments, cash pockets or holders formed with a socket and having a head fitting the said compartments, to lie wholly within the plane thereof, and an arm at each station adapted to be received in the socket of the cash-pocket, substantially as described.

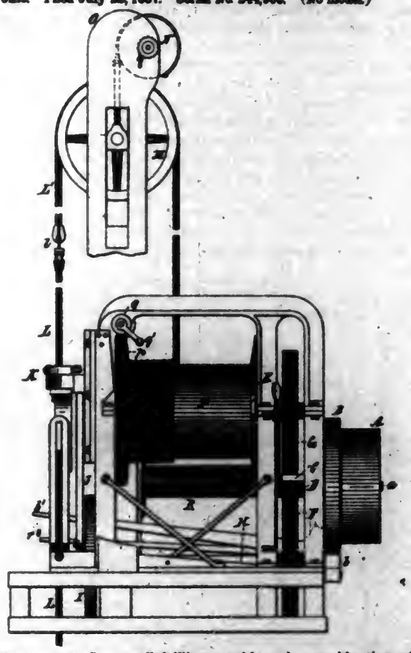
5. The combination, with the carriage formed with compartments, of latches or retainers pivotally mounted thereon and normally effecting a closure of one end of said compartments, substantially as described.

6. The combination, with the comparted carriage, of latches or retainers pivoted thereon and normally effecting a closure of one end of each compartment, and automatically closing gates at the opposite ends of each compartment, substantially as described.

7. In a carrier apparatus, a carriage divided longitudinally into compartments, the bottom wall of which is slotted longitudinally, and guide-plates or flanges extending therefrom between the said pockets, in combination with cash holders or pockets provided with heads fitting in said compartments and whose bodies fit between said flanges, substantially as described.

8. As a new article of manufacture, a cash-pocket for cash-carriers, formed with a head by which it is held in the carriage and with a socket by which it is held on the take-up arm, substantially as described.

9. A carrier apparatus comprising an endless track, a cash-station, and a series of sales-stations, baskets held below each of said stations, a comparted carriage on said track provided with latches normally effecting a closure of the one end of said compartments, a trip-block at each station in the path of one of said latches and a trip-standard for the cash-pockets adapted to eject the same from the carriages simultaneously with the tripping of the latches, a take-up standard at each station provided with an arm for temporarily holding the cash-pockets, and a full complement of trips and take-ups at the cashier's desk representing each of the sales-stations, substantially as described.



399,458. HAME-TUG. JOHN E. WHEELER, Cincinnati, Ohio. Filed Dec. 15, 1888. Serial No. 293,745. (No model.)

Claim.—1. The hame-tug A, having a series of T-shaped slots, J J', and stops K K', in combination with the trace-hook L, having pins M M', for the purpose described.

2. As an improved article of manufacture, the hame-tug A, having a raised loop, D, side bars, F F', center bar, G, stamp H, slots J J', and stops K K', all as herein described.

399,459. WELL-DRILLING MACHINE. WILLET C. WELLS, Tiffin, Ohio. Filed July 22, 1887. Serial No. 244,968. (No model.)

Claim.—1. In a well-drilling machine, the combination of a driving-shaft, a pinion secured thereto, a spur-wheel transmitting power to a cross-head, thereby imparting motion to the drill, and a spur-wheel adapted to actuate the rope-spool for the purpose of raising or lowering the drill, with mechanism for throwing the pinion into engagement with either spur-wheel, substantially as specified.

2. In a well-drilling machine, the combination of a driving-shaft, a pinion mounted thereon, a spur-wheel, a crank-wheel connected therewith and adapted to be driven thereby, a pitman connecting the crank-wheel with a cross-head provided with mechanism adapted to engage with the drill-stock or a cable connected therewith, a rope-spool and a spur-wheel connected therewith, with an eccentric adapted to throw the pinion into engagement with either spur-wheel, substantially as specified.

3. In a well-drilling machine, the combination of a driving-shaft, a balance-wheel thereon, a drum carrying the sand-bucket rope, and a friction-wheel connected with the drum with a sliding box carrying the drum-shaft, and a lever connected with and adapted to actuate the sliding box for the purpose of bringing the friction-wheel into engagement with the balance-wheel, substantially as and for the purpose specified.

4. In a well-drilling machine, the combination of the driving-shaft a, balance-wheel B, brake r^3, drum R, carrying the sand-bucket rope, and friction-wheel r', with a sliding box, r^2, and a lever, r^3, connected with and adapted to actuate the sliding box for the purpose of bringing the friction-wheel into engagement with the balance-wheel, substantially as and for the purpose specified.

5. In a well-drilling machine, the combination of the driving-shaft a, pinion C, spur-wheel F, connected with and adapted to actuate the cross-head K, spur-wheel G, connected with and adapted to actuate the rope-spool, balance-wheel B, and friction-wheel r', connected with the sand-bucket spool, with the eccentric D, substantially as and for the purpose specified.

6. In a well-drilling machine, the combination, with a reciprocating cross-head provided with mechanism adapted to engage with a cable carrying the drill-stock, of a rope supporting the cable carrying the drill-stock and connected to the cable by a swivel, and a clamp for rotating the cable, substantially as specified.

7. In a well-drilling machine, the combination, with a reciprocating cross-head provided with mechanism adapted to engage with a cable carrying the drill-stock, of a spring-pulley adapted to take up the slack in the cable, substantially as specified.

8. In a well-drilling machine, the combination, with a reciprocating cross-head provided with mechanism adapted to engage with a cable connected with the drill-stock, of a drum carrying a rope which supports the cable and mechanism for paying out the rope, substantially as specified.

9. In a well-drilling machine, the combination, with a reciprocating cross-head provided with mechanism adapted to engage with a cable connected with the drill-stock, of a drum carrying a rope which supports the cable, a swivel connecting the rope with the cable, and mechanism for rotating the cable, substantially as specified.

10. In a well-drilling machine, the combination of a reciprocating cross-head provided with mechanism adapted to engage with a cable carrying the drill-stock, and a drum carrying a rope which supports the cable, with mechanism for paying out the rope, and mechanism for actuating the drum for the purpose of raising or lowering the drill, substantially as specified.

11. In a well-drilling machine, the combination of a reciprocating cross-head adapted to engage with a cable carrying the drill-stock, with a rope supporting the cable, a drum to which the rope is connected, and a spring-pulley adapted to take up the slack in the cable substantially as specified.

12. In a well-drilling machine, the combination of a reciprocating cross-head provided with mechanism adapted to engage with a cable carrying the drill-stock, with a spring-pulley, a yoke suspended from the spring-pulley and supporting a sheave, and a rope supporting the cable and taking over said sheave, substantially as specified.

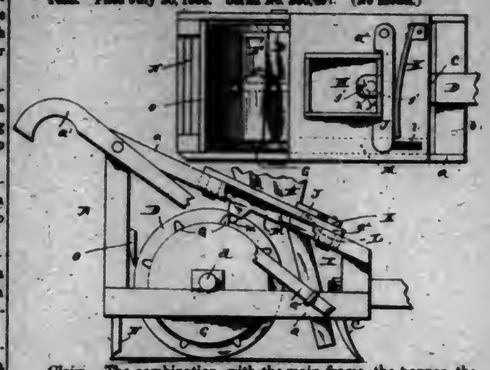
13. In a well-drilling machine, the combination of a reciprocating cross-head provided with mechanism adapted to engage with a cable carrying the drill-stock, with a spring-pulley, a yoke suspended from the spring-pulley and supporting a sheave, elastic bumpers beneath said yoke, and a rope supporting the cable and taking over said sheave, substantially as specified.

14. In a well-drilling machine, the combination of a reciprocating cross-head provided with mechanism adapted to engage with a cable connected with the drill-stock, a rope supporting the cable, a spring-pulley adapted to take up the slack in the cable, and a cord whereby the tension of said spring-pulley may be increased or decreased, substantially as specified.

15. The combination, in a well-drilling machine, of a reciprocating cross-head, an externally-threaded temper-screw, a clamp adapted to lock the temper-screw to a cable supporting the drill-stock, and a nut journaled in the cross-head and supporting the temper-screw, with mechanism for locking the nut to the temper-screw, substantially as specified.

16. The combination, in a well-drilling machine, of a reciprocating cross-head, an externally-threaded temper-screw, a clamp adapted to lock the temper-screw to a cable supporting the drill-stock, and a nut journaled in the cross-head and supporting the temper-screw, with mechanism for locking the nut to the cross-head, substantially as specified.

17. The combination, in a well-drilling machine, of a reciprocating cross-head, an externally-threaded temper-screw, and a clamp adapted to lock the drill-stock to a cable supporting the drill-stock, with mechanism for locking the nut to the temper-screw or to the cross-head, substantially as specified.



18. The combination, in a well-drilling machine, of a reciprocating cross-head, a temper-screw journaled therein, a clamp adapted to lock the temper-screw to a cable supporting the drill-stock, and mechanism for rotating the temper-screw, substantially as specified.

19. In a well-drilling machine, the temper-screw T, clamp t, nut k', and means for rotating the temper-screw, in combination with the eccentric c^6, substantially as and for the purpose specified.

20. The grip U, consisting of pivoted jaws u, having recesses u', the arm u^3, and the link u^2, connecting the outer jaw with the arm, substantially as and for the purpose specified.

21. The grip U, consisting of pivoted jaws u, having recesses u', the link u^2, arm u^3, and catch u^4, substantially as and for the purpose specified.

399,460. SEED-DRILL. MILLARD F. WHITE, Gleason Station, Tenn. Filed July 20, 1888. Serial No. 280,497. (No model.)

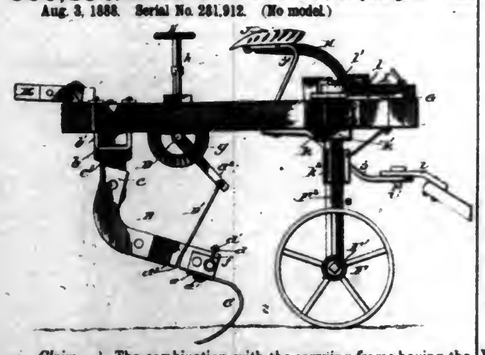
Claim.—The combination, with the main frame, the hopper, the dropping-tube communicating with the hopper through its bottom, the furrow-opener in front of said tube, the pivoted lever J, having the perforated extension passing into a slot in the front of the hopper and provided with the pin L, passing through the slot l, and the slide-bar M, pivoted to the pin L, and having the depending pin m, of the cylinder D, journaled upon the main frame, provided with the door F and discharge-openings d^3, and having the tappets G in a circumferential rabbet at one of its ends, as specified.

399,461. WASH-STAND. EDWARD W. WOODRUFF, Washington, D. C. Filed Sept. 13, 1887. Serial No. 249,562. (No model.)

Claim.—1. As a new article of furniture, the stand A, provided with the wash hand-basin below the top b, a receptacle for a slop-water jar or pail, and two reservoir-tanks, f and g, one at each side of said basin and elevated above and overhanging the slab b, as set forth, said tanks having their inner forward corners removed to permit free access to the basin.

2. In a portable wash-stand, the combination, with the stand A, of a sliding draw-out commode arranged as a drawer in said stand, having a seat, and the sliding imperforate cover above the latter fitted with a foot-rest and adapted to hold implements for blacking shoes, substantially as set forth.

3. In a portable wash-stand, the combination, with the stand A, of a sliding draw-out commode having a chamber-receptacle, a seat, the sliding imperforate cover above the latter fitted with a foot-rest and adapted to hold a blacking box and brushes, and the hinged front piece adapted to be turned up to form a closed drawer, or to be turned down to permit access to the foot-rest and the removal of the sliding cover and access to the commode, substantially as set forth.



4. In a portable wash-stand, the basin *d*, attached to the slab *b*, combined with an open trough, *m*, supported below the basin, to catch the waste water and conduct it to the slop-pail, the waste-valve for the basin, and the actuating-lever Q below and connected with said valve and above the trough.

5. In a wash-stand, the soap-cup *h*, indented, provided with a drip-hole perforated through the slab, and a surrounding groove, *a*, in the under side of said slab, to prevent drippings from running away on the under surface, as set forth.

6. In a portable wash-stand, the combination of the reservoir tank or tanks carried by the stand, the slab *b*, the basin below the latter, the plug or valve *p*, provided with a pendent stud, a pivoted lever engaging said stud and provided with a hand-lift, the open trough *m* below said plug and lever, and a compartment for the waste-water receiver below the basin, substantially as set forth.

7. In a portable wash-stand, the basin *d*, attached to the slab *b*, combined with a waste-pipe for said basin having its lower end open and accessible, the waste-valve for the basin, the valve-stem situated in said drain-pipe, and the transverse actuating-lever Q, situated below the open end of the drain-pipe and connected with said valve-stem through said open end, and an operating-handle for said lever.

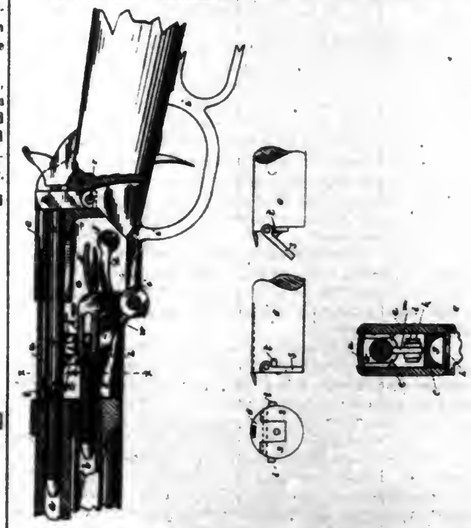
399,462. SULKY-PLOW. JOHN H. ZEIN, Gettysburg, Pa. Filed Aug. 3, 1888. Serial No. 281,912. (No model.)

Claim.—1. The combination, with the carrying-frame having the longitudinally-slotted bar applied thereto, of the pendants or posts having tenon-like projections fitting in the slot of said bar and provided with screws fitted with nuts, and the plow-beams provided at their inner ends with socket-forming plates articulated or pivoted to said pendants or posts, substantially as set forth.

2. The combination, with the plow-beams and the plows, of the clips secured to said beams at their outer or rear ends, the slotted cross-bars connecting said beams, and adjusting-screws to effect the holding of both the shanks of the plows and the cross-bars, substantially as specified.

3. The combination, with the carrying-frame, of the plow-beams applied thereto, the slotted bar or yoke *d*, adjustably securing said beams, the sockets or clips *e*, holding the plow-shanks, and eyebolts *f*, receiving bolts from said beams and connecting with said slotted bars or yokes *d*, substantially as and for the purpose described.

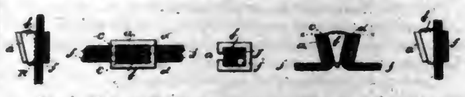
4. The combination, with the carrying-frame provided with plows, of the roller having its tongue or pole provided with a deflected or angled plate having a pin or stud engaging with an apertured step-like plate applied to the carrying-frame, substantially as set forth.



5. The combination, with the carrying-frame, of the wheels borne by axles having spindles applied to said frame and provided with levers connected or linked together, a hand-lever for actuating the link or connecting medium between the aforesaid levers, the pawl or detent engaging with a ratchet positioned upon the carrying-frame, which pawl or detent is disposed to move edgewise in a guide or clip secured upon parallel bars or pieces of the frame, and which pawl or detent is actuated by a crank-lever linked thereto, substantially as set forth.

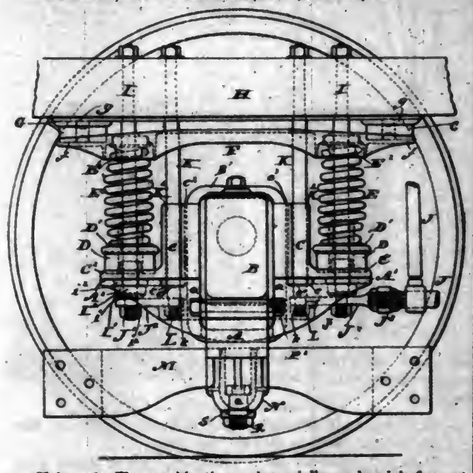
399,463. FIRE-KINDLER. EDWARD ZOEKER, Corunna, Ind. Filed Sept. 26, 1888. Serial No. 286,405. (No model.)

Claim.—In a fire-kindler, the conical receptacle B, having its ends open and composed of a series of integral coils of wire arranged in contact and increasing regularly in diameter from the apex to the base, the stem or handle connected directly to the base of the receptacle and consisting of the strands E E', arranged in contact, and the strand F, coiled around the wires E E', and the strengthening-wire H, extending axially through the receptacle and connecting the base thereof to the apex, substantially as specified.



399,464. MAGAZINE FIRE-ARM. ROBERT M. AUSHENBAUGH, Beaver, and GEORGE R. RUFFLEY, Glenfield, Pa. Filed May 29, 1888. Serial No. 275,527. (No model.)

Claim.—1. In a magazine fire-arm, the combination of an endwise-movable breech-bolt having the parallel slotted arms *m* depending therefrom near its front end, a pivoted lever, *i*, the carrying-block *c*, having the rearward-extending arms *d* pivoted at a point in rear of the fulcrum of the lever, the horizontal slotted levers *k*, arranged above the carrying-block when the latter is in position to receive a cartridge from the magazine, and having the depending vertical arms at their rear ends, which are secured to the lever *i*, a vertically movable block, *l*, fitted in the parallel vertical slots of the arms *m*, and having pins fitted in the horizontal slots of the levers *k*, and an arm, *w*, carried by the lever, for the purpose of raising the carrying-block *c*, substantially as and for the purpose described.



2. The combination of an endwise-movable breech-bolt, an ejector plate, *s*, pivoted at its upper edge to the front end of said breech-bolt, and having laterally-extending lugs *t* projecting from opposite sides of said ejector-plate, near the pivot thereof, and fixed lugs on the frame of the gun and arranged on opposite sides of the breech-bolt, in the path of the lugs *t* on the ejector-plate, whereby when the breech-bolt is suddenly drawn rearward the lugs *t* will be suddenly struck by the fixed lugs to raise the ejector-plate forcibly and expel the shell, substantially as described.

399,465. WIRE-COUPLING. WILLIAM BAINBRIDGE, Omaha, Nebr. Filed Aug. 26, 1888. Serial No. 283,715. (No model.)

Claim.—The combination, in a wire-coupling, of a sleeve provided with a central chamber larger at one end than at its opposite end, and having straight inner walls inclined toward each other throughout the length of the sleeve, a wedge having an inclined exterior surface corresponding with the inner walls of the sleeve, and wires interposed between the wedge and sleeve, in the manner and for the purpose described.

399,466. CAR-TRUCK. WILLIAM S. G. BAKER, Baltimore, Md. Filed June 7, 1888. Serial No. 276,368. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the car-body, the axle-box, the supporting-springs, the spring-carriage supporting the springs, means for supporting the spring-carriage from the axle-box, and supports for holding the springs when the spring-carriage is removed.

2. The combination, substantially as hereinbefore set forth, of the car-body, the axle-box, the spring-carriage, means for supporting the spring-carriage from the axle-box, the springs connected with the car-body and resting on the spring-carriage, the post extending through the springs and connected to the carriage, and the supports for holding the springs when the spring-carriage is removed.

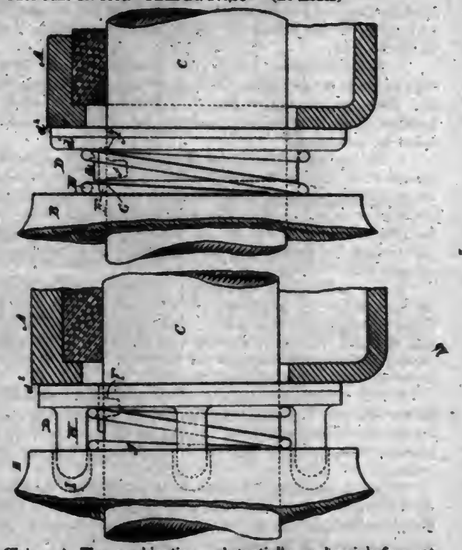
3. The combination, substantially as hereinbefore set forth, of the car-body, the axle-box, the spring-carriage supported by the axle-box, the springs connected to the car-body and resting on the spring-carriage, the posts extending through the springs, the guide-blocks, the guide-posts extending through the guide-blocks, and means for holding the springs in position on the posts independent of the carriage.

4. The combination, substantially as hereinbefore set forth, of the car-body, the axle-box, the spring-carriage supported by the axle-box, the springs connected with the car-body and resting on the spring-carriage, the guide-blocks, and the guide-posts connected with the car body and extending through the guide-blocks.

5. The combination, substantially as hereinbefore set forth, of the car-body, the axle-box, the spring-carriage supported thereon, the supporting-springs resting on the carriage, the spring-posts connected to the car-body extending through the springs and through the spring-carriage, the brace-rods having a short section connected to the lower ends of the spring-posts, and devices for securing the section of the brace-rods to the remaining portions of the braces near their junction with the spring-posts and for removing the short section without removing other parts of the braces.

6. The combination, substantially as hereinbefore set forth, of the car-body, the axle-box, the spring-carriage supported thereon, the supporting-springs resting on the carriage, the spring-posts connected to the car-body extending through the springs and through the spring-carriage, the guide-blocks, the guide-posts, the brace-rods having a short section connected to the lower ends of the spring-posts and to the guide-posts, and devices for securing the section of the brace-rods to the remaining portions of the braces near their junction with the spring-posts and the guide-posts.

7. The combination, substantially as hereinbefore set forth, of the axle or axle-box, the hanger supported thereby, the grip-bar seated in the hanger, the spring-carriage, and means independent of the grip-bar hanger for supporting the spring-carriage.



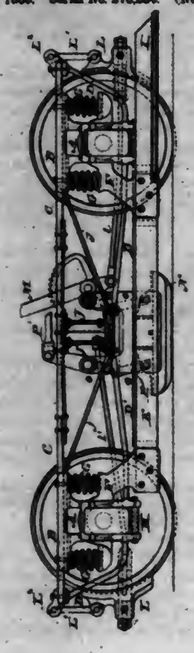
8. The combination, substantially as hereinbefore set forth, of the axle or axle-box, the hanger supported thereby, and the grip-bar flexibly supported in the hanger.

9. The combination, substantially as hereinbefore set forth, of the axle-box, the saddle supported thereby, the hanger secured to the saddle, and the grip-bar seated in the hanger.

10. The combination, substantially as hereinbefore set forth, of the axle-box, the hanger supported thereby, the grip-bar seated in the hanger, and means for limiting the movement of the grip-bar in the hanger.

11. The combination, substantially as hereinbefore set forth, of the car-body, the axle-box, the springs, the spring-carriage, the braces, the guide-blocks, and the guide-posts extending through the guide-blocks.

399,467. CAR-AXLE BOX. WILLIAM S. G. BAKER, Baltimore, Md. Filed June 19, 1888. Serial No. 277,510. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the axle-box, the axle, the dust-guard that bears against the axle-box, and the tongue or key on the axle which fits in a groove or keyway in the dust-guard.

2. The combination, substantially as hereinbefore set forth, of the axle-box, the axle, the spring-actuated dust-guard that bears against the axle-box, and the T-shaped tongue or key resting in a socket in the axle, and which fits in a groove or keyway in the dust-guard.

3. The combination, substantially as hereinbefore set forth, of the axle-box, the car-wheel, the axle, the dust-guard that bears against the end of the axle-box, devices for directly connecting the dust-guard to the wheel, and the tongue-and-groove connection between the guard and axle.

399,468. CAR-TRUCK. WILLIAM S. G. BAKER, Baltimore, Md. Filed June 26, 1888. Serial No. 278,235. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the car-axle boxes, the grip-frame, and the brackets secured to the grip-frame and resting on the axle-boxes.

2. The combination, substantially as hereinbefore set forth, of the axle-boxes, the grip-frame, the brackets secured to the grip-frame and resting on the axle-boxes, and the car-springs resting in seats on the brackets.

3. The combination, substantially as hereinbefore set forth, of the axle-boxes, the grip-frame, the brackets secured to the grip-frame and resting on the axle-boxes, the pedestals through which the brackets extend, and the bolts connecting the arms of the pedestals below the axle-boxes.

4. The combination, substantially as hereinbefore set forth, of the axle-boxes, the grip-frame, the brackets secured thereto and resting on the axle-boxes, the pedestals having side openings through which the brackets extend and having seats in which the brackets rest when the axle-boxes are removed, the car-supporting springs mounted on the brackets, and devices for connecting the lower ends of the pedestal-arms below the axle-boxes.

5. The combination, substantially as hereinbefore set forth, of the car-axle box, the grip-frame, and a bracket secured to the grip-frame, extending over the axle-box and resting in a transversely-curved seat formed in the top of the box over the center of the journal-bearing, said bracket at its upper end being free to rock transversely across the box in the curved seat thereof.

6. The combination, substantially as hereinbefore set forth, of the axle-box, the bracket resting thereon, the grip-frame secured to the lower bifurcated end of the bracket, the pedestal in which the axle-box is mounted, and the rods for bracing the lower end of the pedestal.

7. The combination, substantially as hereinbefore set forth, of the brackets, the axle-boxes on which the brackets rest, the grip-frame secured to the brackets, and the life-guards secured to the grip-frame at the lower ends of the brackets.

8. The combination, substantially as hereinbefore set forth, of the car-wheels, the wheel-brakes, the jointed levers connecting opposite wheel-brakes on the same side of the car-truck, the rock-shaft *s'*, the operating-lever, connections between the operating-lever and the rock-shaft, and connections between the rock-shaft and the jointed levers between the brakes.

9. The combination, substantially as hereinbefore set forth, of the car-wheels, the grip-frame, the wheel-brakes, the brake-beams connecting similar brakes on opposite sides of the truck, the jointed levers connecting the brake-beams, hinged link-supports for the upper ends of the brake-shoes, a rock-shaft, an operating-lever, jointed hinged connections between the operating-lever and the rock-shaft, and connections between the rock-shaft and the levers connecting the brake-beams.

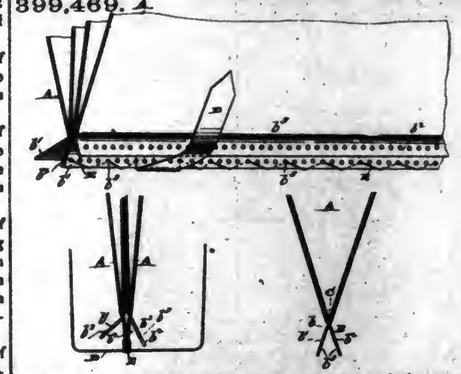
10. The combination, substantially as hereinbefore set forth, of the grip-frame, the track-brake, and yielding connections between the grip-frame and the track-brake, whereby the brake is normally withdrawn from the track.

11. The combination, substantially as hereinbefore set forth, of the frame, the track-brake, the vertical posts secured to the brake and extending through the frame, the adjusting-nuts, and springs interposed between the adjusting-nuts and the frame.

12. The combination, substantially as hereinbefore set forth, of the frame, the track-brake, yielding connections between the track-brake and frame, whereby the brake is normally withdrawn from the track, the rock-shaft, the jointed levers connecting the track-brake to the rock-shaft, and a lever secured to the rock-shaft for operating the brake.

13. The combination, substantially as hereinbefore set forth, of the grip-frame, the track-brakes, the grip-housing, the shafts mounted in bearings in the grip-frame and in the grip-housing, the jointed lever, connections between the brakes and the shafts, the operating-lever connected to the shafts, the rock-shaft, and connections between the operating-lever and the rock-shaft.

14. The combination, substantially as hereinbefore set forth, of the grip-frame, the track-brakes yieldingly connected to the grip-frame, the grip-housing, the shafts mounted in bearings in the grip-frame and in the grip-housing, the jointed lever-connections between the brakes and the shafts, the operating-lever connected to the shafts, the rock-shaft, and connections between the operating-lever and the rock-shaft.



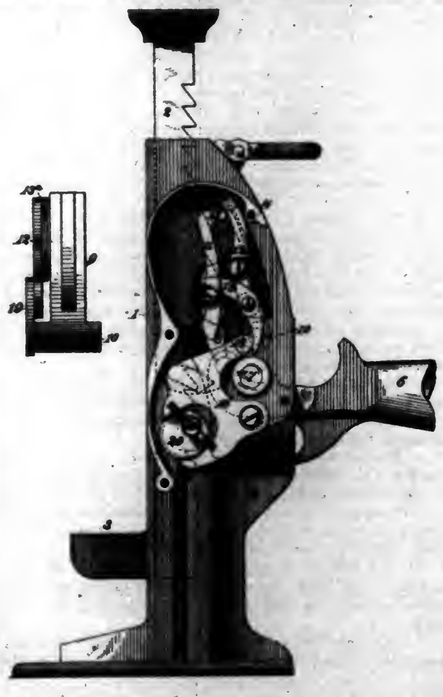
399,469. BOOK. GEORGE D. BARNARD, St. Louis, Mo. Filed Mar. 2, 1888. Serial No. 265,973. (No model.)

Claim.—1. The herein-described book-guards, the same consisting of a strip folded, stiffened, and perforated, as set forth.

2. The combination of the straps, the guards, and the signatures, said guards being perforated and the guards connected with each other and with the straps, substantially as described.

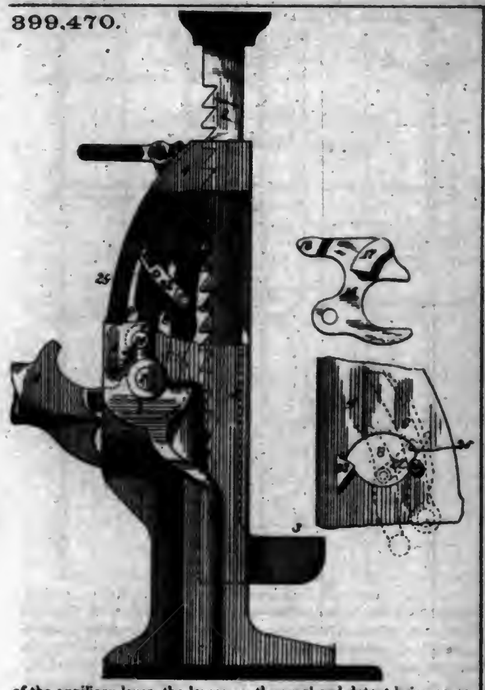
3. The combination of the straps, the guards, and the signatures,

399,469.



said guards being folded, stiffened, and perforated, and the guards being connected with each other and with the straps, substantially as described.

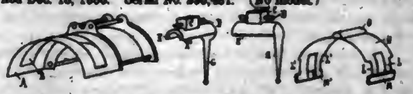
399,470. LIFTING-JACK. JOHAN BARRETT, Allegheny, Pa. Filed Oct. 26, 1888. Serial No. 289,196. (No model.)



Claim.—1. A toothed bar, in combination with a pivotal lever, a pawl pivoted to said lever, a detent pivoted to the frame, and spring-actuated levers pivoted to said pawl and detent, and having their upper ends rigidly supported as against the action of their actuating-springs, substantially as set forth.

2. A toothed bar, in combination with a pivoted operating-lever, a pawl pivoted to said lever, a detent pivoted to the frame, spring-actuated levers pivoted to said pawl and detent, an auxiliary lever pivoted to the lower end of the spring-actuated lever on the detent, a stud or projection on the pawl adapted to engage one end of the auxiliary lever, a movable tripping-plate having a cam-lug, and a stop or shoulder respectively adapted in certain positions of the plate to engage and shift the lower end of the pawl and to hold one end of the auxiliary lever as against inward movement, substantially as set forth.

3. A toothed bar, in combination with a pivoted operating-lever, a pawl pivoted to said lever, a detent pivoted to the frame, spring-actuated levers pivoted to said pawl and detent, an auxiliary lever pivoted to the spring-actuated lever of the detent below its pivotal point, and a stud or projection on the pawl adapted to engage one end



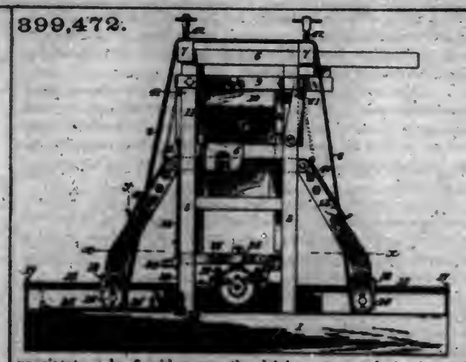
399,470.

of the auxiliary lever, the levers on the pawl and detent being so arranged, as described, that when rigidly at their upper ends, as against the action of their springs, they will operate to hold the pawl and detent against the toothed bar, and when the lower end of the pawl and the ends of the auxiliary lever are similarly supported they will cause the pawl and detent to move away from the toothed bar, substantially as set forth.

4. A toothed bar, in combination with a pivoted operating-lever, a spring-actuated pawl pivoted to said lever, a spring-actuated detent pivoted to the stationary frame, said detent being arranged outside of the pawl, a tripping-dog pivoted to the pawl, and a stop or shoulder on the frame with which said dog can in certain positions engage and operate to force the pawl and detent away from the toothed bar, substantially as set forth.

399,471. WAGON-BRAKE. AUGUSTE C. T. BAUTAIN, Paris, France. Filed Dec. 13, 1888. Serial No. 293,431. (No model.)

Claim.—1. The combination, in a friction-brake for vehicles, of the retaining-plate A, the curved plate H, the block C, having a lever, G, and adapted to rock on the curved plate, the friction-bands P P', having cramps Q Q', the draft-band R, connected at its ends with the rocking block, and means for operating the lever, substantially as described.



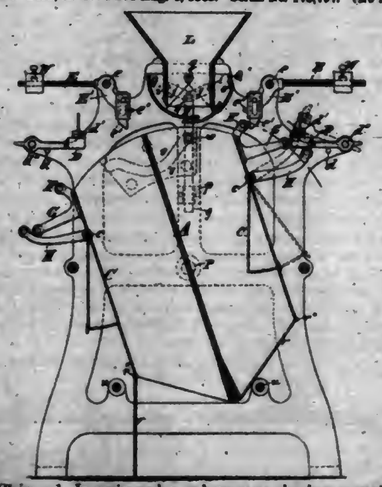
2. The combination, in a friction-brake for vehicles, of a stationary retaining-plate, A, having a slot, B, a curved plate, H, having separated fingers connected by end plates M M', rocking block C, supported by the curved plate and having a pin, D, and a projecting lever, G, the separated friction-bands P P', connected by end plates N N', provided with cramps Q Q', the draft-band R, located between the friction-bands provided with stops T T', and having end links, S S', connected with the pin of the rocking block, and means for operating the lever of the rocking block, substantially as described.

3. The combination, in a friction-brake, of a retaining-plate, A, a curved plate, H, having end plates M M', a rocking block, C, the friction-bands P P', having end plates N N', the draft-band R, between the friction-bands, connected at its ends with the rocking block, and means for operating the block, substantially as described.

399,472. BALING-PRESS. ELWOOD BEARDS, Centre Star, Ala. Filed Aug. 4, 1888. Serial No. 281,971. (No model.)

Claim.—1. The combination of the compressing-arms, the cross-bar connecting their upper ends, the follower on said cross-bar, the endless screws actuating said arms, the bevel-wheels upon the inner

399,472.



proximate ends of said screws, the driving counter-shaft at a right angle therewith, the interposed adjustable bevel-gear, the reversing-lever controlling said gear, the lateral springs actuating said lever, and the plate having notches engaging the free end of the lever, substantially in the manner and for the purpose herein set forth.

2. The combination of the compressing-arms, the cross-bar connecting their upper ends, the follower on said cross-bar, the endless screws actuating said arms, the bevel-wheels upon the inner proximate ends of said screws, the driving counter-shaft at a right angle therewith, the interposed adjustable bevel-gear, the reversing-lever controlling said gear, the lateral springs actuating said lever, the plate having notches engaging the free end of the lever, the vertical reciprocating rod having a bent end underlying the notch in said plate which engages the end of the lever when the counter-shaft is geared to the screws to move the follower upward, and the arm from said rod intersecting the path of the cross-arm carrying the follower, all substantially in the manner and for the purpose herein set forth.

3. The combination, in a cotton or hay press, of the compressing-arms, the horizontal cross-bar connecting their upper ends, the follower carried by said cross-bar, the endless screws actuating said compressing-arms, the bevel-wheels upon the inner proximate ends of said screws, the driving counter-shaft at a right angle therewith, the interposed adjustable bevel-gear, the reversing-lever controlling said gear, the lateral springs actuating said lever, the plate having notches engaging the free end of the lever, an angular lever pivoted to swing vertically and having one arm underlying the notch in said plate that engages the end of the lever when the counter-shaft is geared to the screws to move the follower downward, a second angular lever pivoted on the bed-plate to swing horizontally, a link coupling the two, and a rod extending from the free arm of said horizontal lever outward parallel with the proximate endless screw and terminating in an arm in position to be engaged by the lower end of the compressing-arms traversing said screw, all substantially in the manner and for the purpose herein set forth.

399,473. GRAIN SCALE AND MEASURE. R. JOHN M. BECKER, New York, N. Y. Filed Aug. 6, 1888. Serial No. 173,797. (No model.)

Claim.—1. In grain scales and measures having an oscillating box, a lever-detent connected with the box and adapted to be actuated

by the quantity of grain received into the compartment above a determined level and arranged to engage with a catch on the frame of the box to hold the box in an inclined position, in the manner described, and for the purpose set forth.

2. In grain scales and measures having an oscillating box, a measuring-detent consisting of the lever C H, connected with the box and adapted to be actuated by the quantity of grain received into the compartment above a determined level, and the catch D, arranged to engage with and hold the box, in the manner described, and for the purpose set forth.

3. In grain scales and measures, an oscillating prismatic box having straight sides divided into compartments, and having at the bottom thereof doors constructed in the arc of a circle whose center is the fulcrum on which the box oscillates, and operating in the manner and for the purpose set forth.

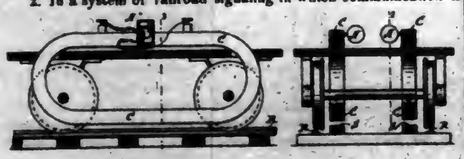
4. In grain scales and measures, the combination of the oscillating receiver A, having the groove V, with the spout L, provided with the doors Q, operated by the rod *g*, adapted to engage with the groove V and with the doors Q, substantially in the manner described, and for the purpose set forth.

5. In grain scales and measures, the combination, with the oscillating box A, supported on a fixed frame so as to turn, substantially as described, and having the projection F, of the scale-beam E, having the weight W, and arranged to hold and release the box, substantially as and for the purposes set forth.

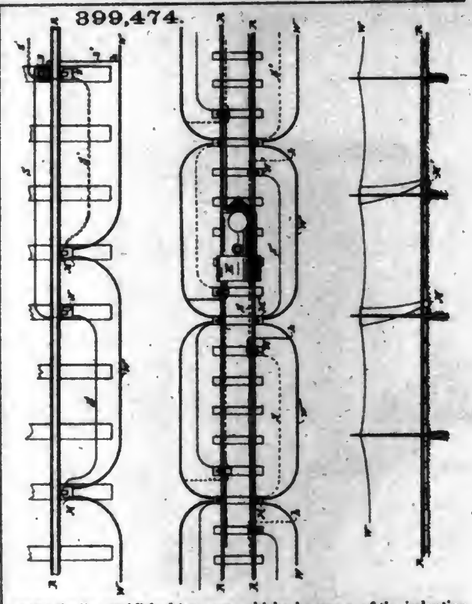
6. In grain scales and measures, the combination, with the box A, hung on the pivots P on a fixed frame, so as to oscillate, substantially as described, and having the projection F, of the weighing-detent consisting of the scale-beam E, having the weight W, and the detent E', provided with the nib *e'*, adapted and arranged to hold and release the box, substantially as described, and for the purpose set forth.

7. In grain scales and measures, the combination, with the oscillating box A, provided with the projection F, and having doors on its lower end constructed in the arc of a circle whose center is the point of support of the box, of the spout L, provided with the doors Q, operated by the rod *g*, arranged to engage with the doors and with the groove V on the side of the box, and of the detent consisting of the beam E, having the weight W, and detent E', provided with the nib *e'*, substantially as and for the purpose set forth.

8. In grain scales and measures, the combination, with the box A, hung on pivots on a fixed frame, so as to oscillate in the manner described, and having the projection G, swinging section C, and arm H, of the detent D, pivoted to the frame supporting the box, and arranged to engage with the projection G to hold the box, and adapted to be released from engagement by the arm H, substantially as and for the purposes set forth.



9. In grain scales and measures, the combination, with the box A, hung on pivots on a fixed frame, so as to oscillate in the manner described, and having the projections F and G, the swinging section C, and arm H, of the detent E E', adapted to engage with the projection F, and the detent D, adapted to engage with the projection G and be released by the arm H, substantially as described, and for the purpose set forth.



10. In grain scales and measures, the combination of the oscillating box A, provided with the projections F and G and having the lever C H, and doors at its lower end constructed in the arc of a circle whose center is the point of support of the box, of the detent E E', adapted to engage with the projection F, and of the detent D, adapted to engage with the projection G and be released by the detent-lever C H, and of the spout L, provided with the doors Q, operated as described, substantially as and for the purpose set forth.

399,474. RAILROAD SIGNALING DEVICE. FRANK P. BENJAMIN, New York, N. Y. Filed Feb. 11, 1888. Serial No. 263,717. (No model.)

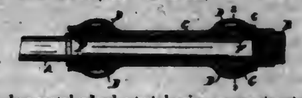
Claim.—1. In a system of railroad-signals in which communication between vehicles is automatically established by means of the inductive effects of a current of electricity, the combination of a plurality of separate and independent local circuits arranged on both sides of the track, a vehicle carrying a plurality of conductors respectively parallel to and in inductive relation to different portions of said local circuits, said local circuits carrying make and break devices in the path of a moving vehicle for the purpose of signaling both ahead and behind it, and an electrical generator the current from which is automatically cut into and out of said local circuits by said make and break devices, substantially as described.

2. In a system of railroad signaling in which communication is

automatically established between vehicles by means of the inductive effects of a current of electricity, the combination of a vehicle having a plurality of conductors, each including instruments for receiving signals, and a plurality of local circuits arranged on both sides of the track parallel to and in inductive relation to said vehicle-conductors, respectively, substantially as described.

3. In a system of railroad-signals in which communication between trains is automatically established by means of the inductive effects of a current of electricity, the combination of a vehicle carrying a conductor with instruments for receiving signals, a local circuit arranged along the line, one part of which is parallel to and in inductive relation to said vehicle-conductor, and another part of which, carrying make and break devices in the path of a moving vehicle, is out of inductive relation to said vehicle-conductor, and an electrical generator, the current from which is cut into and out of said local circuits by said make and break devices, substantially as described.

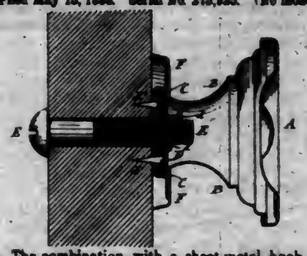
4. In a system of railroad signaling in which communication is established between vehicles by means of the inductive effects of a current of electricity, the combination of a vehicle carrying a conductor with signaling-instruments, and a plurality of separate and independent local circuits arranged along the line in inductive relation thereto, said local circuits being overlapped, substantially as and for the purpose set forth.



5. In a system of railroad signaling in which communication between vehicles is established by means of the inductive effects of a current of electricity, the combination of a vehicle carrying a conductor with signaling-instruments, and a plurality of separate and independent local circuits arranged along the line in inductive relation thereto having make and break devices in the path of a moving vehicle, said local circuits being overlapped, substantially as described.

6. In a system of railroad-signals in which communication between trains is automatically established by means of the inductive effects of a current of electricity, the combination of a vehicle having a conductor with instruments for receiving signals, a plurality of local circuits arranged along the line, parts of which are parallel to and in inductive relation to said vehicle-conductor and other parts of which, carrying make and break devices, are out of inductive relation to said vehicle-conductor, said local circuits being overlapped, and an electrical generator the current from which is cut into and out of said local circuits by said make and break devices, substantially as described.

7. In a system of railroad signaling in which communication between vehicles is automatically established by means of the inductive effects of a current of electricity, the combination of a vehicle having a plurality of conductors, each including instruments for receiving signals, and a plurality of local circuits overlapped and arranged on both sides of the track in inductive relation to said vehicle-conductors, respectively, substantially as described.

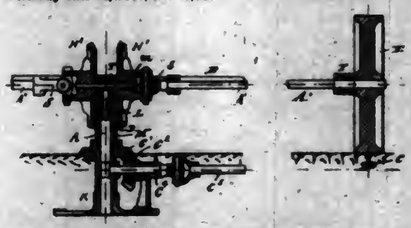


8. In a system of railroad signaling, the combination of a plurality of local circuits, each circuit including make and break devices, and a make-and-break device common to a plurality of said circuits, whereby when the circuit is completed in one of said local circuits it is automatically broken in the other, substantially as described.

399,475. WHEEL. ERNST M. BENNETT, Toledo, Ohio. Filed Sept. 10, 1888. Serial No. 285,043. (No model.)

Claim.—In a metal wheel, a hub having an annular chamber upon each end thereof, formed of an integral concentric portion having recesses upon the outer edge, and correspondingly formed caps having coincident recesses, in combination with return-spokes partially embracing the body portion of the hub and passed through the recesses, as and for the purpose set forth.

399,476. SHEET-METAL KNOB. JULIUS BERDUCHER, New York, N. Y. Filed May 15, 1888. Serial No. 273,925. (No model.)



Claim.—The combination, with a sheet-metal knob the base of which is provided with a re-enforcing plate having a central screw-tap and one or more bent-up prongs made integral with said plate, of a washer extending around the base of the knob, having holes registering with said prongs, and a fastening-screw passing through said washer and engaging the screw-tap of the re-enforcing plate, substantially as set forth.

399,477. BOTTLE-CLEANING MACHINE. BARTHOLOMEW BENNINGTON, Hull, County of York, England. Filed Oct. 9, 1888. Serial No. 287,610. (No model.) Patented in England Oct. 22, 1887, No. 14,305.

Claim.—In a bottle-cleaning machine, the combination of the soaking-vessel A, the horizontal shaft journaled therein and having radial arms, and the containing-boxes pivotally suspended from the outer ends of the said radial arms and divided into compartments adapted to receive the bottles with their mouths upward, whereby the bottles constantly remain in an upright position, and are submerged, filled, and raised from the liquid in the tank by the rotation of the shaft, all substantially as shown and set forth.

399,478. HORSE-POWER. CARL V. BIRK, Borup, Denmark. Filed Nov. 1, 1888. Serial No. 289,717. (No model.) Patented in England Sept. 24, 1888, No. 13,777; in France Dec. 3, 1888, No. 190,680, and in Germany Jan. 14, 1889, No. 46,642.

Claim.—1. In a horse-power, the combination, with a spindle, of a sleeve on the same, a cross-bar on said sleeve, beams secured to the ends of said cross-bar and inclined toward each other, bearings secured to the outer meeting ends of said beam, shafts journaled in said bearings, and wheels secured on the outer ends of the shaft and running on a suitable support, cog-wheels connected with the inner ends of the shafts, and a cog-wheel mounted loosely on the spindle and engaged with the cog-wheels on the inner ends of the shafts, substantially as set forth.

2. In a horse-power, the combination, with an upright spindle, A, of the sleeve L on the same, the cross-piece T on the sleeve L, beams B, secured to the cross-piece C and to bearings F, the shafts A', journaled in the bearings F, wheels E, fixed on the outer ends of the shafts A, the beveled cog-wheels H' H², connected with the inner ends of the shafts A', the transverse bolt *m* in the cross-bar T, on which bolt *m* the wheels H' H² are mounted, and the cog-wheel D, loosely mounted on the spindle A, substantially as set forth.

399,479. ALIZARINE-GREEN. RENÉ BOHN, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Oct. 13, 1888. Serial No. 288,429. (Specimens.)

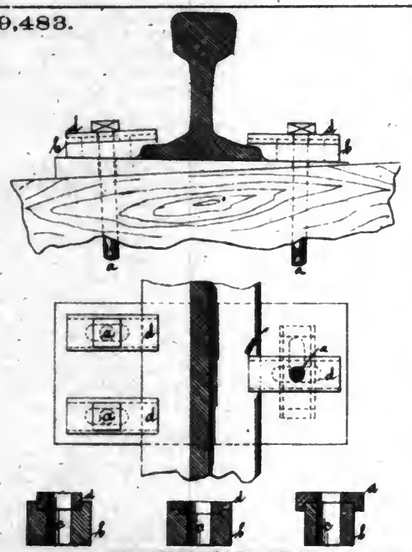
Claim.—As a new product, the coloring-matter or dye-stuff (alizarine-green) hereinbefore described, and having the following characteristics: In its free or uncombined state it appears under the form of fine bluish-gray needle-shaped crystals which are insoluble in cold water and possess only a slight degree of solubility in boiling water and in alkaline solutions; it forms blue saline compounds with alkaline carbonates and green compounds upon being mixed with caustic potash or soda liquor in excess, the compounds thus formed being quite insoluble in excess of caustic-alkaline solutions, and it produces soluble compounds with the bisulphites of potash, soda, or ammonia, which, with the aid of chrome mordants, produce shades more or less approaching a green.

399,480. ALIZARINE-BLUE SULPHO-ACID. RENÉ BOHN, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Oct. 13, 1888. Serial No. 288,431. (Specimens.)

Claim.—As a new product, the coloring-matter or dye-stuff (alizarine-blue sulpho-acid) hereinbefore described, and having the following characteristics: In its free state it is nearly insoluble in cold water, but it dissolves in much boiling water with a characteristic bluish-green color; its alkaline salts are readily soluble in water with a blue color, which, upon the addition of caustic potash or soda liquor in excess, changes into a bright green; said alkaline salts are precipitated by the addition of common salt in sufficient excess; by the addition of hydrochloric acid to an alkaline solution of alizarine-blue sulpho-acid a purple crystalline precipitate of the free acid is produced which dissolves in adequate excess of hydrochloric acid with a red color, and alizarine-blue sulpho-acid or its bisulphite compounds produce upon chrome-mordanted wool blue shades with a greenish hue.

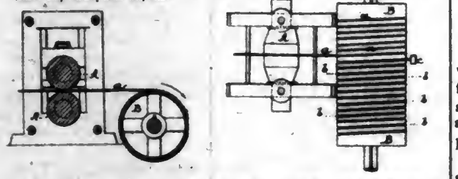
399,481. ALIZARINE-BLUE SULPHURIC ACID. RENÉ BOHN, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Oct. 13, 1888. Serial No. 288,432. (Specimens.)

Claim.—As a new product, the coloring-matter or dye-stuff (alizarine-blue sulphuric acid) hereinbefore described, and having the following characteristics: It is capable of forming two series of alkaline salts, those containing the minimum of alkali exhibiting a yellow or brown appearance, while a larger proportion of alkali effects a change of the said color into purple or blue; by adding to the purple solution a small amount of mineral or organic acid it assumes gradually the before-named yellow or brown tint; by the further addition of a mineral or organic acid the alizarine-blue sulphuric acid becomes precipitated in alizarine-like yellow flocks, and it dyes wool or other animal fiber with the aid of mordants blue.



399,482. ALIZARINE INDIGO-BLUE. RENÉ BOHN, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Oct. 31, 1888. Serial No. 289,673. (Specimens.)

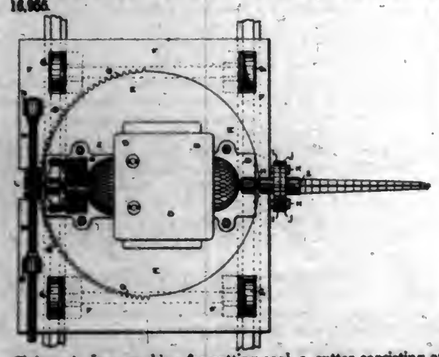
Claim.—As a new product, the coloring-matter or dye-stuff (alizarine indigo-blue) hereinbefore described, and having the following characteristics: It is insoluble in water even at the boiling-heat; it forms blue saline compounds upon treatment with caustic or carbonated alkalies, which compounds are quite insoluble in caustic-alkaline solutions; it dissolves with a bright indigo-blue color in concentrated sulphuric acid; it combines with the bisulphides of potash, soda, or ammonia, thus producing compounds soluble in water and capable of being employed in dyeing and printing; upon chrome-mordanted wool it produces shades similar to those produced by indigo-blue.



399,483. METHOD OF FIXING RAIL-CHAIRS ON TIMBER-SLEEPERS. ARPAD BOZZANO, Augsburg, Bavaria, Germany. Filed Aug. 16, 1888. Serial No. 282,904. (No model.) Patented in Germany June 16, 1888, No. 45,741; in France July 27, 1888, No. 192,010; in Belgium Aug. 14, 1888, No. 82,910; in England Aug. 16, 1888, No. 11,887; in Sweden Sept. 10, 1888, No. 1,692, and in Italy Sept. 30, 1888, XXII, 34,058, XLVIII, 34.

Claim.—The combination, with the pressing-plate *d* and the binding-plate *b*, of the screw *a*, made to pass through the perforation in the pressing-plate and through the slot in the binding-plate, said pressing and binding plates being provided with the engaging depressions and ridges running longitudinally along the connecting-faces of said plates, substantially as herein shown and described.

399,483.

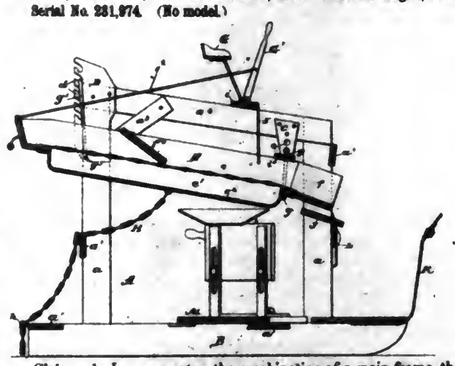


399,484. MECHANISM FOR MAKING COILS FOR METAL SKELETONS FOR COMPOSITE STRUCTURES. JEAN BORDENAVE, Paris, France. Filed Sept. 28, 1887. Serial No. 250,773. (No model.) Patented in France Mar. 10, 1887, No. 182,086; in Italy Mar. 22, 1887, XXI, 31,408, XLII, 357; in England Mar. 23, 1887, No. 4,366, and in Spain Mar. 30, 1887, No. 10,743.

Claim.—1. As a means of forming the metallic coil destined to form the skeleton of a cement pipe, the combination, with the rolls for rolling the metal bar, of a drum having the proper sectional contour rotatively mounted adjacent to said rolls, said drum having a spiral peripheral groove to receive the bar and being capable of endwise movement, substantially as set forth.

2. The combination, with the rolls A for rolling the flanged bar, of the drum B, rotatively mounted adjacent to the rolls and having a peripheral spiral groove, *b*, to receive the bar from the rolls, said drum being free to move longitudinally, and a fixed stud, as *c*, engaging the spiral groove in the drum and serving to feed the latter endwise, substantially as set forth.

399,485. MACHINE FOR CUTTING COAL. THOMAS BOWER, Hull, ROBERT W. BOWER, Leeds, and JAMES BLACKBURN, Woodlesford, County of York, England. Filed July 5, 1888. Serial No. 279,145. (No model.) Patented in England May 26, 1887, No. 7,662, and Dec. 9, 1887, No. 16,955.

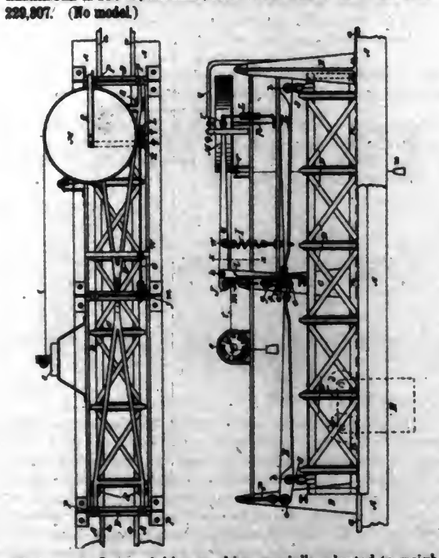


Claim.—1. In a machine for cutting coal, a cutter consisting of a tapering bar, A, provided with cutters or pieces B, of polygonal form, having diamond-shaped or pyramidal steel bits C secured thereto, substantially as and for the purpose herein described.

2. In a machine for cutting coal, the combination, with the tapering cutter bar or shaft A, provided with the coupling-plate J, of the motor D, having its shaft H provided with the coupling-plate I, whereby motion is transmitted direct from the motor-shaft, substantially as herein described.

3. In a mining-machine, the combination, with a laterally-moving carriage, of an electric motor mounted thereon, and a cutter-bar in line with, carried by, and forming a continuation of the armature-shaft, substantially as set forth.

4. In a mining-machine, a taper cutter-bar polygonal in cross-section, in combination with a series of removable cutters, B, correspondingly tapered and adapted to fit over and be rotated by said taper bar, and provided with diamond-shaped pointed steel projections, substantially as set forth.

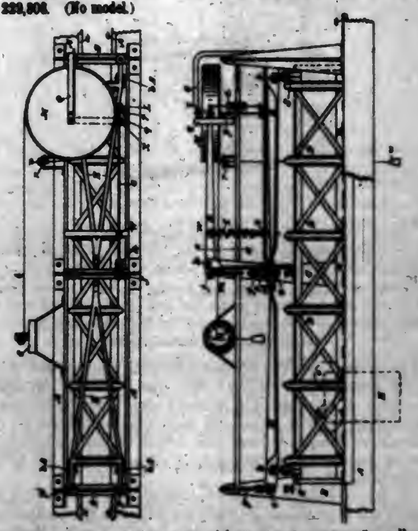


399,486. SEPARATOR. JAMES M. BRADSHAW and WILLIAM R. MEEK, Table Rock, Colo. Filed Feb. 8, 1886. Renewed Aug. 4, 1888. Serial No. 281,974. (No model.)

Claim.—1. In a separator, the combination of a main frame, the vibrating shoe suspended within the same, the chain connected to the frame and shoe at opposite ends and limiting the movement of the shoe in one direction, and a stop for limiting the movement of the shoe in the opposite direction, substantially as described, for the purpose set forth.

2. In a separator, the combination of a main frame, a vibrating shoe suspended within the main frame, the chain connected at opposite ends to the frame and shoe, and the spring-metal stop I, fixed to the main frame and depending therefrom into the path of the vibrating shoe, substantially as described, for the purpose set forth.

399,487. MACHINE FOR WEIGHING TRAVELING LOADS. ALEXANDER R. BROWN, Cleveland, Ohio. Filed Mar. 5, 1887. Serial No. 229,807. (No model.)

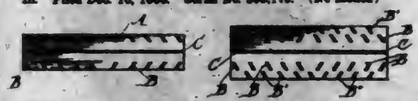


Claim.—1. In a weighing-machine specially adapted to weigh and record the weights of loads passing over a railway, the combination of the following instrumentalities, arranged and operating in substantially the manner hereinbefore set forth—viz., first, a suitable depressible platform provided with tracks which form continuations of those of the railway upon which the load to be weighed is supposed to travel and suitably supported in the proper relationship to said railway; second, the system of supporting-levers forming the connecting means between said depressible platform and its means of support, the final one of the series of said levers constituting the weight-indicating beam, and being arranged to move (by the depression of the depressible platform) in opposition to the resistance of a suitable spring; third, the marking device arranged at the end of the longer arm of said final one of the series of levers and operating to make marks of lengths corresponding with those of the movements of the end of said lever, and, fourth, a suitable surface for the registration thereon of the marks so made by the device at the end of said lever.

2. The combination of the following instrumentalities, all arranged and operating together in substantially the manner and for the purposes hereinbefore set forth: first, the railway over which the traveling-loads to be weighed are supposed to travel; second, the depressible platform provided with rails which form continuations of the rails of said railway, and which is suspended from suitable supports in the proper relationship to said railway; third, the marking-beam G and an intermediate system of levers connected therewith and with each other, and operating to connect the said depressible platform with its means of support, and, fourth, a dash-pot applied to one of the levers, (preferably to the end of the longer arm of the final lever G,) and connected with some stationary part of the apparatus, and operating, as specified to prevent the marking device of the lever G making any movement beyond the point up to which it should move, in order to make a mark that will correctly indicate the weight exerted upon the depressible platform by the load being weighed, and to thus prevent any inaccuracy in the registration of the lines or marks employed for estimating the aggregate weight of the loads passed over the depressible platform.

3. In a weighing apparatus or contrivance adapted specially to the weighing of traveling loads, the combination of, first, the depressible platform D, suspended from suitable supports, and having its track arranged substantially in line with that of the railway over which the loads to be weighed are supposed to travel; second, a suitable supporting-frame operating to sustain the suspended and depressible platform; third, a resistant spring connected at one end to the final one of the system of levers and at the other end to some stationary portion of the apparatus, and, fourth, a system of levers, each one of which has its pivotal or fulcral points (or knife-edge bearings) arranged in a right line, in order that each and every one of said levers may work at all times with the same degree of leverage, and the final one of which system of levers operates to produce a record of marks, the various lengths of which correspond substantially with the variable movements of its longer arm, the said combination as a whole being and operating in the manner and for the purposes hereinbefore set forth.

399,488. MACHINE FOR WEIGHING TRAVELING LOADS. ALEXANDER R. BROWN, Cleveland, Ohio. Filed Mar. 5, 1887. Serial No. 229,808. (No model.)

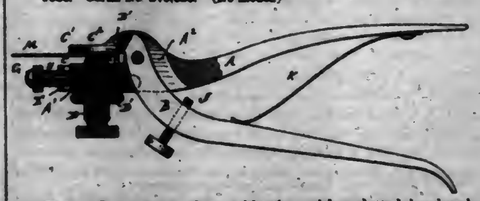


Claim.—1. The combination, with the track-beams of a railway, of the slightly-depressible platform suspended within a suitable frame-work supported by said track-beams, and provided with rails which form continuations of those secured to said track-beams, a system of levers from which said depressible platform is suspended, and which is sustained by said frame-work, and means for registering the extent of movement of the longer arm of the final lever of said system, all substantially as and for the purpose set forth.

2. In combination with the depressible platform D, a system of levers from which it is suspended, and a scale-beam provided with a suitable resistant for indicating the extent of movement of said platform, a uniformly-rotated drum or wheel, M, (moved by any suitable mechanism within or without said drum,) and a marking device on the scale-beam to register the movements of the latter on the face of said drum, whereby I am enabled to not only register the measurement-marks of all weights passed over the platform D, but am also enabled to ascertain the exact times at which said loads or any of them may have made their passage over the weighing apparatus.

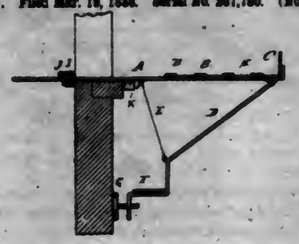
3. In combination with the tramway and the depressible platform suspended within a frame-work supported on said tramway, the system of levers, including the scale-beam G, supported by said frame-work, and from which said platform is suspended, and the adjustable resistant spring I, adapted to have its tension regulated so that the machine will not begin to operate under any less load than the minimum weight of the loads to be carried over the tramway, all substantially as hereinbefore explained.

4. In combination with the scale-beam G, the registering-drum M, and a suitable marker device applied to the scale-beam, a guide or keeper bar, *g*, and a suitable anti-friction roller mounted on the scale-beam and traveling against the face of said keeper-bar, in substantially the manner and for the purpose hereinbefore explained.



399,489. BELT-FASTENER. EDWARD L. BUDLONG, Bowmanville, Ill. Filed Dec. 10, 1888. Serial No. 293,179. (No model.)

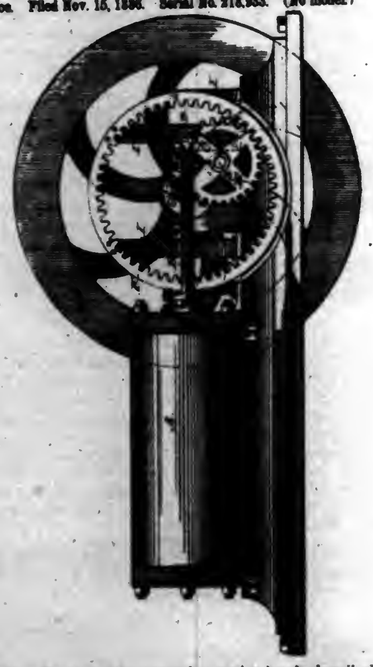
Claim.—1. The plate A, provided on each of its side edges with series of chisel-formed teeth B, the teeth standing at an inclination to the sides of the plate, the teeth on the two ends having an opposite inclination to each other adapted when the two ends of the belt are driven down upon them to draw the abutting ends of the same together and prevent lateral spreading thereof, substantially as described.



2. In combination with the plate A, having series of chisel-formed teeth on each outer edge thereof, and having the diagonal inclination to said side edges specified, the teeth B, adapted to be bent into the form of hooks in the act of forcing the ends of the belt down upon the same, substantially as described.

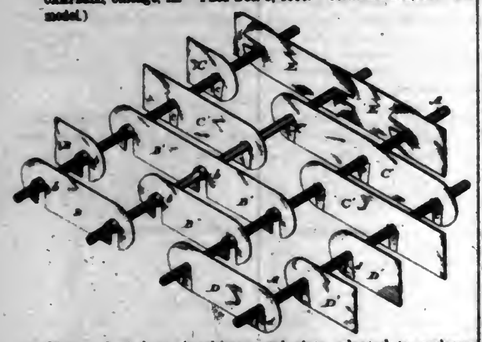
399,490. SAW-SET. ANDREW L. BUELL and EDGAR BUELL, Clinton, Conn., assignors to Francis T. L. Ihne, New York, N. Y. Filed July 13, 1888. Serial No. 279,866. (No model.)

Claim.—In a saw-set, the combination, with a slotted head and its handle, of a handle pivoted in said head and having a diamond-shaped setting-jaw, a sliding gage on said head, a pin fixed in the end of the head, a tubular screw surrounding said pin and screwed through a threaded aperture in the closed end of the sliding gage, and an abutment on the above-mentioned head, substantially as herein shown and described.



399,491. WINDOW-STAND. KASMIERAS BUKAWIETH, New York, assignor of one-half to Mandel Pianka, Brooklyn, and Adam Moras, New York, N. Y. Filed Mar. 19, 1888. Serial No. 267,789. (No model.)

Claim.—1. In a window-stand, the combination, with two bars united by slats forming a seat, of braces hinged to the ends of said bars and united at their swinging ends by a foot-rail, rods connecting the swinging ends of the braces with the above-mentioned bars, a retaining-bar through which the above-mentioned bars are passed, and keys or pins in said bars and resting against the retaining-bars, substantially as herein shown and described.

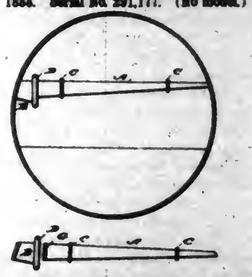


2. The combination, with two bars united by slats forming a seat, of braces hinged to the ends of said bars, a foot-rail uniting the swinging ends of said braces, rests on the swinging ends of the braces, rods connecting the swinging ends of the braces with the ends of said bars, a retaining-bar through which the above-mentioned bars are passed, and keys or pins passed through apertures in said bars and resting against the retaining-bars, substantially as herein shown and described.

399,492. MEANS FOR CONVERTING MOTION. EDWARD BURKE, Lemars, Iowa, assignor to the Gateway Manufacturing Company, same place. Filed Nov. 15, 1886. Serial No. 218,933. (No model.)

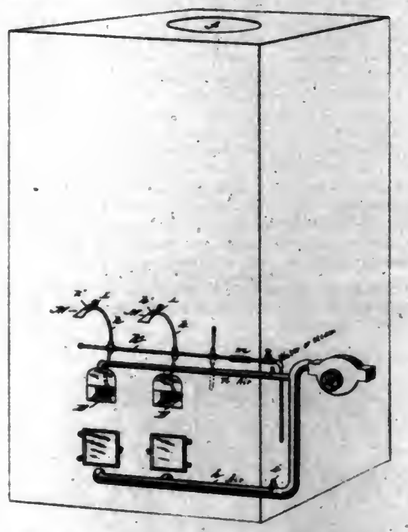
Claim.—The means for converting motion herein described, consisting of a rectilinearly-reciprocating rod, B, a shaft, G, with rigid crank D, a small traveling gear-wheel mounted upon the outer end of said crank and having a crank connecting with the rectilinearly-moving rod, and a stationary concentric gear connected with the traveling gear-wheel, substantially as and for the purpose described.

399,493. HEAT-ABSORBING PLATE FOR COOLING-COILS. ALLAN CAMPBELL, Chicago, Ill. Filed Dec. 3, 1888. Serial No. 292,562. (No model.)



Claim.—1. A heat-absorbing metal plate adapted to embrace and rest upon two or more of the pipes of a cooling-coil, substantially as and for the purpose hereinbefore set forth.

2. A heat-absorbing metal plate notched or slotted to fit upon two or more of the pipes of a cooling-coil and having flanged saddles which embrace the pipes, substantially as hereinbefore set forth.

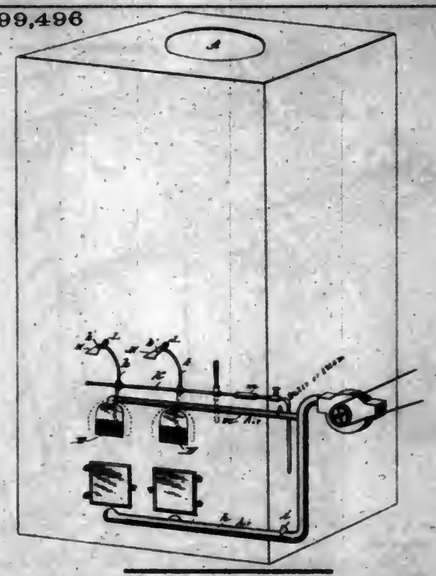


3. A heat-absorbing metal plate notched or slotted to fit upon two or more of the pipes of a cooling-coil, with blocks or plugs which fill the notches and closely embrace the pipes, substantially as herein-before set forth

399,494. BARREL-HEAD. JAMES A. CAMPBELL, New Orleans, La. Filed Nov. 17, 1888. Serial No. 291,177. (No model.)

Claim.—The combination, with the sections of a barrel-head such as described, of the large wedge having one end adapted to enter the chine-groove of a barrel and its opposite end beveled, and a small wedge having one end adapted to enter the chine-groove, its opposite end beveled to engage the bevel of the large wedge, and provided with a flange overhanging the said beveled end, substantially as specified.

399,495. KILN FOR CALCINING STONE, &c. GRANVILLE R. CARLETON, Rockport, Me. Filed July 7, 1888. Serial No. 279,309. (No model.)



Claim.—In combination with the barrel of the kiln and with the arch or fire-box thereof, having a grate, and with the ash-pit thereof, an air-pipe communicating with the ash-pit beneath the grate, with air-forcing mechanism therefor, and a steam or water pipe arranged to discharge steam or water within the arch or fire-box and over the surface of the fuel, substantially as and for the purpose set forth.

399,496. METHOD OF CALCINING ROCK. GRANVILLE R. CARLETON, Rockport, Me. Filed July 7, 1888. Serial No. 279,310. (No model.)

Claim.—1. The method of calcining rock in the manufacture of lime, consisting of, first, introducing an air-blast underneath the fuel in the kiln to increase the draft, and, second, introducing a spray of steam or water above the bed of coals, substantially as and for the purpose described.

2. The hereinbefore-described mode of calcining rock in a kiln having a barrel to contain the rock and arches leading thereto, consisting in applying an air-blast below the grate to create a draft, and in applying steam or a spray of water within the arch above the fuel to regulate the heat, as and for the purpose set forth.

399,496.

399,497. COMBINED GAS AND ELECTRIC LIGHT FIXTURE. JOHN C. CASSIDY, East Orange, N. J. Filed Jan. 3, 1889. Serial No. 295,246. (No model.)

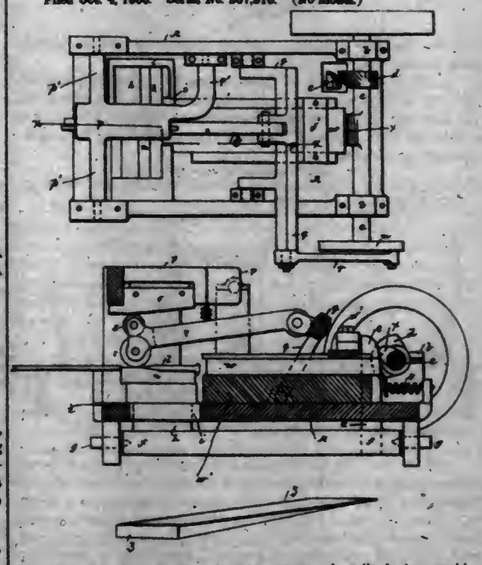
Claim.—In a coupling for combined gas and electric light arms, the combination of the section A, connected with the gas-conducting tube, with the section B, connected with an electric-light-wire connecting-tube, said section B being provided in its inner surface with a recess forming a passage for the electric-light wires between the two sections, substantially as set forth.

399,498. TRACE-CARRIER. ALEXANDER R. CLARK, Rockhills, Tex. Filed Nov. 22, 1888. Serial No. 291,541. (No model.)

Claim.—The combination of the frame A, having the hook B formed upon its lower edge and provided with a slot or opening, C, the sides of which are inclined toward each other, with the triangular-shaped rod or rods which are pivoted upon the frame and around which the band is passed, and which, when closed, clamp the back-band against the inclined sides of the slot or opening, and at the same time close the upper end of the hook, substantially as shown and described.

399,499. PHOTOGRAPHIC LENS. ALVAN G. CLARK, Cambridgeport, Mass. Filed Oct. 4, 1888. Serial No. 287,302. (No model.)

Claim.—1. In a photographic tube, the combination of a concavo-convex crown-glass lens, D, ground on spherical lines, and a concavo-convex flint-glass lens, C, ground on spherical lines, with a front combination consisting of two similar lenses separated from each other by a ring of blackened metal or substitute therefor, substantially as described and set forth.



2. In a photographic tube, a front combination, X, composed of two lenses having their respective surfaces both ground to spherical curves, or curves practically spherical, substantially as described.

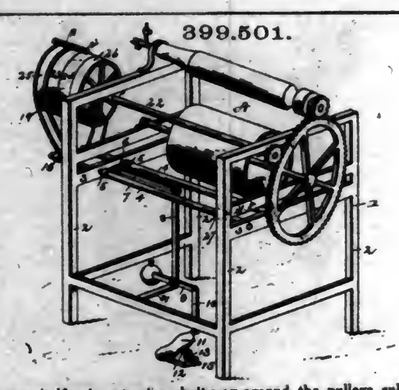
3. In a photographic tube, a front combination, X, composed of two lenses having their respective surfaces both ground to curves which are practically spherical and separated from each other, substantially as described.

399,499.

399,500. SPIKE-MACHINE. JAMES P. COLLINS, Allegheny, Pa. Filed Oct. 4, 1888. Serial No. 287,318. (No model.)

Claim.—1. In a machine for the purpose described, the combination consisting of the shaft *c* and a means for rotating the same, the gripping-dies *m k*, one of which having a limited movement toward the other, the inclined plates *n o*, the rollers *r s*, operating between the same, mounted in an arm, *t*, connected to a rocker, *q*, actuated by means of a disk, *u*, and pitman *v*, connected to the driving-shaft *c*, and the heading device *w*, capable of moving forward toward the gripping-dies *m k* by means of a cam, *x*, secured to the shaft *c*, the said heading device being capable of being elevated and made to operate on a tapering or inclined surface, substantially as and for the purpose set forth.

2. In a spike-machine, the combination of a stationary inclined plate, *n*, the fixed and movable gripping-dies for holding the blank in fixed position on said plate, an inclined fixed block arranged in the vertical plane of said plate *n* and above the latter, and an endwise-movable arm carrying two rollers, one adapted to ride against the inclined block to depress the other roller upon the blank held on the plate *n* by the gripping-dies, substantially as and for the purpose described.

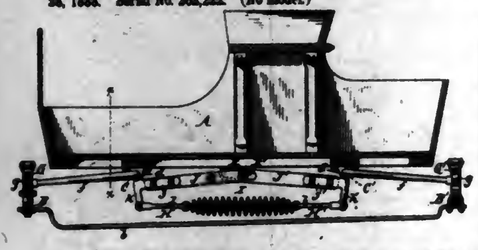


3. In a spike-machine, the combination, with the gripping-dies, of an endwise horizontally-movable header and a tapered block or plate removably fitted between the rear end of said header and the support thereof, substantially as and for the purpose described.

399,501. BELT-SHIFTING MECHANISM. JOHN J. DALEY, Brooklyn, N. Y. Filed Nov. 5, 1888. Serial No. 290,011. (No model.)

Claim.—1. The combination, in a belt-shifting device, of two movable rods mounted in cross-pieces of the supporting-frame, the outer portions of said rods carrying the belt-rods and the inner portions united by collars 5, connected with a lever for operating the rods, whereby the same may be moved in the direction necessary either to start, reverse, or stop the machine, substantially as specified.

2. The combination, with the movable rods mounted in cross-pieces upon the end of the frame, of brackets 16, secured thereto and carrying the belt-rods consisting of a center-rod encircling the pulley



399,501.

and two half-rods extending half-way around the pulleys, substantially as described.

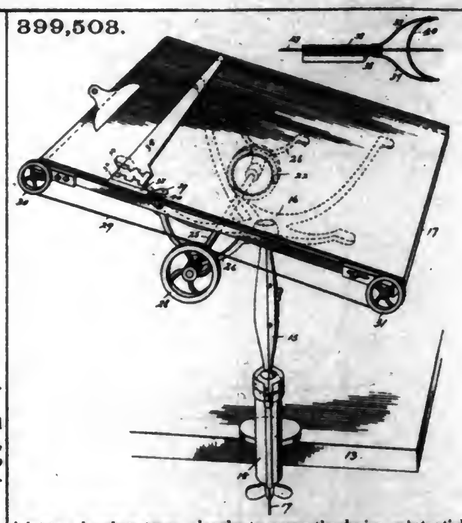
3. The combination, with the cross-piece having collars 5 mounted upon the shifting-rods, of an arm, 7, connected with said cross-piece, the outer end of the arm being pivoted to a vertical rod, 8, secured to a weighted lever, 9, upon a standard, 31, secured to the frame, substantially as specified.

399,502. WAGON. ELMER G. DAVIS, Friendship, N. Y. Filed Jan. 26, 1888. Serial No. 262,222. (No model.)

Claim.—1. The combination, with the running-gear and the vehicle-body, of rock-shafts journaled to the under side of the body and having arms attached to the running-gear, depending arms or levers secured to said rock-shafts, a spiral spring connected at opposite ends to said depending arms and tending to draw said arms inwardly toward each other, and connecting-links secured, respectively, at their inner ends to said rock-shafts and pivotally connected together at their outer free ends, whereby the movement of either rock-shaft is imparted to the other rock-shaft, substantially as set forth.

2. The combination, with the running-gear and the body provided with rock-shafts having arms attached to the running-gear, of depending arms or levers also mounted on said rock-shafts, yokes or frames pivoted to said depending arms, spiral springs connecting said yokes, and connecting-links secured at their inner ends to said rock-shafts and united at their outer ends by a movable connection, substantially as set forth.

3. The combination, with the running-gear and the body provided with rock-shafts having arms attached to the running-gear, of depending arms or levers also mounted on said rock-shafts, yokes or frames pivoted to said depending arms and provided with a series of notches or hooks, spiral springs connecting said yokes, and pivoted links connecting said rock-shafts, substantially as set forth.



4. The combination, with the body and the front and rear axles, B B', having elliptical springs G G', of rock-shafts C C', pivoted to the under side of the body, and having arms *f*, attached with their outer ends to said elliptical springs, depending arms or levers *h h'*, mounted on said rock-shafts, yokes or frames H H', pivoted to the arms *h h'*, spiral springs I, connecting said yokes, and links J J', secured with their inner ends to said rock-shafts and united at their outer ends by a connection consisting of a pin secured to one of said links and engaging in a slot formed in the other link, substantially as set forth.

399,503. COPY HOLDER AND REGISTER. JAMES C. A. DEAN, Chicago, Ill. Filed Oct. 13, 1888. Serial No. 288,016. (No model.)

Claim.—1. A copy-holder comprising, in combination, a table for the copy and a standard having a universal ball-and-socket joint therein, and suitable means whereby to secure the copy-holder, substantially as described.

2. A copy-holder comprising, in combination, a table secured to a spider, and a standard connected at one end by a ball-and-socket joint to a bracket-clamp, whereby to secure the device, substantially as described.

399,503.

3. The combination, with a copy-holder, comprising a table and a suitable standard or support, of a marking-finger secured to an endless traveling belt or cord, and a foot-pedal and connections between said traveling belt and the foot-pedal, whereby the marker may be moved by depressing the pedal, substantially as described.

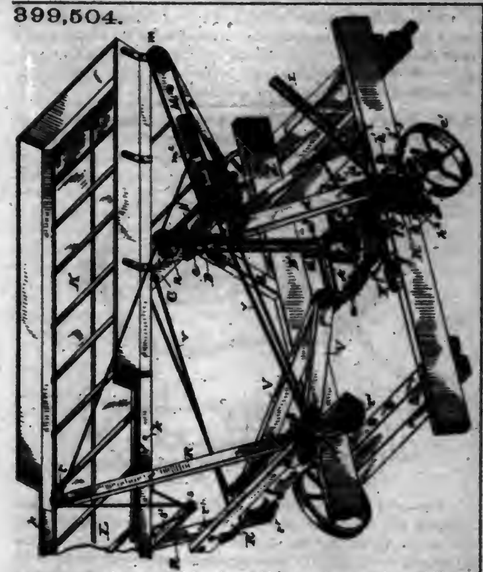
4. The combination, with a copy-holder, of a marking-finger secured at one end to an endless cord or belt, a rotatable shaft bearing a sheave, over which said belt is passed, a ratchet-and-pawl mechanism adapted to rotate said shaft, a foot-pedal, and a cord connecting the foot-pedal and the ratchet mechanism, substantially as described.

5. The combination, with a foot-pedal and disk, of a cord secured to the pedal at one end and at the other to the periphery of the disk, a ratchet-wheel concentric to the disk, pawls pivoted upon the rim of the disk and adapted to engage the ratchet-teeth, a shaft bearing both disk and ratchet and a belt-pulley, a belt passed over said pulley, and a marking-finger connected to said belt, substantially as described.

6. The combination, with a copy-holder, of a marking-finger connected to an endless traveling belt, a shaft and pulley for moving said belt, a ratchet device for rotating the shaft, a cord or rod connecting the ratchet with the foot-pedal, and stops whereby to limit the movement of the marking-finger, substantially as described.

7. In combination with a copy-holder, a movable marking-finger and a traveling belt, said finger having spring-clamping jaws, whereby to secure it to the belt, substantially as described.

399,504. STRAW-STACKER. WILLIAM W. DINGEE, Racine, Wis., assignor to the J. I. Case Threshing Machine Company, same place. Filed July 14, 1888. Serial No. 279,923. (No model.)



Claim.—1. In a stacker, the combination, with a carrier and its main supporting-frame, of a pivoted cross-head, a sector-frame interposed between the cross-head and the carrier, a shaft mounted on the cross-head and provided with pinions engaging the sectors, and a brace, the ends of which are at all times the same distance apart, connected with the cross-head and adapted to move with the same, said brace supporting the carrier in rear of its connection with the sector-frame, substantially as described.

2. In a stacker, the combination, with the main supporting-frame, of a shaft mounted vertically therein, a cross-head mounted on said shaft, a rigid brace-frame connected with the lower end of said shaft, and a carrier having its forward end supported by the said cross-head and its rear end supported by the brace-frame, substantially as described.

3. In a stacker, the combination, with the main supporting-frame, of a shaft vertically mounted therein, a cross-head and gear-segment mounted on said shaft, a sector-frame pivoted on said cross-head, a rigid brace-frame rigidly connected with the gear-segment on the shaft, and a carrier having its forward end supported on the sector-frame

399,504.

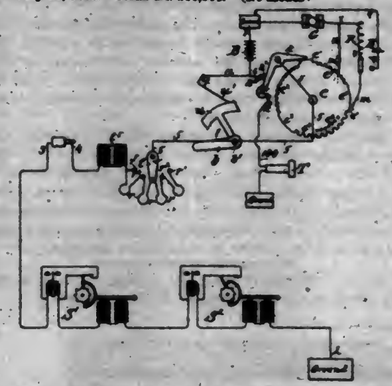
and its rear end supported by the rigid brace-frame, substantially as described.

4. In a stacker, the combination, with the main frame, of a pivoted sector-frame, a shaft provided with pinions engaging the sectors, a rigid brace-frame having cord-guides, a shaft on said brace-frame, a carrier having its forward end pivoted to said sector-frame, and a cord or cords connected with the carrier passing through the guides of the brace-frame engaging the sector-frame forward of its pivots and connected to the shaft on the brace-frame, substantially as described.

5. In a stacker, the combination, with the main supporting-frame, of a shaft vertically mounted therein, a cross-head on the upper end of said shaft, a rigid brace-frame rigidly connected with the lower end of said shaft and provided with cord-guides, a shaft mounted on said rigid brace-frame, a carrier having its forward end connected with said cross-head, and a cord or cords connected with the carrier passing through the cord-guides and connected to the shaft on said rigid brace-frame, substantially as described.

6. In a stacker, the combination, with a swinging carrier and a gear-segment connected with the same, of a power-shaft provided with a pinion, a counter-shaft provided at one end with a pinion, gearing connecting the other end of the shaft with the said segment, and a support provided with two engaging-gears, one of which is always in gear with the power-shaft, the said support being adapted to be moved to bring either of its gears into engagement with the gear on the counter-shaft, substantially as described.

7. In a stacker, the combination, with a swinging carrier and a gear-segment connected therewith, of a shaft adapted to slide in its bearings and provided with a worm engaging said segment, a main shaft, and reversing-gearing connecting the same with the worm-shaft, substantially as described.



8. In a stacker, the combination, with a swinging carrier and a gear-segment connected therewith, of a shaft adapted to slide in its bearings and provided with a worm engaging said segment, an adjustable stop on said shaft, a main shaft, and reversible gearing connecting the said main shaft with said worm-shaft, substantially as described.

9. In a stacker, the combination, with a swinging carrier and a gear-segment connected therewith, of a main or power shaft provided with a pinion, a counter-shaft provided with a pinion at one end, and gearing connecting its opposite end with the said segment, and a pivoted plate having two engaging-gears mounted thereon, one of which is always in engagement with the pinion on the main shaft, said plate being adapted to be moved so as to bring first one and then the other of its gears into engagement with the pinion on the counter-shaft, substantially as described.

10. In a stacker, the combination, with a swinging carrier, of a gear-segment provided with pins or stops, reversible gearing for actuating said segment, a weighted lever for reversing said gearing, a link attached to said lever and having a projection lying in the path of the said pins or stops on said segment, a slotted link connected with the reversing-gearing, and a pin on said lever engaging the slot of said link, substantially as described.

11. A folding straw-carrier having a rear portion slightly narrower than the forward portion and pivoted to the latter forward of the rear end of the same, substantially as described.

399,505. TRANSMITTING-INSTRUMENT FOR ELECTRIC SIGNALING APPARATUS. WALKER J. DUDLEY, Everett, Mass., assignor to the Dudley Electric Manufacturing Company, Concord, N. H. Filed July 19, 1888. Serial No. 280,261. (No model.)

Claim.—1. The controlling-shaft movable to and held in different positions, combined with a current-interrupter controlled by the said shaft, and a lock for said current-interrupter and a releasing-projection therefor connected with the said shaft, whereby the said interrupter is released and produces a number of electric impulses dependent on the point at which the said shaft has been stopped, substantially as described.

2. The main-line and two branch circuits containing sources of different kinds of electric currents—as, for instance, a battery and magneto-generator—combined with a transmitting-instrument comprising a movable signaling-surface having a definite cycle of movement, the same at each operation, and an actuator therefor, and circuit-controlling contacts operated thereby during said continuous movement, controlling the connection of said branches with the main line, substantially as and for the purpose described.

3. The main-line and three branch circuits, one containing a battery, one a magneto-generator, and the third containing a source of currents of opposite polarity to that of the said battery, combined with a transmitting-instrument comprising a movable signaling-surface having a definite cycle of movement, the same at each operation, and actuator therefor and circuit-controlling contacts operated thereby, by which the said branches are all connected to line each at different times during a single operation of said signaling-surface, substantially as and for the purpose described.

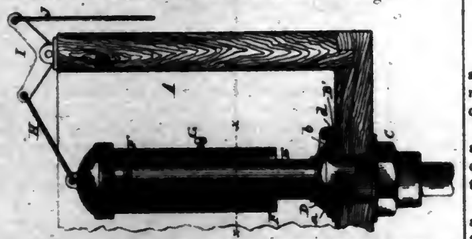
4. The actuating-shaft and wheel having a signaling-surface loose thereon and actuating-spring connecting said shaft and wheel, combined with a stop for said wheel released by said actuating-shaft and a second stop connected with said wheel-stop and operated thereby, the second stop being arranged to arrest the actuating-shaft, except when the first is engaged with the said wheel, substantially as described.

5. The actuating-shaft and transmitting-wheel loose thereon, combined with an actuating-spring connecting the said shaft and wheel, an arm loose on said shaft, and stops co-operating with said arm on said wheel, and a projection co-operating with said arm connected with said actuating-shaft, substantially as and for the purpose described.

6. The actuating-shaft and disk fixed thereon, having a portion of its periphery provided with ratchet-teeth, combined with a pawl to engage said teeth, a circuit-controlling wheel loose on said shaft, and an actuating-spring connecting said shaft and wheel, and a stop for said wheel operated to release the wheel by the movement of the shaft, substantially as described.

7. The actuating-shaft movable to and held in different positions, combined with a circuit-controlling wheel having a signaling-surface and electric contacts controlled thereby, a segment connected with said wheel, and a projection co-operating with the said segment connected with the actuating-shaft, whereby the said segment is moved to prevent a portion of the signaling-surface from operating the contacts, substantially as described.

8. The combination of the main circuit and generator of electricity therein, with resistance in said circuit and contact-points between different portions of said resistance, a switch movable over the said contact-points, and an electro-magnet included in said circuit, and an armature therefor which engages and arrests the said switch when

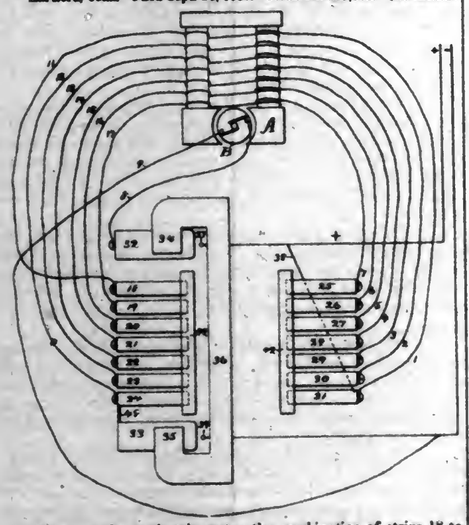


the attraction of the magnet overcomes the retractor of the armature, substantially as described.

9. The combination of the actuating-shaft, with a movable switch engaged by said shaft, and an electro-magnet and its armature that arrests the said switch, a lock that retains the said switch in the position to which it has been moved, and a releasing device for said lock operated by said shaft before the latter engages the said switch, substantially as and for the purpose described.

10. The combination of the actuating-shaft with a movable switch engaged by said shaft, and an electro-magnet and its armature that arrests the said switch, a lock that holds the said armature up to its magnet, and an actuator for said lock on said shaft by which the armature is released while the switch is engaged by the shaft, substantially as and for the purpose described.

11. The main circuit and transmitting instrument provided with a circuit-controlling wheel and electric contacts operated thereby, combined with a branch circuit containing a source of electricity which is connected to said main circuit during the movement of said wheel, and another branch containing a telephone which is connected to said main circuit by the wheel-controlled contacts when said wheel is arrested in its normal position, substantially as described.

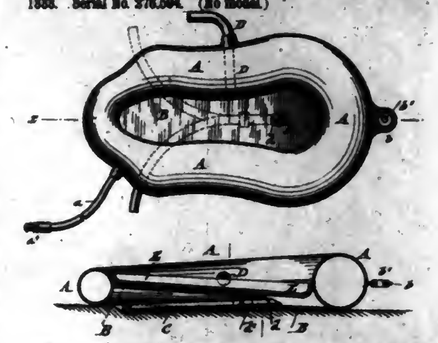


399,506. FLUSH-TANK VALVE. PATRICK V. DWYER, St. Paul, Minn. Filed Sept. 1, 1888. Serial No. 284,335. (No model.)

Claim.—1. In combination with a flushing-tank, A, having an outlet, a hinged valve, D, provided with an upright tube, E, a shorter tube, F, closed at its upper end and surrounding and separated from tube E, and means for tipping the valve and its tubes positively.

2. In combination with a tank having an outlet, a valve, D, provided with a tube, E, and adapted to close the outlet, and an adjustable pipe, F, closed at its upper end and secured to the pipe E, substantially as and for the purpose set forth.

399,507. SWITCH FOR ELECTRIC MOTORS. ARTHUR H. EDDY, Hartford, Conn. Filed Sept. 28, 1887. Serial No. 250,952. (No model.)



Claim.—1. In an electric motor, the combination of strips 18 to 31, inclusive, series springs 40, and the slide D, having the pair of blank strips 42, substantially as described, and for the purpose specified.

2. In an electric motor, the combination of the strips 18 to 31, inclusive, series springs 40, the slide D, having the pair of blank strips 42, contact-strips 32 and 33, the latter connected with the strip 24, connected blanks 34 35, and the armature and field circuits, substantially as described, and for the purpose specified.

3. In an electric motor having a switch for changing the machine into a shunt or series machine, the combination of the switch, with a catch for holding it in its position for starting, and a spring for throwing it into its second position upon releasing the catch, substantially as described, and for the purpose specified.

399,508. RUBBER BED-PAN. ANTON C. ROGERS, Bath Beach, assignor to the Ideal Rubber Company, Brooklyn, N. Y. Filed June 9 1888. Serial No. 276,594. (No model.)

Claim.—1. A rubber bed-pan provided with an inflatable rim and a bottom web secured at one end to the under side of the inflatable rim, and at the opposite end inclined upward and secured to the sides of the rim, so as to form a discharge-spout, substantially as set forth.

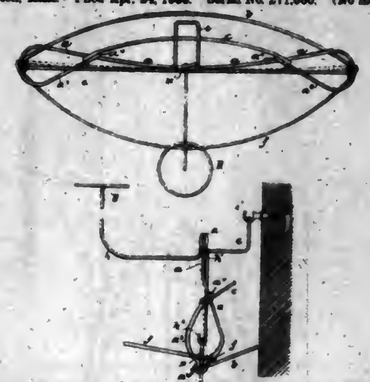
2. The combination, with a bed-pan having an inflatable rim and a bottom web, of a fixed discharge-tube connected to said web, and of a rigid discharge-tube swiveled to the fixed tube, so as to extend to either side of the pan, substantially as set forth.

3. The combination, with a bed-pan having an inflatable rim and a bottom web, of a detachable concave bowl corresponding in shape to the interior cavity of the pan, substantially as set forth.

399,509. FRUIT-ASSORTER. FRANK H. ELLETHORPE, Port Clinton, Ohio. Filed Oct. 11, 1888. Serial No. 287,785. (No model.)

Claim.—1. In a fruit-assorter, the combination of a frame, an inclined loose flexible perforated separating diaphragm connected at its upper end to the said frame, and an agitating device arranged beneath the said loose diaphragm.

2. In a fruit-assorter, the combination of a supporting-frame, a loose flexible perforated diaphragm connected to the frame, an agitating-frame arranged below and adapted to support this diaphragm, and means for giving this agitating-frame a longitudinal movement under the diaphragm, substantially as described.



3. In a fruit-assorter, the combination of a frame, a flexible inclined perforated diaphragm, and a transverse depending retarder, F, this retarder being constructed of flexible material, and having its lower edge resting upon the said flexible diaphragm, substantially as and for the purpose set forth.

4. The combination, with the inclined flexible diaphragm provided with different-sized holes, of a reciprocating agitating-frame arranged beneath and adapted to support the said diaphragm and provided with transverse rollers.

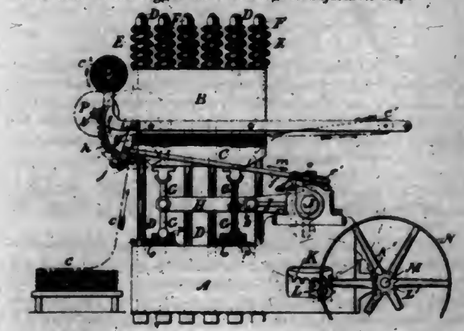
5. The combination of a frame, a perforated diaphragm, a support above this diaphragm, a vertically-guided stop-bar, G, a pivoted weighted angle-lever upon the said support, and a chain connecting the angle-lever and stop-bar, substantially as and for the purpose set forth.

6. The combination of a trough, a spout attached thereto and provided with the notches *m*, a vertically-movable gate, the transverse bars connected together by means of the hand-lever and to the gate by suitable connecting-rods, and the confining staples or loops secured over the notches *m*, substantially as described.

399,510. HANGER FOR WEARING-APPAREL. WILLIAM BYRNE, Boston, Mass. Filed Apr. 24, 1888. Serial No. 271,660. (No model.)

Claim.—1. The shoulder portion *a* of the hanger, bent to form end loops, and the brace-bar *c*, extended rearwardly from the shoulder portion, combined with the transverse pantaloons-supporting bar *p*, engaging the said end loop, substantially as described.

2. The shoulder portion *a* of the hanger, bent to form end loops, a^3, combined with the curved back brace, *b*, having its ends bent into the said loops, substantially as described.



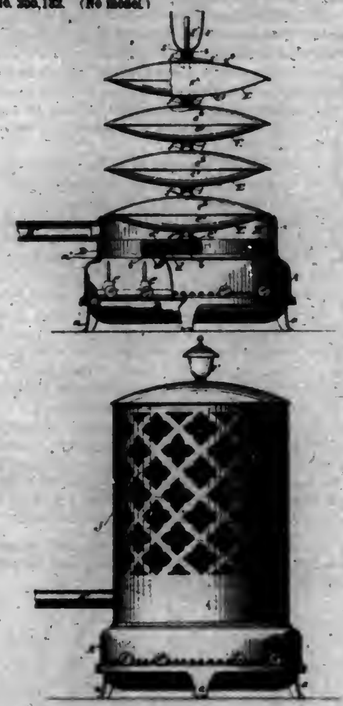
3. The shoulder portion *a* and transverse pantaloons-bar *p*, connected to the ends thereof, combined with the loop-like hat-holder H, having hooks to engage the shoulder portion, and the bar *p*, to form a central support for the latter, substantially as described.

4. The shoulder portion *a*, combined with the curved back and front braces for a coat, connected to the said shoulder portion at or near its ends to operate substantially as described.

5. The shoulder portion *a*, bent substantially as shown and described, and its attached hook *c*, combined with the back and front braces, substantially as described.

399,511. MACHINE FOR PRESSING FABRICS. THOMAS C. FAWCETT, Leeds, County of York, England. Filed Aug. 10, 1888. Serial No. 282,442. (No model.) Patented in England Feb. 16, 1888, No. 2,339.

Brief.—The toggles are all connected to one crank, which is constructed to throw the knuckles of the toggles past the center, thus imparting two pressures at each revolution of the crank. Mechanism is provided for drawing through the cloth in installments, and the lower arms of the toggles have bearings in adjustable steps.



Claim.—1. The combination, with the upper pressure-plate and its springs and the lower pressure-plate, of toggles arranged under said lower plate, a crank-shaft, and rods connecting the knuckles of said toggles with the crank in said shaft, said crank being constructed to move said knuckles past the center, whereby two pressure impulses are imparted to the press at each revolution of the crank-shaft.

2. The combination of the upper and lower pressure-plates, the toggles arranged under the lower pressure-plate, the rods connecting said toggles with the crank in the shaft J, the said shaft, the crank *d* thereon, the arm *g*, its pawl *j*, the slotted rod *f*, connecting the arm *g* with crank *d*, the toothed wheel A, engaged by pawl *j*, the cloth-feeding roller P, and the pinion *l*, on the journal of roller P, gearing with the wheel A, substantially as set forth.

3. The combination of the upper and lower pressure-plates, the crank-shaft, the toggles coupled together and connected to the crank in the crank-shaft, the steps *p* under said toggles, and the adjusting-wedges *o* under said steps, whereby the lower pressure-plate may be set to the proper elevation.

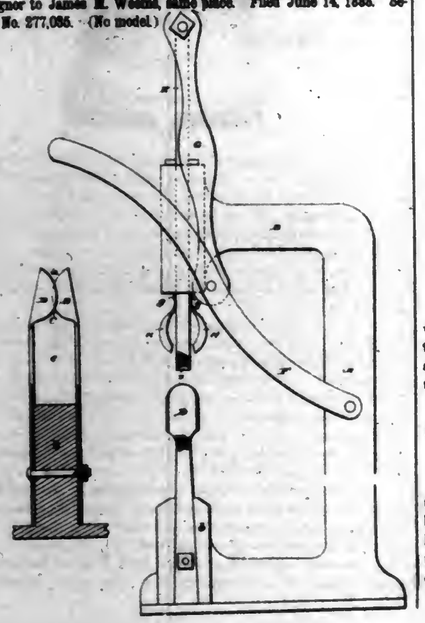
399,512. PORTABLE STEAM GENERATOR AND RADIATOR COMBINED. ROBERT G. FERGUSON, Saratoga Springs, N. Y., assignor of one-half to Oscar A. Day, same place. Filed Nov. 15, 1887. Serial No. 255,182. (No model.)

Claim.—1. In a portable combined steam generator and radiator, the combination, with the steam-generator D, having its water-chamber of small vertical extension and provided with a series of vertical walled perforations, *c c*, all as described, of the burners C, situated directly beneath the said steam-generator, and the horizontal radiator E, having its lower side wall, *e'*, directly over the series of vertical perforations in said steam-generator and its chamber communicating directly with the chamber of the latter, substantially as and for the purposes set forth.

2. In a portable combined steam generator and radiator, the combination, with the steam-generator D, having its water-chamber of small vertical extension and provided with a series of vertical walled perforations, *c c*, all as described, and a series of two or more horizontal radiators, E E, having free communication with each other and with the steam-generator, of burners C C, situated beneath the said steam-generator, and the inclosed chamber H, situated between the latter and the horizontal wall *e'* of the said radiator, substantially as and for the purposes set forth.

3. In a portable combined steam generator and radiator, the combination, with the steam-generator D, having its water-chamber *d* of small vertical extension and provided with a series of vertical walled perforations, *c c*, all as described, and the burners C C, operating below the said steam-generator, of a series of connected horizontal radiators, E E, composed each of concave-convex walls e' e^2, as

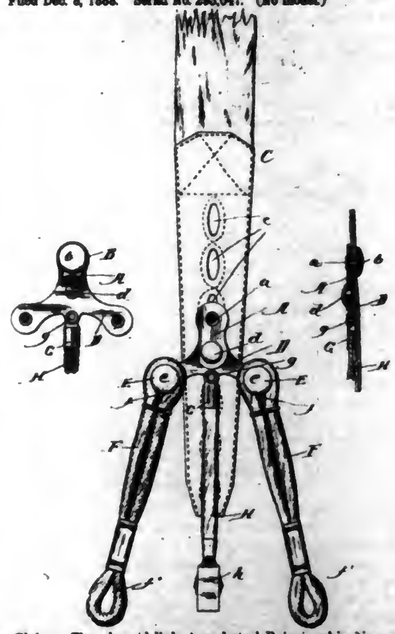
described, and situated one above the other and having free communication with each other, the lowermost radiator of the series being connected with the said steam-generator and having its lower side wall, *d'*, heated by the products of combustion passing upwardly through the walled perforations in the said steam-generator, all substantially as and for the purposes set forth.



4. In a portable combined steam generator and radiator, the combination, with the steam-generator D, having its water-chamber of small vertical extension and provided with a series of vertical walled perforations, a combustion-chamber below the said steam-chamber and containing burners C, and the radiator E above said generator and communicating with it, of the chamber H between said radiator and generator, with the lower side wall, *d'*, of the former forming the upper wall of said chamber H, and the pipe G', leading from the said chamber to an exit, substantially as and for the purposes set forth.

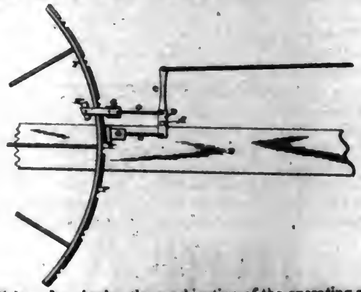
5. In a portable combined steam generator and radiator, the combination, with the series of horizontal radiators E E, having each the horizontal concavo-convex walls d' d^2, and the chambers of which communicate each with the other, and the steam-generator D, having its water-chamber of small vertical extension and provided with a series of vertical walled perforations, e e, of a series of burners contained within an inclosed chamber situated underneath the said steam-generator, and heating through the walled perforations of the latter the lower side wall of the lowermost radiator of the series, and a liquid fuel tank supplying the said burners with fuel, and the chamber H between the said steam-generator and the lower radiator and provided with an exit for escape of the products of combustion, substantially as and for the purposes set forth.

6. In a portable combined steam generator and radiator, the combination, with the uppermost one of the series of radiators E, of the measuring-vessel F and the tubular plug F', having its lower end screw-threaded and working in a screw-threaded opening in the bottom of the said vessel and communicating with the chamber of the radiator and having one or more openings, *a*, communicating with the chamber of said measuring-vessel, substantially as and for the purposes set forth.



7. The combination, with the portable combined steam generator and radiator above described, and consisting of a series of horizontal radiators, E E, formed each by concavo-convex walls d' d^2, and having their chambers communicating with each other, and a steam-generator, D, having its water-chamber *d* of small vertical extension and communicating with the lowermost one of the series of radiators, and having through it a series of vertical walled perforations, e e, which communicate above with the chamber H between this generator and the lower radiator and below with the combustion-chamber provided with a series of burners, of the open-work or perforated jackets K, inclosing the steam-generator and the several radiators of the series and supported from the base which supports the burners and steam-generators, all substantially as and for the purposes set forth.

399,513. PEACH-STONER. CHARLES I. FERRIOTT, Dawson, Tex., assignor to James M. Weems, same place. Filed June 14, 1888. Serial No. 277,055. (No model.)

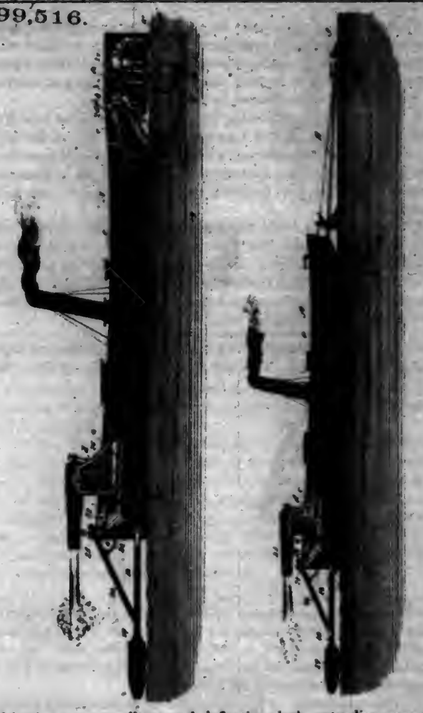


Claim.—The improved peach stoning and halving machine herein described, consisting, essentially, of the main frame having the part *b* rising from its base, the yielding holding-blades D, having their upper edges beveled and formed as cutters and overlapping at their side edges, as shown, the plunger having its lower end recessed and provided with an annular cutting-edge, the crescent-shaped cutting-blades H, secured to said plunger above its cutting-point, with their convex edges forming cutters, the operating-lever, and pitman connecting the same with the upper end of the plunger, substantially as specified.

399,514. SUSPENDERS. BENJAMIN O. FOSTER, Humboldt Park, Ill. Filed Dec. 8, 1888. Serial No. 293,047. (No model.)

Claim.—The pivoted link A and stud B, in combination with the bar D, a suspender-end, and a suspender for attaching the suspender-end to the suspender, the latter provided with means for attaching the stud thereto, substantially as specified.

399,515. BRAKE. JOHN FULTON, Biggs, Oreg. Filed Nov. 22, 1888. Serial No. 291,548. (No model.)



Claim.—In a brake, the combination of the operating-shaft provided with a crank, the arms projecting at right angles from the shaft, the brake-bars, the connecting-rods between the brake-bars and the arms, and the brakes which are applied to opposite sides of the periphery of the wheel upon its same side, substantially as shown.

399,516. COMBINED TORPEDO AND GUN BOAT. RICHARD J. GATLING, Hartford, Conn. Filed Oct. 29, 1888. Serial No. 289,450. (No model.)

Claim.—1. A torpedo-boat having a spar-torpedo projecting from the stem, an upwardly-curved deflecting-deck extending from the bow back of the engines, and a compartment at the rear of the boat having sighting-apertures through the curved deck, said compartment having operative connections to the torpedo, substantially as described.

2. A torpedo-boat provided with offensive weapons at its bow,

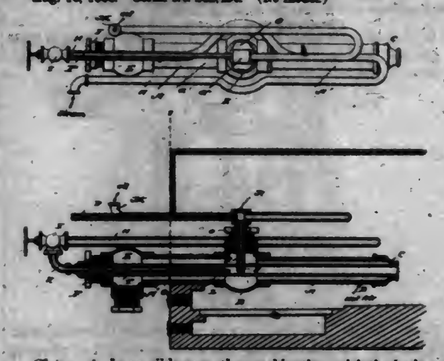
399,516.

and having an upwardly-curved deflective deck extending over and to the rear of the engines, and a rear compartment open at top, but shielded in front by said deck, from which compartment the offensive weapons and steering-gear may be operated, substantially as described.

3. A torpedo-carrying boat, substantially as described, having a forwardly-projecting spar pivoted by one end to the stem thereof, an explosive shell attached to said spar, a stay-rod pivoted by one end to said spar and having by its opposite end a detachable engagement with the boat, whereby said spar is supported in a horizontal position, a tripping-lever pivoted near the engaged end of said rod, an operator's compartment annexed to the stern of said boat, extending rearwardly therefrom, and communicating by a passage-way with the hold thereof, and a chain attached to one arm of said tripping-lever and extending to said compartment, substantially as set forth.

4. A gun-boat provided with a deflective deck extending rearwardly from the bow and over the engines, an open-top compartment for the crew in rear of said deck and having sighting-apertures through the curved deck, said compartment having side ports protected by shields, substantially as described.

5. A torpedo-carrying boat, substantially as described, having a forwardly-projecting spar attached to the stem thereof, an explosive shell attached to said spar, a gun mounted on said boat capable of throwing shells containing high-power explosives, substantially as described, an operator's compartment annexed to the stern of said boat, extending rearwardly therefrom, and electric conductors extending between said gun and compartment, substantially as set forth.

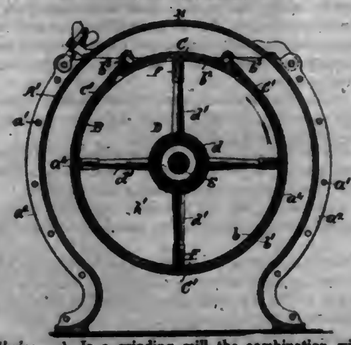


6. A torpedo-carrying boat, substantially as described, having an operator's compartment annexed to the stern thereof, whereby said boat is caused to become a shield against projectiles fired toward the bow of said boat, a longitudinal extension of the keel under said compartment, a post rigidly secured to the floor thereof and the extremity of said extension, and a rudder having its post-bearings in said floor and extension, substantially as set forth.

7. A torpedo-carrying boat, substantially as described, having an operator's compartment annexed to the stern thereof, whereby said boat is caused to become a shield against projectiles fired toward the bow of said boat, a rudder having its post extending through the floor of said compartment, a tiller-holder fixed to said floor having notches in its upper end, and a tiller pivotally connected to said rudder-post and engaging in said notches, substantially as set forth.

8. A torpedo-carrying boat, substantially as described, having an operator's compartment annexed to the stern thereof, whereby said boat is caused to become a shield against projectiles fired toward the bow of said boat, and curved shields within said compartment extending from the stern of the boat rearwardly, substantially as set forth.

9. A torpedo-carrying boat, substantially as described, having an operator's compartment annexed to the stern thereof, whereby said boat is caused to become a shield against projectiles fired toward the bow of said boat, the deck of said boat at its junction with said compartment being upwardly inclined, and having one or more longitudinal sight-holes therein communicating with said compartment, substantially as set forth.



399,517. OIL-BURNER. CHARLES GILBERT, Omaha, Nebr. Filed Aug. 10, 1888. Serial No. 282,430. (No model.)

Claim.—1. In an oil-burner, the combination, with the body composed of two tubular sections, of a coupling therefor, a nut arranged in the upper branch of the coupling, the T-coupling arranged in said nut, the oil-pipe extending nearly the entire length of the burner and communicating with the T-coupling, the pipe G, arranged in the main body, a pipe leading from the T-coupling to said pipe in the main body, and the small pipe K, leading from the valve and passing into the main body, substantially as specified.

2. In an oil-burner, the combination, with the main body composed of two tubular sections united by a T-coupling, one section having a hot-air inlet and a reducer and the other section a coupling for the main supply, a tube arranged within the body and provided with an opening, T, a reducing-nut at the T-coupling, a T-coupling arranged within said nut, an oil-supply pipe extending from the T-coupling in the main body, a steam-pipe extending the entire length of the main body in a loop form and having a valve at one end, a small pipe leading from said valve and passing into the pipe arranged within the main body, and an air-pipe communicating with the T-coupling N, substantially as specified.

399,518. GRINDING-MILL. JOHN GOSS, Chicago, Ill. Filed May 24, 1888. Serial No. 274,934. (No model.)

Claim.—1. In a grinding-mill, the combination, with the inclosing-casing constructed in two parts and provided on the interior with the annular shoulders, as described, of the wire-gauze cylinder, the edges of which overlap and have a close bearing on said shoulders, the corrugated plate, the clamping-bands for securing said cylinder in proper position relative to the inclosing-casing and said corrugated plate, and the beater-arms, as described, substantially as and for the purpose set forth.

2. In a grinding-mill, the combination, with the inclosing-casing provided on the inner side with the annular shoulders a^3 a^4, of a wire-gauze cylinder arranged on the interior of the inclosing-casing, and having the edges overlap said shoulders, the clamping-bands C C^2, having screw-threaded ends, the curved corrugated plate C, provided with lugs b^2, the screw-threaded nuts engaging with the correspondingly-threaded ends of the clamping-bands, and the beater arms and

bars, as described, all arranged and operating in the manner and for the purpose set forth.

3. In a grinding-mill of the character described, the combination, with the inclosing-casing provided on the inner sides with annular shoulders a^3 a^4, of the wire-gauze cylinder B, the curved corrugated plate C, provided with the perforated lugs b^3, the clamping-bands encircling said gauze cylinder and having the ends adjustably secured in said lugs, the reducing-wheel D, rotating inside of the gauze cylinder, and the driving-shaft upon which said wheel is rigidly mounted, substantially as and for the purpose set forth.

899,519. AUTOMATIC FIRE-EXTINGUISHER. FREDERICK GRINNELL and RICHARD W. GRINNELL, Providence, R. I. Filed Mar. 20, 1887. Serial No. 232,874. (No model.)

Claim.—1. The combination, with an automatic fire-extinguisher having metallic parts for holding the water in check and releasing the same upon the occurrence of a fire, of a globe made of non-corrodible material secured hermetically to the extinguisher and inclosing the said parts, so as to protect the same from the action of corrosive gases, substantially as described.

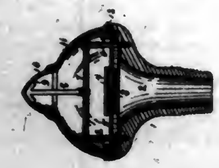
2. The combination, with an automatic fire-extinguisher having metallic parts for holding the water in check and releasing the same upon the occurrence of a fire, and having also a base adapted to fit a covering-globe, of a non-corrodible globe fitted air-tight to such base and inclosing the said parts, so as to protect them from the action of corrosive gases, substantially as described.

3. The combination, with an automatic fire-extinguisher having metallic parts for holding the water in check and releasing the same upon the occurrence of a fire, of a non-corrodible cap or globe inclosing such parts and hermitically sealed with non-corrodible sealing material.

4. The combination of an automatic fire-extinguisher, having metallic parts for holding the water in check and releasing the same upon the occurrence of a fire, with a protecting cap or globe inclosing the said parts and a non-corrodible sealing material closing the joint between the cap and the extinguisher, as and for the purpose set forth.

5. The combination, with an automatic fire-extinguisher having metallic parts for holding the water in check and releasing the same upon the occurrence of a fire, of a non-corrodible cap or globe inclosing such parts and hermetically sealed with a non-corrodible sealing material that will melt or soften at or below the operative temperature of the extinguisher.

6. The combination of an automatic fire-extinguisher with a protecting cap or globe therefor made in parts and sealed together with a fusible and non-corrodible sealing material.



7. The combination of an automatic fire-extinguisher with a corrodible cap adapted to cover the same, made in parts and sealed together with a fusible non-corrodible sealing material.

8. The combination, with an automatic fire-extinguisher, of a fibrous composition cap surrounding the same, substantially as set forth.

9. The combination of an automatic fire-extinguisher with a paper cap therefor, a metallic attachment secured to the cap where it will abut on part of the extinguisher, and a soldered connection between the attachment and the extinguisher.

10. The combination of the automatic fire-extinguisher with the paper cap, the metallic attachment secured to the cap, the soldered connection between the said attachment and the extinguisher, and a covering of non-corrodible material over the soldered connection.

899,520. AUTOMATIC FIRE-EXTINGUISHER. FREDERICK GRINNELL, Providence, R. I. Filed Feb. 3, 1888. Serial No. 262,958. (No model.)

Claim.—1. In an automatic fire-extinguisher, the combination of the valve closing the water-passage with a protecting-cap fitted with an air-tight joint to the extinguisher-base, and a heat-actuated device independent of said joint located entirely within the cap and holding said cap to its seat until released by heat.

2. In an automatic fire-extinguisher, the combination of the valve closing the water-passage with a protecting-cap fitted with an air-tight joint to the extinguisher-base, and a heat-actuated device independent of said joint located in the space between the valve and cap, and secured to both valve and cap, so as to hold them to their respective seats until released by heat.

3. In an automatic fire-extinguisher, the combination of the valve closing the water-passage with a protecting-cap covering the valve, and inclosing a heat-actuated device adapted to hold the cap to its seat until released by heat, the said cap made partly of heat-conducting material and partly of heat-insulating material, and the said device secured to the heat-conducting part.

899,521. AUTOMATIC FIRE-EXTINGUISHER. FREDERICK GRINNELL, Providence, R. I. Filed Feb. 3, 1888. Serial No. 262,959. (No model.)

Claim.—1. In an automatic fire-extinguisher, the combination of a valve closing the water-passage, a cap seated on the extinguisher and covering the valve, and a heat-actuated device inside the cap connecting the valve and the cap through a lever the fulcrum of which is supported from the base of the extinguisher.

2. The combination of the base 1, having water-passage 2, valve 4, closing said passage, yoke 8, supported on the base 1, lever 7, fulcrumed on the said yoke, strut 6, between lever 7 and valve 4, cap 10, fitted to base 1 and inclosing the parts, as shown, and a device, as 9, connecting lever 7 to the cap and releasing both cap and valve when subjected to a temperature above the normal.

3. The combination of the extinguisher-base, having a water-passage, as shown, with an imperforate cap fitted air-tight to the base and inclosing between it and the base a valve covering the water-passage, and also inclosing a reacting thermal device, the latter having a bearing on a fixture to the base and holding both the valve and the cap to their respective seats.

4. In an automatic fire-extinguisher, the combination of the base with a non-corrodible cap seated thereon, a valve closing a passage through the base, and a heat-actuated device secured to the inside of the cap, said device bearing against a support from the base, and a valve whereby the said device holds the valve and the cap to their seats.

5. The combination of the extinguisher-body, having a water-passage closed by a valve, a flexible valve-seat for the valve, a cap seated on said body, and a heat-actuated device located entirely within the cap and holding the valve closed against its flexible seat, and also holding the cap to the body.

6. The combination of the extinguisher-body, having a water-passage and a valve for closing the same, with a cap inclosing a heat-actuated device and the valve, the former having a support from the base and holding both the valve and the cap to their seats, and the said body having an adjustable seat for the cap.

7. In an automatic fire-extinguisher, the combination, with the extinguisher-body, having a water-passage, as shown, and a valve closing such passage, of a heat-actuated device supported from the base controlling the valve, and an imperforate non-corrodible cap seated on the body and inclosing said valve and heat-actuated device, the said cap having secured to its interior surface a metallic anchorage to which the said device is attached.

8. The combination of the extinguisher-body, having the water-passage, as shown, and a valve closing the same, a heat-actuated device supported from the base holding the valve closed, and a glass cap seated on the base and inclosing the valve and heat-actuated device, the said cap having a metallic anchorage secured to its interior surface, to which the heat-actuated device is attached.

899,522. AUTOMATIC FIRE-EXTINGUISHER. FREDERICK GRINNELL, Providence, R. I. Filed Feb. 3, 1888. Serial No. 262,960. (No model.)

Claim.—1. The combination, in an automatic fire-extinguisher, of an air-chamber, a supply-pipe, a valve closing an inlet-port from the

899,522.

supply-pipe to the air-chamber, a second valve closing a discharge-port from said air-chamber, and a heat-actuated device holding both of said valves closed and located entirely within the air-chamber independently of either valve-seat, substantially as and for the purpose set forth.

2. The combination, in an automatic fire-extinguisher, of an air-chamber, a supply-pipe, a valve closing an inlet-port from the supply-pipe to the air-chamber, a second valve closing a discharge-port from said air-chamber, a heat-actuated device located entirely within said air-chamber, and a lever connected at one end to said heat-actuated device and bearing upon one of said valves at its other end, substantially as set forth.

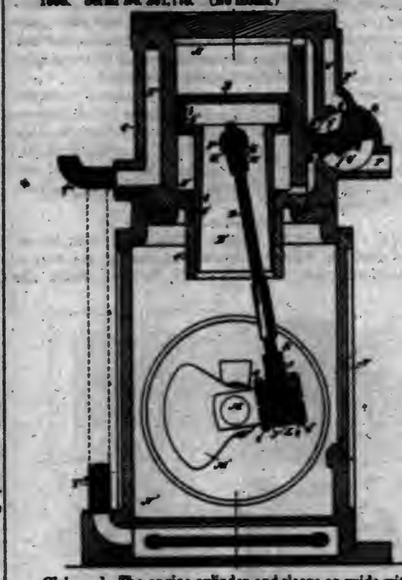
3. The combination, in an automatic fire-extinguisher, of an air-chamber, a supply-pipe, a valve closing an inlet-port from the supply-pipe to the air-chamber, a second valve closing a discharge-port from said air-chamber, a heat-actuated device located entirely within said air-chamber, a lever, a rod connecting one end of said lever with said heat-actuated device, the rod 11, supporting the other end of said lever and resting upon one of said valves, and an elastic medium against which said lever bears, substantially as set forth.

899,523. AUTOMATIC FIRE-EXTINGUISHER. FREDERICK GRINNELL, Providence, R. I. Filed Mar. 9, 1888. Serial No. 266,737. (No model.)

Claim.—1. An automatic fire-extinguisher having a chamber communicating with the supply-pipe, a valve closing a discharge-outlet, and a heat-actuated device located entirely within the chamber and adapted to cause the opening of the valve when the temperature rises above the normal.

2. The combination, in an automatic fire-extinguishing apparatus, of a water-pipe, a valve closing an outlet from said pipe, an air-chamber communicating with the water-pipe, the said air-chamber being located so as to have air trapped within it by the water, and a heat-actuated device located in the said air-chamber and connected with the said outlet-valve, so that the said valve will be released by the heat-actuated device when the temperature rises above a predetermined point, as set forth.

3. An automatic fire-extinguisher having a chamber communicating with the supply-pipe, a valve closing an outlet and held closed against the pressure from within by a heat-actuated device located entirely within the chamber, the said device being attached to a yielding or movable part of the said chamber, so as to cause the internal pressure to hold the valve closed.

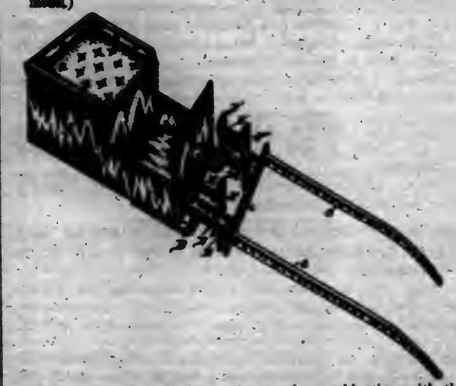


4. An automatic fire-extinguisher having a chamber communicating with the supply-pipe, a valve closing an outlet, a flexible diaphragm in the wall of said chamber, and the heat-actuated device in the chamber connecting the diaphragm and the valve, for the purpose set forth.

5. The combination, in an automatic fire-extinguisher, of an extinguisher-chamber communicating with the supply-pipe, an air-chamber leading into the extinguisher-chamber, a valve closing an outlet, and a heat-actuated device located in said air-chamber and controlling the valve.

6. The combination, in an automatic fire-extinguisher, of an extinguisher-chamber communicating with the supply-pipe, an air-chamber located within the extinguisher-chamber, the said air-chamber having an inlet from the extinguisher-chamber, a valve closing an outlet, and a heat-actuated device in said air-chamber controlling the valve.

7. The combination, in an automatic fire-extinguisher, of an extinguisher-chamber communicating with the supply-pipe, an air-chamber leading into the extinguisher-chamber through a contracted inlet, a valve closing an outlet for the water, and a heat-actuated device located in said air-chamber and controlling the valve.

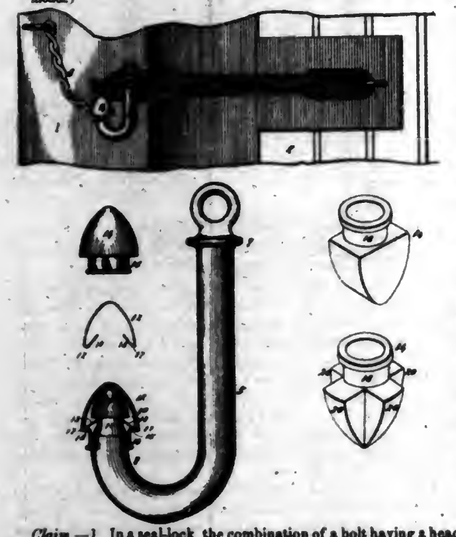


899,524. COMPOUND GARRETT-ENGINE. EARL W. HAMLIN, San Francisco, Cal., assignor to O. S. Wilson, same place. Filed Jan. 24, 1888. Serial No. 261,775. (No model.)

Claim.—1. The engine-cylinder and sleeve or guide with a piston fitted therein and having a hollow cylindrical trunk projecting outwardly through the sleeve, the yoke E, fitting a pin within the trunk and inclosing the anti-fractional ring F, yoke J J', fitted to the crank-pin at the opposite end, and the intermediate connecting-rod, D, having screw-threads of the same direction and pitch cut upon its opposite ends, so that one end may be screwed into the yoke E and set against the block H to close the ring F and take up wear at that end, and be equally screwed out of the strap or yoke upon the crank end, so that the distance between the two centers will remain the same, substantially as herein described.

2. The engine-cylinder having the piston of the cylindrical hollow-trunk pattern extending outward through a guide-sleeve at one end, the pin fixed inside the trunk, and the connecting-rod extending from said pin to the crank with screw-threads cut at opposite ends, so that adjustment for wear upon the pin G may be made by turning the connecting-rod without lengthening the distance between the two points, in combination with the two-part yoke J J', the cap-screws d d', and the set-screw e, substantially as herein described.

899,525. SHAFT ATTACHMENT FOR VEHICLES. DUNCAN D. HARR, Allegheny, Pa. Filed July 18, 1888. Serial No. 280,209. (No model.)



Claim.—1. In a shaft attachment, the combination, with the vehicle and shafts, of spiral springs placed longitudinally one above and the other below the shafts, substantially as described, and for the purpose set forth.

2. The combination, in a shaft attachment for two-wheeled vehicles, of a main spring and a supplementary spring set longitudinally one above and the other below the shafts, substantially as shown and described.

3. In a two-wheeled vehicle having pivotally-attached shafts and cross-bar, said bar being wider than the vehicle-body, the combination of the braces G G', with blocks F F', located above and below said braces and giving bearing to the bolts E E', said bolts passing through the standards B B' and supporting the main springs D D', and supplementary spring *d*, all arranged substantially as described.

4. In a two-wheeled vehicle having pivotally-attached shafts, the combination, with the standards B B', having recesses *b b'* for the eye-lugs *A A'*, of the braces G G', bolts E E', passing longitudinally through the standards B B' and bearing against blocks F F', springs D D', surrounding the bolts or rods E E', of the supplementary springs *d d'*, and nuts *e e'*, impinging against said springs, substantially as described and for the purpose set forth.

399,526. SEAL-LOCK. MICHAEL C. HARNEY, St. Louis, Mo., assignor of one-half to William H. Brennan, Ann Brennan, and Mary A. Grace, all of same place. Filed Sept. 1, 1888. Serial No. 284,342. (No model.)

Claim.—1. In a seal-lock, the combination of a bolt having a head forming a shoulder, a spring having ends fitting beneath the head of the bolt, and a seal having a shoulder engaging against the extremities of the spring, substantially as and for the purpose set forth.

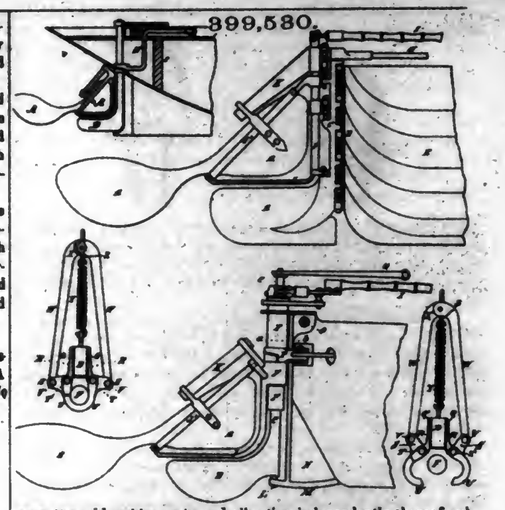
2. In a seal-lock, the combination of the bolt formed with a hook or upturned end, a head on the end of the bolt, a spring having ends engaging beneath the head of the bolt, and a seal fitting over the head of the bolt and having a shoulder engaging the extremities of the spring, substantially as set forth.

399,527. SPONGE FOR REDUCING GOLD AND SILVER AND OTHER ORES. ABRAHAM T. HAY, Burlington, Iowa. Filed Sept. 25, 1888. Serial No. 286,265. (Specimens.)

Claim.—A ferruginous sponge containing iron and an alkali or alkalies, substantially as and for the purposes set forth.

399,528. PROCESS OF MANUFACTURING STEEL. ABRAHAM T. HAY, Burlington, Iowa. Filed Sept. 26, 1888. Serial No. 286,450. (Specimens.)

Claim.—A ferruginous sponge containing iron, calcium, aluminum, sodium, and chromium, substantially as set forth.



399,529. PROCESS OF REDUCING GOLD, SILVER, &c. ABRAHAM T. HAY, Burlington, Iowa. Filed Oct. 4, 1888. Serial No. 287,198. (No specimens.)

Claim.—The herein-described method of smelting ores—such as those of gold, silver, copper, and lead—consisting in reducing the ore, together with a ferruginous alkaline sponge, substantially as set forth.

399,530. APPARATUS FOR PROPELLING AND STEERING VESSELS. THOMAS R. HEATHORN, London, England. Filed Oct. 23, 1888. Serial No. 288,968. (No model.) Patented in England Feb. 26, 1887, No. 3,066.

Claim.—1. In a vessel, the combination, with the rudder having its post fastened to the stern-post, of the vibrating propellers hinged

399,530.

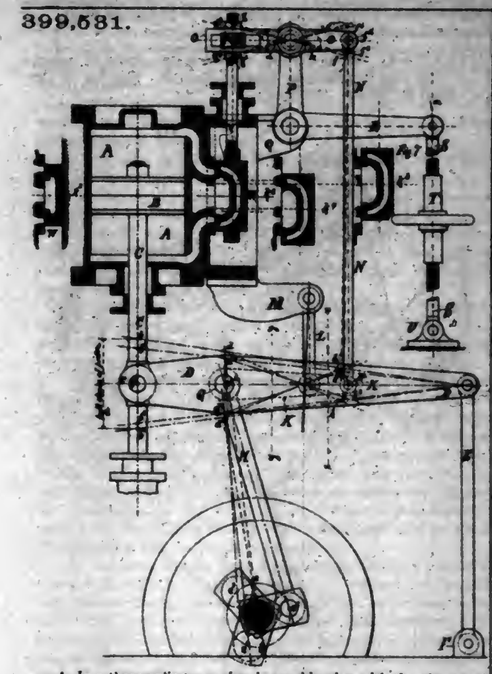
upon the said rudder-posts and vibrating independently thereof, substantially as described.

2. In a vessel, the combination, with the rudder-post, of two independent propellers hinged to said rudder-post and adapted to be spread apart for retarding the motion of the vessel, substantially as described.

3. In a vessel, the combination, with rudder and vibrating propeller-posts, the one adapted to pass through the other, of a bracket fastened to said propeller-post and hinged to the stern-post of the vessel, and a guide at the bottom of the rudder-post, substantially as described.

4. In a vessel, the combination, with the rudder-post and the propeller-post hinged thereupon, but vibrating independently thereof, of a fastening device engaging said posts and normally holding them in their vertical positions, substantially as described.

5. In a vessel, the combination, with the rudder and propeller posts, connected together but moving independently one of the other, of a fastening device for engaging said posts, said device consisting of the clips or jaws U, pivoted to the stern-post and having their outer ends pivotally engaged at V with the spring-impelled bars W, substantially as described.



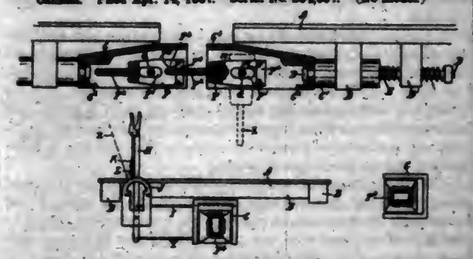
399,531. STEAM-ENGINE VALVE-GEAR. JOSEPH J. HEINDL, Brooklyn, N. Y. Filed Dec. 26, 1888. Serial No. 294,502. (No model.)

Claim.—1. In a three-cylinder engine, in combination with the piston-rod of any one of the said cylinders, a main-valve-operating lever connected to and operated by said piston-rod and swinging upon a vibrating fulcrum, a pitman or connecting-rod joining said main-valve-operating lever with one of the crank-pins of a triple-crank shaft, a secondary lever connected to and operated by said main operating-lever, a vibrating fulcrum supporting said secondary lever, a pitman or connection between said secondary lever and a valve-operating lever, and a connecting valve-stem and valve of a second cylinder of the set of three, substantially as set forth.

2. In a three-cylinder engine, in combination with the piston-rod of any of the said cylinders, a main-valve-operating lever connected to and operated by said piston-rod and swinging upon a vibrating fulcrum, a pitman or connecting-rod joining said main-valve-operating lever with one of the crank-pins of a triple-crank shaft, a secondary lever connected to and operated by said main-valve-operating lever, a vibrating fulcrum supporting said secondary lever, a pitman or connecting-rod joining said secondary lever to a slotted-valve-operating lever, a vibrating fulcrum or support for said slotted-valve-operating lever, and means for adjusting the position of said fulcrum-support, and a valve-stem and valve of a second cylinder of the set of three connected to and operated by said slotted-valve-operating lever, substantially as and for the purposes set forth.

3. A valve-adjusting mechanism for steam-cylinder steam-chests, consisting of a slotted lever attached directly to the valve-stem, a vibrating fulcrum-support for said slotted lever made adjustable to or from the valve-stem to lengthen or shorten the throw of valve, an adjusting arm or lever operating through a rock-shaft, to which both the vibrating fulcrum-support and the adjusting-arm are attached, a fixed bearing for the support of said rock-shaft, and a turn-buckle rod adapted to be lengthened or shortened, one end of said turn-buckle rod being attached to said adjusting-arm and the other to a fixed center or swing support, substantially as set forth.

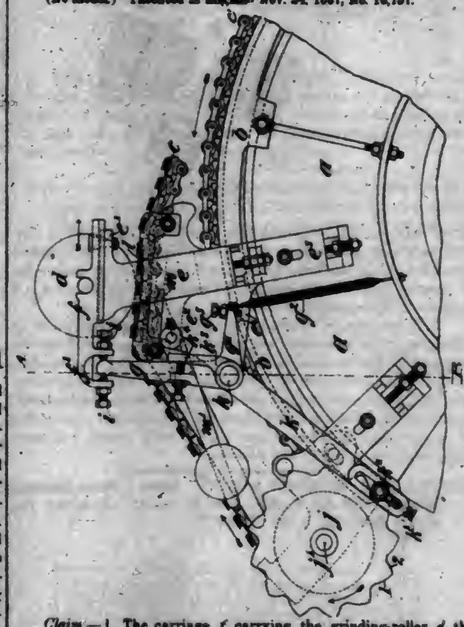
399,531.



4. In a three-cylinder engine, in combination with the piston-rod of any one of said cylinders, a main-valve-operating lever connected to and operated by said piston-rod and swinging upon a vibrating fulcrum, a pitman or connecting-rod joining said main operating-lever with one of the crank-pins of a triple-crank shaft, a rod connecting said main-valve-operating lever directly with the valve-lever, the valve-lever operating upon a vibrating support, and the connected valve and valve-stem of a second cylinder of the set of three, substantially as set forth.

5. In a three-cylinder engine, in combination with the piston-rod of any one of said cylinders, a main-valve-operating lever attached to and operated by said piston-rod and swinging upon a vibrating fulcrum, a pitman or connecting-rod joining said main-valve-operating lever with one of the crank-pins of a triple-crank shaft, a connecting-rod directly attached to and operated by said main operating-lever and communicating motion to and operating a slotted-valve lever, a vibrating fulcrum-support for said slotted-valve lever, and means or mechanism for adjusting the position of said fulcrum or support to effect a longer or shorter throw of valve, and a valve-stem and valve of a second cylinder of the set of three connected to and operated by said slotted lever, substantially as and for the purposes set forth.

6. In a three-cylinder-engine, the combination of the piston-rods of said engine, main-valve-operating levers connected directly to said piston-rods and swinging upon a vibrating fulcrum, connecting-rods joining said levers to the cranks of a triple-crank shaft, said crank-shaft being placed in such position that the center line of motion of said connecting-rods shall not be parallel with the center line of motion of the said piston-rods, whereby the movements of the cranks valves, and piston-rods are never in exact unison with each other, substantially as set forth.



399,532. CAR-COUPLING. ALEXANDER HENRY, Delaware, Ontario, Canada. Filed Apr. 14, 1887. Serial No. 234,837. (No model.)

Claim.—1. In a car-coupling, the draw-bars C, formed round in cross-section at C' and revolving laterally in their bearings, in combination with reversible coupling links or pins F, which are secured in and revolve laterally with the draw-bars, and formed with longitudinal oblong slots F^4, vertical slots F^5, shoulders F^6, and entering end F^7, formed with flanges *n'*, as and for the purpose set forth.

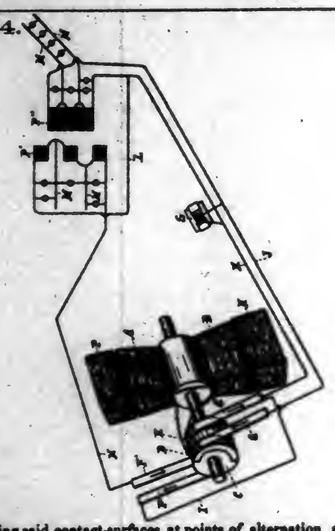
2. In a car-coupling, the draw-bars C, formed round in cross-section at C' and revolving laterally in their bearings, and reversible coupling links or pins F, which are secured in and revolve laterally with the draw-bars, and formed with longitudinal oblong slots F^4, vertical slots F^5, shoulders F^6, and entering end F^7, formed with flanges *n'*, in combination with the lever H, cog-segment J, dog K, spring L, and connecting-rods I I, as and for the purpose set forth.

399,533. APPARATUS FOR CONTROLLING THE GRINDING OF CARDING-ENGINE FLATS. JOHN M. HETHERINGTON, Manchester, County of Lancaster, England. Filed Aug. 10, 1888. Serial No. 282,449. (No model.) Patented in England Nov. 24, 1887, No. 16,157.

Claim.—1. The carriage *f*, carrying the grinding-roller *d*, the shaft *h*, and arms *g*, for sliding the said carriages to and fro, the lever $k\ k^2$, for operating upon the shaft *h* through the arm *g*, and the cam *j*, for operating upon the lever $k\ k^2$, substantially as and for the purpose set forth.

2. The roller *d*, mounted on the sliding carriage *f*, the slide at *d'* on the bracket *c*, having the described inclination with respect to the rail *l* upon each side of the carding-engine, in combination with means, substantially as described, for traversing the carriages *f* to and fro during the grinding action of the roller *d* upon each flat in the traveling chain *c*, substantially as set forth.

3. The cam-wheel *j*, the lever $k\ k^2$, the shaft *h*, and the lever-arms *g*, one formed with an arm, *g'*, attached to the spring g^6, in combination with the sliding carriages *f f'*, carrying the guiding-roller *d*, substantially as set forth.

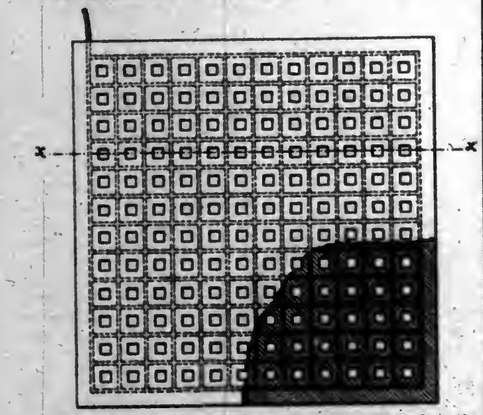


4. The grinding-roller *d* and movable bearings therefor, in combination with the shaft *h*, arms mounted on said shaft and operating said bearings, the lever *k* on said shaft and adapted to actuate said arms, and the cam *j*, engaging and adapted to oscillate said lever, substantially as set forth.

399,534. SYSTEM OF ELECTRICAL DISTRIBUTION AND CONVERSION. THOMAS H. HINES, Detroit, Mich., assignor to the Hines Induction-Light and Motor Company, of Michigan. Filed Apr. 30, 1888. Serial No. 271,987. (No model.)

Claim.—1. In a system of electrical distribution, the combination of an alternating-current machine provided with two sets of brushes, a line-wire electrically connected with one set of brushes of like sign, and independent return branches from said line-wire electrically connected, respectively, with the two brushes of the other sign, whereby electrical waves of one polarity may be maintained throughout the line-circuit and its branches.

2. In a system of electrical distribution, the combination of an alternating-current generator, contact-surfaces connected with the terminals of its generating-coils, two pairs of distributing-brushes alter-

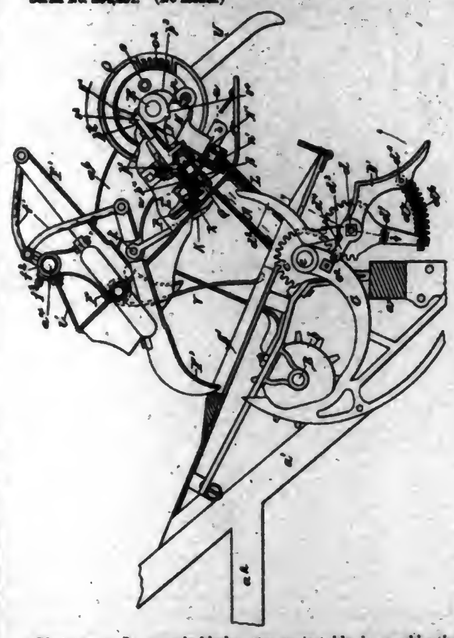


399,534.

nately engaging said contact-surfaces at points of alternation, a line-wire electrically connected to two brushes of like sign, and independent return branches of said line-wire connected, respectively, to the brushes of opposite sign, whereby intermittent impulses of one direction will circulate in the respective circuits.

3. In a system of electrical distribution, the combination of an alternating-current generator, contact-surfaces connected with the terminals of its generating-coils, two pairs of distributing-brushes alternately engaging said contact-surfaces at points of alternation, a line-wire electrically connected to a pair of brushes of like sign, independent return branches of said line wire connected, respectively, to the brushes of opposite sign, an induction-generator in each branch, and translating devices supplied by said generator.

399,535. SECONDARY BATTERY. JOSEPH L. HUBER, Hamburg, Germany. Filed Jan. 12, 1888. Serial No. 296,191. (No model.) Patented in France Oct. 3, 1888, No. 193,357.



Claim.—1. In a secondary electric battery, an electrode having the conductor or conductors of electricity in the form of net-work, grating, or screen embedded in the active mass for the storage of electricity, which mass is provided with perforations or impressions corresponding with the meshes or holes of the conductor, substantially as and for the purpose specified.

2. As an improvement in secondary batteries, an electrode consisting of a conductor or conductors in the form of net-work, grating or screen covered with the active mass, which has formed therein perforations or impressions, substantially as and for the purpose described.

3. An electrode for secondary batteries, comprising a conductor within the active mass, which mass is provided with perforations or impressions, substantially as and for the purpose set forth.

4. As a new article of manufacture, an electrode for secondary batteries, consisting of a conductor or conductors in the form of net-work, grating, or perforated plate, serving as a support for the active mass, which is provided with perforations or impressions for the passage of the battery-fluid, substantially as specified.

399,536. GRAIN-BINDER. GEORGE G. HUNT, Bristol, Ill., assignor to the Plano Manufacturing Company, Plano, Ill. Filed Jan. 15, 1887. Serial No. 224,451. (No model.)

Claim.—1. In a grain-binder, the grain-table, in combination with a binding-arm mounted below the table, a packer-shaft mounted above the table over the binding-arm shaft and provided with cranks, vibrating packer-arms mounted on said cranks and extending inward over the table, and shipping mechanism for the packer-shaft constructed to operate at certain predetermined points, whereby the packer-shaft is always stopped with one of the packers projected inward and downward, substantially as and for the purpose specified.

2. In a grain-binder, the grain-table, in combination with a binding-arm mounted below the table, a packer-shaft mounted above the table and provided with cranks, vibrating packer-arms mounted on said cranks and extending inward over the table, and shipping mechanism for stopping and starting the packer-shaft, constructed and arranged to stop the latter at a point which will leave one of the packer-arms projected inward and lying alongside the closed binding-arms, substantially as and for the purpose specified.

3. In a grain-binder, the packer-shaft, in combination with its drive wheel mounted loosely thereon, the friction-clutch provided with diametrically-opposite radial lugs g^9 g^{10}, the spring-lever H, arranged to engage with one of said lugs at a certain fixed point for unclutching the wheel from the packer-shaft, the bell-crank lever H', having one of its arms arranged to engage the spring-lever H, and the rocking binding-arm shaft *c* and its operating crank-arm c^4, said crank-arm being arranged to engage the other arm of the bell-crank lever H', substantially as and for the purpose specified.

4. In a grain-binder, the packers, in combination with a yielding grain-stop independent of both the compressor and trip-arm, against which the gavel is formed, substantially as and for the purpose specified.

5. In a grain-binder, the packers, in combination with the yielding grain-stop d^3, independent of the trip-arm and compressor, and the bundle-discharger U, substantially as and for the purpose specified.

6. In a grain-binder, the binding-arm, in combination with the packers, a yielding grain-stop against which the gavel is formed, and an independent yielding trip-arm separated entirely from the grain-stop and graduated to present less resistance than said stop, substantially as and for the purpose specified.

7. The bracket D, in combination with the shaft *d* secured thereto, the grain-stop d^3, provided with an elongated hub, the spring d^{13}, the compressor D', composed of two separate arms mounted loosely on the hub of the grain-stop and connected together near their outer ends, the arm d^7, to which the compressor is connected by sliding rod and spring, and the gear-sectors whereby said arm is vibrated, substantially as and for the purpose specified.

8. In a grain-binder, the binding mechanism and its main or cam shaft arranged above the grain, in combination with a clutch-pawl attached to and carried by said shaft, a driving-wheel mounted loosely on said shaft and connected thereto by the said pawl, a stop-arm, also arranged above the grain and in the path of the pawl, a trip-arm arranged above the grain and fixed on a rock-shaft, and a link-rod connecting a crank-arm on said rock-shaft with the stop-arm, substantially as and for the purposes specified.

9. The main or cam shaft E, in combination with the wheel *c*, mounted loosely thereon and provided with a flange-rim having projections *c'*, as described, the spring clutch-pawl F', carried by the shaft and adapted to engage the said projections, its toe being widened to project laterally beyond the rim of the wheel and turned forward to form a projection, c^8, radially beyond the rim of said wheel, and the stop-arm arranged to engage with the said projection c^8, substantially as and for the purposes specified.

10. The main or cam shaft, in combination with a bracket, E', fastened thereto, a spring-pawl, c^6, pivoted to the bracket, a locking projection, c^5, on the bracket, and the stop-arm arranged to engage both pawl and lock, substantially as and for the purposes specified.

11. The bracket E', fastened to the main shaft and provided at its outer edge with a cam-surface, c^7, and notch c^6, in combination with a spring-pawl pivoted to the bracket, the stop-arm, the drive-wheel loose on the shaft, the yielding locking-bolt M, arranged to be engaged and depressed by the cam on the bracket and to just enter the notch therein at the moment the pawl is disconnected from the wheel, and the lock-bolt spring of greater strength than the pawl-spring, whereby the thrust upon the bolt will throw the bracket forward slightly to seat the bolt in the notch after the pawl is disengaged from the wheel, substantially as and for the purposes specified.

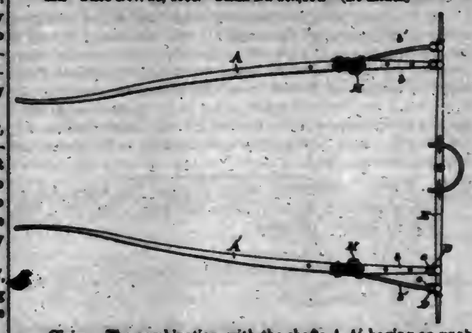
12. The main or cam shaft, in combination with the bracket E', fastened thereto and provided with the cam c^7, and notch c^6, the lock-arm c^5 on the bracket, the spring-pawl c^6, pivoted to the bracket, the drive-wheel loose on the shaft and provided with projections *c'*, the stop-arm I, the lock-bolt M, and its actuating-spring *m'*, stronger than the pawl-spring, all constructed and operating substantially as and for the purposes specified.

13. In a grain-binder, the breast-plate L, provided with the bent slot *l* and the pivoted cord-placer P, arranged at one side of said slot and shaped to guide the cord into the knotting-hook, said cord-placer being provided with mechanism whereby it is vibrated at the proper time downward and across the slot to bring the cord into proper position, in combination with a cord-support pivoted close to the breast-plate and arranged to stand normally direct across the slot therein, and mechanism whereby the said support is turned away from the slot just as the bundle is bound and returns to its place just before the binding-arm opens, substantially as and for the purposes specified.

14. The pivoted cutter S, in combination with the shaft s^6, provided with the fork *s'* and bent crank-arm s^4, and the cam s^5 on the main or cam shaft, substantially as and for the purpose specified.

15. The packers F', in combination with the links f^7 and the studs f^9, sleeved to the rod c^4 and adjustable lengthwise of said rod, substantially as and for the purposes specified.

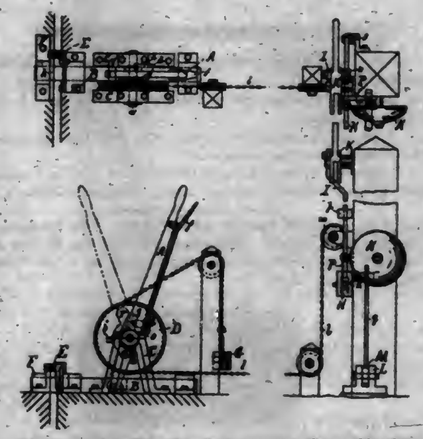
16. The packers F', in combination with the links f^7, the studs f^9, to which said links are pivoted, and sleeves carrying the said studs and mounted on the rod c^4, said sleeves being independently adjustable around said rod as a center, substantially as and for the purposes specified.



17. In a grain-binder, the main or cam shaft, in combination with the packer-shaft, chain-wheels mounted on each, and a single drive-chain arranged and operating to drive both shafts, substantially as and for the purposes specified.

18. In a grain-binder, the binding mechanism, in combination with the packing mechanism, chain-wheels constructed and arranged for driving each respectively, a single chain for driving said wheels, and a chain-driving wheel mounted on the frame of the binder, whereby the entire chain-driving mechanism is attached to and removable with the binder, substantially as and for the purposes specified.

19. The main or cam shaft E, in combination with the chain-wheel *e*, mounted loosely thereon, the packer-shaft F, the chain-wheel *f*, mounted loosely thereon, clutch mechanism for connecting and disconnecting the said wheels and their respective shafts, a single chain, B', arranged to drive the wheels *e* and *f*, and the chain-wheel b^3, mounted on the binder-frame, substantially as and for the purposes specified.



20. The main or cam shaft E, in combination with the chain-wheel *e*, mounted loosely thereon, the packer-shaft F, the chain-wheel *f*, mounted loosely thereon, clutch mechanism for connecting and disconnecting the said wheels and their respective shafts, a single chain, B', arranged to drive the wheels *e* and *f*, the chain-wheel b^3, mounted on the binder-frame, the gear-wheel b^5, attached to said wheel b^3, and the driving-shaft B, provided with a pinion engaging with said wheel b^5, substantially as and for the purposes specified.

399,537. THILL FOR VEHICLES. GEORGE H. HUTTON, Baltimore, Md. Filed Nov. 26, 1888. Serial No. 292,104. (No model.)

Claim.—The combination, with the shafts A A', having an unobstructed space between them, of the branches *b' b'*, secured to the outside of shafts, and a spring-yielding trace-hook attached to each of said shafts, the whole arranged to operate substantially as shown and described, and for the purposes set forth.

399,538. SWITCH-SIGNAL. FRANK H. KELSEY, New Haven, assignor of part interest to Joseph C. Peck, same place, and James Graham, Orange, Conn. Filed Mar. 17, 1888. Serial No. 267,464. (No model.)

Claim.—1. In railway signaling apparatus, the combination, with the operating-lever and the bolt operated thereby, of a bolt-lock pivoted beside the bolt and adapted to drop across the end of the bolt at right angles to its line of motion when the bolt is fully retracted and prevent forward motion of the bolt, substantially as shown and described.

2. The combination of an operating-lever with the bolt B, operated thereby, to lock the draw-bridge or switch, the bolt-lock E, pivoted beside the bolt and adapted to drop across the end of the bolt, the dog *d*, pivoted to the lever on the side of the lever-fulcrum, opposite to the pawl *h*, and adapted to be caught and held by the projection *e* on the frame, a sprocket or chain wheel provided with a ratchet, *g*, formed on its side, the pawl *h*, pivoted on the lever adapted to engage at one end with the ratchet, and having its opposite end weighted and so shaped as to come in contact with a stop, and thereby be thrown out of engagement with the ratchet when the operating-lever is at one end of its travel, and a chain passing around the chain-wheel, connected at one end to a weight and at the other end to the mechanism for operating the semaphore, substantially as described.

3. In combination, the weighted lever H, pivoted at one end and adapted to be lifted and held up by a chain, *l*, the rod I, having at its lower end a fork which engages and rests upon the lever, and provided at its upper end with a slot, and a semaphore-arm connected to the rod I by a bolt passing through the slot in the rod and into the arm near its fulcrum, substantially as and for the purpose specified.

4. In railway signaling apparatus, the combination, with a bell or gong and suitable mechanism for operating it fixed beside the rails of the track, of the lever H, the rod I, provided with a forked end, *n*, and a slot, *o*, in the other end, the semaphore-arm K, the chain or wire *l*, the chain-wheel D, with a ratchet, *g*, formed on the side of it, the

pawl *h*, the lever A, the dog *d*, pivoted on the lever, and the stops *i* and *e*, all combined as and for the purpose specified.

5. In combination, the operating-lever A, the dog *d*, pivoted on the lever, the sprocket or chain wheel D, with a ratchet, *g*, formed on the side of it, the pawl *h*, pivoted on the lever A and provided with a weighted end, the stop *i* on the frame, the bolt B, the bolt-lock E, the socket F, carrying the rib *k*, the weight G, the chain or wire *l*, the lever H, the rod I, provided with a forked end, *n*, and a slot, *o*, in the other end, the semaphore-arm K, the lever M, the rod *q*, the bell-hammer P, and the bell or gong N, all combined substantially in the manner and for the purpose specified.

399,539. ATOMIZER. ROBERT S. KNODE, Fort Wayne, Ind., assignor of one-half to Emmett L. Siver, same place. Filed Oct. 4, 1888. Serial No. 287,339. (No model.)

Claim.—1. In an atomizing apparatus, the combination of the air-tube A with the liquid-tube B, with the sleeve *c*, the connecting-tube D, and the cup C, for the purpose and substantially as described.

2. In an atomizing apparatus, the combination of the separable connecting-tube D, constructed with two curves, with a liquid-tube adapted to be rotated thereon, and with a vessel for containing the liquid to be sprayed.

399,540. SURGICAL DRAINAGE-TUBE. JOHN E. LEE, Conshohocken, Pa., assignor to the J. Ellwood Lee Company, same place. Filed Aug. 2, 1888. Serial No. 281,732. (No model.)

Claim.—1. A surgical drainage-tube of coiled wire, substantially as described.

2. A surgical drainage-tube of coiled wire, having the top coil bent up to form a loop.

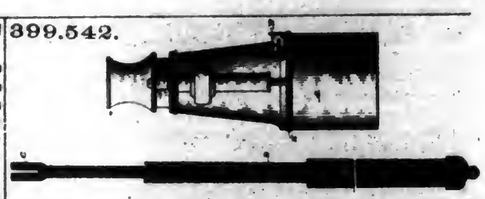
3. A surgical drainage-tube of coiled wire, with the coils at one end soldered together into a solid tube.

4. A surgical drainage-tube of closely-coiled wire, but having some of the coils stretched apart, as and for the purpose set forth.

399,541. SUPERHEATER AND BURNER. JOHN LIVINGSTONE, Toronto, Ontario, Canada. Original application filed Apr. 25, 1888, Serial No. 271,797. Divided and this application filed Dec. 1, 1888. Serial No. 292,396. (No model.)

Claim.—1. The superheater and burner consisting of an outer casing, a perforated tube within the outer casing, forming a space between it and the casing, iron or steel filings or pieces filling said space, and nozzles connecting the inner tube and outer casing, substantially as described.

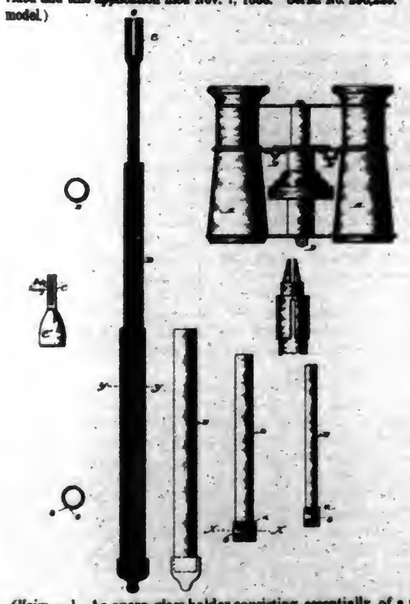
2. The superheater and burner consisting of an outer casing, a perforated tube within the outer casing and forming a space between it and the casing, wire-cloth surrounding the perforated tube, iron or steel filings or pieces filling said space, and nozzles connecting the tube and outer casing, substantially as described.



399,542. OPERA OR MARINE GLASS. WILLIAM MACK, Terre Haute, Ind. Filed July 17, 1888. Serial No. 280,168. (No model.)

Claim.—1. An opera or marine glass provided with a tube, socket, or clamp secured to or formed with a cross or yoke piece of the glass in a plane at right angles to the length of the glass and adapted to removably receive and tightly hold a detachable holder or handle, substantially as described.

2. In an opera-glass or the like, the combination of a cross or yoke piece with a vertical socket, sleeve, or clamp having a lower open



399,542.

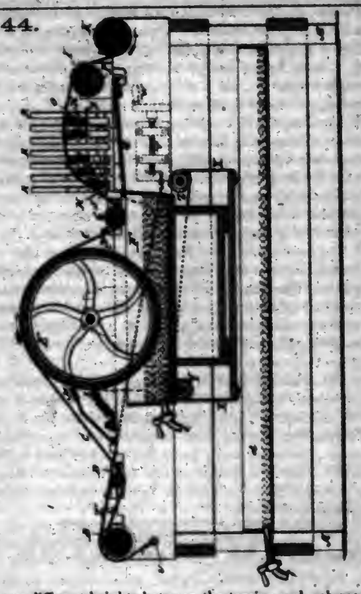
end and transversely located upon and secured to or formed with the cross-piece and adapted to receive and hold the end of a detachable handle for the glass, substantially as described.

399,543. OPERA-GLASS HOLDER. WILLIAM MACK, Terre Haute, Ind. Original application filed July 17, 1888, Serial No. 280,168. Divided and this application filed Nov. 7, 1888. Serial No. 290,289. (No model.)

Claim.—1. An opera-glass holder consisting, essentially, of a rigid body portion having its upper outer end longitudinally bifurcated, forming spring legs or arms tending to spring apart and adapted to snugly and removably fit in the herein-described tube or socket of an opera-glass, and thereby rigidly hold the same in position, as set forth.

2. An opera-glass holder comprising telescopic sections having exterior and interior intermeshing corrugations, the section at one end having its outer end longitudinally bifurcated to engage the yoke-piece of an opera-glass, said bifurcated end having a soft lining, and the section at the opposite end serving as a handle, substantially as described.

3. An opera-glass holder comprising telescopic sections, one or more of which are provided with exterior corrugated collars having outwardly-springing ends and sliding in adjoining sections, the section at one end being longitudinally bifurcated to hold the yoke-piece of the opera-glass and the opposite end section serving as a handle, substantially as described.



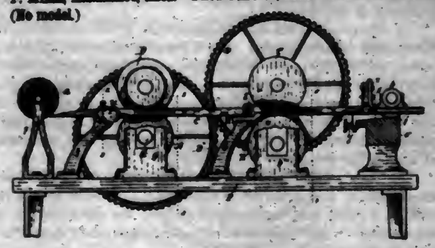
4. An opera-glass holder comprising telescopic sections, one end section serving as a handle and the opposite end section adapted to removably hold the glass, for the purpose set forth, the inner ends of said sections being provided with serrations or corrugations sliding in similar corrugations in the interiors of the adjoining sections.

5. An opera-glass holder comprising telescopic sections, the section at one end serving as a handle and the opposite end section adapted to be removably secured to a cross-piece of a glass, the inner ends of said sections being provided with exterior and interior intermeshing corrugations and outwardly-springing ends, as described.

399,544. APPARATUS FOR COATING PAPER AND OTHER MATERIAL. THOMAS MAHARAN, New York, N. Y. Filed Sept. 12, 1888. Serial No. 285,234. (No model.)

Claim.—1. The combination, with a trough, F, and a delivery-roller, E, rotating therein, and over which the web passes, of a tension-roller, G, above the trough, and under which the web passes, a web-receiving roller, K, and the softened scrapers H, adjustable in a vertical plane to different heights between the tension and web-receiving rollers and constituting a support for the web, over and against which the latter travels, substantially as described.

399,544.



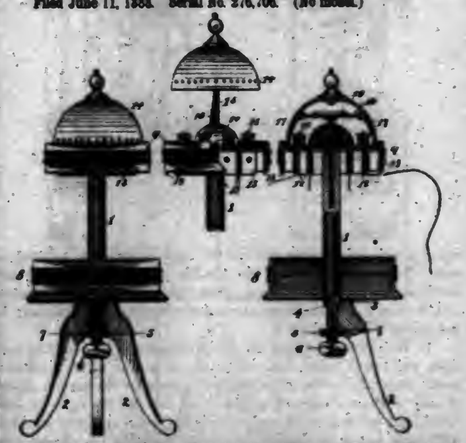
2. The combination, with a trough, F, a delivery-roller, E, and rollers for feeding a web over the delivery-roller, of arms R, arranged to form guideways, a series of scrapers, H, adjustable vertically independent of each other in said guideways, and pins S, for supporting the scrapers at different heights, substantially as described.

3. The combination, with a delivery-roller, E, and rollers for feeding a web over the same, of the trough F, the straps X, suspending the trough, the strap-supporting guide-roller Y, and the rotary shaft Z, connected with the straps for winding and unwinding the same to raise and lower the trough, substantially as described.

4. The combination, with a web-carrying roller, B, a trough, F, a delivery-roller, E, over which the web travels, a web-receiving roller, K, and tension-rollers, of a brake-band, T, passing around a part of the web-carrying roller, and a longitudinally-adjustable screw, V, connected with one end of the brake-band, and having a handle, W, for rotating it, substantially as described.

5. The combination, with a trough, F, a delivery-roller, E, over which the web passes, and a web-receiving roller, K, of softened scrapers H, located between the delivery and web-receiving rollers, and constituting a supporting-rest over which the web passes, and a distributing-roller, I, having an absorbent covering, P, and rotating in bearings between the guides and web-receiving roller, substantially as described.

399,545. MACHINE FOR MAKING METAL SASH. WILLARD F. MILLS, Kalamazoo, Mich. Filed June 12, 1888. Serial No. 276,841. (No model.)



Claim.—1. The combination of a suitable support, a bracket thereon having a V-shaped recess for the strip of metal to pass through, a roller having an angular peripheral groove and a wheel above in said groove, between which groove and wheel the metal passes, a bracket having a ⊥-shaped recess, through which the metal next passes, and a roller having a peripheral groove and a roller below, between which rollers the ⊥-shaped metal strip passes, substantially as set forth.

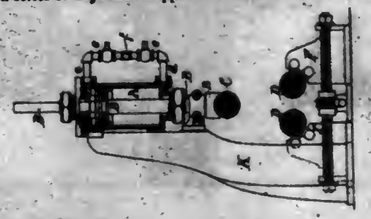
2. The combination of a suitable support, a bracket thereon having a V-shaped recess for the strip of metal to pass through, a roller having an angular peripheral groove and a wheel above in said groove, between which wheel and groove the metal strip passes, a ⊥-shaped recess, through which the metal strip next passes, two rollers, between which the ⊥-shaped metal passes, one having the peripheral groove to receive the stem of the metal strip, the tool having the prong and shoulders for separating the parts of the double stem and turning them over, and the bracket and roller having the T-shaped recess between them, through which the metal finally passes, substantially as set forth.

3. The combination of a suitable table or support, a reel on which the metal strip is wound, a V-shaped recess for the metal to pass through, the grooved roller, and wheel in said groove, the ⊥-shaped recess, through which the U-shaped metal passes, the rollers, one of which is grooved and between which the ⊥-shaped metal passes, and the tool having the prong and shoulders, and the end bracket having the block and roller with T-shaped recess, through which the sash is drawn in its completed condition, substantially as set forth.

399,546. WORK-STAND. DANIEL H. MURPHY, Hartford, Conn. Filed June 11, 1888. Serial No. 276,706. (No model.)

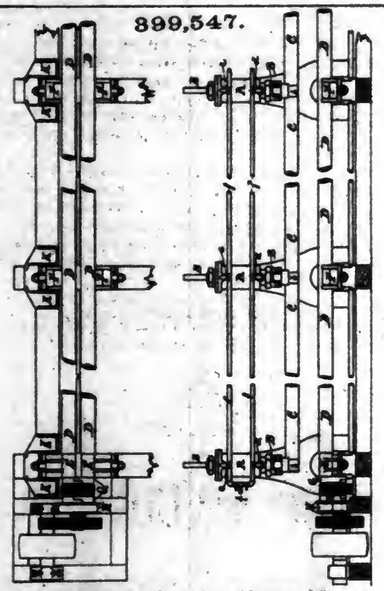
Claim.—1. In combination, in the within-described work-stand, the spindle 1, having a socket in its upper end, a rod having a vertical movement in the socket, a spring, 16, attached to the rod, a diaphragm attached to the upper end of the rod, the springs 17, and the cover 14, all substantially as described.

2. In combination, in the within-described work-stand, the spindle bearing a socket in its upper end, a rod having a vertical movement in the socket, a spring attached to the rod, a diaphragm attached to the upper end of the rod, and a cover removably attached to the diaphragm, substantially as described.



3. In combination, in the within-described work-stand, the spindle 1, having a reduced upper end, a rotary tray borne on the upper end of the spindle, said tray bearing the posts 11, and having the tubes 12 projecting through the floor, and the knives, substantially as described.

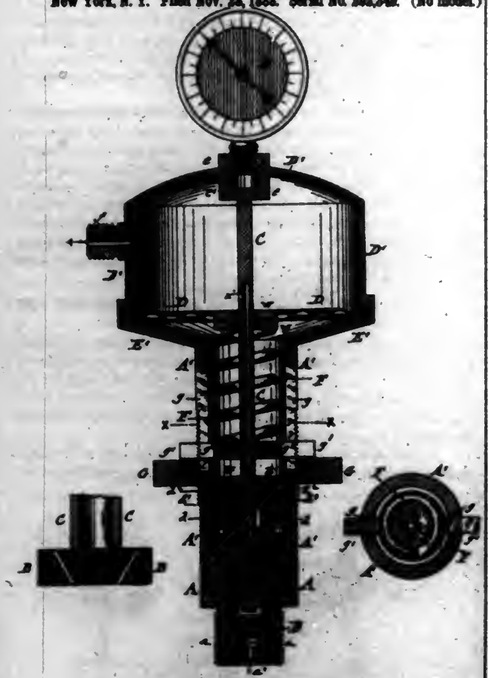
4. In combination, in the within-described work-stand, the spindle 1, having a reduced upper end, a rotary tray borne on the reduced portion of the spindle, the sides of the tray extending below the floor, said tray bearing the posts 11, and having the tubes 12 extending through the floor of the tray to act as a finger-guide to the thread, and the knives, substantially as described.



399,547. HOSE-MACHINE. JOHN MURPHY, Brooklyn, N. Y. Filed Nov. 21, 1888. Serial No. 291,498. (No model.)

Claim.—1. In combination with the lower rollers of a hose-making machine, a direct-acting steam or air cylinder provided with upper and lower ports and communicating pipes and valves for the admission or discharge of the operating medium, and an upper roller supported and operated by means of a piston moved in said cylinder substantially as and for purposes specified.

2. In combination with the lower rollers of a hose-making machine, a series of adjustable supports for said lower rollers, an upper



899,547.

roller, a supporting piston and rod for said upper roller, and one or more direct-acting steam or air cylinders provided with upper and lower ports, and communicating pipes and valves for the admission and discharge of the medium operating said pistons, substantially as and for purposes set forth.

3. In combination with the three rollers of a hose-making machine, any one of which is covered with an annular layer of soft and elastic material, a series of adjustable supports for the bottom rollers of said machine, a supporting piston and rod for the upper of said rollers, and one or more direct-acting steam or air cylinders provided with ports, and communicating pipes and valves for the admission of the medium operating said supporting piston and rod, substantially as and for purposes set forth.

899,548. PRESSURE-REGULATING VALVE. JOHN HAGELDINGER, New York, N. Y. Filed Nov. 29, 1888. Serial No. 292,349. (No model.)

Claim.—1. The combination, in a testing-machine, of the specimen-carriers, the tension of compression mechanism, the specimen cylinder and piston, the card-carrier cylinder and piston, and a communication between the two cylinders, whereby displacement in one cylinder causes corresponding displacement in the other cylinder, substantially as described.

2. The combination, in a testing-machine, of the specimen-carriers, the tension or compression mechanism, the specimen cylinder and piston, the card-carrier cylinder and piston, and a communication between the two cylinders, with a valve-chest, communicating-tubes between the chest and the specimen-cylinder and between the chest and the card-carrier cylinder, and valves in said chest, so that the passages between the two cylinders may be regulated, substantially as and for the purpose set forth.

3. The combination of the specimen cylinder and piston and the drum cylinder and piston with a valve-chest, G, valves therein, a reservoir, H, a pump, and communications from the valve-chest to both the specimen-cylinder and piston-cylinder, substantially as and for the purpose described.

4. The combination, in a testing-machine, of the collars E E', cylinders F, and their pistons and rods confined between said collars, a cylinder, J, and its piston, and a recording-drum connected to said piston in such a manner as to be revolved as the piston in the cylinder J is moved, substantially as described.

5. The combination of the collar E, the pointed blocks W, adapted to engage with the specimen, and a spring in the rear of the blocks to keep said blocks always in contact with said specimen, substantially as and for the purpose set forth.

6. The combination of the collar E, the pointed blocks W W, and springs at the rear of said blocks, with blocks V V, carrying friction-rollers, and springs in the rear of these blocks, so that the rollers will at all times bear against the specimen to be tested, substantially as described.

7. The combination of the collar E and the pointed blocks W with a spindle, W', having a threaded portion adapted to a threaded opening in the block W, and a spring adapted to force the spindle and the block against the specimen to be tested, substantially as set forth.

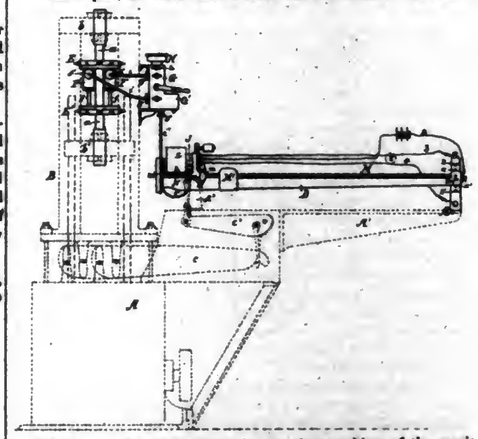
8. The combination, in a testing-machine, of the scale-beam and its balancing-pivot with a poise and operating mechanism therefor and a driving-pulley for said mechanism, said pulley being mounted on the pivot-line of the beam, so that the power exerted on the driving-belt will not affect the balancing of the beam, substantially as set forth.

9. The combination, in a testing-machine, of the scale-beam and its balancing-pivot with a poise-operating screw, a driving-pulley, and mechanism connecting the pulley to the screw, said pulley being mounted on the pivot-line of the beam, so that the power exerted on the driving-belt will not affect the balancing of the beam, substantially as described.

10. The combination, in a scale-beam, of the screw, the wheel P, magnets, an armature situated between said magnets, and the lever S, having at one end the said armature and at the opposite end carrying the shaft Q, and mechanism for driving said shaft, substantially as and for the purpose set forth.

11. The combination, in a scale-beam, of the screw-shaft, a wheel, P, an annular recess, *p*, therein, having two bearing-faces, *p' p²*, a driving-roller, *q*, and a lever carrying the same, and devices by which said roller is thrown against either the faces *p' p²* or suspended between the two, substantially as and for the purpose described.

12. The combination, in a scale-beam, of its screw-shaft, the wheel P, having an annular recess therein, driving-roller *q*, its shaft Q, mounted on the lever S, an armature at one end of said lever, magnets I I', and a shaft, Q', connected to said shaft Q with a belt-wheel *q'*, substantially as described.



13. The combination, in a scale-beam, of the screw, its driving-wheel, the pivoted lever S, carrying at one end the driving-shaft Q, an armature at its opposite end, magnets on each side of said armature, with springs *v v*, tending to keep said armature in a central position, and a driving-roller on said shaft Q, central between the two surfaces of the recess in the wheel P, substantially as described.

14. The combination, in a testing-machine, of the specimen cylinder and piston, the recording-drum L and its cylinder and piston, and connections between said cylinders with a scale-beam, and lever mechanism connected thereto and to the specimen, a screw-shaft carrying a pencil-holder, and reversible driving mechanism for actuating said pencil-holder, magnets controlling said driving mechanism, and contacts on said scale-beam and on the frame, so that as the scale-beam swings it will make and break the circuit through said magnets, the whole acting in conjunction with the drum and its cylinders to form a chart giving the tensile or compression strength and the amount of expansion or contraction, substantially as set forth.

15. The combination, in a recording-drum, of the screw M, and a pencil-carrier mounted in bearings and having teeth engaging with said screw, with a lever mounted on said pencil-carrier and having a finger, n^3, on the movement of which the pencil-carrier is thrown out of gear with the screw, substantially as specified.

16. The combination of the drum-shaft K, a driving pinion or pulley, K', with a drum, L, carrying the record-paper, and a nut, P, adapted to bind the drum to or release it from the driving mechanism, substantially as and for the purpose described.

899,549. TESTING AND RECORDING MACHINE. TITUS OLSEN, Philadelphia, Pa. Filed June 28, 1888. Serial No. 278,443. (No model.)

Claim.—1. The combination, in a testing-machine, of the specimen-carriers, the tension of compression mechanism, the specimen cylinder and piston, the card-carrier cylinder and piston, and a communication between the two cylinders, whereby displacement in one cylinder causes corresponding displacement in the other cylinder, substantially as described.

2. The combination, in a testing-machine, of the specimen-carriers, the tension or compression mechanism, the specimen cylinder and piston, the card-carrier cylinder and piston, and a communication between the two cylinders, with a valve-chest, communicating-tubes between the chest and the specimen-cylinder and between the chest and the card-carrier cylinder, and valves in said chest, so that the passages between the two cylinders may be regulated, substantially as and for the purpose set forth.

3. The combination of the specimen cylinder and piston and the drum cylinder and piston with a valve-chest, G, valves therein, a reservoir, H, a pump, and communications from the valve-chest to both the specimen-cylinder and piston-cylinder, substantially as and for the purpose described.

4. The combination, in a testing-machine, of the collars E E', cylinders F, and their pistons and rods confined between said collars, a cylinder, J, and its piston, and a recording-drum connected to said piston in such a manner as to be revolved as the piston in the cylinder J is moved, substantially as described.

5. The combination of the collar E, the pointed blocks W, adapted to engage with the specimen, and a spring in the rear of the blocks to keep said blocks always in contact with said specimen, substantially as and for the purpose set forth.

6. The combination of the collar E, the pointed blocks W W, and

springs at the rear of said blocks, with blocks V V, carrying friction-rollers, and springs in the rear of these blocks, so that the rollers will at all times bear against the specimen to be tested, substantially as described.

7. The combination of the collar E and the pointed blocks W with a spindle, W', having a threaded portion adapted to a threaded opening in the block W, and a spring adapted to force the spindle and the block against the specimen to be tested, substantially as set forth.

8. The combination, in a testing-machine, of the scale-beam and its balancing-pivot with a poise and operating mechanism therefor and a driving-pulley for said mechanism, said pulley being mounted on the pivot-line of the beam, so that the power exerted on the driving-belt will not affect the balancing of the beam, substantially as set forth.

9. The combination, in a testing-machine, of the scale-beam and its balancing-pivot with a poise-operating screw, a driving-pulley, and mechanism connecting the pulley to the screw, said pulley being mounted on the pivot-line of the beam, so that the power exerted on the driving-belt will not affect the balancing of the beam, substantially as described.

10. The combination, in a scale-beam, of the screw, the wheel P, magnets, an armature situated between said magnets, and the lever S, having at one end the said armature and at the opposite end carrying the shaft Q, and mechanism for driving said shaft, substantially as and for the purpose set forth.

11. The combination, in a scale-beam, of the screw-shaft, a wheel, P, an annular recess, *p*, therein, having two bearing-faces, *p' p²*, a driving-roller, *q*, and a lever carrying the same, and devices by which said roller is thrown against either the faces *p' p²* or suspended between the two, substantially as and for the purpose described.

12. The combination, in a scale-beam, of its screw-shaft, the wheel P, having an annular recess therein, driving-roller *q*, its shaft Q, mounted on the lever S, an armature at one end of said lever, magnets I I', and a shaft, Q', connected to said shaft Q with a belt-wheel *q'*, substantially as described.

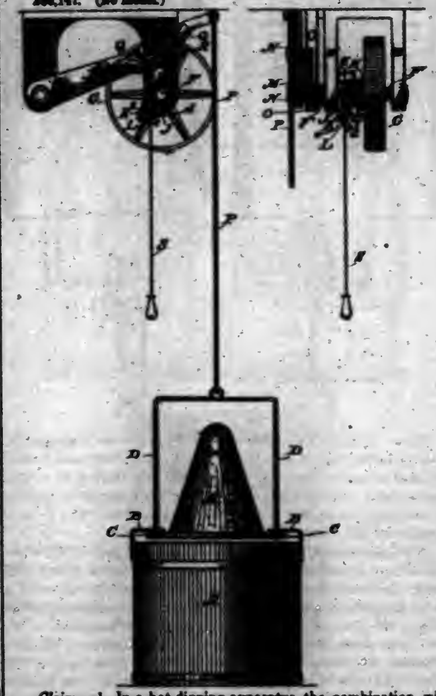
13. The combination, in a scale-beam, of the screw, its driving-wheel, the pivoted lever S, carrying at one end the driving-shaft Q, an armature at its opposite end, magnets on each side of said armature, with springs *v v*, tending to keep said armature in a central position, and a driving-roller on said shaft Q, central between the two surfaces of the recess in the wheel P, substantially as described.

14. The combination, in a testing-machine, of the specimen cylinder and piston, the recording-drum L and its cylinder and piston, and connections between said cylinders with a scale-beam, and lever mechanism connected thereto and to the specimen, a screw-shaft carrying a pencil-holder, and reversible driving mechanism for actuating said pencil-holder, magnets controlling said driving mechanism, and contacts on said scale-beam and on the frame, so that as the scale-beam swings it will make and break the circuit through said magnets, the whole acting in conjunction with the drum and its cylinders to form a chart giving the tensile or compression strength and the amount of expansion or contraction, substantially as set forth.

15. The combination, in a recording-drum, of the screw M, and a pencil-carrier mounted in bearings and having teeth engaging with said screw, with a lever mounted on said pencil-carrier and having a finger, n^3, on the movement of which the pencil-carrier is thrown out of gear with the screw, substantially as specified.

16. The combination of the drum-shaft K, a driving pinion or pulley, K', with a drum, L, carrying the record-paper, and a nut, P, adapted to bind the drum to or release it from the driving mechanism, substantially as and for the purpose described.

899,550. ELECTRIC SWITCH. HARRY T. PARRY, West Chester, Pa. Filed Apr. 28, 1888. Serial No. 272,112. (No model.)



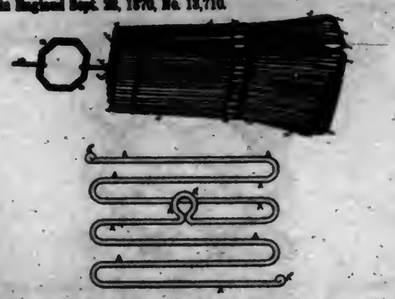
Claim.—1. The combination of a switch-shaft, an arm thereon, a spring-lever carried thereby, and a terminal having a portion tangential to the pivot of the lever, whereby the free arm of said lever has a sliding contact with the tangential portion of the terminal during that portion of its movement which is due to the action of the spring, all substantially as specified.

2. The combination of the U-shaped terminal D and the flat terminal C, placed across the open end of the U-shaped terminal, with a switch-shaft having an arm, a contact-lever pivoted to said arm, and a spring acting on said lever and serving to move the same independently of the arm, all substantially as specified.

3. The combination of the U-shaped terminal and the straight terminal, a shaft having a cross-head, and two levers, I I', pivoted thereto and connected together by a spring, each lever having contact-faces for bearing upon the terminals, substantially as described.

4. The combination of the U-shaped terminal having a lug, *p*, with a straight terminal, C, and the shaft and spring-lever for completing the circuit between the terminals C D, substantially as described.

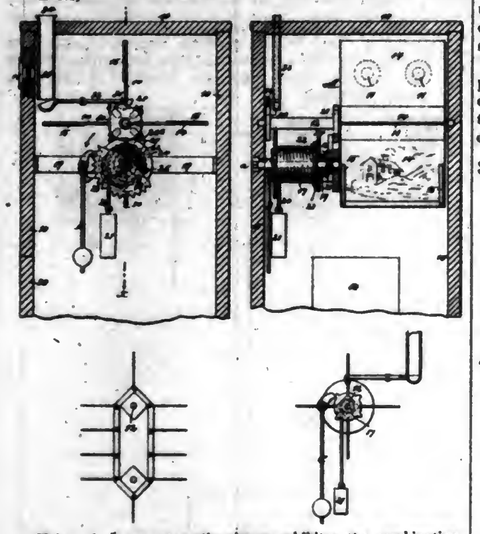
899,551. HAT-FORMING MACHINE. SETH G. PALMER, South Norwalk, Conn., assignor, by direct and mesne assignments, to Elias M. Palmer and Alden Selmans, same place. Filed Sept. 24, 1888. Serial 286,147. (No model.)



Claim.—1. In a hat-dipping apparatus, the combination, with a crank, of a pivoted lever having a slot within which the pin of said crank extends, and the cone-supporting platform suspended from the forward end of said lever, substantially as set forth.

2. The combination, with a revolving crank and a pivoted lever having a slot within which the crank-pin travels during its circuit, of a rod pivotally hung from the end of said lever, and the cone-supporting platform suspended from the rod, substantially as set forth.

3. In combination with the reciprocatory lever and the bail of the cone-supporting platform, the rigid rod connecting said bail and lever, whereby a positive and synchronous movement is imparted from the latter to the former, substantially as set forth.

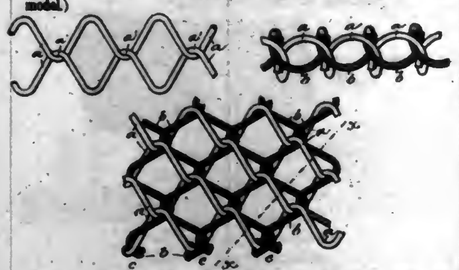


899,552. APPLIANCE FOR HANGING AND EXHIBITING BOOT OR SHOE LASTS. JAMES PATON, Johnstone, County of Renfrew, Scotland. Filed Nov. 24, 1888. Serial No. 291,590. (No model.) Patented in England Sept. 28, 1870, No. 13,710.

Claim.—The herein-described appliance for hanging and exhibit-

ing boot or shoe laces and such like goods, comprising a central suspending loop with wires or rods branching out from such central loop in a horizontal plane and having their unconfined outer ends raised or rounded, as and for the purpose set forth.

399,553. AUTOMATIC PICTURE-EXHIBITOR. CLARA E. PATTERSON, New York, N. Y. Filed May 19, 1888. Serial No. 274,418. (No model.)



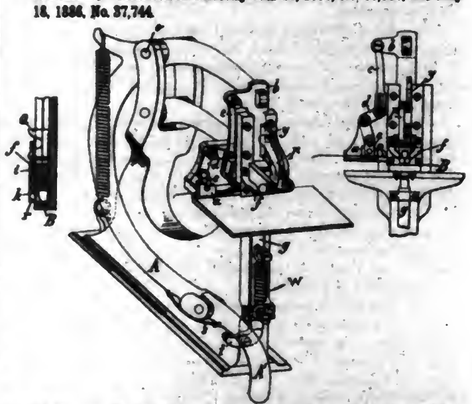
Claim.—1. In an automatic picture-exhibitor, the combination, with a picture-holder, of an actuating-shaft upon which said holder is mounted, a motor connected to said shaft and tending to revolve the same, and a lever normally blocking said shaft against revolution, said lever being interposed in the path of entrance of a coin, so as to be tripped by said coin, substantially as described.

2. In an automatic picture-exhibitor, the combination, with a picture-holder, of an actuating-shaft upon which said holder is mounted, a motor connected to said shaft and tending to revolve the same, a lever normally blocking said shaft against revolution, and a coin-chute leading to the free end of the lever, substantially as described.

3. In an automatic picture-exhibitor, the combination, with a picture-holder, of an actuating-shaft upon which said holder is mounted, a motor connected to said shaft and tending to revolve the same, a lever normally blocking said shaft against revolution, said lever being interposed in the path of entrance of a coin, whereby it may be tripped by said coin, and a Geneva stop-movement located between the motor and the picture-holder shaft, substantially as described.

4. In an automatic picture-exhibitor, the combination, with a picture-holder, of an actuating-shaft upon which said picture-holder is mounted, a motor connected to said shaft and tending to revolve the same, said motor consisting of a shaft, a drum carried thereby, a cord and a weight attached to said cord, a lever normally blocking said picture-holder shaft against revolution, said lever being interposed in the path of entrance of a coin, whereby it may be tripped by said coin, and a Geneva stop-movement located between the motor and the picture-holder shaft, substantially as described.

399,554. WOVEN-WIRE MAT AND SCRAPER. ROBERT B. PRAHL, Hartford, Conn. Filed July 27, 1887. Serial No. 245,397. (No model.)



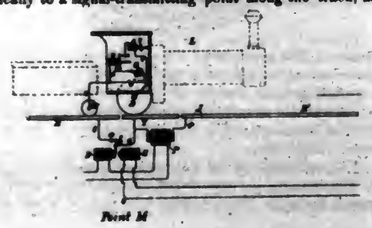
Claim.—1. As an improved article of manufacture, a wire mat and scraper composed of a system of primary coils interwoven with each other, and a transverse system of locking-coils interwoven with each other and with the primary coils, the turns of the locking-coils lying outside of the successive primary coils, whereby the several coils are held against depthwise movement on each other, all substantially as described.

2. In combination, in an interwoven-wire fabric, a series of interlocking primary coils, *a*, and a series of transverse and interlocking bracing-coils, *b*, the latter having a greater number of turns to the unit of length than the former, the successive turns of each bracing-coil lying alternately over and under the successive primary coils, all substantially as described.

3. In combination, in an interwoven fabric of spirals of wire, the primary fabric and the secondary fabric, the coils of the two sets crossing each other and interwoven, so that the planes common to the points of intersection in the two sets are approximately coincident, all substantially as described.

399,555. BOOK-STAPLING MACHINE. CARL R. PREUSER, Roudnitz, Leipsic, Saxony, Germany. Filed May 5, 1887. Serial No. 237,393. (No model.) Patented in Germany Jan. 26, 1886, No. 36,510, and May 18, 1886, No. 37,744.

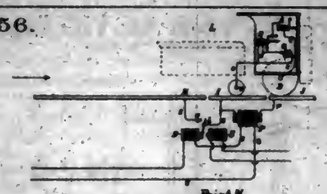
Claim.—1. In a book-stapling machine, the combination, with a driver-slide, of a wire-feeding slide, a cam-piece on said feeder-slide, and mechanism, substantially as herein shown and described, connecting said cam on the feeder-slide with the driver-slide, substantially as set forth.



2. In a book-stapling machine, the combination, with a driver-slide, of a slide having blades, a mandrel provided with bevels, a fork on the slide having the blades, which fork has beveled ends that act on the bevels of the mandrel, springs for holding said mandrel, and mechanism for operating the slide having the blades from the driver-slide, substantially as herein shown and described.

3. In a book-stapling machine, the combination, with a driver-slide, of a wire-feeder slide, a cam-piece on said feeder-slide, a slide having blades, a mandrel, a slide having blades and fork with beveled ends acting on the mandrel, springs for holding the mandrel, mechanism for operating the feeder-slide from the driver-slide, and mechanism for operating the slide having the blades from the driver-slide, substantially as herein shown and described.

4. In a book-stapling machine, the combination, with mechanism for driving staples, of a lever for operating the said mechanism, a handle part pivoted on said lever, a spring held on the lever and handle section, a pivoted lever having one end below said handle part, and a sliding anvil resting on the other end of said lever, substantially as herein shown and described.



399,556. ELECTRIC RAILWAY-SIGNAL. THEODORE A. B. PUTNAM, New York, N. Y., assignor to the Railway Cab Electric Signal Company, same place. Filed Oct. 3, 1885. Serial No. 178,868. (No model.)

Claim.—1. In an electric railway-signal, the combination of an induction-coil with the opposite terminals of its primary connected electrically to a signal-transmitting point along the track, and a remote signal-receiving point, to which the terminals of the secondary coil are electrically connected, substantially as set forth.

Point M

399,556.

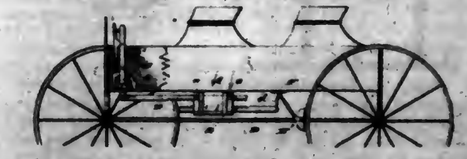
Point N

2. The combination, with a railway-track having insulated spaces or breaks, of an induction-coil with the opposite terminals of its primary connected, respectively, to two rails insulated from each other, and a signaling-point to which the terminals of the secondary coil are connected, substantially as set forth.

3. The combination, with two successive rails of a railway-track insulated from each other, of an induction-coil having the opposite terminals of its primary wire connected to said rails, respectively, and a signaling-point to which the terminals of the secondary coil are connected, substantially as set forth.

4. The combination of two rails of a railway-track insulated from each other, an induction-coil having the opposite terminals of its primary connected to said rails, respectively, a locomotive running on said track, a partial electric circuit on said locomotive with its terminals in connection with the rails, and normally closed and completed therethrough, and a generator and alarm in said circuit, substantially as set forth, whereby at the instant of crossing the insulation between said rails the partial circuit will be completed through the primary of said coil.

5. The combination, with a locomotive, of a partial circuit terminating in connections with the rails, a generator in said circuit, and a closed shunt-circuit of relatively higher resistance connecting the poles of said generator, substantially as set forth.

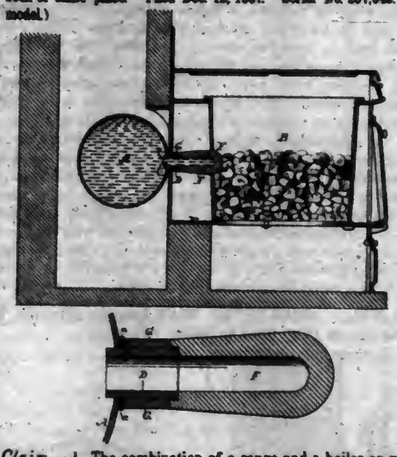


6. The combination, with a locomotive, of a partial circuit terminating in connections with the rails and normally closed or completed through the rails, a generator in said circuit, a closed shunt-circuit extending from one pole of the generator to the other, and an electro-magnet in said shunt-circuit, substantially as set forth, whereby the diversion of an excessive current into said shunt-circuit actuates said magnet.

7. The combination, with a locomotive, of a partial circuit terminating in connections with the rails and normally closed or completed through the rails, a generator in said circuit, a shunt-circuit extending from one pole of the generator to the other, whereby the current from said generator is normally divided between said two circuits, an electro-magnet in said shunt-circuit, and the armature of said magnet provided with a retractive resistance sufficient to prevent its attraction by the normal current in said shunt-circuit, but insufficient to prevent its attraction when the current therein is greatly increased by the introduction of an extraordinary resistance in said partial circuit, substantially as set forth.

8. The combination, with a locomotive, of a partial electric circuit terminating in connections with the rails and normally closed or completed through the rails, a generator in said circuit, an alarm electro-magnet in said circuit, a shunt-circuit extending from one pole of the generator to the other, an electro-magnet in said shunt-circuit, and circuit-breaking contacts in connection with the armature of said magnet and with said partial circuit, substantially as set forth, whereby upon a sufficient increase of the current in said shunt-circuit said armature is attracted and the said partial circuit is thereby broken.

9. A locomotive, a partial circuit thereon terminating in connection with the rails, and normally closed or completed through the rails, a generator in said circuit, a shunt-circuit extending from one pole of the generator to the other, and an electro-magnet in said shunt-circuit, combined together and with the track-rails, with insulations between the rails and with an induction-coil, the primary of which is connected at its opposite terminals to two rails on opposite sides of the insulation, whereby on crossing such insulation the partial circuit on the locomotive is completed through the primary of of said coil, substantially as set forth.

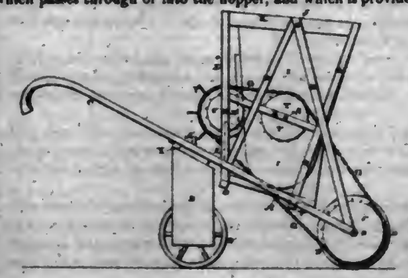


399,557. VEHICLE-BRAKE. CHRISTOPHER T. QUICK, Temple Hill, Ky. Filed Dec. 27, 1888. Serial No. 294,612. (No model.)

Claim.—1. In a vehicle-brake, the combination of a supporting-box adapted to be secured to the under part of a vehicle, pinions or gears mounted therein, and the rack bars or lever engaging with the upper and lower parts of said pinions or gears and connected to an operating-lever, and the brake-bar carrying brake-shoes, substantially as described.

2. In a vehicle-brake, the combination of the box adapted to be opened and closed, secured to the bottom of the vehicle by metallic straps surrounding the same, pinions mounted in said box, and the rack-bars passing through said box and engaging with the upper and lower parts of said pinions, one of which is connected to an operating-lever in the forward part of the vehicle and the other to the brake-bar carrying the brake-shoes at the rear part of the vehicle, substantially as described.

399,558. RANGE-BOILER. THOMAS W. REES, Philadelphia, Pa., assignor of one-half to Thomas W. Snowden and Richard T. Stockman, both of same place. Filed Dec. 12, 1887. Serial No. 257,649. (No model.)



Claim.—1. The combination of a range and a boiler or water-heater located within the structure of the range and fixedly set in respect to the fire-pot of the same, with a plug having a screw-connection with the shell of the boiler, and having a closed outer end which projects to or into the fire-pot of the range, all substantially as specified.

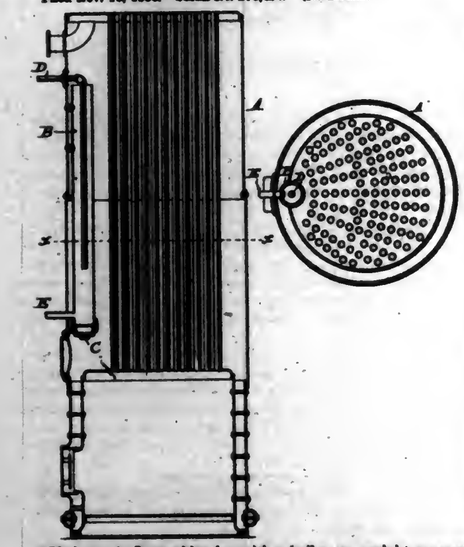
2. The combination of a range and a boiler or water-heater located within the structure of the range and fixedly set in respect to the fire-pot of the same, with a nipple screwed directly into the shell of the boiler and projecting therefrom, a hollow plug screwed onto said nipple and projecting into the fire-pot of the range, and a packing-ring for preventing leakage at the shell of the boiler, all substantially as specified.

3. The combination of a range and a boiler or water-heater located within the structure of the range and fixedly set in respect to the fire-pot of the same, with a nipple screwed into and projecting from the shell of the boiler, a hollow plug screwed onto the outer end of the nipple and projecting into the fire-pot of the range, and a collar and packing interposed between the said plug and the shell of the boiler, all substantially as specified.

399,559. SEED-PLANTER AND FERTILIZER-DISTRIBUTER. CHARLES R. REID, Heidelberg, Miss. Filed Oct. 27, 1888. Serial No. 289,313. (No model.)

Claim.—1. The combination of a suitable frame, supporting-braces which extend therefrom, a hopper pivoted in these supporting-braces so as to have a swinging movement at its lower end, the shaft which passes through or into the hopper, and which is provided with

899,559.



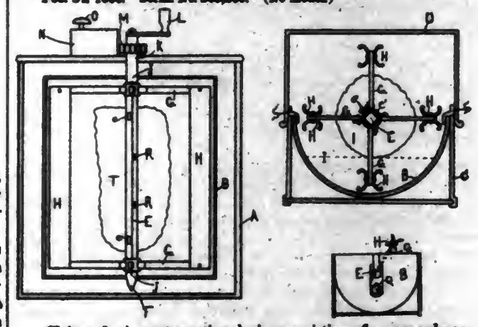
operating-wheels, an operating-chain for passing around these wheels, an operating-axle provided with a supporting-wheel, and a wheel for operating the chain, and hooks or other devices for holding the hopper in an operative position, substantially as shown.

2. The combination of the main frame, a supporting-wheel, the axle to which the wheel is secured, and which is provided with an operating-wheel for the chain, a hopper which is pivoted at its upper end, so that its lower end will have a swinging movement, a shaft provided with an operating-wheel for engaging with the chain, a stirring device located inside of the hopper, a second shaft, also provided with an operating-wheel and a device for distributing the seed or fertilizer, and hooks or other devices for holding the lower portion of the hopper in an operative position, substantially as described.

3. The combination of the main frame provided with handles, the axle provided with a supporting-wheel at one end, the supporting-legs at the opposite end of the frame, and a vertically-adjustable frame provided with a fulcrum or bearing by means of which the entire planter can be swung around within its own length, substantially as set forth.

4. The combination of the main frame provided with handles, the front axle provided with a supporting and operating wheel, the legs Z, a vertically-adjustable frame, Y, the axle C, journaled in the said frame, and the wheel D, substantially as specified.

899,560. STEAM-BOILER. EDWIN REYNOLDS, Milwaukee, Wis. Filed Nov. 10, 1888. Serial No. 290,457. (No model.)

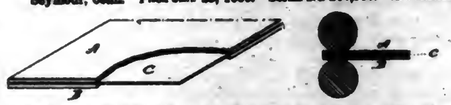


Claim.—1. In combination with a boiler, an upright reservoir secured within the water-space thereof and open at its upper end, a feed-water pipe extending into the upper end of the reservoir, and a blow-off pipe at the lower end of the reservoir, all substantially as shown, whereby the latter is adapted for use as a heater and separator, and also as a surface blow-off.

2. In combination with a boiler, an upright feed-water reservoir provided with a bottom plate or cap, and a feed-pipe, all substantially as shown, whereby the sediment and deposit may be thoroughly removed.

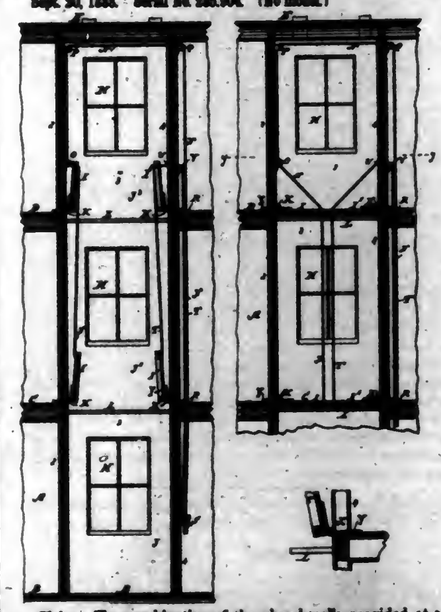
3. In combination with a boiler, an upright reservoir open at its upper end, a removable cap applied to the lower end of the reservoir, a feed-water pipe at the upper end, and a blow-off pipe at the lower end.

4. In combination with a boiler, an upright reservoir open at its upper end and having said upper end located at or about the water-line, a feed-water pipe entering the top of the reservoir and extending nearly to the bottom of the latter, and a blow-off pipe at the lower end of the reservoir.



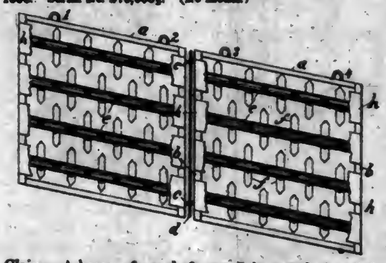
899,561. MEAT-ROASTER. ELISHA R. KENT, Chicago, Ill. Filed Feb. 24, 1888. Serial No. 265,209. (No model.)

Claim.—1. A meat-roasting device consisting of a covered pan, a spit suitably journaled therein, radial arms on such spit, and transverse curved pouring devices upon such arms, the arms being of such length as to permit the pouring devices to dip into the liquid in the bottom of the pan.



2. In a meat-roasting device, the combination of a covered pan with a spit journaled therein, a crank attached thereto, arms upon said spit, and transverse curved pouring devices across said arms outside of the meat and in such position as to pass through the liquid in the bottom of the pan to carry it up and pour it on the meat as the rotation progresses.

899,562. COLD-ROLLING SHEET METAL. PHILIP RICHARDS, Seymour, Conn. Filed Jan. 25, 1889. Serial No. 297,580. (No model.)



Claim.—The herein-described improvement in cold-rolling sheet metal, which consists in placing the sheet to be operated upon between two planished copper plates, and then passing the said two plates with the sheet between them between the rolls under pressure, substantially as described.

899,563. HATCHWAY. JOHN ROACH, New York, N. Y. Filed Sept. 20, 1888. Serial No. 285,904. (No model.)

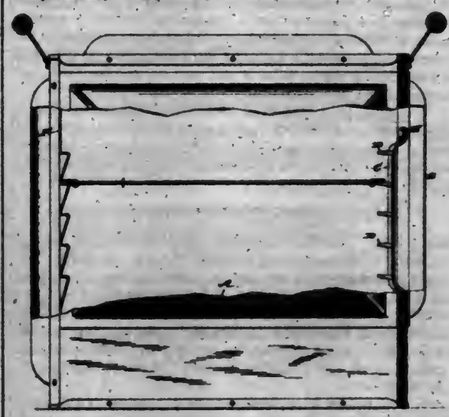
Claim.—The combination of the closed walls provided at each floor-landing with a pair of covers, each pair secured, respectively, to opposite sides of the walls by hinges, the spring-plates respectively connected at one end with the hinges to the covers and loose and sliding at the other end for automatically closing the covers down toward each other, and two independent cords passing over pulleys respectively connected with all the covers at one side of the shaft and both descending together at one side thereof and adapted to be simultaneously drawn down together, or to be independently drawn down, substantially as described.

899,564. HARROW. OSMUND ROREM, Elliott, Ill. Filed June 9, 1888. Serial No. 276,600½. (No model.)

Claim.—A harrow formed of a parallelogram frame of plank, *a d*, set edgewise in a vertical plane, to the lower edge of which are secured boxes, in which revolve cylinders *c*, parallel to the front side, *a*, which are provided with flat teeth having short pyramidal points, the teeth passing through said cylinder at right angle each to the preceding, and the plane of their flat sides parallel with the axis of the cylinder, with draft-hooks 1 2 3 4 placed in the front side and pitched as shown, and fixed covering-planks, in combination with a hinged cover, substantially as specified.

899,565. PRESSURE-REGULATING STOP-COCK. EMIL REUTT, New York, N. Y. Filed May 24, 1888. Serial No. 274,908. (No model.)

Claim.—The combination of the casing having the vertical receiving-channel *c* and the lateral delivery-channel, *d*, the valve-seat E, located between said receiving and delivery channels, the valve D, arranged in the casing and closing upwardly upon the valve-seat with the pressure of the fluid, and having a valve-stem, F, rising through the valve-seat and extending to the outside of the casing at the upper end thereof, a low-pressure chamber, L, in the casing above the lateral delivery-channel, a flexible diaphragm, G, closing the casing at the low-pressure chamber secured to the valve-stem, and by its rising movement under the fluid-pressure lifting and closing the valve upon its seat, a spring, H, located in the valve-stem and pressing upon the diaphragm to force it downward and thereby lower and open the valve, and against the pressure of which spring the valve closes on its seat, a wheel, J, outside the casing for lifting and closing the valve-stem against the pressure of the spring, the internally-screw-threaded cover F, and the tubular screw-nut I, adjustable in the cover, pressing on the upper end of the spring and through which nut and spring the valve-stem passes to the hand-wheel, substantially as described.

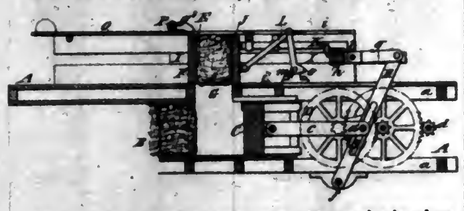


899,566. CHIMNEY CAP OR VENTILATOR. ERWIN P. RYDER, Port Jefferson, N. Y. Filed Oct. 17, 1888. Serial No. 288,269. (No model.)

Claim.—1. In a chimney cap or ventilator, the flue-pipe section A, having the radial wings or flanges C, and the cap D, supported thereon, the said wings or flanges extending from below to above the pipe-top on its outer side, gradually increasing in width to their upper ends, and the said cap forming a clear way and through side opening all round between the wings at the top of the pipe, as shown and described.

2. In a chimney cap or ventilator, the flue-pipe section A, having the collar B, the radial wings or flanges C, and the cap D, the said wings or flanges starting from a point on the pipe at the collar and extending above the top of said pipe, gradually increasing in width from said collar to their upper ends, and supporting the cap-plate to form a clear way and through side opening all round between the wings at the top of the pipe, as shown and described.

899,567. DOMESTIC OR PORTABLE OVEN. MARION S. SAGER, Washington Court-House, Ohio. Filed May 5, 1888. Serial No. 272,992. (No model.)



Claim.—1. The combination, with an oven having side and end doorways, of the tray-supports C, rigidly secured to the corners of the oven, substantially as shown, and for the purpose set forth.

2. The combination, with a domestic or portable oven having side and end doorways of sufficient size to permit the insertion of the trays through either doorway, of the tray-supports C, secured to the corners of the oven and provided with projections D, formed integrally therewith, substantially as shown, and for the purpose set forth.

3. The combination, with an oven having side and end doors, A and B, of an inner side wall, F, having transverse corrugations, and casting C or tray-supports, constructed substantially as shown, secured to the opposite corners from the lining F; said tray-supports C having

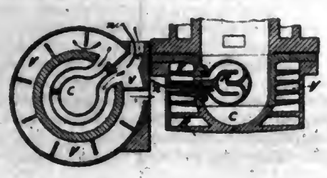
projections D, with which the trays engage, substantially as shown and for the purpose set forth.

399,568. POWER BALING-PRESS. WILLIAM W. SEELEY, Albany, N. Y. Filed Aug. 30, 1888. Serial No. 284,162. (No model.)

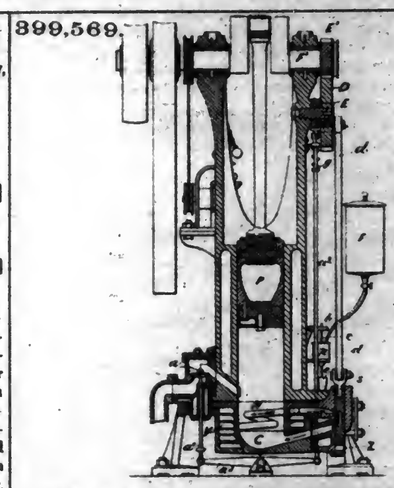
Claim.—1. In a press, the combination, with a condensing-chamber, of a compression-chamber, a feeding passage or chamber intermediate the same, a plunger or follower operating in the condensing-chamber, a movable abutment for the condensing-chamber, a pusher or ram operating in the compression-chamber, driving mechanism, a connection between said driving mechanism and the movable abutment and between the driving mechanism and the follower, and a connection between the driving mechanism and the pusher or ram, said plunger or follower and abutment being moved forwardly in unison to convey compressed material above the feeding passage or chamber, through which it may be forced downwardly in front of the pusher or ram, substantially as specified.

2. In a press, the combination, with a condensing-chamber, of a plunger or follower within the condensing-chamber, a movable abutment operating to close one end of said chamber during the compression, toggles maintaining said abutment in such position, a cross-head for operating the toggles, a lever for operating the cross-head, a connection between the lever and the cross-head, and a connection between the cross-head and the plunger or follower, substantially as specified.

3. In a press, the combination, with a condensing-chamber, of a movable abutment closing one end of said chamber during the compression, a plunger within said chamber, slider-bars connected to said plunger or follower, toggles acting on said abutment, a cross-head operating both the follower or plunger and the abutment, and a lever for operating the cross-head, substantially as specified.



4. In a press, the combination, with a pusher or ram, of a crank for operating the pusher or ram, a plunger or follower, a movable abutment, a lever operated from said crank, and a connection between said lever and the plunger or follower and between the lever and the abutment, whereby motion is transmitted to both the plunger or follower and said abutment, substantially as specified.



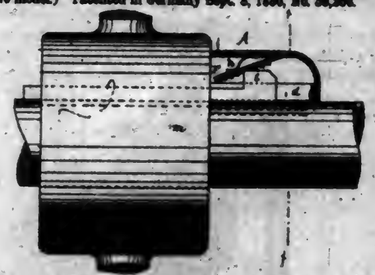
5. In a press, the combination, with a pusher or ram, of a crank for operating said pusher or ram, a plunger or follower, a movable abutment, a slotted lever operating to transmit motion both to the follower or plunger and the abutment, and a connection between said lever and the plunger or follower and between the lever and the abutment, substantially as specified.

6. In a press, the combination, with a condensing-chamber, of a rocking or tilting cover therefor and a movable roller carried by the follower or plunger above said cover and occupying such a position as to be approximately above the point of compression, substantially as specified.

399,569. PETROLEUM-ENGINE. MATHIAS V. SCHILTS, Cologne Germany. Filed June 25, 1887. Serial No. 242,474. (No model.) Patented in Germany June 16, 1885, No. 36,044, and Apr. 10, 1886, No. 38,121; in France Aug. 12, 1885, No. 170,620, and July 3, 1886, No. 177,161; in Belgium Aug. 12, 1885, No. 69,892, and June 30, 1886, No. 73,679; in England Oct. 27, 1885, No. 12,896, and Aug. 16, 1886, No. 10,490; in Austria-Hungary Nov. 10, 1885, No. 30,369, and Oct. 23, 1886, No. 19,835, and in Italy Feb. 4, 1886, No. 19,209, and May 10, 1887, No. 20,715.

Claim.—1. In a hydrocarbon-engine, a metallic evaporating jacket surrounding the explosion-chamber of the engine and subdivided by transverse partitions, so as to increase the inner surface, substantially as described, and for the purpose specified.

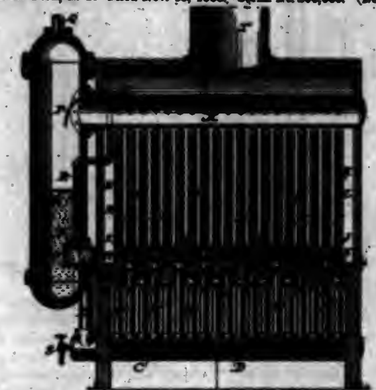
2. In a hydrocarbon-engine, the combination of the explosion-chamber with a metallic evaporating-jacket separated from the explosion-chamber by a single wall, and therefore directly heated by the explosions, the said jacket being subdivided by transverse partitions, so as to increase the inner evaporating-surface of the jacket and to lengthen in this way the evaporating-canal, the said evaporating-canal being furnished with a valve adapted to produce and interrupt communication with the explosion-chamber at every cycle of the engine, substantially as described.



3. In a hydrocarbon-engine, the combination of the explosion-chamber with (*a*) a metallic evaporating-jacket separated from the explosion-chamber by a single wall, and therefore directly heated by the explosions, the said jacket being subdivided by transverse partitions, so as to increase the inner evaporating-surface and to lengthen in this way the evaporating-canal, the said jacket being furnished with a valve adapted to produce and interrupt communication with the explosion-chamber at every cycle of the engine, (*b*) an oil feeder or pump adapted to introduce into the said evaporating-canal small exactly-measured quantities of liquid fuel at every cycle of the engine, and (*c*) a pump, preferably the working-cylinder, adapted to produce in the said canal at every cycle of the engine a sharp air-current into or toward the explosion-chamber of the engine, substantially as described.

4. In a hydrocarbon-engine, the combination of the explosion-chamber with (*a*) an evaporating-jacket separated from the explosion-chamber by a metallic wall only, and subdivided by transverse partitions, so as to form a helical or zigzag canal surrounding the explosion-chamber, said canal being provided with a valve adapted to produce and interrupt communication with the explosion-chamber at every cycle of the engine, (*b*) an oil feeder or pump adapted to introduce into the said evaporating-canal small exactly-measured quantities of liquid fuel at every cycle of the engine, and (*c*) a pump, preferably the working-cylinder, for producing in the said canal at every cycle of the engine an air-blast into or toward the explosion-chamber, substantially as described.

5. In a hydrocarbon-engine, the combination of the explosion-chamber with (*a*) a helical or zigzag-shaped evaporating-canal surrounding the explosion-chamber and cast in one piece with the same, said canal being furnished with a valve adapted to establish and interrupt communication with the explosion-chamber at every cycle of the engine, (*b*) an oil feeder or pump adapted to introduce into the said evaporating-canal small exactly-measured quantities of liquid fuel at every cycle of the engine, and (*c*) a pump, preferably the working-cylinder, for producing in the said canal at every cycle of the engine an air-blast into or toward the explosion-chamber, substantially as described.

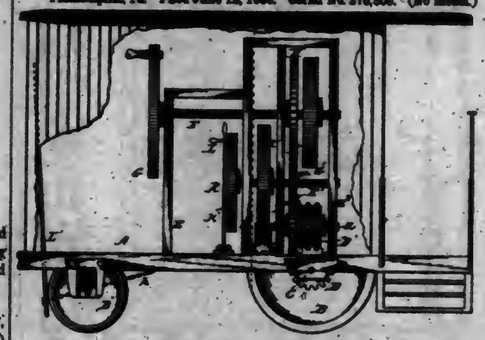


6. In a hydrocarbon-engine, the combination of the explosion-chamber with (*a*) a metallic evaporating-canal separated from the explosion-space by a single wall, the said canal being partly formed by a helical or zigzag passage surrounding the explosion-chamber and partly situated in the interior of the latter, and furnished with a valve adapted to produce and interrupt communication with the explosion-chamber at every cycle of the engine, (*b*) an oil feeder or pump adapted to introduce into the said evaporating-canal small exactly-measured quantities of liquid fuel at every cycle of the engine, and (*c*) a pump, preferably the working-cylinder, for producing in the said canal at every cycle of the engine an air-blast into or toward the explosion-chamber, substantially as described.

399,570. SAFETY-COVER FOR KEY-NOSES. GOTTLIEB P. SUHRIDT, Schmiedeberg, Saxony, Germany. Filed Dec. 2, 1887. Serial No. 256,746. (No model.) Patented in Germany Sept. 8, 1886, No. 36,986.

Claim.—A safety-cover for the key-noses of shafts, composed of a covering-box provided with an interior U-shaped spring pressing against the sides of the key, and with a pivoted and spring-actuated rack that engages the nose of the key, substantially as set forth.

399,571. SECTIONAL STEAM-BOILER. CHARLES L. SEABURY, New York, N. Y. Filed Nov. 13, 1888. Serial No. 290,669. (No model.)



Claim.—1. The combination, in a sectional steam-boiler, with its fire-box and furnace, and with lateral circulating-manifolds placed one on each side of the fire-box and connected with a water-supply pipe, of a series of detachable steam-generating manifolds or sections mounted in the furnace over the fire-box, each consisting of a transverse pipe spanning the fire-box and connected at each end to corresponding vertical tubes in the two lateral manifolds, an inner tube inclosed within the transverse pipe and whose open ends project beyond the closed end of said pipe, a series of upright tubes closed at their upper end and whose lower ends are fitted to the transverse pipe to communicate freely therewith, open-ended upright tubes fitted to said inner tube to communicate therewith and extend therefrom up into the upright closed tubes nearly to the top thereof, and discharge-tubes connecting the two ends of the transverse pipe with a suitable delivery-pipe, substantially in the manner and for the purpose herein set forth.

2. The combination, in a sectional steam-boiler, of the lateral manifolds D D, the interposed detachable manifolds H H, the standing pipes L L, fitted to said detachable manifolds, the inclosed tubes J K, the steam-delivery pipes N, connected with said inclosed tubes, and a steam-drum, M, to which all of said delivery-pipes are connected, substantially in the manner and for the purpose herein set forth.

3. The combination, in a sectional steam-boiler, of the lateral manifolds D D, the interposed detachable manifolds H H, the standing pipes L L, fitted to said detachable manifolds, the inclosed tubes, the steam-delivery pipes N, connected with said inclosed tubes, a vertical drum, E, connected mediately at its upper end with said steam-delivery pipes and at its lower end with the two lateral manifolds, and a water-supply pipe communicating therewith, substantially in the manner and for the purpose herein set forth.

4. The combination, in a sectional steam-boiler, of the lateral circulating-manifolds, the interposed detachable steam-generating manifolds, the standing pipes fitted to said detachable manifolds, the connected tubes inclosed in the standing pipes and detachable manifolds, the steam-delivery pipes connected with said inclosed inner tubes, a vertical drum connected mediately at its upper end with said steam-delivery pipes, a valve-chamber communicating with the lower end of said drum and with the two lateral circulating-manifolds, a valve controlling the communication with the drum and opening inwardly into the chamber, and a water-supply pipe connected with said chamber, substantially in the manner and for the purpose herein set forth.

399,572. MOTOR FOR RAILWAY-CARS. EDWIN R. SHUMAN, Philadelphia, Pa. Filed June 12, 1883. Serial No. 276,808. (No model.)

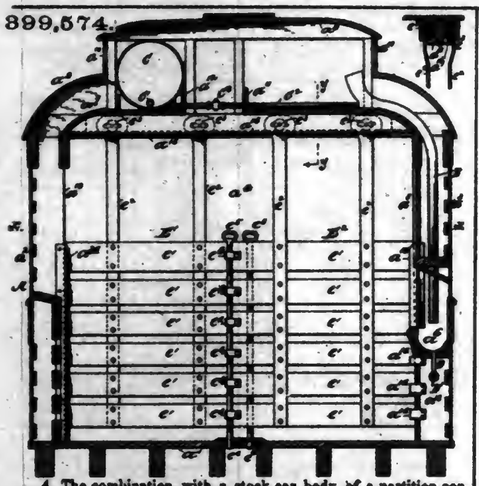
Claim.—1. In motors for cars, the combination, with the driving-axle C of the car and the worm-wheel D, mounted thereon, of a train of motor-gearing for communicating motion to said axle, the same comprising the main and supplementary shafts F F', arranged at right angles to the axle and geared together and to the worm-shaft, each shaft being provided with an independent motor-crank, substantially as described.

2. In motors for cars, the combination, with the driving-axle C, of the worm-wheel D, mounted thereon, the worm D', engaging with said worm, the toothed wheel I upon the worm-shaft, the pinion or idler G^3, the main and supplementary motor-shafts F F', the former carrying the gear-wheel H, the fly-wheel G, and pulley G', and the latter carrying the idler G^3 and fly-wheels K K', substantially as described.

3. In a motor for cars, the combination, with a shaft, F', of said motor, and a fly-wheel, K, mounted thereon, of a pair of horizontally-movable brake-shoes, operating-chains connected therewith and passing over pulleys, a brake-lever to which said chains are connected, and suitable retracting-springs attached to said shoes, substantially as set forth.

4. In a motor for cars, the combination, with the motor-gearing train comprising the supplementary power-shaft F', carrying the crank-pulley K', of the slotted starting-lever R, substantially as set forth.

399,573. BOOK-BINDER'S PRESS-BOARD. JOHN H. SHAW, Chicago, Ill. Filed Dec. 11, 1888. Serial No. 293,143. (No model.)



Claim.—As a new article of manufacture, a book-binder's press-board, A, provided with the steel spring-rods B, adapting said board to yield in a limited degree to unequal pressures without breaking, and to resume its proper and original form when relieved, substantially as described.

399,574. STOCK-CAR. WILLIAM H. H. SMITH, Brooklyn, N. Y. Filed Sept. 19, 1888. Serial No. 285,800. (No model.)

Claim.—1. The combination, with a stock-car body, of a partition consisting of two sections arranged out of line and sliding widthwise of the car, jaws on the car-body sustaining one end of each section, and vertical bolts sustaining the opposite ends, substantially as specified.

3. The combination, with a stock-car body, of a partition consisting of two suspended sliding sections arranged out of line, removable bolts sustaining one end of each section, and fixed jaws sustaining the opposite ends, substantially as specified.

399,574.

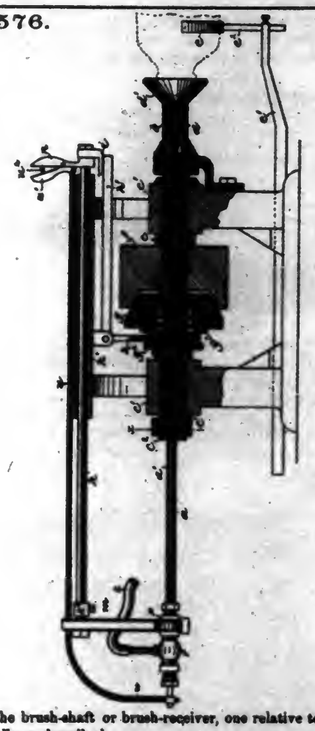
4. The combination, with a stock-car body, of a partition consisting of two sections arranged out of line and jointly extending across the car-body and removable bolts for securing said partitions in position when extended across the car, substantially as specified.

5. The combination, with a stock-car body, of a partition consisting of two slatted sections arranged out of line and jointly extending across the car-body, removable bolts, and fixed jaws for sustaining the partitions, substantially as specified.

6. In a stock-car, the combination, with the carlings having tracks on each side, of partitions comprising two sections, hangers extending from said sections, and grooved wheels journaled in the upper ends of said hangers engaging the tracks, substantially as specified.

7. In a stock-car, the combination, with carlings arranged transversely, of tracks on each side of said carlings, partitions comprising overlapping sections, hangers extending from said sections, grooved wheels on said hangers, fixed jaws for sustaining one end of each section, eyes at the opposite ends of said sections, and bolts passing through said eyes and engaging with the floor, substantially as specified.

399,575. WHISK-BROOM. CHARLES SKEELS, Brooklyn, N. Y. Filed Oct. 20, 1887. Serial No. 252,890. (No model.)



Claim.—The hereinbefore-described broom, consisting of the handle, a cross-piece rigidly secured across one end of said handle, the inner course of fiber forming the under work having its ends rigidly bound to said handle above the cross-piece, the outer course of fiber forming the outer work having its ends bound to said handle above the ends of the inner course, and the whole stitched together below the cross-piece, substantially as described.

399,576. BOTTLE-WASHER. GEORGE S. BLOOM, Newport, R. I., assignor to Joseph M. Hoyt, William G. Hoyt, and Charles Healey, all of Lynn, Mass. Filed July 19, 1886. Serial No. 208,445. (No model.)

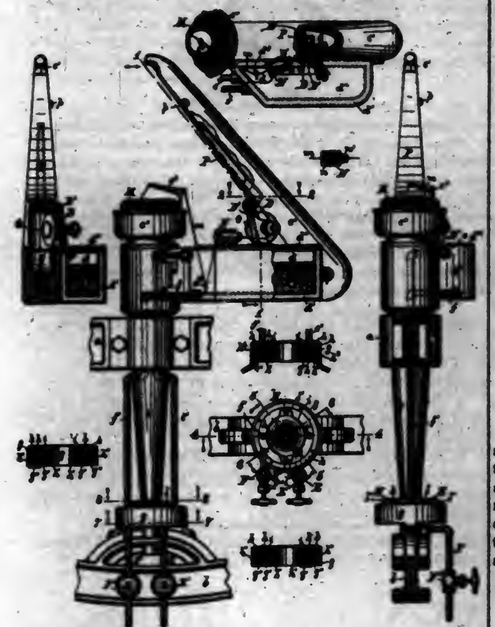
Claim.—1. The combination, with the brush-receiver and rotary brush-shaft, one movable with relation to the other, and driving mechanism for rotating said brush-shaft, of a spring-closed clutch for transmitting motion from said driving mechanism to said brush-shaft, the members of which engage at the beginning of the movement by which the brush enters the bottle, and disengage at the end of the movement by which the brush is withdrawn from the bottle, substantially as and for the purposes hereinbefore set forth.

2. The combination of the brush-shaft and brush-receiver, one movable with relation to the other, with a pulley free to rotate loosely with relation to the brush-shaft and provided with one member of a clutch, and a co-operating clutch member connected to rotate with the brush-shaft and longitudinally movable with relation to the brush-shaft and to the said pulley, a shipper-lever engaged with said longitudinally-movable clutch member, and an actuating projection that operates said shipper and is itself operated by the longitudinal movement of the brush-shaft or brush-receiver, one relative to the other, substantially as described.

399,576.

3. The combination of the brush-shaft with a sleeve inclosing the same and connected to rotate therewith and bearings for said sleeve, a pulley loose on said sleeve and provided with one member of a clutch and a co-operating clutch member keyed upon said sleeve and longitudinally movable thereon to engage and disengage said pulley, as described, and a clutch-shipper engaged with said longitudinally-movable clutch member, substantially as described.

399,577. VEHICLE-HUB. MILTON B. SOUTHERLAND, East Perryville, Tenn., assignor of one-half to James R. Hount, same place. Filed July 11, 1888. Serial No. 279,634. (No model.)



Claim.—1. In a vehicle-wheel, the combination, with the spokes and felloes, of the metallic hub consisting of the flange *a*, the collar *b*, forming between itself and said flange an annular groove or channel for the spokes, a sleeve integrally formed with said flange and collar, and a second flange adapted to be screwed upon said sleeve, substantially as described.

2. In a vehicle-wheel, a metallic hub comprising a flange, a contiguous collar, and an externally-threaded sleeve, said flange, collar, and sleeve formed in one piece, in combination with a removable flange, *c*, adapted to be screwed upon said sleeve, and a packing-ring between said flange and the sides of the spokes, substantially as herein described.

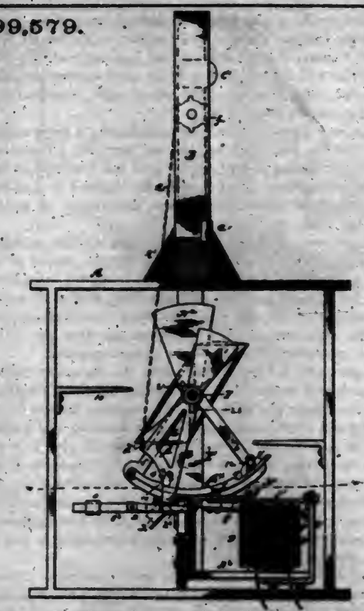
3. An improved vehicle-wheel, comprising spokes and felloes, a metallic hub formed in two sections, one section consisting of an integral exterior flange, interior collar, and threaded sleeve, and the other section consisting of an external removable flange adapted to be screwed upon said sleeve, a packing-ring over said collar and between the inner face of the removable flange and the spokes, and a boxing in said sleeve screwed within the core of the fixed flange, substantially as described.

399,578. WAXING DEVICE FOR WAX-THREAD SEWING-MACHINES. EDWARD A. STRONG, Brockton, Mass., assignor of one-half to Henry G. Phipps, same place. Filed Oct. 26, 1887. Serial No. 253,208. (No model.)

Claim.—1. The combination, with the post and horn of a wax-thread sewing-machine, of a jacketed wax-tank, the stationary cup *g*, having inner and outer annular grooves, the rotating ring *h*, having inner and outer annular grooves and vertical pins or projections H, the pipes *d* and *f*, leading, respectively, from the grooves to the jacketed tank, the pipe E, leading from a source of steam-pressure to the inner grooves, the drip leading from the outer grooves, and the collar *l*, secured to the post and engaging the pins or projections on the ring, substantially as described.

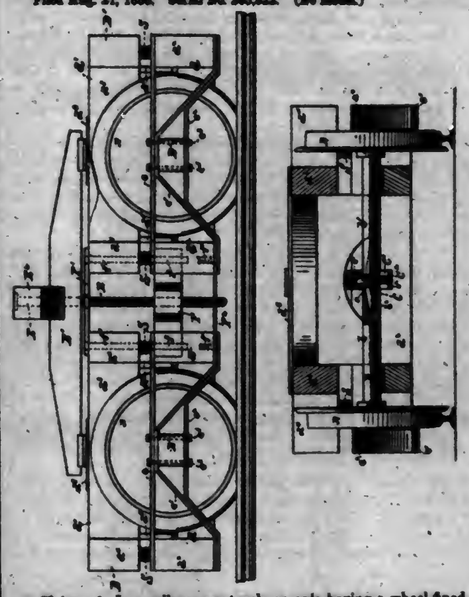
2. The combination of a jacketed wax-tank, a bracket, D, having the channel D' communicating with the jacketed tank, the horn *d*, the chambered arm P, pivoted to the bracket and communicating with the channel therein, and a steam-supply for the tank, substantially as described.

399,579. SEMAPHORE-SIGNAL. FREDERICK STIEBEL and CHARLES WERNERS, Louisville, Ky., assignors to the American Semaphore Company, same place. Filed Mar. 21, 1888. Serial No. 267,969. (No model.)



Claim.—1. The combination, with a railroad-track, of a semaphore signaling apparatus having electro-magnets located at each end of a block of said railroad, a closed circuit through the track and semaphore at one end of the block, and a second closed circuit through the semaphore at the opposite end of the block, said second circuit being adapted to be automatically broken by the operation of the first-mentioned semaphore, substantially as set forth.

2. The combination, with a railroad-track, of a semaphore signaling device having electro-magnets, a closed circuit through the track and semaphore-magnets located at one end of a block, a second circuit through a semaphore at the opposite end of the block, and contact-pieces attached to the first-mentioned semaphore to normally close said second circuit, substantially as set forth.



3. The combination, with a railroad-track, of two semaphores having electro-magnets, a closed circuit through the railroad-tracks and semaphore located at one end of a block, a second closed circuit through the track, a conducting-wire and a semaphore at the opposite end of the block, and contact-pieces attached to the first-mentioned semaphore to normally close said second circuit, substantially as set forth.

4. The combination, with a railroad-track, of two semaphores having electro-magnets, a closed circuit through the railroad-tracks and a semaphore located at one end of a block, a second closed circuit through a semaphore at the opposite end of the block, the track, and a conducting-wire, contact-pieces attached to a rigid part of the first-mentioned semaphore and included in said second circuit, and an arm carried by a moving part of the first-mentioned semaphore to connect the contact-pieces and normally close said second circuit, substantially as set forth.

399,579.

399,580. CAR-TRUCK. SOLOMON P. STODDARD, Brookville, Ind. Filed Aug. 21, 1888. Serial No. 283,322. (No model.)

Claim.—1. In a railway-car truck, an axle having a wheel fixed on each end thereof and bisected midway its length, with a conical recess in each of the opposed inner ends of the thus constituted sections thereof, a mandrel having conical ends fitted into said recesses in the axle-sections and giving bearings therefor, and a collar or disk loosely journaled on said mandrel between said opposed inner ends of said axle-sections, substantially as and for the purpose specified.

2. In a railway-car truck, an axle having a wheel fixed on each end thereof and bisected midway its length, with a conical recess in each of the opposed inner ends of the thus constituted sections thereof,

a mandrel having conical ends fitted into said recesses in the axle-sections and giving bearings therefor, and a collar or disk loosely journaled on said mandrel between said opposed inner ends of said axle-sections, together with a frame carried by the truck-timbers and fitted loosely upon and giving bearing to said collar or disk, substantially as and for the purpose set forth.

3. A car-truck composed of a frame constituting a lower section thereof, in which the wheel axle or axles are journaled, a frame constituting an upper section thereof upon which the drafting-bars rest and have play, and springs seated between the opposed faces or timbers of said upper and lower section-frames, substantially as and for the purpose specified.

4. In a car-truck, the combination of a frame in which the wheel axle or axles are journaled and constituting a lower section of the truck, with a frame which is imposed upon the lower section and upon which the drafting-bars rest and have play, springs seated between the timbers of the said upper and lower truck-sections, and flanges on the upper section which reach into and have play in the lower section, substantially as and for the purpose specified.

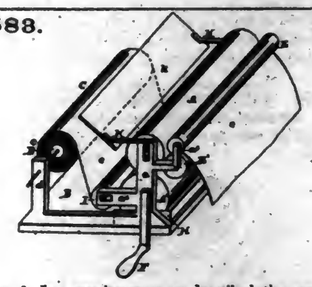
5. In a car-truck, the combination, with the transverse timbers thereof, of arch-bars composed of a brace-bar extending longitudinally of the truck from the forward to the rearward timbers on the upper side thereof, a truss extending similarly between said timbers from the under side thereof and bent intermediate its ends to reach upwardly to said brace-bar, and a truss extending similarly of the truck and below and in contact with said first truss and bent to reach upwardly to a less height than said first truss, together with axle-boxes seated between the crowns of said trusses and bolts passing through and uniting said brace-bar, trusses, and boxes, substantially as and for the purpose specified.

6. A car-truck composed of separate and independent sections, in each of which is journaled a bisected axle having a wheel fixed on the outer end of each section of said axle, and a conical-ended mandrel-bearing for the correspondingly-recessed opposed inner ends of said axle-sections, together with a collar journaled loosely upon said mandrel between said opposed ends of said axle-sections, a coupling between and pivotally uniting said truck-sections, a king-bolt seated in said coupling, and drafting-bars pivoted on said king-bolt, with its ends reaching to and resting upon each truck-section, substantially as and for the purpose set forth.

399,581. PROCESS OF MAKING A BROWN DIE. JOSEF STRASBURGER, Moscow, Russia, assignor to the Actien-Gesellschaft für Anilin Fabrikation, Berlin, Germany. Filed Nov. 7, 1888. Serial No. 290,244. (No specimens.) Patented in Germany June 22, 1888, No. 1,989, and July 14, 1888, No. 1,950; in England July 23, 1888, No. 10,653; in Russia July 30, 1888, No. 7,908; in France Aug. 10, 1888, No. 179,376; in Austria-Hungary Aug. 10, 1888, No. 7,840, and in Italy Sept. 30, 1888, XXII, 23,899, XLVII, 306.

Claim.—1. The process herein described of producing coloring-matter for dyeing, the same consisting, first, in combining tetrazo-diphenyl with one molecule of salicylic acid, then combining with the product one molecule of resorcin, and finally combining with the product a diazobenzole-sulphonic acid and precipitating the dye or color, substantially as specified.

2. The process herein described of producing coloring-matter for dyeing, the same consisting in treating resorcin with paradiazo-benzole-sulphonic acid, then dissolving the product in water, then adding to the solution the product obtained by the reaction of tetrazo-diphenyl with salicylic acid, then allowing the mixture to stand a suitable period of time, and then heating it and adding common salt, by which the coloring-matter is precipitated, which is finally filtered, pressed, and dried, substantially as specified.

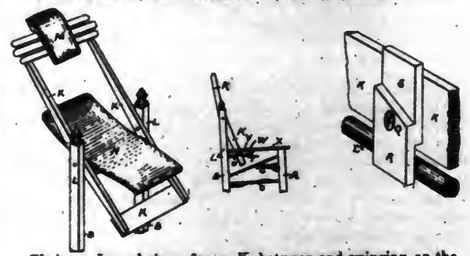


399,582. HINGE. CORNELIUS F. SULLIVAN, Boston, Mass., assignor, by mesne assignments, to Charles C. Richmond, same place. Filed May 7, 1888. Serial No. 273,021. (Model.)

Claim.—A box-hinge composed of the plates A B, to be placed respectively on the inside of the box and of the cover, and provided with ears *a b* at right angles to the main plates and united by a link, C, having a straight portion, 2, at one end and a straight side to form stops, the cover-plate being provided with a slot to allow it to pass over the link C, substantially as shown and described.

399,583. LETTER-COPYING PRESS. CHARLES A. THOMPSON, Galveston, Tex. Filed Dec. 20, 1888. Serial No. 187,157. (No model.) Patented in England Mar. 9, 1888, No. 3,077; in Canada May 12, 1888, No. 21,667, and in France June 16, 1888, No. 189,382.

399,588.



Claim.—1. In a copying-press, as described, the combination of the dampening-roller A', moistened in the manner described, with the smoothing-roller I at one side of and in close proximity to it and situated between said dampening-roller and the roll of paper, and the roller A, journaled in the standard *a*, and the smoothing-rollers E E, placed at one side and beyond the rollers A and A' and journaled in brackets a^2, the several parts made and all arranged and combined in the manner and for the purposes described, whereby the paper is evenly and smoothly moistened before the copy-paper is applied and both are kept smooth during the process of copying.

2. The combination, with the frame B, having roller I, journaled in brackets a^2 in close proximity to roller A', and rollers A A', journaled in standards *a*, and roller E', journaled in bracket a^2 and the trough H, and the inclined copy-table K, the edges of which are contiguous to the roller A, substantially as and for the purposes set forth.

3. The combination of the water-vessel, the squeezer-roll at the side of the dampening-roll, and the copy-press roll directly over the dampening-roll, substantially as described.

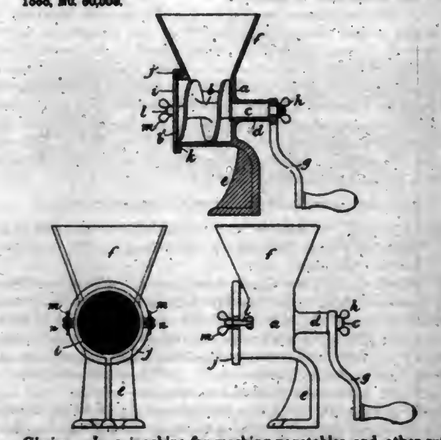
4. In a copying-press, the combination of the press-copy roll with the dampening and the squeezer rolls, whereby the copying is done between the dampening-roll and the press-copy roll after the surplus moisture has been removed from it.

399,584. ROCKING-CHAIR. ORRIN S. TURNER, New Vineyard, Me. Filed Oct. 11, 1887. Serial No. 251,987. (No model.)

Claim.—In a chair, a frame, K, between and swinging on the back uprights, B, of the chair, and at its upper portion having a head-rest, M, in combination with a back-frame, N, located below the head-rest M and adapted to swing on frame K independently of the swing of frame K on uprights B, and with means consisting of a swinging block, V, and pins T, relatively applied to chair and back frames and adapted to be engaged and disengaged, substantially as and for the purposes described.

399,585. FAN ATTACHMENT FOR BABY-CARRIAGES. EDWIN C. VAN NOUHUYS, Albany, and KYRAN C. DOWNER, Greenbush, N. Y. Filed Mar. 5, 1887. Renewed Jan. 16, 1889. Serial No. 296,570. (No model.)

Claim.—1. The combination, with a baby-carriage and its supporting-wheels, of a bracket secured to said carriage and forming the bearings for the fan-actuating shafts, a vertical shaft provided with a friction-wheel which bears against a wheel of said carriage and is held in frictional contact with said wheel by means of a spring-bearing, and a horizontal shaft which is connected by gearing to the vertical shaft and has a series of fan-blades attached thereto, as and for the purpose specified.

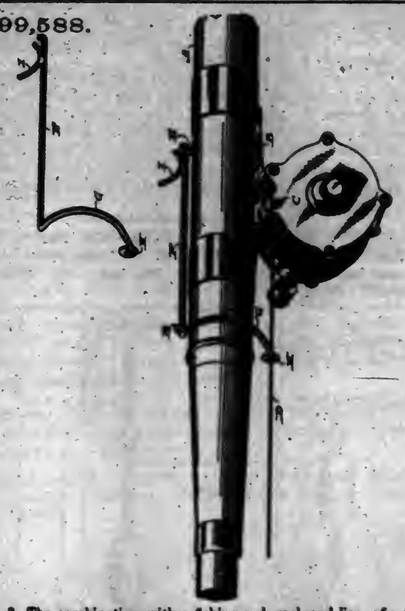


2. A fan attachment for baby-carriages, consisting of a bracket having journal-bearings for a horizontal and a vertical shaft formed therein, the lower bearing for the latter being forced outwardly by a spring, and said vertical shaft having a friction-wheel that is arranged to bear against one wheel of the carriage, the said horizontal shaft being geared to the vertical shaft and having blades for a rotary fan attached thereto to extend over the body of the carriage, as and for the purpose herein specified.

399,586. BOILER-FEEDER. FRANCIS H. VAUGHN and MARION H. VAUGHN, Richmond, Ind., assignors of one-third to Alonzo H. Rigg, same place. Filed Oct. 8, 1888. Serial No. 287,560. (No model.)

Claim.—A fixed valve-stem consisting of a tube which communicates only with a source of water-supply, in combination with a valve-seat which turns on said valve-stem, a pair of water-pipes extending from opposite sides of said seat, a pair of reservoirs connected by said pipes, another pair of pipes and a valve-seat, also connecting said reservoirs, another fixed tubular valve-stem which is connected to a source of steam-supply only and on which the latter seat turns, a tilting-frame for said reservoirs, and outlet-pipes which extend from said reservoirs to the boiler, substantially as set forth.

399,587. MACHINE FOR MASHING POTATOES, &c. CHARLES WARREN, Ipswich, County of Suffolk, England. Filed Dec. 22, 1887. Serial No. 258,702. (No model.) Patented in England Oct. 20, 1887, No. 14,723; in France Feb. 7, 1888, No. 183,806, and in Belgium Feb. 7, 1888, No. 80,559.

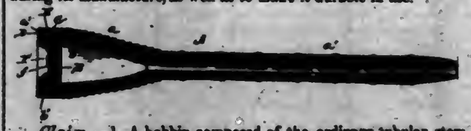


Claim.—In a machine for mashing vegetables and other substances, the combination, with the barrel or cylinder *e*, of the wire-gauze provided with a ring, *k*, extending around the cylinder, of the ring *j*, also extending around the cylinder, having a flange, J', extending over the end of the cylinder and being provided with slotted ears and the swivel-bolts secured to the cylinder and adapted to engage the slotted ears, whereby the wire-gauze is stretched tightly across the end of the cylinder and clamped, substantially as described.

399,588. LINE-GUIDE FOR FISHING-RODS. CHARLES H. WARREN, Racine, Wis. Filed June 8, 1888. Serial No. 276,426. (No model.)

Claim.—1. As a new article of manufacture, an attachment for a fishing-rod that comprises a rocking lever having its forward end bent at an angle to pass around under the rod and terminate in an eye, substantially as set forth.

2. As an improved article of manufacture, a reel-seat provided with bearings, a lever arranged to rock in the bearings and having its forward end terminating in an eye and bent at an angle to pass around under a rod to which said reel-seat may be attached, substantially as set forth.

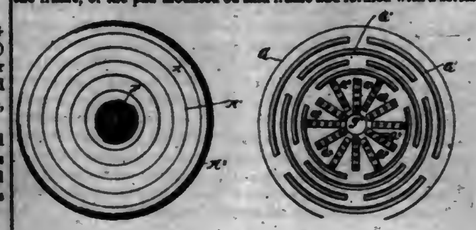


399,588.

3. The combination, with a fishing rod, reel, and line, of a rocking lever having its bearings on the rod and provided with an angular forward extension bent to pass around under the rod and terminate in an eye for engagement with the line, and a thumb-piece arranged on said lever, substantially as set forth.

399,589. BOBBIN. J. HENRY WELLS, Fall River, Mass. Filed Feb. 15, 1888. Serial No. 264,156. (No model.)

Brief.—The object of the invention is to strengthen the bobbin during its manufacture, as well as to make it durable in use.

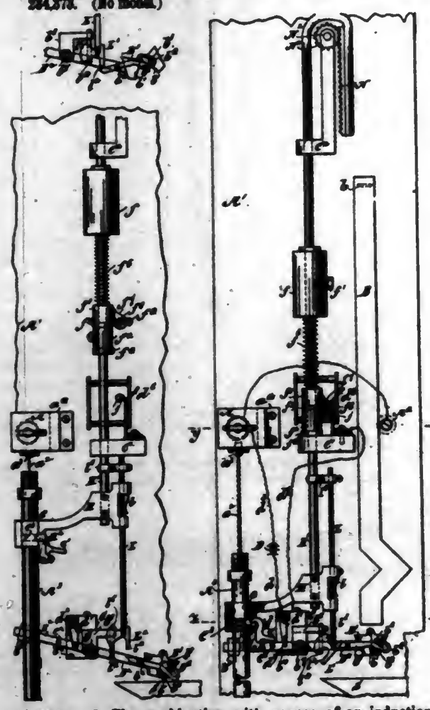


Claim.—1. A bobbin composed of the ordinary tubular stem, having a circumferential inner groove near the lower end of its bore, and a cap of sheet metal having a central portion lying against the lower or base edge of said stem or spindle, provided with an inner flange extending within said stem against the surface of the bore, and with its edge spun into said groove and bearing on the lower side thereof, and having an outer flange extending upward on the outer surface of the stem or spindle, and overlying the groove to re-enforce the stem on the outside of the groove, substantially as specified.

2. The herein-described bobbin composed of the ordinary tubular stem, A, having the enlarged cylindrical base portion *a'* and the conical portion *a*, adjoining said cylindrical portion, and provided with the circumferential groove B, having the rectangular shoulder *b'* in the cylindrical end portion of its bore, and the sheet-metal base-cap C, having the central part, D, the outer flange, E, extending over the groove to re-enforce the bobbin thereat, and the inner flange, F, lying against the surface of the bore, and having its edge turned outward upon the circumferential shoulder *b'* of the groove B, substantially as specified.

399,590. CENTRIFUGAL AMALGAMATOR. WILLIAM WHITE, Mount Vernon, assignor to James B. Brewster and Richard Kelley, New York, N. Y. Filed Nov. 22, 1888. Serial No. 291,546. (No model.)

Claim.—1. In a centrifugal amalgamator, the combination, with the frame, of the pan mounted on said frame and formed with a series



of concentric steps the outer part of which beyond the last step is inclined upwardly and terminates in a downwardly-curved peripheral edge, substantially as shown and described.

2. The combination, with the frame, the rotary pan, the disk above the pan, and the plate secured at its outer edges to the said disk, with a space between the pan and disk, of the vent-tube K, extended through the plate and disk and communicating at its lower end with the space between the pan and disk, and through the plate and provided at its upper end with an enlargement, and the conical hood in said enlarged part with an air-space around the same, substantially as and for the purpose specified.

399,591. COIN-OPERATED INDUCTION-COIL.

PERCY G. WILLIAMS and ALFRED W. ROOVERS, Brooklyn, N. Y., assignors to the Automatic Battery Company, same place. Filed Sept. 1, 1888. Serial No. 284,373. (No model.)

Claim.—1. The combination, with a case, of an induction-coil, primary and secondary circuits therefor, a longitudinally-movable part in electrical contact with the induction-coil, electrodes outside the case, one of which is connected with the said movable part, a weight for moving said movable part in one direction, an arm adapted to be locked with said weight, a rod rigidly secured to said arm, time mechanism having a portion in one of said circuits, and a pin or projection on said rod adapted to contact with said portion of the time mechanism to close such circuit, substantially as specified.

2. The combination, with a case, of an induction-coil, primary and secondary circuits therefor, a longitudinally-movable part in electrical contact with the induction-coil, electrodes outside the case, one of which is connected with the said movable part, a weight for moving said movable part in one direction, an arm adapted to be locked with said weight, a rod rigidly secured to said arm, time mechanism having a portion in one of said circuits, and a yielding pin or projection on said rod adapted to contact with said portion of the time mechanism to close such circuit, substantially as specified.

3. The combination, with a case, of an induction-coil, primary and secondary circuits therefor, a movable part in electrical contact with the induction-coil, electrodes outside the case, one of which is secured to said movable part, a weight for moving said movable part in one direction, an arm adapted to be locked to said weight, a rod rigidly secured to said arm, a lever, a receptacle for a coin mounted on said lever, a pin or projection on said rod, and time mechanism, whereby when a coin has been deposited in the receptacle the lever will rock to close circuit, and when the said movable part for the induction-coil is moved outwardly and the weight is raised said rod will be elevated to permit the operation of the time mechanism and to cause the breaking of the circuit, substantially as specified.

4. In a coin-operated induction-coil, the combination of an indicator, two electrodes extending outside the case, one constructed to be longitudinally movable, a coin-chute, a coin-receptacle moved on receiving a proper coin from the chute, an electric circuit, circuit-changers operated upon the movement of the coin-receptacle, gearing imparting movement to the indicator, and mechanism operated upon the movement of the coin-receptacle to connect said gearing with the movable electrode, substantially as specified.

5. In a coin-operated induction-coil, the combination of an indicator, two electrodes extending outside the case, one constructed to be longitudinally movable, a coin-chute, a coin-receptacle moved on receiving a proper coin from the chute, an electric circuit, circuit-changers operated upon the movement of the coin-receptacle, time mechanism, gearing imparting movement to the indicator, and mechanism operated upon the movement of the coin-receptacle to connect said gearing with the movable electrode, substantially as specified.

6. The combination of an indicator, a rod connected therewith for operating the same, a movable electrode, a lever having at one end a coin-receptacle, and a catch operated by said lever to lock the movable electrode to the said rod, substantially as specified.

7. The combination of an indicator, a rod connected therewith for operating the same, a movable electrode, a catch for securing the movable electrode to the rod, a lever, and a sliding trip, substantially as specified.

8. The combination of a coin-chute, a lever carrying a receptacle for coin, a movable electrode, and a catch operated to be rocked and locked to the said movable electrode by means of a working-lever, substantially as specified.

9. In a coin-operated induction-coil, the combination, with an electrode, of a weight secured thereto and elevated when said electrode is drawn outwardly, an arm adapted to be locked to said weight, a rod frictionally secured to said arm, a trip on said rod, a lever, a receptacle for coin composed of sections and mounted on said lever, and an opening and closing device operated by said trip upon the lowering of said weight to open said receptacle, substantially as specified.

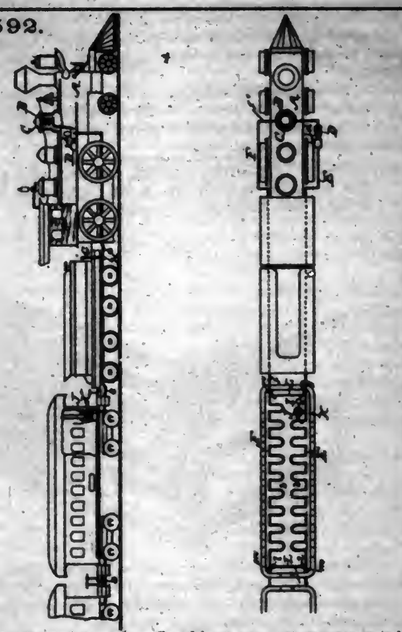
10. The combination, with a movable electrode, of a weight connected to said electrode, an arm connected to said weight, a rod having a sliding connection with said arm, an abutment for said rod, a receptacle for coin, and an opening and closing device operated by said rod, substantially as specified.

11. The combination, with a longitudinally-movable electrode, of a weight secured thereto and elevated when the electrode is drawn outwardly, an arm adapted to be locked to said weight, a rod adapted to be locked to said arm and moved upwardly therewith, time mechanism, and a pin or projection on said rod adapted upon the descent of said rod to rewind said time mechanism, substantially as specified.

12. In a coin-operated induction-coil, the combination, with the weight A^3, provided with a groove, c^3, of the arm H, provided with a dog, H^3, adapted to engage said groove, and the lever B^3, provided with a pin, c^3, substantially as specified.

399,592. SYSTEM OF AND APPARATUS FOR HEATING CARS.

ROBERT J. WILSON, Pittsburg, Pa. Filed Apr. 26, 1887. Serial No. 236,207. (No model.)



Claim.—1. In a car-heating apparatus, the combination, with a main water-heating device mounted on the locomotive-boiler and within the same, of a water-circulating system, consisting of direct and return pipes mounted on a car and arranged and adapted to heat the car by direct radiation, and connected directly to said heating device, and a local or supplementary heating circuit comprising a water-tank, stove, and coil mounted on the car, said coil being connected to the main system by pipes having cocks, whereby the car may be heated independently from the heat derived from the locomotive-boiler, substantially as described.

2. In a car-heating apparatus, the combination, with a main water heating and circulating system comprising a water-heating device mounted on a locomotive and the boiler thereof, and delivery and return pipes connected directly thereto and passing through a car, of a supplementary or local heating and supply circuit mounted on the car and connected to said main system, substantially as described.

3. In a system of heating cars, the combination, with a water heating and supplying device consisting of a steam-pump and coil, said coil being located within the steam-space of the locomotive-boiler and connected to said pump, of delivery and return pipes connected with said coil and passing through the car to be heated, and a stove and supplemental coil carried on the car, said coil being connected to the service-pipes by branch pipes having suitable cocks, whereby said car may be heated independent of the locomotive.

4. In a car-heating apparatus, the combination of a steam-boiler carried upon one of the vehicles of the train, a main water-heater contained in a vessel communicating with said boiler and carried on the same vehicle direct, return-pipes connected to said main heater and traversing the other vehicles of the train, and a supplementary heating-circuit consisting of a coil and heater on each car, connected to said direct and return pipes by branch pipes having cocks, substantially as described.

399,592.

399,593. STEAM-ENGINE.

WILLIAM O. WORTH and JOHN D. WORTH, Cedar Rapids, Iowa. Filed Feb. 10, 1888. Serial No. 263,657. (No model.)

Claim.—1. In an engine of the class described, a shell having cylinders in opposite ends thereof, lateral heads adapted to close the central portion of the shell and having boxes for the crank-shaft, steam-passages along the upper portion of said shell, a central chamber within which the crank and its connections operate and adapted to hold oil, and chambers near the ends of said shell communicating with the exhaust-steam passages, substantially as specified.

2. In an engine, substantially as described, a shell having a central chamber isolated from the steam-passages and adapted to hold oil, and chambers near the ends communicating with the exhaust-steam passages and by a suitable valve with the central chamber, whereby the oil from the exhaust-steam deposited in said end chambers may be conveyed to the central chamber, substantially as set forth.

3. In an engine of the class described, the combination of a shell having a central chamber adapted to hold oil, end chambers communicating with the exhaust-steam passages and also adapted to hold oil, and valves, substantially as described, adapted to be automatically operated by a float, whereby the surplus oil from the end chambers is conveyed to the central chamber, as specified.

4. In an engine, substantially as described, the combination of a shell having a central chamber adapted to hold oil, terminal chambers adapted to catch oil from the exhaust-steam, an automatic valve adapted to allow the surplus oil from the terminal chambers to flow into the central one, and an overflow-pipe communicating with the central chamber and adapted to keep the oil at a uniform level, substantially as set forth.

5. In an engine, the combination, with a shell, substantially as described, having terminal heads with steam-valves therein, of a cylinder having an exhaust-port in one side and adjacent to said head, a valve having a convex face fitting the bore of said cylinder and adapted to slide reciprocally in the same direction as the piston, a reciprocating valve-rod connecting with said valve by an arm extending through said port, and mechanism adapted to actuate said valve-rod, substantially as described, and for the purpose set forth.

6. In an engine, the combination of a crank-shaft having two or more travelers mounted on the crank-pin and a piston having a yoke to receive said travelers and allow for the revolution of the crank, said yoke being adapted to bear on opposite sides of the respective travelers, but on only one side of any one traveler, substantially as and for the purpose set forth.

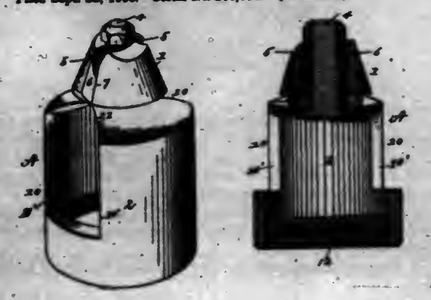
7. The combination, in an engine, of the crank-shaft having two or more travelers mounted on its crank-pin, and a yoke bearing against said travelers from opposite sides, but upon only one side of any traveler, and having for one of its bearing-faces an adjustable wedge, whereby the lost motion due to wear may be taken up, substantially as specified.

8. In an engine of the class specified, the combination, with a cam or eccentric oscillating arms and valves, substantially as described, of a reciprocating rod adapted to actuate the steam or exhaust valves, said rod being placed below the surface of the oil or water within the shell of the engine, whereby the sound caused by actuating said rod is muffled, substantially as set forth.

9. In an engine of the class described, the combination of the valve-rods Q Q, the pivoted arms J J, having travelers *b b*, the spring *p*, and the cam or eccentric mounted on the crank-shaft, substantially as and for the purpose set forth.

399,594. CHIMNEY CAP AND PROTECTOR.

WILLIAM W. WEIGEL, Willink, N. Y. Filed May 18, 1888. Serial No. 274,312. (No model.)

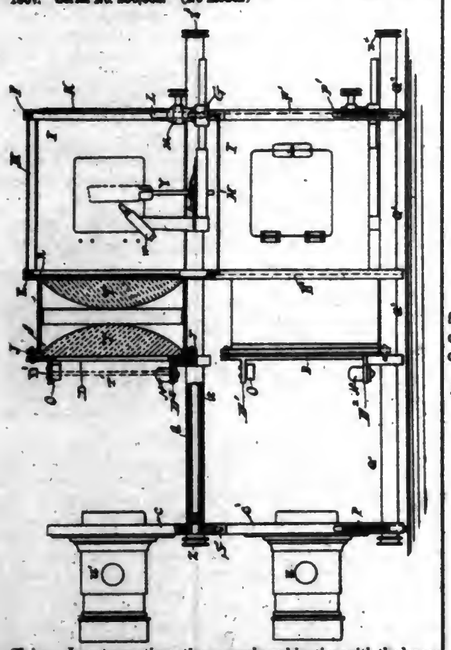


Claim.—1. In a chimney-cap consisting of the main plate having a central opening and provided with circumferential flanges depending from its outer edges and from the edges of its central opening, and the hood arranged over the main plate and provided with a depending surrounding flange resting at its lower edge on the main plate around the central opening therein and removed some distance from the same, the top of the said hood being solid at its center over the opening in the main plate, and provided with apertures *i*, which are over the inclosed portion of the main plate, substantially as specified.

2. A chimney-cap comprising the main plate having a central opening and provided with a circumferential flange, *c*, the hood arranged over the plate and provided with a depending flange resting on the main plate around its opening and removed some distance therefrom, and the deflecting-flange I, larger than the opening in the main plate and depending from the top of the hood, the portion of the top of the hood inclosed by this flange being solid, while the portion around the flange is provided with openings *i*, substantially as specified.

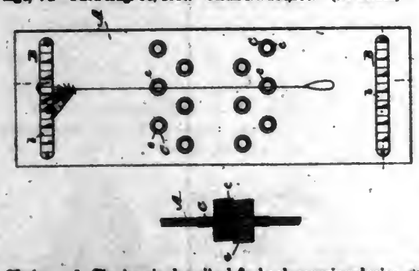
3. In a chimney-cap, the main plate C, having a central opening, c^4, and provided with the depending flanges *c* and *c'*, and the vertical protecting-flange D, standing up around the central opening in the plate, in combination with the hood G, fitting over the main plate and provided with the depending flange *g*, bearing on the plate between the central opening and the outer edge and provided with notches or outlet openings *g' g'*, and the deflecting-flange I, depending from the top of the hood, with its lower edge arranged over the portion of the main plate between the flanges D and *g*, the top of the hood being solid within the deflecting-flange I, and provided with openings *i i* around the same, substantially as specified.

399,595. AUGER-BIT.



FRANK T. WYCKOFF, Williamsport, Pa. Filed Sept. 22, 1888. Serial No. 286,063. (No model.)

Claim.—1. An auger consisting of a cutter having cutting-edges and a cutting-shoulder and an opening through the shoulder, a leader on the shoulder having cutting-edges in its sides aligning with the cutting-edges of the cutter and a threaded opening through its center, and a bolt extending through the opening in the cutter and engaging the threaded opening in the leader, substantially as described.

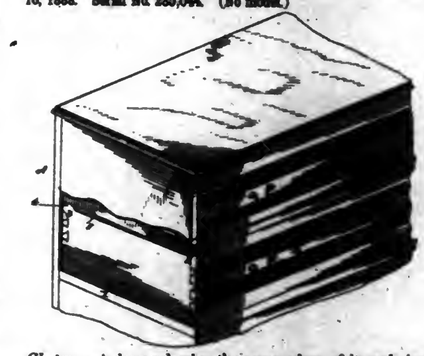


2. An auger having a cutter provided with openings in its sides, the metal surrounding the openings forming cutting-edges, a leader having cutting-edges aligning with and forming a continuation of the cutting-edge of the cutter, and a bolt for holding the leader and cutter together, substantially as described.

399,596. MAGIC LANTERN. HENRY J. BROWER, Brooklyn, assignor to Thomas H. McAllister, New York, N. Y. Filed Sept. 27, 1887. Serial No. 250,908. (No model.)

Claim.—In a stereopticon, the general combination, with the lenses and burners, of metallic plates *c*, D, E, and F, having openings and grooves, substantially as shown, tubes A and B, on which the different plates are mounted, slip-tubes Q, Q', Q², Q³, and Q⁴, fitting on over tubes A and B and separating plates *c*, D, E, and F from each other, milled-head screws Z Z', fitting into tubes A and B, for holding the plates and tubes firmly together, post L, and sleeve M, for holding burner W in position, all substantially as and for the purpose set forth.

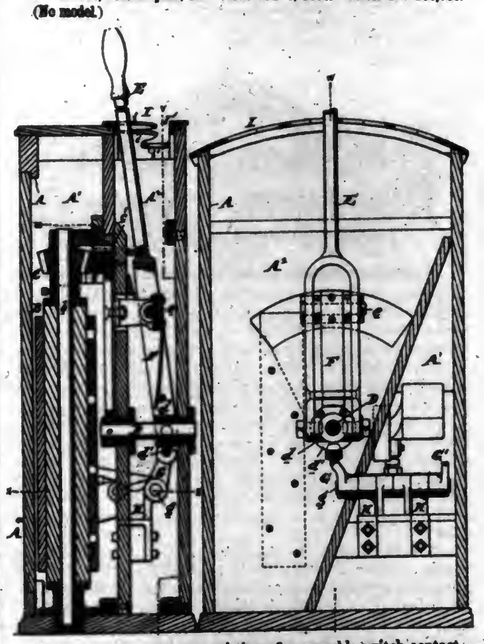
399,597. FISHING-FLY BOOK. THOMAS H. CHUBB, Post Mill Village, Vt. Filed Aug. 31, 1888. Serial No. 284,266. (No model.)



Claim.—1. The herein-described fly-hook-securing device, consisting of the combination, with the card or leaf having means for retaining the hooks, of the coiled-spring retaining-fingers having the end of the coil standing out at substantially right angles to the surface of said card, and the base of the coil secured to the card.

2. The combination, with the card or leaf, of the two coiled-spring fingers passing through the card secured thereto and projecting from opposite sides of the same.

3. The combination, with the card or leaf, of the strip B, having the raised sockets *b*, for holding the points of the fly-hooks, and the eyelets having the corresponding coiled-spring fingers, *c*, operating toward the face of the card for retaining the snells, substantially as set forth.



4. The combination, with the card or leaf having suitable means for holding the free ends of the snells, of the strip B, having raised sockets *b*, for holding the points of the hooks, and spaces or recesses intermediate between said sockets.

399,598. FURNITURE-DRAWER. DWIGHT C. CLAFF, Owosso, Mich., assignor of one-half to David M. Estey, same place. Filed Sept. 10, 1888. Serial No. 285,044. (No model.)

Claim.—A drawer having the upper edges of its ends inclined from the front to the back, and having upwardly-projecting shoulders on the inclined edges, the height of which is equal to the highest point of the inclined edge, substantially as described.

399,599. REGULATOR FOR ELECTRICAL MACHINERY. GEORGE H. CONDICT, Philadelphia, Pa. Filed Oct. 1, 1888. Serial No. 286,906. (No model.)

Claim.—1. A regulator consisting of a movable switch contact-surface for varying the current supplied, in combination with a hand-lever movable in one direction to move said contact-surface and movable transversely thereto to make and break the electric circuit, and a circuit maker and breaker controlled thereby.

2. A regulator consisting of a movable switch contact-surface for varying the current supplied, in combination with a hand-lever movable in one direction to move said contact-surface and movable transversely thereto to make and break the electric circuit, a circuit maker and breaker controlled thereby, and a notched plate for said lever to hold it in position when moved to shift the contact-surface a given distance.

3. A regulator consisting of a movable switch contact-surface for varying the current supplied, in combination with a hand-lever movable in one direction to move said contact-surface and movable transversely thereto to make and break the electric circuit, a circuit maker and breaker controlled thereby, a notched plate for said lever to hold it in position when moved to shift the contact-surface a given distance, and a spring to press said lever normally into the notches.

4. In a regulator, the combination of a moving contact-surface for coupling up circuits in different orders and varying the current, a hand-lever movable on a horizontal axis to shift the contact-surface and movable on a second axis transverse thereto to make or break the circuit, a spring-actuated circuit maker and breaker in the regulator-circuit, and connecting devices, substantially as set out, for operating said circuit maker and breaker by the movement of the hand-lever on the transverse axis.

5. In a regulator, the combination of a source of electrical energy, electric-motor coils, a moving contact-surface for coupling up motor-coil circuits in different order and varying the current, a hand-lever movable on a horizontal axis to shift the contact-surface and movable on a second axis transverse thereto to make or break the circuit, a spring-actuated circuit maker and breaker in the regulator-circuit, and connecting devices, substantially as set out, for operating said circuit maker and breaker by the movement of the hand-lever on the transverse axis.

6. In a regulator, the combination of a rotary contact-surface for coupling up circuits in different orders and varying the current, a hand-lever movable on a horizontal axis to shift the contact-surface and movable on a second axis transverse thereto to make or break the circuit, gearing between said hand-lever and rotary contact-surface to rotate the latter by a reciprocation of the former, a spring-actuated circuit maker and breaker in the regulator-circuit, and connecting devices, substantially as set out, for operating said circuit maker and breaker by the movement of the hand-lever on the transverse axis.

7. In a regulator, an operating handle or lever movable in two lateral directions with reference to its length, and in which said movements are transverse with respect to each other, a current-regulator operated by said handle or lever when moved in one direction, and a circuit-interrupter operated by the handle or lever when moved in the other direction.

8. In a regulator, an operating handle or lever movable in two lateral directions with reference to its length, and in which said movements are transverse with respect to each other, and a guide having a continuous slot with lateral notches therefrom, in which said handle or lever moves, a current-regulator operated by said handle or lever when moved in one direction, and a circuit-interrupter operated by the handle or lever when moved in the other direction.

9. In a regulator, an operating handle or lever movable in two lateral directions with reference to its length, in which said movements are transverse with respect to each other, a guide having a continuous slot with lateral notches therefrom, in which said handle or lever moves, and a spring to force said handle or lever into the notches, a current-regulator operated by said handle or lever when moved in one direction, and a circuit-interrupter operated by the handle or lever when moved in the other direction.

10. In a regulator the combination of the handle or lever movable laterally in two directions, with the guide I, having continuous slot I', and notches *i i'*, opening laterally therefrom, a current-regulator operated by said handle or lever when moved in one direction, and a circuit-interrupter operated by the handle or lever when moved in the other direction.

11. In a regulator, a switch for varying the resistance offered to the line-current, a line-circuit, a circuit-breaker in said line-circuit, and a spring to assist the circuit-breaker in opening and make it move quickly.

12. In a regulator, a switch for varying the resistance offered to the line-current, a line-circuit, a pivoted circuit-breaker in said line-circuit, a spring to assist the circuit-breaker in opening or closing and make it move quickly, a lever for moving one end of the spring up or down above the pivot-point of the circuit-breaker, a hand-lever for moving the resistance-varying switch, and also the lever for moving the spring.

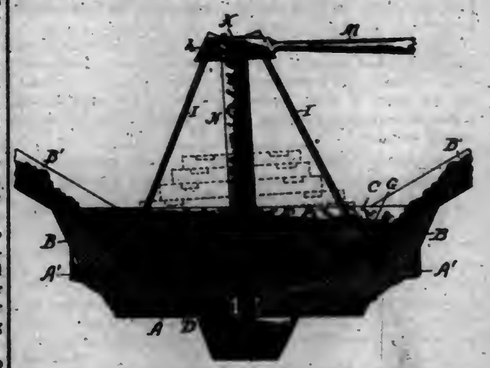
13. In a regulator, the combination of a switch for varying the current flowing through the line, a line-circuit, a circuit-breaker in the line-circuit, a switch-operating lever movable in two directions, a mechanical connection between the lever and current-varying switch, whereby said switch is operated by a movement of said lever in one direction, and a mechanical connection between the lever and circuit-breaker, whereby the circuit-breaker is operated by the other movement of the switch.

14. In a regulator, the combination of a switch for varying the current flowing through the line, a line-circuit, a circuit-breaker for the line-circuit, a single lever movable in two directions, a power-transmitting connection between the lever and current-varying switch, whereby the latter is operated for one movement of the lever, a second power-transmitting connection between the lever and circuit-breaker, whereby the latter is operated for the other movement of the lever, and a guide to prevent two successive movements of the regulator-switch without first moving the lever to operate the circuit-breaker.

15. In a regulator, the combination of a switch for varying the current flowing through the line, a line-circuit, a spring-actuated circuit-breaker for the line-circuit, a single lever movable in two directions, a power-transmitting connection between the lever and current-varying switch, whereby the latter is operated for one movement of the lever, a second power-transmitting connection between the lever and spring of the circuit-breaker, whereby the latter is operated for the other movement of the lever, and a guide to prevent two successive movements of the regulator-switch without first moving the lever to operate the circuit-breaker.

16. In a regulator, a line-circuit, in combination with a switch for varying the current flowing through the line, and a circuit-breaker in the line consisting of a cup holding mercury, a vertically-reciprocating frame, and a removable contact-rod.

17. In a regulator, a line-circuit, in combination with a switch for varying the current flowing through the line, a circuit-breaker in the line consisting of a cup holding mercury, a vertically-reciprocating frame, a removable contact-rod, and a counter-weight to counterbalance the weight of the contact rod and frame.



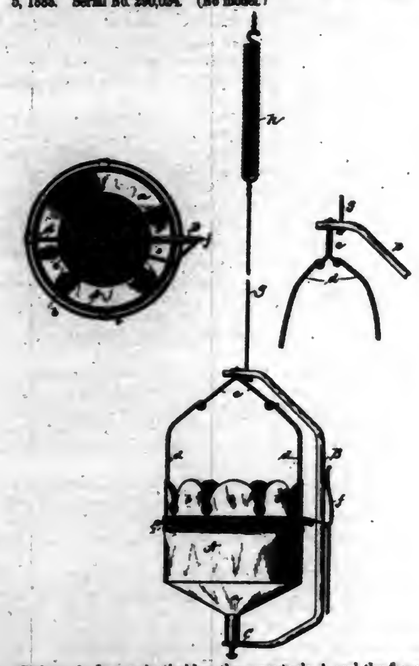
18. The combination of a source of electric supply, a line-circuit, an electric motor in said line-circuit, a current-regulator, and a circuit-breaker in series in said line-circuit and exterior to said motor, and a resistance-shunt connecting the line-circuit on each side of the circuit-breaker.

19. The combination of a source of electric supply, a line-circuit an electric motor in said line-circuit, a current-regulator, and a circuit-breaker in series in said line-circuit and exterior to said motor, a resistance-shunt connecting the line-circuit on each side of the circuit breaker, and a lever to operate the current-regulator or circuit-breaker alternately, but not both at the same time.

20. In a regulator, the combination of a rotary barrel-switch for varying the flow of current in the line, a small pinion on said switch, a segmental rack of great radius meshing with said pinion, and a hand-lever for operating said rack pivoted on an axis at right angles to the barrel of the switch.

21. In a regulator, an operating handle or lever movable in two lateral directions with reference to its length, and in which said movements are transverse with respect to each other, and a series of guide-notches made V-shaped, in which the handle or lever moves and whereby it cannot catch in approaching them, and a spring to force said lever or handle into the notches, a current-regulator operated by said handle or lever when moved in one direction, and a circuit-interrupter operated by the handle or lever when moved in the other direction.

399,600. ORE-CRUSHER. JOHN D. COPLAN, Denver, Colo. Filed Aug. 1, 1887. Serial No. 245,704. (No model.)

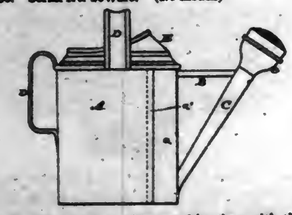


Claim.—1. The combination of a concave bed having sides formed with vertical slots directly over the lowest point of said bed, a heavy or weighted muller having a convex face and guide or stay pins located on its sides at points near the convex face opposite the middle of the curve, and a rocking frame for connection with a prime motor, substantially as described.

2. The combination of a concave bed having pulp-discharge holes through the bottom, and having sides formed with vertical slots over the lowest point of such bed, a heavy or weighted muller having a convex face and provided with guide or stay pins located at the sides opposite the middle of its curve and near its convex face, and a rock-

ing frame for connection with a prime motor, substantially as described.

3. The combination of a concave bed having sides provided with vertical slots over the lowest point of said bed, a heavy or weighted muller having a convex face and vertically-adjustable guide or stay pins located at the sides at points near the convex face and the middle of the curve, and a frame for rocking the muller, substantially as described.



399,601. TWINE-HOLDER. ISAAC DAVIS, Oil City, Pa. Filed Nov. 5, 1888. Serial No. 290,024. (No model.)

Claim.—1. In a twine holder, the receptacle A and the frame B, in which the same is pivoted, in combination with the spring-rods *d*, connected to the receptacle, and the cord *e*, connected to spring-rods and to the frame, substantially as described, whereby the turning of the receptacle in paying out the twine will twist the holding-cord to produce a tension therein, to revolve the receptacle in a reverse direction to wind the twine upon the periphery of the holder, as set forth.

2. In a twine-holder, the combination of the receptacle A, the frame B, in which the same is pivoted, the spring-rods *d*, connected to the receptacle, and the cord connected to the rods and to the frame, and the railing or guide *i*, consisting of a rim projecting out and around the receptacle, and hook *f*, substantially as shown, and for the purpose set forth.

399,602. WATERING-POT. WILLIAM DIXON, Newark, N. J., assignor to the Iron Clad Manufacturing Company, New York, N. Y. Filed Jan. 24, 1889. Serial No. 297,418. (No model.)

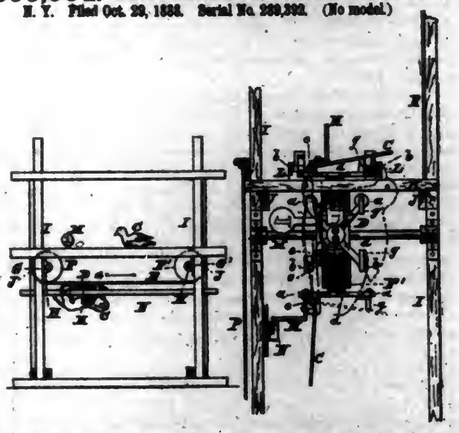
Claim.—1. In a watering-pot, the combination, with the cylinder or body, of a spout, web, and supporting-base formed separately from and adapted to be applied and secured as one integral structure to said body, substantially as and for the purposes hereinbefore set forth.

2. In a watering-pot, the combination, with the cylinder or body, of a spout, web, and supporting-base formed from one continuous piece of sheet metal, separately from and adapted to be applied and secured as one integral structure to said body, substantially as and for the purposes hereinbefore set forth.

3. In a watering-pot, the combination, with the cylinder or body, of a spout, web, and supporting-base, constituting one integral structure, formed separately from and adapted to be applied to said body, said elements being formed or provided with guides, whereby the base, when applied to the body, is guided to and assured in place, substantially as and for the purposes hereinbefore set forth.

4. In a watering-pot, a spout, web, and supporting-base, separately formed and constituting a single integral structure, substantially as and for the purposes hereinbefore set forth.

399,603. JEWELRY-CASE. CHARLES F. DOMANN, Lake View, assignor to William Roetz, Chicago, Ill. Filed Aug. 21, 1888. Serial No. 283,384. (No model.)



Claim.—1. A jewelry-case composed of base A and lids B and B', hinged thereto, and link-bars C and C', pivotally connected with each other and with the lids B B', substantially as set forth.

2. A jewelry-case composed of base A and lids B and B', hinged thereto, link-bars C C', pivotally connected with each other and with the lids B B', and cross-bar E, carrying frame F, all substantially as set forth.

3. A jewelry-case composed of base A and lids B and B', hinged thereto, link-bars C C', pivotally connected with each other and with the lids B B', cross-bar E, carrying frame F, and rods G, rigid with base A, for guiding frame F, all substantially as set forth.

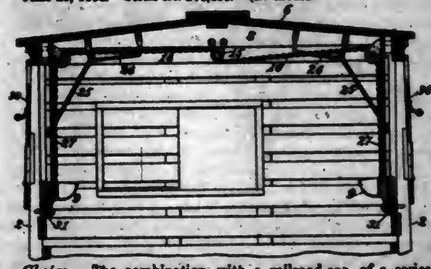
399,604. TARGET. BERNHARD DUPPER and EMIL PREISNER, Buffalo, N. Y. Filed Oct. 22, 1888. Serial No. 289,292. (No model.)

Claim.—1. In shooting-galleries, a target-figure pivoted to a suitable carrier, in combination with an auxiliary target affixed to the main target at approximately a right angle to the face of the main target, whereby the latter, when hit by a bullet, will be knocked down and thereby exhibit the auxiliary target automatically, as and for the object set forth.

2. A compound target consisting of a main target pivoted to a suitable carrier, with the axis of the target in a horizontal line across the line of firing, and an auxiliary target affixed to the main target at approximately a right angle, whereby the latter in disappearing automatically exhibits the auxiliary target, as and for the purpose stated.

3. In compound targets, a main target pivoted to a suitable carrier, with the axis of the target in a horizontal line across the line of firing, in combination with an auxiliary target affixed to the main target at approximately a right angle, the carrier being moved by suitable mechanism for moving-target practice, as and for the purpose set forth.

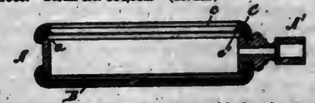
4. In shooting-galleries, the combination, with an endless belt revolving around two pulleys with shafts the axes of which are in horizontal planes, of a series of carriages, each having a pivoted target adapted to be knocked down when struck by a bullet, said targets being provided with laterally-projecting portions supporting the targets upon a suitable rail while traveling with the lower horizontal line of said belt, in a manner as and for the object set forth.



5. In shooting-galleries, the combination, with the belt, of a carriage consisting of an X-shaped frame, D, the four extremities of which engage guides L L, as described, said frame D having upon its upper face lugs *c*, engaging a bar, *f*, affixed to the target proper, and further lugs *g*, carrying said target free of the rear rail, L, after being knocked down, the whole being moved by suitable mechanism, as and for the purpose set forth.

6. In shooting-galleries, the combination, with the movable-target figures C, having auxiliary targets M affixed at approximately a right angle to the face of the said movable-target figures, as described, of the supporting-bar N, arranged parallel with the lower line of the belt, the driving-pulleys with their shafts, and suitable operating mechanism, substantially as and for the purpose set forth.

7. The combination, with a suitable frame, of the two horizontally-revolving shafts G G', carrying the pulleys F F', and the belt E, stretched over said pulleys and carrying upon its flat side a series of carriages, D, provided with targets C, the carriages being arranged to move in guides L L when upon the upper plane of the belt, and supported upon the rail N by the auxiliary targets M when upon the lower plane, said auxiliary targets being placed at approximately a right angle to the face of the target proper and sliding upon said supporting-bar N, as and for the object stated.



8. The carriage D, consisting of an X-shaped body having its forward members provided with guide-wheels *a* and upwardly-projecting lug *g*, and its rear members provided with laterally-projecting slides *b*, one of which is also fitted with an upwardly-pointing lug, *g*, the lugs *c*, bar *f*, and bolt *e*, the whole being arranged upon an endless belt driven by suitable mechanism for target practice, as and for the object stated.

399,605. STOCK-CAR. JAMES P. ELDER, Philadelphia, Pa. Filed June 25, 1888. Serial No. 278,158. (No model.)

Claim.—The combination, with a railroad-car, of a series of transverse guide-rods secured to the roof-framing, a series of vertical guide-rods secured to the side framing, a lower hay-rack-frame rod or bar fitting freely and without connection thereto and adapted to traverse vertically between the vertical guide-rods and side framing, an upper hay-rack-frame rod or bar fitting freely upon the transverse guide-bars, and rods or bars connecting the upper and lower hay-rack-frame bars, substantially as set forth.

399,606. WATCH-CASE. CHARLES E. GILBY, Chicago, Ill. Filed Dec. 3, 1888. Serial No. 294,532. (Model.)

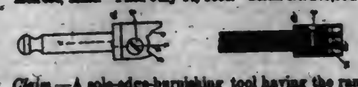
Claim.—In a watch-case, the plain wide band or case-body A, externally threaded at each edge and provided with a pendant, A', and an internal seat, *a*, at its front edge, in combination with a back cap, B, provided with an internally-threaded flange projecting beyond the periphery of said body, and a bezel, C, provided with a like internally-threaded projecting flange and an inwardly-projecting flange extending inward over the seat *a* of the body, substantially as specified.

399,607. METHOD OF MANUFACTURING HEELS. CHARLES W. GILDOM, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed June 26, 1888. Serial No. 278,143. (No model.)

Claim.—1. In the art or method of manufacturing heels, piling the lifts in a pile and forming in the same a U-shaped wedge-like opening, thereby stretching or expanding the heel to pitch or incline the same, substantially as described.

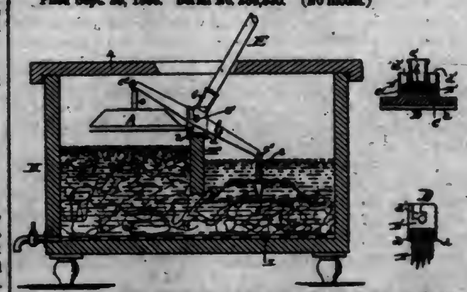
2. In the art or method of manufacturing heels, piling the lifts in a pile and forming in the same a U-shaped wedge-like opening, thereby stretching or expanding the heel to pitch or incline the same, and then filling the said cut with a filling to prevent the contraction of the heel, substantially as described.

399,608. HEEL-CUTTING DIE. CHARLES W. GILDOM, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed June 29, 1888. Serial No. 278,560. (No model.)



Claim.—1. The mold F, combined with the die having a cutter-blade beveled at its outer side and acting, when forced into the heel, to force outwardly, as described, the substance of the heel outside the blade to give to the heel at its rear the desired bevel or pitch, substantially as described.

2. The die having a cutter-blade beveled at its outer side and acting, when forced into the heel, to force outwardly, as described, the substance of the heel outside the blade to give to the heel at its rear the desired bevel or pitch, and the convex-faced follower, substantially as described.



3. The die having a cutter-blade beveled at its outer side and acting, when forced into the heel, to force outwardly, as described, the substance of the heel outside the blade to give to the heel at its rear the desired bevel or pitch, and the center block and presser-pin to operate substantially as described.

399,609. SOLE-EDGE-BURNISHING TOOL. WILLIAM GORDON, Melrose, Mass. Filed July 14, 1888. Serial No. 279,984. (No model.)

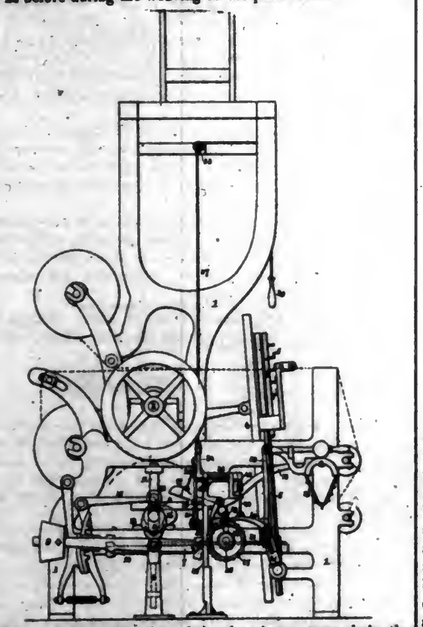
Claim.—A sole-edge-burnishing tool having the rand-lip 3, sole-edge-burnishing face 2, and lip or rest 4, and divided across said lips and face into two or more sections, which are rigidly but detachably connected, and are rounded along their meeting edges to form a groove, *a*, extending across the burnishing face and lips of the tool, as set forth.

399,610. WASHING-MACHINE. WILLIAM H. GOSS, Yonkers, N. Y. Filed Sept. 25, 1886. Serial No. 296,235. (No model.)

Claim.—The combination of the tank, the transverse partition therein, and the casting D, having slotted upstanding lugs D', mounted on said partition, with the lever C, having trunnions engaging the slots in lugs D', and the compressors mounted on the ends of said lever at opposite sides of the partition, substantially as and for the purpose specified.

399,611. MANUFACTURE OF IRON. ABRAHAM T. HAY, Burlington, Iowa. Filed Sept. 27, 1888. Serial No. 286,032. (No specimens.)

Claim.—A ferruginous sponge containing iron, an alkali, and a metal isomorphous with iron and thermo-electric relative thereto, substantially as set forth.



399,612. MANUFACTURE OF STEEL. ABRAHAM T. HAY, Burlington, Iowa. Filed Oct. 3, 1888. Serial No. 287,076. (No specimens.)

Claim.—The herein-described method of manufacturing steel,

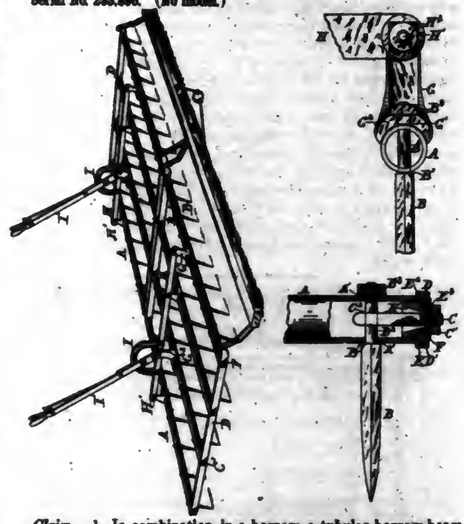
consisting in desiliconizing and wholly or partially decarburizing the metal, as in a Bessemer converter or open-hearth furnace, and fining and alloying the molten steel by adding thereto a ferruginous alkaline sponge, substantially as set forth.

399,613. SHUTTLE-BOX PATTERN MECHANISM FOR LOOMS FOR WEAVING FABRICS HAVING END BORDERS. FRANK HERDIS, Philadelphia, Pa. Filed Jan. 23, 1888. Serial No. 261,500. (No model.)

Brief.—At the time of completion of the weaving of the plain fabric the retainer, which holds the movable part of the pattern mechanism out of operative position, is tripped by the tripping-toe, and thereby the pattern mechanism proper is allowed to operate, and the boxes are shifted to permit of the weaving of the fancy border. At the same time the pawl, which actuates the tripping-toe mechanism, is placed in inoperative position. When the border is completed, the loom is stopped, as by the picking in of an empty shuttle, and the retainer is then placed in its former position by hand, thus throwing out of action the shuttle-box mechanism and once more throwing into action the tripping-toe mechanism, which proceeds to operate as before during the weaving of the plain fabric.

Claim.—1. The combination of the drop-box pattern-chain, the operating-cam 16 therefor, the bar 18, having an arm movable into and out of range of the cam, a retainer for holding said arm out of action, a tripper for said retainer, and mechanism for actuating said tripper, all substantially as specified.

2. The combination of the drop-box pattern-chain, the operating-cam 16 therefor, the bar 18, having an arm movable into and out of range of the cam, a retainer for holding said arm out of action, and a tripping device for said retainer, comprising a shaft having a tripping-toe and worm-wheel, another shaft having a worm and ratchet wheel, and means for operating said ratchet-wheel, all substantially as specified.



3. The combination of the drop-box pattern-chain, the operating-cam 16 therefor, the bar 18, having an arm movable into and out of range of the cam, a retainer for holding said arm out of action, a tripping-toe for said retainer, operating-gearing for said toe having a ratchet-wheel, a pawl for operating said ratchet-wheel, means for actuating the pawl, and a connection between said pawl and the retainer, whereby the pawl is thrown out of action on the release of the retainer, all substantially as specified.

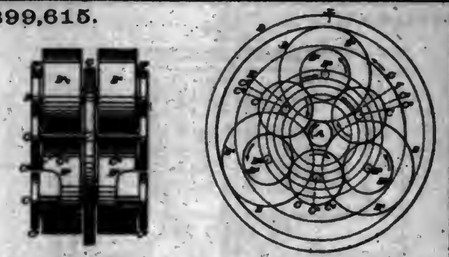
4. The combination of the drop-box pattern-chain, the operating-cam 16 therefor, a bar, 18, having an arm movable into and out of range of the cam, a retainer for holding said arm out of action, a tripping-toe for said retainer, the pawl and ratchet and intervening gearing for operating said toe, and a rock-shaft having two arms, one connected to the pawl and the other to the retainer and to the movable arm of the bar 18, all substantially as specified.

5. The combination of the drop-box pattern-chain, the operating-cam 16 therefor, the bar 18, having an arm movable into and out of range of the cam, a retainer for holding said arm out of action, a tripping-toe, an operating-shaft therefor having a driving-pin adapted to a slot of greater width than the pin, and means for driving said shaft, all substantially as specified.

6. The combination of the drop-box pattern-chain, the operating-cam 16 therefor, the bar 18, having an arm movable into and out of range of the cam, a retainer for holding said arm out of action, a tripping-toe, an operating-shaft therefor having a worm-wheel, a driving-shaft having a worm and ratchet wheel, means for operating said ratchet-wheel, a bracket carrying said driving-shaft, and means for adjusting said bracket, whereby worm-wheels of different diameters may be used, all substantially as specified.

399,614. HARROW. SIMON P. HENDRICKS, Rockford, Ill., assignor to the Skandia Plow Company, same place. Filed Dec. 17, 1888. Serial No. 293,896. (No model.)

Claim.—1. In combination, in a harrow, a tubular harrow-beam provided with transverse holes A', extending therethrough, for admitting harrow-teeth, an end cross-beam having transverse openings D' therein, the combined double bushing and washer E, the bushing E' thereof being inserted into the end of the tubular harrow-beam, the bushing E' extending through the opening D' in the end cross-beam, and the washer E² embraced between the end of the harrow-beam and an end cross-beam, an eyebolt threaded to receive a nut, having an eye, C², and being inserted through the end cross-beam and combined double bushing and washer E, a harrow-tooth threaded to receive a nut inserted through one of the holes A' in the harrow-beam and the eye C² in the eyebolt, and nuts for securing all of said parts operatively together, substantially as described, and for the purpose specified.



2. In combination, a harrow-beam provided with transverse holes A', extending therethrough, for admitting harrow-teeth, a harrow-tooth having a horizontal shoulder thereon and cylindrical portion B², adapted to be inserted through the holes A' in said beam and threaded to receive a nut, an adjusting-standard having a vertical hole, G', extending through the foot G² thereof to admit said tooth therethrough, and a nut, B³, for securing said tooth into and said standard upon said harrow-beam, substantially as set forth.

3. In combination, the harrow-beams A, provided with transverse holes A', extending therethrough, the end cross-beams, D, having transverse openings D' therein, the combined double bushings E, inserted into the ends of the harrow-beams A and through the end cross-beams, D, the washers F, the eyebolts C, the teeth B, inserted through the harrow-beams A and eyes C² in the eyebolts C, the standards G, the adjusting-beams H, the bolts H', and nuts B³, C', and H², for securing said parts operatively together, substantially as described, and for the purpose set forth.

399,615. ROLLER-BEARING. REUBEN W. HUNT, San Francisco, Cal. Filed Apr. 13, 1888. Serial No. 270,567. (No model.)

Claim.—1. In a roller-bearing, the combination of a series of bearing-rollers bearing directly on the central journal and the bearing-casing, a series of separating-rollers to keep the bearing-rollers separate from each other, bearing neither on the shaft nor casing, but on the bearing-rollers, and a ring bearing at its periphery on journals of the bearing-rollers, and at its inner side on journals of the separating-rollers, the bearing-rollers having journals of smaller diameter than the bearing-rollers and adapted to bear only on journals of the separating-rollers, and the latter journals being adapted to bear only on the last-mentioned journals of the bearing-rollers, all substantially as and for the purposes set forth.

399,615.

rollers, and the latter journals being adapted to bear only on the last-mentioned journals of the bearing-rollers, all substantially as and for the purposes set forth.

2. In a roller-bearing, the combination, with a ring, E, of a series of rollers, B, consisting of journals B', bearing directly on the shaft A, and the casing D, of journals B², rotating in contact with the periphery of the ring E, and of journals B', of smaller diameter than the journals B', and a series of rollers, C, consisting of journals C', adapted to bear only on the journals B², adapted to bear only on the journals C², and of journals C', rotating in contact with the inner side of the ring E, all substantially as shown and described, and for the purposes set forth.

3. A roller-bearing comprising the central journal, the bearing-casing, a ring, E, coaxial with the central journal, a series of bearing-rollers bearing directly on the central journal and the bearing-casing and having journals rotating in contact with the periphery of the ring E, and journals smaller than the bearing-rollers and bearing only on a series of separating-rollers keeping the bearing-rollers separate from each other, and said series of separating-rollers bearing on said smaller journals, but on no other parts of the bearing-rollers, nor on the shaft nor casing, and having journals rotating in contact with the inner side of the ring E, all constructed, arranged, combined, and adapted to operate substantially as and for the purposes set forth.

4. A roller-bearing comprising the shaft A, the casing D, the ring E, the series of rollers B, consisting each of two journals, B', bearing directly on the shaft A and casing D, of a journal, B², located between the journals B' and rotating in contact with the periphery of the ring E, and of two journals, B', of smaller diameter than the journals B' and located one at the outer end of each journal B' and bearing only on the journals C', each journal B² on and between two journals C', and the series of rollers C, consisting each of two journals C², bearing only on the journals B', each journal C² on and between two journals B', and of a journal, C', located between the journals C² and rotating in contact with the inner side of the ring E, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

5. In a roller-bearing, the combination of a series of bearing-rollers bearing directly on the central journal and the bearing-casing, a series of separating-rollers to keep the bearing-rollers separate from each other, bearing neither on the shaft nor casing, but on the bearing-rollers, a ring bearing at its periphery on journals of the bearing-rollers, and at its inner side on journals of the separating-rollers, and a ring bearing at its periphery on journals of the separating-rollers, the bearing-rollers having journals of smaller diameter than the bearing-rollers and adapted to bear only on journals of the separating-rollers, and the latter journals being adapted to bear only on the last-mentioned journals of the bearing-rollers, all substantially as and for the purposes set forth.

6. In a roller-bearing, the combination, with rings E and F, of a series of rollers, B, consisting of journals B', bearing directly on the shaft A and the casing D, of journals B², rotating in contact with the periphery of the ring E, and of journals B', of smaller diameter than the journals B', and a series of rollers, C, consisting of journals C', adapted to bear only on the journals B², adapted to bear only on the journals C', and of journals C², rotating in contact with the inner side of the ring E, and the periphery of the ring F, all substantially as shown and described, and for the purposes set forth.

7. A roller-bearing comprising the central journal, the bearing-casing, two rings, E and F, coaxial with the central journal and of different diameters, a series of bearing-rollers bearing directly on the central journal and the bearing-casing, and having journals rotating in contact with the periphery of the larger ring, E, and journals smaller than the bearing-rollers and bearing only on a series of separating-rollers, keeping the bearing-rollers separate from each other, and said series of separating-rollers bearing on said smaller journals, but on no other parts of the bearing-rollers, nor on the shaft nor casing, and having journals rotating in contact with the inner side of said larger ring, E, and in contact with the periphery of the smaller ring, F, all constructed, arranged, combined, and adapted to operate substantially as and for the purposes set forth.

8. A roller-bearing comprising the shaft A, the casing D, the rings E and F, the series of rollers B, consisting each of two journals, B', bearing directly on the shaft A and casing D, of a journal, B², located between the journals B' and rotating in contact with the periphery of the ring E, and of two journals, B', of smaller diameter than the journals B' and located one at the outer end of each journal B' and bearing only on the journals C', each journal B² on and between two journals C', and the series of rollers C, consisting each of two journals C², bearing only on the journals B', each journal C² on and between two journals B', and of a journal, C', located between the journals C² and rotating in contact with the inner side of the ring E and the periphery of the ring F, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

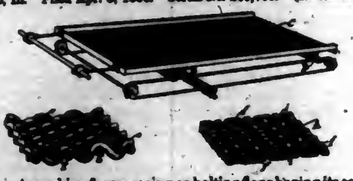
9. In a roller-bearing, the combination of a series of bearing-rollers bearing directly on the central journal and the bearing-casing, a series of separating-rollers to keep the bearing-rollers separate from each other, bearing neither on the shaft nor casing, but on the bearing-rollers, a ring bearing at its periphery on journals of the bearing-rollers, and at its inner side on journals of the separating-rollers, and a ring bearing at its inner side on journals of the bearing-rollers, the bearing-rollers having journals of smaller diameter than the bearing-rollers and adapted to bear only on journals of the separating-rollers, and the latter journals being adapted to bear only on the last-mentioned journals of the bearing-rollers, all substantially as and for the purposes set forth.

10. In a roller-bearing, the combination, with rings E and G, of a series of rollers, B, consisting of journals B', bearing directly on the shaft A and the casing D, of journals B², rotating in contact with the periphery of the ring E, and the inner side of the ring G and of journals B', of smaller diameter than the journals B', and a series of rollers, C, consisting of journals C', adapted to bear only on the journals B², adapted to bear only on the journals C², and of journals C', rotating in contact with the inner side of the ring E, all substantially as shown and described, and for the purposes set forth.

11. A roller-bearing comprising the central journal, the bearing-casing, two rings, E and G, coaxial with the central journal and of different diameters, a series of bearing-rollers bearing directly on the central journal and the bearing-casing, and having journals rotating in contact with the periphery of the smaller ring, E, and in contact with the inner side of the larger ring, G, and journals smaller than the bearing-rollers, and bearing only on a series of separating-rollers keeping the bearing-rollers separate from each other, and said series of separating-rollers bearing on said smaller journals, but on no other parts of the bearing-rollers, nor on the shaft nor casing, and having journals rotating in contact with the inner side of said smaller ring, E, all constructed, arranged, combined, and adapted to operate substantially as and for the purposes set forth.

12. A roller-bearing comprising the shaft A, the casing D, the rings E and G, the series of rollers B, consisting each of two journals, B', bearing directly on the shaft A and casing D, of a journal, B², located between the journals B' and rotating in contact with the periphery of the ring E and the inner side of the ring G, and of two journals, B', of smaller diameter than the journals B', and located one at the outer end of each journal B', and bearing only on the journals C', each journal B² on and between two journals C', and the series of rollers C, consisting each of two journals C², bearing only on the journals B², each journal C² on and between two journals B², and of a journal, C', located between the journals C² and rotating in contact with the inner side of the ring E, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

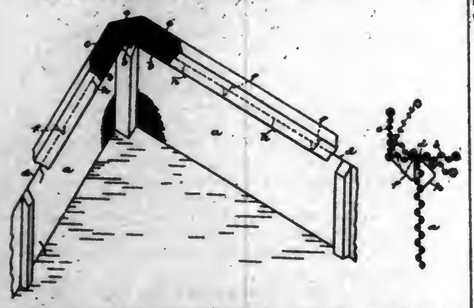
13. In a roller-bearing, the combination of a series of bearing-rollers bearing directly on the central journal and the bearing-casing, a series of separating-rollers to keep the bearing-rollers separate from each other, bearing neither on the shaft nor casing, but on the bearing-rollers, a ring bearing at its periphery on journals of the bearing-rollers and at its inner side on journals of the separating-rollers, a ring bearing at its periphery on journals of the separating-rollers, and a ring bearing at its inner side on journals of the bearing-rollers, the bearing-rollers having journals of smaller diameter than the bearing-rollers and adapted to bear only on journals of the separating-rollers, and the latter journals being adapted to bear only on the last-mentioned journals of the bearing-rollers, all substantially as and for the purposes set forth.



14. In a roller-bearing, the combination, with rings E, F, and G, of a series of rollers, B, consisting of journals B', bearing directly on the shaft A and the casing D, of journals B², rotating in contact with the periphery of the ring E and the inner side of the ring G, and of journals B', of smaller diameter than the journals B', and a series of rollers, C, consisting of journals C², adapted to bear only on the journals B², and of journals C', rotating in contact with the inner side of the ring E and the periphery

of the ring F, all substantially as shown and described, and for the purposes set forth.

15. A roller-bearing comprising the central journal, the bearing-casing, three rings coaxial with the central journal and of different diameters, a series of bearing-rollers bearing directly on the central journal and the bearing-casing, and having journals rotating in contact with the periphery of the intermediate ring and with the inner side of the larger ring, and journals smaller than the bearing-rollers and bearing only on a series of separating-rollers keeping the bearing-rollers separate from each other, and said series of separating-rollers bearing on said smaller journals, but on no other parts of the bearing-rollers, nor on the shaft nor casing, and having journals rotating in contact with the inner side of said intermediate ring and with the periphery of the smaller ring, all constructed, arranged, combined, and adapted to operate substantially as and for the purposes set forth.

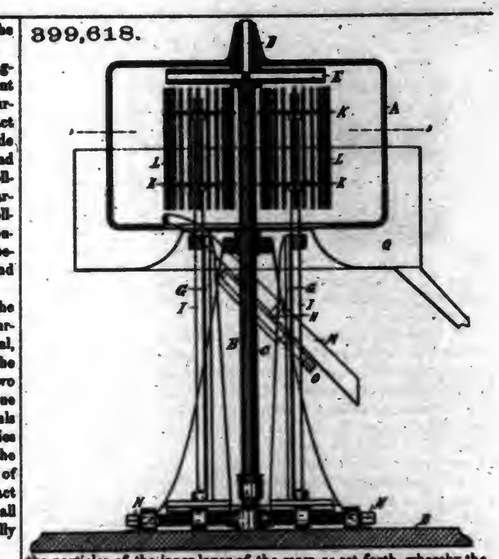


16. A roller-bearing comprising the shaft A, the casing D, the rings E, F, and G, the series of rollers B, consisting each of two journals, D', bearing directly on the shaft A and casing D, of a journal, B^2, located between the journals B' and rotating in contact with the periphery of the ring E and the inner side of the ring G, and of two journals, B^3, of smaller diameter than the journals B' and located one at the outer end of each journal B' and bearing only on the journals C^2, each journal B^2 on and between two journals C^2, and the series of rollers C, consisting each of two journals C^2, bearing only on the journals B^2, each journal C^2 on and between two journals B^2, and of a journal, C^3, located between the journals C^2 and rotating in contact with the inner side of the ring E and the periphery of the ring F, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

399,616. SCREEN FOR BOLTING FLOUR. OLIVER P. HUMFORD, Chicago, Ill. Filed Apr. 5, 1888. Serial No. 269,700. (No model.)

Claim.—A machine for screening or bolting flour having its screening-surface composed of a flattened woven-wire fabric, substantially as and for the purposes set forth.

399,617. FENCE. HARRO IHSEN, Jersey City, N. J. Filed Apr. 16, 1888. Serial No. 270,786. (No model.)



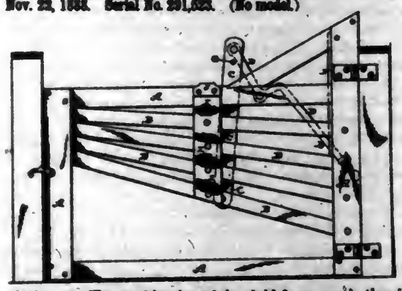
Claim.—1. The combination, with a fence, of a horizontally-arranged tilting cap or top plate and supports to maintain it normally in said position, said cap being hinged or pivoted thereto, so as to tilt downward one side and upward the other side of the fence, and slightly overbalanced for automatically returning to the normal position, substantially as described.

2. The combination, with a fence, of a tilting cap or top hinged or pivoted thereto and stops to maintain it normally in the horizontal position, said cap being slightly overbalanced and also having stops to limit the tilting action for automatically returning to the horizontal position, and said cap or top being constructed with an upwardly-projecting flange or angle-plate on the upwardly-tilting side, substantially as described.

399,618. METHOD OF EXTRACTING BUTTER-FAT FROM MILK. CARL A. JOHANSSON, Stockholm, Sweden. Filed Mar. 22, 1887. Serial No. 231,946. (No model.) Patented in England Mar. 15, 1888, No. 3,994.

Claim.—1. The improvement in the art of obtaining butter-fat from milk, which consists in subjecting the milk to centrifugal action in a rapidly-revolving drum and simultaneously therewith separating

399,618.



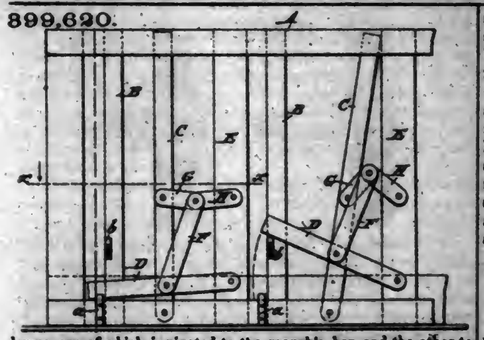
the particles of the inner layer of the mass, as set forth, whereby the blue milk within said layer is set free and is driven off by centrifugal force and the butter globules are allowed to coalesce.

2. The improvement in the art of obtaining butter-fat from milk, which consists in subjecting the milk to centrifugal action in a rapidly-revolving drum and simultaneously therewith separating the particles of the inner layer of the mass, as set forth, whereby the blue milk within such layer is set free and is driven off by centrifugal force and the butter globules are allowed to coalesce, continuously removing the blue milk and also continuously removing the butter as it sinks by gravity, substantially as specified.

3. The improvement in the art of obtaining butter-fat from milk, which consists in continuously feeding the milk into a rapidly-revolving drum in which it is submitted to centrifugal action, separating the particles of the inner layer of the mass within such drum, whereby the blue milk in such layer is set free and is driven off by centrifugal force and the butter globules are allowed to coalesce and sink by gravity, and continuously removing the blue milk and also continuously removing the butter from the drum, substantially as specified.

399,619. GATE. SAMUEL W. KEASLING, Rockwell, Ind. Filed Nov. 22, 1888. Serial No. 291,523. (No model.)

Claim.—1. The combination of the rigid frame-work, the pivoted bars, and the flexible connection fastened to the bars, whereby the bars are supported in a horizontal position, but are left free to move upward, substantially as described.



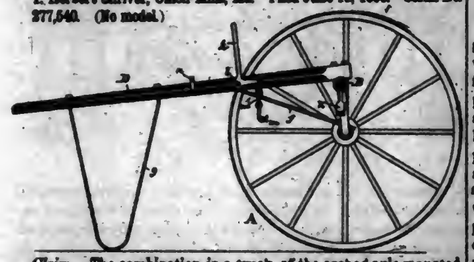
2. The combination of the rigid frame, the bars pivoted therein at one end, the lifting-rod connected to the lower bar, the operating-lever, and a device for locking the lever in position, substantially as set forth.

3. The combination of the rigid frame, the bars pivoted thereon at one end, the lifting-rod, the operating-lever, and the flexible connection for supporting the bars in a horizontal position, substantially as specified.

399,620. CATTLE-STANCHION. DAVID LANE, Hayt's Corners, N. Y. Filed Oct. 8, 1888. Serial No. 287,405. (No model.)

Claim.—1. In a self-fastening cattle-stanchion, the combination of the fixed stanchion-bar, the movable stanchion-bar pivoted at its lower end, the horizontal lever located transversely to said bars and in a position to be acted upon by the animal, the interpivoted short

399,620.



levers, one of which is pivoted to the movable bar and the other to the stationary frame, and the connecting-rod between the interpivoted levers and the horizontal lever, all arranged substantially as described.

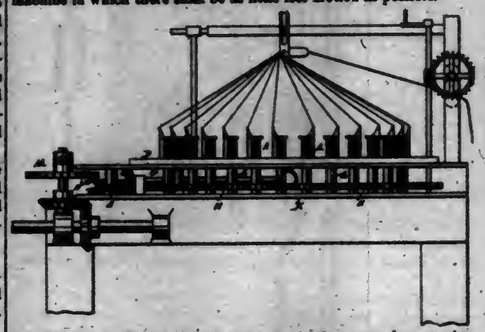
2. In a self-fastening cattle-stanchion, the combination of the stationary post B, pivoted bar C, the lever D, located transversely to bars B and C, the interpivoted short levers G H, one of which is pivoted to the bar C and the other to the stationary frame, and the connecting-rod F between the interpivoted levers and the lever D, all arranged substantially as described.

3. The combination of the stationary bar B, having a lug *b*, the pivoted bar C, the pivoted lever D, located across the two bars B and C, the short levers G and H, lever F, pivoted at the junction of said levers and to the lever D, and the frame-work A, having the projecting pin *a*, all arranged substantially as described.

399,621. CANNING-HOUSE TRUCK. MARTIN J. LEARY, Westminster, Md., assignor of two-thirds to James Shriver, same place, and T. Herbert Shriver, Union Mills, Md. Filed June 19, 1888. Serial No. 277,540. (No model.)

Claim.—The combination, in a truck, of the arched axle mounted upon wheels, the tongue secured thereto, the hooks dependent from and longitudinally adjustable on said axle, the lever having a hook secured at one end, and the catch on the axle, whereby said lever is held when the crate is elevated, substantially as specified.

399,622. HOTEL-REGISTER. ARTHUR D. MACKEY, Lawrence, Kans., assignor to I. R. Mackey. Filed Mar. 26, 1888. Serial No. 268,558. (No model.)

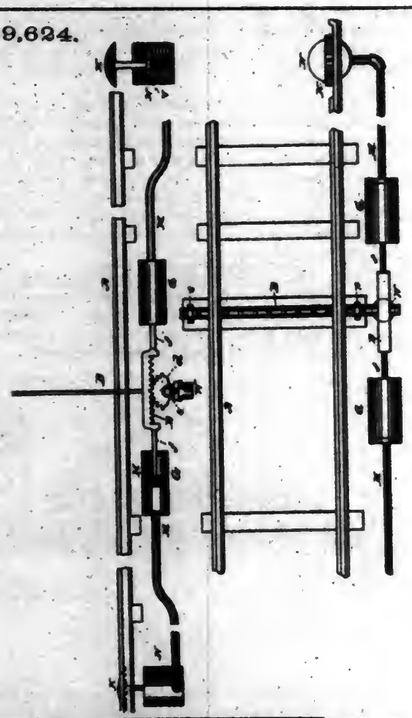


Claim.—1. A hotel-register comprising signature-sheets and blotter-sheets alternately arranged, the pages of the signature-sheets having horizontal printed signature-lines of words, and the spaces between said lines being serially numbered, the pages of the blotter-sheets having spaces formed by horizontal and vertical lines and the spaces serially numbered in duplicate to correspond with the numbered spaces of the signature-pages, all combined substantially as set forth.

2. A hotel-register comprising signature-sheets and blotter-sheets alternately arranged, the pages of the signature-sheets having horizontal printed signature-lines of words, and the spaces between the said lines being serially numbered, the pages of the blotter-sheets having spaces formed by horizontal and vertical lines, and the spaces serially numbered in duplicate to correspond with the numbered spaces of the signature-pages, the said signature-sheets and blotter-sheets being arranged in reverse order to each other, and combined as set forth, and for the purpose specified.

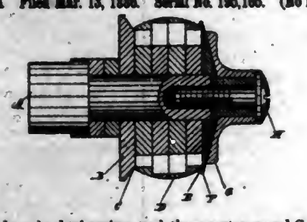
399,623. BRAIDING-MACHINE. WILHELM MUNDT, Brooklyn, assignor of two-thirds to Jacob Habermann and Rinka Ochs, both of New York, N. Y. Filed Aug. 27, 1888. Serial No. 283,260. (No model.)

Brief.—The object of the invention is to provide a braiding-machine in which there shall be as little lost motion as possible.



Claim.—1. The combination of plates having crossed serpentine guide-slots, spool-spindles movable in said guide-slots, wheels for conveying the spindles, a series of engaged cog-wheels disposed in a circle for operating the wheels that convey the spindles, vertical shafts disposed at different points within the circuit of engaged cog-wheels, actuating-gears on said shafts engaging certain of said cog-wheels, beveled gears on said shafts, a diametrical shaft provided with beveled pinions at its opposite ends for engaging two of said beveled wheels and with a beveled pinion near its center, a main actuating radial shaft, as O', provided with a pinion, O, at its outer end, which meshes with the transmitting mechanism of the driving-shaft, and with a pinion, as O^2, at its inner end, which meshes with the central pinion of said diametrical shaft, and an auxiliary actuating radial shaft, as T', provided with a beveled pinion, T, at its inner end, which also meshes with said central pinion of the diametrical shaft, and with a beveled pinion, as T^2, at its outer end, which meshes with one of the beveled gears on one of said vertical shafts, substantially as described.

2. The combination of plates having crossed serpentine guide-slots, spool-spindles movable in said guide-slots, wheels for conveying the spindles, a series of engaged cog-wheels disposed in a circle for operating the wheels that convey the spindles, vertical shafts disposed at different points within the circuit of engaged cog-wheels, actuating-gears on said shafts engaging certain of said cog-wheels, beveled gears on said shafts, a diametrical shaft provided with beveled pinions at its opposite ends for engaging two of said beveled wheels and with beveled pinions near its center, a main actuating radial shaft, as O', provided with a pinion, O, at its outer end, which meshes with the transmitting mechanism of the driving-shaft, and with a pinion, as O^2, at its inner end, which meshes with one of the central pinions of said diametrical shaft, an auxiliary actuating radial shaft, as T', provided with a beveled pinion, T, at its inner end, which also meshes with said central pinion of the diametrical shaft, and with a beveled pinion, as T^2, at its outer end, which meshes with one of the beveled gears on one of said vertical shafts, and a short shaft, as E', provided at its inner end with a second pinion, E, which meshes with the other central beveled pinion, and at its outer end with a beveled pinion, E^2, which meshes with the beveled gear on another of said vertical shafts, substantially as described.



399,624. RAILROAD-GATE. JAMES W. HERRINGALL, Prairie Creek, Ind., assignor of one-half to Curtis G. Thomas, same place. Filed Dec. 3, 1888. Serial No. 292,496. (No model.)

Claim.—The pivoted railroad-gate having a segment-gear and weight secured to its pivotal portion, in combination with a reciprocating rack, a piston-rod and piston attached to the rack, a horizontal air-cylinder, an upright air-cylinder, pistons, and pressure-head rising above the track, and an air-pipe connecting the horizontal and upright cylinders, substantially as specified.

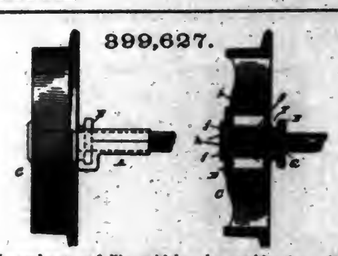
399,624.

399,625. TOOL FOR TRIMMING HEELS. OSCAR L. NOBLE, Boston, Mass. Filed Mar. 13, 1886. Serial No. 195,165. (No model.)

Claim.—In a heel-trimming tool, the counter-guard G and rand-guide F, in combination with the cutter D, the counter-guard and the rand-guide being in separate pieces and the counter-guard being loosely mounted on its journal, substantially as and for the purpose set forth.

399,626. WASHING-FLUID. SAMUEL L. PARAMORE, St. Louis, Mo., assignor to the Tower Manufacturing Company, same place. Filed Sept. 17, 1888. Serial No. 285,595. (Specimens.)

Claim.—1. A washing-liquid composed of an extract of black snakeroot, gentian root, bloodroot, Virginia snakeroot, ginseng, slippery-elm bark, Indian corn and oats, and a solution of common salt substantially in accordance with the formula as described.

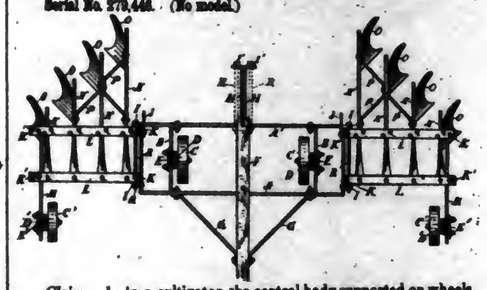


2. A washing-liquid composed of an extract of the following ingredients in about the following proportions: one pound of black snakeroot, one pound of gentian root, one pound of bloodroot, one pound of Virginia snakeroot, half a pound of ginseng, half a pound of slippery-elm bark, six pounds of Indian corn, three and a half pounds of oats, and half a pound of common salt in solution, substantially in accordance with the formula as described.

399,627. AXLE-LUBRICATOR FOR CARS. GEORGE W. PARKER, Terre Haute, Ind. Filed May 8, 1888. Serial No. 273,305. (No model.)

Claim.—1. In coal-cars and like vehicles, an axle-clamp or journal-bearing having at one end a raised collar and a groove, and provided with a central longitudinal opening and a lubricating-chamber, substantially as described.

2. In coal-cars or like vehicles, a wheel constructed with a central opening surrounded by a continuous oil chamber or reservoir communicating with such opening through outwardly-inclined apertures, the said wheel having the inner end of its hub constructed with a raised collar and continuous groove, substantially as described.



399,627.

3. In coal-cars and like vehicles, the combination, with an axle-clamp or journal-bearing constructed at one end with a raised collar and a groove and secured to the under side of the vehicle, of a wheel having the inner end of its hub constructed with a corresponding collar and groove, the collars and grooves of the two being adapted to fit each other, substantially in the manner shown and described.

4. In coal-cars and like vehicles, the combination, with an axle-clamp or journal-bearing constructed at one end with a collar and groove, of an axle having spiral grooves on opposite sides of its journal tending in an opposite direction to each other, and a wheel having a central opening for the journal surrounded by a continuous oil chamber or reservoir communicating with such opening through suitable apertures, the said wheel having the inner end of its hub constructed with a collar and groove corresponding to the clamp, substantially as described.

399,628. CULTIVATOR. JOSEPH A. PEARCE, Grand Rapids, Mich., assignor of one-half to Milo B. Stewart, same place. Filed July 9, 1888. Serial No. 279,442. (No model.)

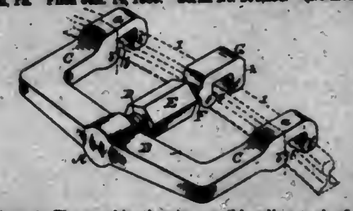
Claim.—1. In a cultivator, the central body supported on wheels, in combination with wings hinged to either side of said body, and supporting-wheels for said wings placed in front of the cultivator-teeth and within the space covered by the cultivator, substantially as described.

2. In a cultivator, the central body, in combination with detachable wings, one on each side, said body provided with lugs and bolts for attaching the wings to said body, said wings adapted to be attached to the extreme outside of the body when cultivating at a distance from the center line of the body, and to be attached to the rear of the body in order to cultivate the space passed over by said central body, substantially as described.

3. The combination, with the body provided with the extremes H H and lugs I I and I' I', of the wings bearing the teeth O O O, &c., and provided with bolt-holes K K and K' K' and the bolts R R, said wings adapted to be attached to either side of the body at points most distant from the tongue and to the projections H H, substantially as described.

399,629. POLISHING-CYLINDER. JAMES L. PERRY, Watertown, assignor to the Berlin Machine Works, Beloit, Wis. Filed Oct. 25, 1887. Serial No. 253,304. (No model.)

Claim.—1. A polishing-cylinder having longitudinal concavities in its circumference, a series of radial arms that have their outer ends passed through the periphery of the cylinder to extend beyond said concavities, clamping-rods connected to said outer ends of the arms, and suitable means for actuating said arms to bring the clamping-rods in and out of contact with the polishing material on said cylinder, substantially as set forth.



2. A polishing-cylinder having longitudinal concavities in its circumference, a shaft for the cylinder, radial arms eccentrically connected to the shaft, and having their outer ends passed through said cylinder to extend beyond the concavities therein, clamping-rods arranged on said ends of the arms, and suitable means for holding the cylinder stationary and actuating the shaft to bring the clamping-rods in or out of contact with the polishing material on said cylinder, substantially as set forth.

3. A polishing-cylinder having longitudinal concavities in its circumference, a shaft for the cylinder provided with a series of lugs, a series of radial arms having slotted inner ends arranged on the shaft and provided with grooves or sockets to engage the lugs thereon, the outer ends of said arms passed through the cylinder to extend beyond the concavities therein, clamping-rods arranged on said outer ends of the arms, and suitable means for holding the cylinder stationary and actuating the shaft to bring the clamping-rods in or out of contact with the polishing material on said cylinder, substantially as set forth.

4. A polishing-cylinder, a shaft for the cylinder, ratchet-wheels fast on the shaft, pawls pivoted to the adjacent heads of the cylinder to normally engage the ratchet-wheels, and a pivotal rod passed through said cylinder, and provided with lugs or buttons that come under against the pawls, substantially as set forth.

5. A polishing-cylinder having longitudinal concavities in its circumference, a shaft for the cylinder, ratchet-wheels fast on the shaft, pawls pivoted to the adjacent heads of the cylinder to normally engage the ratchet-wheels, a pivotal rod passed through the cylinder and provided with lugs or buttons that come under against the pawls, a series of radial arms eccentrically connected to the shaft, and having their outer ends passed through the cylinder to extend beyond the concavities therein, clamping-rods arranged on these outer ends of the arms, and suitable means for holding said cylinder stationary and actuating the shaft, substantially as set forth.

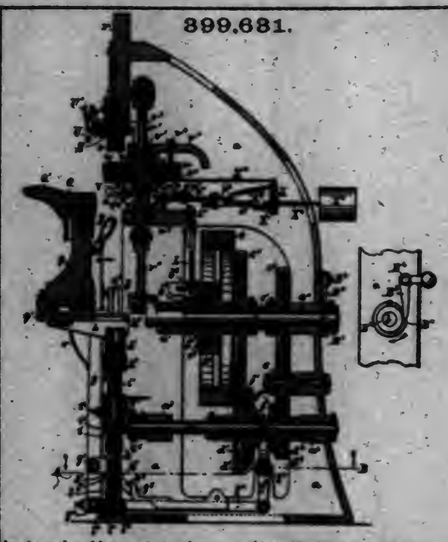
399,630. RAIL-BENDING TOOL. WILLIAM H. PHILLIPS, Jonkintown, Pa. Filed Jan. 14, 1889. Serial No. 296,256. (No model.)

Claim.—1. The combination, in a rail-bending tool, of a beam having arms for engaging the rail, a bending-head also engaging the rail, and a nut interposed between the beam and bending-head, and engaging with portions of both, substantially as described.

2. The combination, in a rail-bending tool, of the beam B, arms C C, having recesses *b* for the rails, and a screw-threaded stud, D, on said beam, with a head, G, recessed for the reception of the rail, and having a screw-threaded stem, F, and a nut adapted to the threads on stud D and stem F, substantially as described.

3. The combination, in a rail-bending tool, of the beam B, arms C C, and head G, with a stem, F, a stud, D, on said beam, a screw-threaded nut adapted to said stud D and stem F, a flattened portion, *c*, on the beam, and a flattened portion, *h*, on the head, so that the tool can be formed into a jack, substantially as described.

399,631. HEEL-NAILING MACHINE. JOSEPH H. POPE, Brockton, Mass., assignor to the American Heeling Machine Company, same place. Filed Nov. 7, 1888. Serial No. 290,179. (No model.)



Claim.—1. In a heeling-machine, the cam or eccentric *k' k''*, arranged between the pressure-screw-supporting block *k* and the step *l*, and having the lever or projection k^3, in combination with the lever *g* and the link *g''*, connected to the friction-clutch lever g^5, and provided with the tooth or projection g^6, substantially as and for the purpose set forth.

2. In a heeling-machine, the vertically-movable jack-support *h* and the spring-pressed pawl *n*, pivoted on said jack-support or an extension thereon, in combination with the jack-operating lever *g* and the adjustable latch *m*, secured to said lever, substantially as and for the purpose set forth.

3. In a heeling-machine, the nail-die holder *v*, having the horizontal grooves v^6 v^6, and the detachable nail-die *w*, inserted in said holder, in combination with the spring-pressed fastening-pins w^6 w^6, arranged in the die-holder and adapted to lock the nail-die to said holder, as specified.

4. In a heeling-machine, the expansive spring-actuated boot or shoe centering jaws *x x*, pivoted and geared together as described, combined with a yoke, X, to which the supporting-bar of said jaws is pivoted, said yoke being hung on fulcra X' X', as described, for the purpose of longitudinally adjusting said jaws relative to the nail-die when the top lift is being spanked, substantially in a manner as set forth and described.

399,681.

5. In a heeling-machine, a pair of spring-pressed expansive boot or shoe centering jaws, *x x*, pivoted in their rear ends to the supporting-bar, said bar being hung on fulcra x^{10} x^{10} in the pivoted yoke X, in combination with the balance-weight X^2, substantially as and for the purpose set forth.

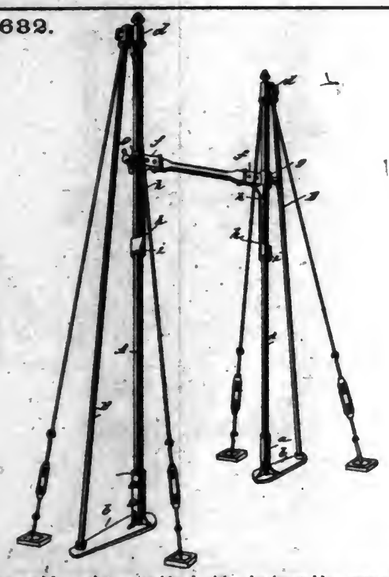
6. In a heeling-machine, the expansive spring-pressed boot or shoe centering jaws *x x*, pivoted in their rear ends to the support x', in combination with the pivoted bar x^2, and the adjusting-screw x^3 and thumb-nut x^4, arranged on the parts x' x^4, as described, for the purpose of adjusting the said jaws *x x* in a longitudinal direction relative to the nail-die, substantially as set forth and described.

7. In a heeling-machine, the starting-lever R, connected to a clutch mechanism for actuating the plunger *r*, combined with a pivoted safety-lever, R^2, connected to the starting-lever R, as described, and having a tooth or projection, R^7, adapted to enter recesses in the awl or driver block shipper-bar U, for the purpose of preventing the plunger being actuated until the awls or drivers are placed in their proper positions relative to the nail-die, as set forth.

8. In a heeling-machine, the loose driving-pulley *c*, having recessed hub c^4 and one or more stop projections, c^5, and a hub, b', secured to the plunger-actuating shaft *b*, and having the spring-pressed pawl b^3, mounted on the pin b^4, combined with the rocking plate L, connected to the starting-lever R, and having in its lower end the inclined projection L^4 and stop screw or projection L^5, substantially as and for the purpose set forth.

9. In a heeling-machine, the nail-die holder *v*, mounted on the sleeve *v'*, combined with the regulating-screw v^4 and adjustable rest-screws v^5 v^5, and the lateral regulating and fastening screws v^6 v^6, substantially as and for the purpose set forth.

10. In a heeling-machine, the driving-shaft *b* and the pulley *c*, loosely journaled and having clutch mechanism for connecting said parts together, combined with a weighted pawl, B^2, and a toothed hub, B', secured to the driving-shaft *b*, substantially as and for the purpose set forth.



11. In a heeling-machine, the vertically-adjustable jack-support *h* and screw-shaft *i i'* and gear i^4, connected to a friction-clutch reversing mechanism, as described, combined with an adjustable post or bar, H', secured to said jack-support and adapted to be brought in contact with said gear i^4 when the jack reaches its lowest position, substantially as and for the purpose set forth.

399,632. EXERCISING APPARATUS. ROBERT REACH, Philadelphia, Pa. Filed June 27, 1888. Serial No. 278,248. (No model.)

Claim.—1. An exercising apparatus consisting of vertical posts A A, a horizontal bar, sockets for receiving the ends of said bars, said sockets having bearings encircling the posts in line with the bar and provided with a second bearing-point at a distance from the first, substantially as described.

2. An exercising apparatus consisting of vertical posts A A, set in sockets in base-plates, cap-pieces for said vertical posts, and supporting-rods extending directly to the rear, fitting in sockets in the

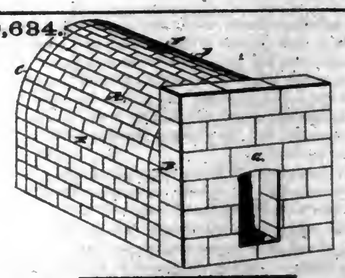
399,682.

cap-pieces and base-plates, combined with a horizontal bar supported on the vertical posts, substantially as described.

399,683. CAR-HEATER. FRANK RUPRECHT, Syracuse, N. Y., and FRANCIS G. BATH, Philadelphia, Pa. Filed May 31, 1888. Serial No. 275,563. (No model.)

Claim.—1. In combination with two sections of a car steam-heater pipe, a valve-case interposed and connected at opposite ends to said sections and valves arranged conversely in relation to each other in the case and held mechanically in closed positions under different degrees of resistance, as set forth.

2. In combination with two sections of a car steam-heater pipe, a valve case interposed and connected at opposite ends to said sections, valves arranged conversely in relation to each other in the case, and springs opposed to the movements of the valves from their seats, as set forth.



3. In combination with the pipe-sections A A', the case C, provided with the pipe attachments *a a'* at the centers of its ends, and having thereat the compartments C C, intervening longitudinal channels *c c*, connecting said compartments at opposite sides of the longitudinal central line of the case, and each provided with a valve-seat reverse from that of the other, valves *v v'*, movable in said channels and closing against the aforesaid seats, and springs *d d*, adjustable in tension and pressing the valves onto their seats, substantially as described and shown.

4. In combination with the pipe-sections A A', the case C, interposed and connected to said pipe-sections, compartments C C in opposite ends of the case, longitudinal channels *c c*, connecting the compartments, reversely-disposed valves *v v'* in said channels, springs *d d*, holding the valves in their closed position, the stop-cock *e*, connected to the pipe-section A', and the telescopic coupling *h* on said pipe-section, substantially as described and shown.

399,684. COKE-OVEN. MICAJAH SANDFORD, Gallitzin, Pa. Filed Dec. 27, 1887. Serial No. 259,115. (No model.)

Claim.—The coke-oven A, constructed of equal-sized large blocks, having a laterally-arched top and a common feed and discharge opening in the middle of said top, and a door, I, in its front, in combination with the heavy stone wall C, rectangular in shape, provided with a door registering with the door I, not leaning on the front of the oven, and with its sides rising flush with the sides of said oven, so that when a number of said ovens are arranged side by side the side edges of said walls will be in contact all the way to the tops, and will support the earth packed between the arched tops of adjacent ovens, for the purpose of laying a railway-track thereon, substantially as specified.

399,684.

399,685. TELEPHONE-LINE CABLE. GEORGE F. SHAVER, New York, N. Y., assignor to the Shaver Corporation, same place. Filed July 5, 1888. Serial No. 278,053. (No model.)

Claim.—1. The combination of a diaphragm of a telephonic instrument with one or more metallic wires connected thereto, which wire or wires are wound around, inclosed, or are impacted upon a fibrous core, as above described.

2. The combination of a diaphragm of a telephonic instrument with one or more metallic wires connected thereto, which wire or wires are wound around, inclosed, or are impacted upon a fibrous core saturated with a water-repellent viscid material, as above described.

399,686. BELT-PULLEY. JOHN A. J. SHULTZ, St. Louis, Mo., assignor to Bruce C. Alvord, same place. Filed Oct. 13, 1888. Serial No. 288,022. (No model.)

Claim.—1. A pulley provided with a facing, said facing being wider than the pulley-rim and having its side edges confined in the sides, respectively, of the rim, substantially as described.

2. A pulley provided with a facing, said facing being wider than the pulley-rim and having its side edges confined in grooves, respectively, in the sides of the pulley-rim, substantially as described.

3. A pulley provided with a facing, said facing being wider than the pulley-rim and having its side edges folded and confined in grooves in the sides, respectively, of the sides of the pulley-rim, substantially as described.

4. A pulley provided with a facing, said facing being wider than the pulley-rim and having its side edges folded and wedged in grooves in the sides, respectively, of the pulley-rim, substantially as described.

5. A pulley provided with a facing, said facing being wider than the pulley-rim and having its side edges confined in the sides, respectively, of the rim, and its ends united by means of the fastenings and plates, substantially as described.

6. A pulley or wheel provided with a facing, said facing being wider than the face of the pulley or wheel, and having its side edges secured to the sides, respectively, of said face, substantially as described.

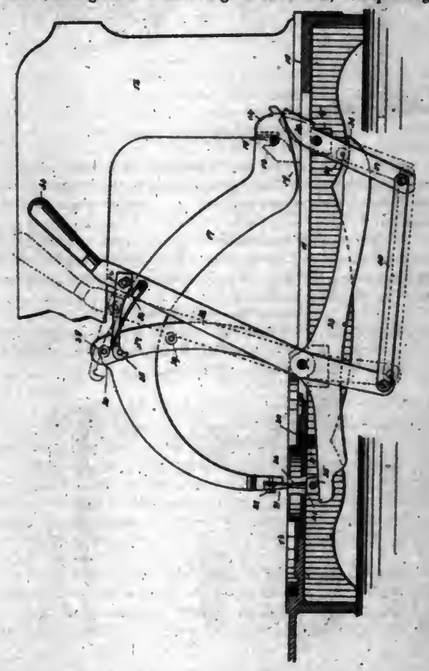
399,687. APPARATUS FOR MANUFACTURING SEAMLESS DRESS-SHIELDS. FRIEND W. SMITH, Jr., Bridgeport, Conn. Filed Oct 15, 1888. Serial No. 288,074. (No model.)

Claim.—1. The combination, with the former having slots which extead in the direction of the line of stretching and provided with stretching-pins within said slots, of the bed-plate upon which said former is supported, a pair of leaves provided with gouge-slots and hinged to said plate on opposite sides of said former, and means for folding said leaves closely to said former, substantially as set forth.

2. The combination of the form to which the shield is stretched, having stretching devices adapted to be operated through guide-slots in said form, a bed-plate having a central transverse rib, a pair of hollow leaves having slots corresponding with the aforesaid slots, said leaves hinged to said rib at the ends thereof and provided with steam inlet and outlet pipes, and means for folding said leaves closely to said form, substantially as set forth.

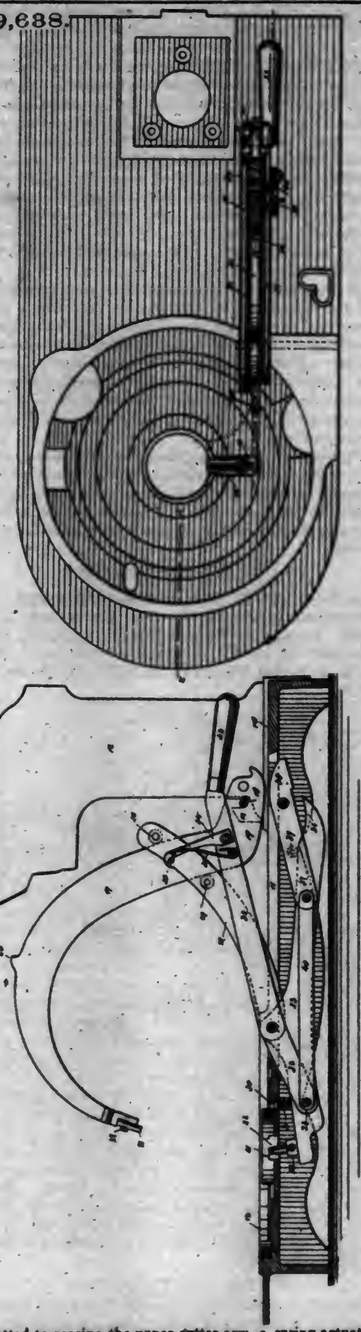
3. The combination of the bed-plate E, having transverse rib G and mounted upon any suitable table, F, the post K, projecting upward from said table and having stop-pin 13, the plates A C, having ears 11 12 extending laterally therefrom and pivoted to the post K, and the lug 14, extending from the plate A, substantially as set forth.

399,687.



4. The combination, with the plates A C, having slots 2 extending in the direction of the line of stretching, and the plate B, having cam-slots 4 extending athwart the slots 2, said plates having a common pivotal point, stretching devices projecting through said slots 2 4, the bed-plate which supports said former and to which the latter is pivoted, and the leaves H, hinged to said plate and having slots 10, which register with the slots 2 when said leaves are folded against the plates A C, whereby the fabric is automatically attached to the stretching devices and the movements of the latter rendered perfectly free within said leaves, substantially as shown, and for the purpose set forth.

399,688. BUTTON-HOLE-CUTTING ATTACHMENT FOR SEWING-MACHINES. RUDOLPH SPAHN, Brooklyn, N. Y. Filed Oct. 22, 1888. Serial No. 288,747. (No model.)

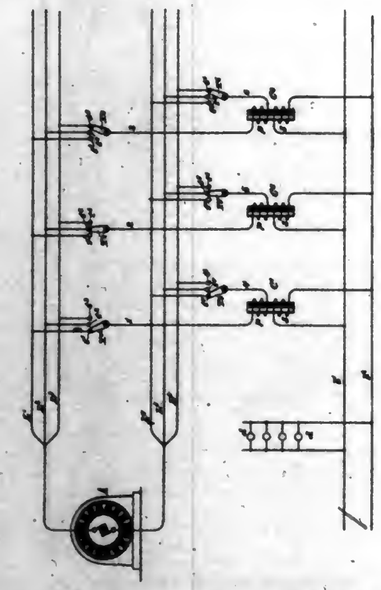


Claim.—1. The combination, with the bed of a sewing-machine and a curved cutter-arm fulcrumed at one end upon the upper face of the bed, of an essentially straight cutter-arm pivoted beneath the bed, said cutter-arms being provided with an anvil and cutter, respectively, a pivotal slotted guide-arm embracing the upper cutter-arm, a compressing-arm, a trip-lever engaging the upper and lower cutting-arms, and a link connecting the compressing-arm and trip-lever, substantially as shown and described.

2. The combination, with the bed of a sewing-machine and a curved cutter-arm fulcrumed at one end upon the upper face of the bed, of an essentially straight cutter-arm pivoted beneath the bed, said cutter-arms being provided with an anvil and cutter, respectively, a pivoted slotted guide-arm embracing the cutter-arm, a compressing-arm slotted to receive the upper cutter-arm, a spring-actuated latch connecting the compressing-arm with the guide-arm, a trip-lever engaging the upper and lower cutter-arms, and links connecting the compressing-arm and trip-lever, substantially as and for the purpose specified.

3. The combination, with the bed of a sewing-machine, a curved cutter-arm fulcrumed upon the upper face of the bed, provided with an essentially straight heel, and a pivoted slotted arm embracing the upper cutter-arm, of an essentially straight spring-actuated cutter-arm pivoted beneath the bed, said cutter-arms being provided with an anvil and cutter, respectively, parallel therewith, a compressing-arm slotted to receive the guide-arm and upper cutting-arm, a trip-lever provided

399,688.



with a finger and friction-roller engaging, respectively, with the upper and lower cutting-arms, and a link-connection between the compressing-arm and trip-lever, substantially as shown and described.

4. The combination, with the bed of a sewing-machine, a curved cutter-arm fulcrumed upon the upper face of the bed, provided with an essentially straight heel and a stop upon the upper edge, and a guide-arm embracing the cutter-arm, provided with spaced friction-rollers, of an essentially straight cutting-arm pivoted beneath the bed, said cutter-arms being provided with an anvil and cutter, respectively, a reciprocating compressing-arm slotted to receive the guide-arm and upper cutter-arm, a spring-actuated latch pivoted to the compressing-arm, engaging with the guide-arm, a trip-lever provided with a finger and friction-roller engaging, respectively, with the upper and lower cutter-arms, and links connecting the compressing-arm and trip-lever, substantially as shown and described.

5. The combination, with the bed-plate of a sewing-machine and a curved arm fulcrumed at one end upon the upper face of the bed, of an essentially straight arm pivoted below the bed, a detachable anvil-block attached to the upper arm, a detachable cutter secured to the lower arm, a pivoted slotted guide-arm embracing the upper curved arm, and a reciprocating arm embracing the guide-arm and upper arm, a trip-lever, and a link-connection between the trip-lever and the compressing-arm, all combined to operate substantially as and for the purpose specified.

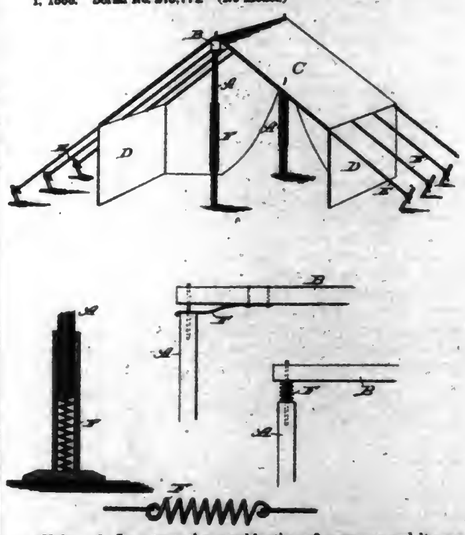
6. The combination, with an upper cutter-arm and a lower cutter-arm provided, respectively, with an anvil and cutter, of a guide-arm engaging the upper cutter-arm, a compression-arm having a latch at its upper end detachably engaging the guide-arm, and a time trip-lever engaging the said cutter-arms, substantially as and in the manner set forth.

399,639. SYSTEM OF ELECTRICAL DISTRIBUTION. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed Nov. 23, 1886. Serial No. 219,639. (No model.) Patented in England July 12, 1887, No. 9,739; in Germany July 12, 1887, No. 43,129; in France July 12, 1887, No. 184,742; in Belgium July 12, 1887, No. 78,173, and in Canada Nov. 10, 1887, No. 27,975.

Claim.—1. The combination, with a source of electricity, of multiple conductors extending from the respective poles, a series of converters having their primary coils respectively connected with different pairs of said conductors, and a single pair of distributing-conductors with which the secondary coils are connected in multiple arc.

2. The combination, with a source of electricity, of two or more conductors leading from the respective poles thereof, two or more converters having their primary coils respectively connected with different pairs of conductors thus formed, and translating devices connected in multiple arc with the several secondary coils of said converters.

3. The combination, with an alternate-current electric generator, of two or more main lines extending from each pole, translating devices, distributing-conductors with which said devices are connected, and means for supplying currents to said distributing-conductors from the different pairs of main lines.



4. The combination of a source of alternating electric currents, a series of main lines extending from each pole thereof, a series of converters, conductors including the respective primary coils of the same, switches applied to one terminal of each of said conductors, and contact-points applied to each switch connected with the respective main lines leading from one pole of the source.

5. The combination of a source of alternating electric currents, a series of main lines extending from one pole thereof, a series of converters, conductors leading from said main lines and including the respective primary coils of the same, switches applied to one terminal of each of said conductors, and contact-points applied to each switch connected with the respective main lines and connections from the remaining terminals of said conductors with the remaining pole of said source.

6. The combination, with the primary coil of an electric converter, of pairs of supply-conductors, means for supplying currents of electricity thereto, and a circuit-controller through which connections with the different pairs of conductors are secured.

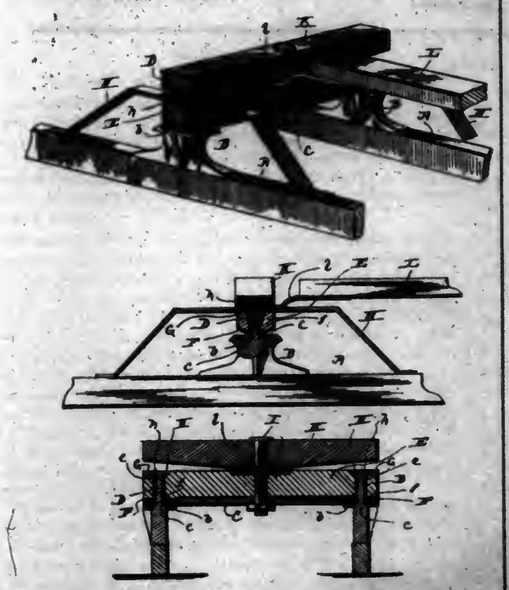
7. The combination, with the primary circuit of an electric converter, of multiple mains and circuit-controlling devices for connecting any pair of said mains to said primary circuit.

399,640. TENT. ALVINUS B. WOOD, Ann Arbor, Mich. Filed June 1, 1888. Serial No. 275,774. (No model.)

Claim.—1. In a tent, the combination of a canvas and its supporting-post provided with a spring which permits the post to lengthen or shorten as the canvas contracts or expands, substantially as described.

2. In a tent, the combination of a ridge-pole, upright posts supporting the same, and springs placed in or upon such posts, whereby the ridge-pole is raised or lowered as the tent-canvas expands or contracts, substantially as described.

399,641. TOOL-HANDLE. JOHN H. WUNDER, Lancaster, Pa., assignor to E. F. Bowman and W. B. Musser, same place. Filed Oct. 22, 1888. Serial No. 288,811. (No model.)



Claim.—1. A tapering tool-handle which is provided with a longitudinal groove in one of its sides, in combination with a tool-shank bent inward at its rear end but extending laterally out from said groove, and a movable sleeve fitting on said handle in contact with said shank to hold the latter in place, substantially as set forth.

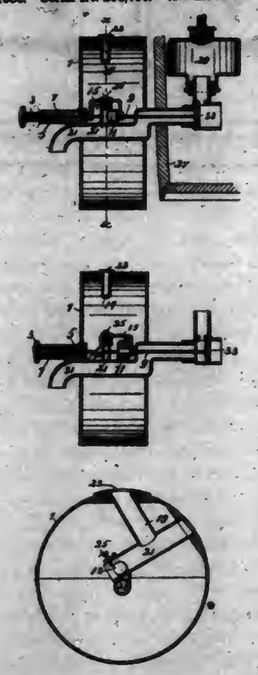
2. A tool-handle having a longitudinal groove which ends before reaching the upper end of said handle, in combination with a tool-shank bent inward at its upper end and set into said groove, and a removable sleeve which fits on said handle in contact with said stem to bind the latter in place, substantially as set forth.

3. A tapering longitudinally-slotted sleeve, in combination with a tool-shank and a tool-handle having a tapering stem which is provided with a longitudinal groove to receive said tool-shank, the groove and slot corresponding in position, and the side of the tool-shank extending into said slot, substantially as set forth.

399,642. SLEIGH-KNEE. EDWIN J. YOUNGS, Flint, Mich., assignor to the Castres Mallory Company, same place. Filed Oct. 16, 1888. Serial No. 288,208. (No model.)

Claim.—1. In a bob-sleigh, the combination, with the standards secured to the runners at opposite points, of the torsion-plate connected at its ends to the standards, and the bolster swiveled at its center to the torsion-plate, whereby the runners are allowed free oscillating movement independent of each other and of the bolster, substantially as and for the purpose specified.

2. In a bob-sleigh, the combination, with the standards attached to the runners, of the torsion-plate connecting the upper ends of the said standards, and the beam provided on its under side with convex plates bearing on the torsion-plate and secured in position by vertical pins, substantially as specified.



3. In a bob-sleigh, the combination, with the standards affixed to the runners and provided at their upper ends with vertical pins D, of the torsion-plate connecting the upper ends of the standards and provided with apertures fitting over the said pins, the beam provided with tapered openings or slots fitting the pins, and the convex plates on the under side of the beam bearing on the torsion-plate, substantially as specified.

4. In a bob-sleigh, the combination of the runners, the standards secured to the runners and provided with the transverse channels *b* in their upper ends, the torsion-plate affixed at its ends in the said channels, the pins D rigid with the standards and passing vertically through the said torsion-plate, the beam provided with openings fitting over the pins and having convex plates bearing on the torsion-plate, and the braces secured at their ends to the runners and passing at intermediate points through transverse grooves in the upper side of the beam, substantially as specified.

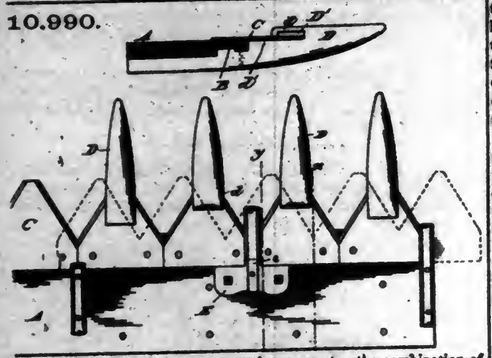
5. In a bob-sleigh, the runners having the standards, the pins D, extending upward from and rigid with the standards, the torsion-plate T, extending across and connecting the standards, the beam E, rounded on the under side and bearing at said rounded side on the torsion-plate, the tapered openings in the beam through which openings the pins D pass, and the braces H, connected with the runners and passing over the top of the beam and receiving the upper end of the pins D, as set forth.

6. In a bob-sleigh, the runners having the standards, the torsion-plate T, extending across and connecting the standards, and the beam E, rounded on the under side and bearing at said rounded side on the torsion-plate, substantially as set forth.

399,643. AUTOMATIC COIN-OPERATED DEVICE. BARTON S. MOLYNEUX, Minneapolis, Minn., assignor, by direct and mesne assignments, to the National Water Supply Company, of Minnesota. Filed Nov. 24, 1888. Serial No. 291,700. (No model.)

Claim.—1. In a device of the class described, the combination, with the plunger 3, having the spring 5 and the stop 17, of the rod 9, having the yoke 15, and the seat 11, adapted to receive and support a suitable coin interposed between it and the plunger, by means of which motion is transmitted from said plunger to said rod 9, substantially as described.

2. In a device of the class described, the combination, with a suitable support or case, 1, having a suitable coin-conduit fitted with a suitable stop, 25, of the plunger 3, the yoke 15, and the seat 11, adapted to receive and support a suitable coin interposed between it and the plunger, substantially as described.



3. The combination, with the reservoir and the receiving-chamber, of the valve arranged to control the flow of liquid from said receiving-chamber, the valve-rod provided with a seat having a cavity therein, a plunger provided with a stem adapted to enter the cavity in said seat, a coin-conduit arranged to conduct a coin to a position between said plunger and said seat; and a stop arranged to arrest said coin in such position, substantially as described.

REISSUES.

10,990. ATTACHMENT FOR MOWING-MACHINES. WILLIAM S. FOX, Short Creek, Ohio. Filed Mar. 15, 1883. Serial No. 267,266. Original No. 350,351, dated Mar. 15, 1887.

10,990.

Claim.—1. In a harvester cutting apparatus, the combination of the cutters, the guard-fingers D, having the rear ends of their overhanging portions *d* turned down and bearing upon the cutters near their front ends, and the keepers E intermediate the guard-fingers fixed to the finger-bar and having their front ends extended, turned down, overhanging, and bearing upon the cutters near their front ends, and a portion bearing upon their rear edges, substantially as and for the purposes set forth.

2. In a harvester cutting apparatus having the usual form of finger-bar A, cutter-bar B, and cutters C, the keepers E intermediate the guard-fingers attached to the finger-bar and having their front ends extended, turned down, and bearing upon the cutters near their front ends, and a portion, *e*, bearing upon said cutters on their rear edges, as and for the purposes set forth.

3. In a harvester cutting apparatus, the combination of the cutters, the guard-fingers D, having their overhanging portions *d* turned down and bearing upon the cutters near their front ends, and the keepers E intermediate the guard-fingers, attached to the finger-bar and bearing upon the cutters near their front ends, to prevent vertical vibration of the front ends of the cutters, substantially as shown and specified.

PHOTO LITH NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE CARTER.

Decided March 1, 1889.

STATEMENT.

One of the claims in this application has been rejected because it covers an illegitimate combination or an aggregation of elements. Applicant appealed from such rejection to the Examiners-in-Chief. The Board refused to take jurisdiction of the appeal and remanded the case to the Primary Examiner for reconsideration and such action as would dispose of the merits of all the claims. The examiner has referred the case to the Commissioner for instructions.

1. Whenever a claim for an illegitimate combination is presented in an application which also contains claims for different elements constituting distinct and separate inventions which ought not to be claimed in the same application, a vital objection as to form is presented, and the claim may be rejected for the purpose of enabling the Office to require division. Such a rejection, though relating to form, involves merits, and an appeal therefrom should lie to the Examiners-in-Chief.
2. Division must be required for two reasons: *first*, because the distinct subjects of invention ought not to be embraced in one application; *second*, because the applicant has not the right by aggregating claims to any number of distinct inventions under a false claim to a combination to force the Office to examine and act upon his several inventions.
3. There is no rule or requirement that an appeal which, though made because relating to form, involves the absolute merits of a claim shall be taken to the Commissioner merely to save applicant the appeal fee. If applicant be put to the trouble and expense of a second appeal after the requirement of division has been complied with and the application has reached the stage for full consideration upon its entire merits, the fault is with applicant who has presented his application under such conditions rather than due to the Office or its practice.

REFERENCE.

BRICK-MOLDS.

Application of Edward B. Carter filed April 19, 1888, No. 271,127.

Messrs. C. A. Snow & Co. for the applicant.

HALL, *Commissioner:*

In this case the examiner advises the Commissioner that the claims were objected to on the ground that they embraced aggregations and not legitimate combinations. Relying upon *ex parte Gillette*, (44 O. G., 819,) he refused to enter upon a consideration of the merits of the claims until the question of form was settled. The examiner evidently held that the alleged illegal combination as presented in the claims raised a question of form. In due time applicant appealed to the Examiners-in-Chief. Such tribunal refused to assume jurisdiction and give consideration to the appeal, and remanded the application to the Primary Examiner for further action, which would dispose of the merits of the whole case. The examiner thereupon referred the matter to the Commissioner for instructions.

I shall not look into the case to determine whether the status involved is one in which the illegitimacy of combination can be said to raise a preliminary question as to form, but will content myself with pointing out the conditions under which that question arises.

The question of legitimacy of combination is necessarily one involving merits. It may, however, present itself in such a way as to constitute one of form also. Thus in an application where appears a claim for a combination between three elements, A, B, and C, and no other claim is made to either of the elements, no question can arise as to form. A decision on the merits of the combination claim can be made at once, thus disposing of the entire application. As contradistinguished from such a case, take one wherein the elements A, B, and C are distinct and separate subjects of invention—one for a governor of an engine, another for a hoisting apparatus, and a third for a lifting jack. The application contains a claim for a combination between the three elements, and also broad and specific claims for the three distinct subjects or elements, respectively. It is apparent at a glance that the claim is for an illegitimate combination, and that the remaining claims are for such subjects which prevent their being prosecuted in the same application. Division must be required for two reasons: *first*, because the three distinct subjects of invention ought not to be embraced in one application or secured in one set of Letters Patent; *second*, because the applicant has not the right, by aggregating claims to any number of distinct inventions under a false claim to a combination, to force the Office to examine and act upon his several inventions. The practice and the rules recognize and provide for the requirement of division, and this supposititious case is one in which such requirement should be made. Here is presented a case where one of two things must occur—either the illegitimate claim must be disposed of preliminarily, so that a division may be required between the remaining claims, or else the whole application must be examined upon its merits. The Office must be put to the trouble of examining as many inventions as may be presented under an illegitimate combination claim for one fee, when separate applications covering them should be filed and separate fees paid, and the question of division must await the whole procedure, to be determined after final action on the merits and appeals, or be waived altogether.

It has always been and is the settled practice that these preliminary questions, such as division, must be disposed of before the merits are considered. No one

proposes to change such practice; but how can escape be had if in such case the examiner, finding himself confronted with the illegitimate claim, is compelled to give it consideration with the others and finally reject it? In my judgment, such a claim has a double aspect; it involves merits, because it covers a combination which must be considered and disposed of; there is also presented a question vital to the consideration of the whole application, and in this respect the question must be disposed of before the *proper* claims can be considered and acted upon. Whenever, therefore, a claim for an illegitimate combination is presented in an application, which also contains claims for different elements constituting distinct and separate inventions, which ought not to be claimed in one and the same application, a vital objection as to form is presented, and the claim may be rejected for the very purpose of enabling the Office to require division. In various decisions the Commissioner has held that such a rejection, though relating to form, involves merits, and an appeal therefrom should lie to the Examiners-in-Chief. (*Ex parte Gillette*, 44 O. G., 819; *ex parte Carpenter*, MS. Dec., February 2, 1889; *ex parte Willcox and Borton*, 45 O. G., 455.) It is not to be understood that this rule applies to any other case than the one mentioned. An application might contain claims for an illegal combination without any claims for the elements thereof, but still include other claims for matter in no wise related to the supposed combination. This would be embracing two separate and distinct inventions in a single application. Division would be required. Applicant would elect which invention he would prosecute in the pending application, and if he retained the claim for the improper combination consideration would be given on its merits and the claim rejected. The only distinction between a rejection under such conditions and one in the supposed case is that in the former the action is made for the single purpose of disposing of the whole application on its merits, while in the latter the rejection is for the twofold purpose of removing a vital objection as to form which stands in the way of a requirement of division, and at the same time disposing of the merits of this obstructing claim. In other words, the latter is an instance in which it is impossible to enter at once upon the merits of the whole application and consider all the claims without waiving and foregoing the requirement of division. The obstructing claim stands in a position somewhat analogous to a plea which possesses its own merits in bar or abatement, but which must be disposed of by the court before the actual merits of the contention can be taken up. What shall be done under these circumstances? There can be but two answers: either to require division upon the theory that the claim to the combination is no claim—to ignore it as such—deny the applicant's right to a rejection and appeal to the Examiners-in-Chief and so on to the Supreme Court of the District of Columbia, or else to reject the claim on its merits and thus enable the Office to make the requirement of division. Evidently, to pursue either of these courses is the same in effect and differs only as to the direction an appeal shall take. In either case the claim to the combination is rejected and refused recognition. If the action is *called* a "rejection," the appeal may go to the Examiners-in-Chief; but if it be termed a "requirement for division" the appeal comes direct to the Commissioner. The term applied to the action is immaterial; the merits of the claim are involved, and so long as the distinction is maintained between appeals which go to the Examiners-in-Chief and those which go to the Commissioner it is not only appropriate but proper that the appeal taken from such an action should go to the former tribunal. Formerly all appeals went to the Board, and certainly such a one as this should.

In the present case applicant appealed from the action of the Primary Examiner rejecting the claim. The Board declined to take jurisdiction and remanded the application to the examiner, holding that an appeal did not lie until the examiner had disposed of the entire case—all the claims upon all questions of merits—citing *ex parte Mewes*, (C. D., 1872, 163;) *ex parte Smoot*, (C. D., 1877, 51;) *ex parte Smith*, (MS. Dec., Examiners-in-Chief, 517.) The correctness of the practice announced in such decisions and the pertinency of the authorities are undoubted when applied to a case which has reached such a stage that the consideration of all the merits involved can be entered upon; but until all preliminary vital questions are disposed of such stage cannot be reached. (Rule 64.) Rules 65 and 134 must be construed *in pari materia* with Rule 64, and it must also be remembered that the rules were made for the cases which arise and not the cases for the rules. The spirit and prime purpose of a system of practice must always be kept in mind, and mere details and incidentals subordinated thereto. The case now before me appears to be one not specifically provided for in the rules, and the claim under consideration is one involving a vital question of form and also one of merits, and hence falls partly under the effect of two rules of practice, but wholly within the scope of neither. Under such circumstances the claim must be disposed of in accordance with the general spirit and equity of the practice. The rights of the applicant must also be considered and protected. He should not be required to go to extra expense or pay unnecessary appeal fees; but if he sees proper to present an application with a claim to a combination when he has only an aggregation of inventions which have no place in a single application, and also at the same time makes claims for several separate inventions, he should submit to a proper division. This can only be accomplished by elimination of the claim to the illegal combination, and this in turn can be effected only through a rejection of such claim. If upon such rejection applicant still persists in the claim, his remedy lies in an appeal which must go either to the Examiners-in-Chief or to the Commissioner. Now, is there any rule or requirement that an appeal which, though made because relating to form, involves the absolute merits of the claim shall be taken to the Commissioner rather than to the Board merely to save applicant the appeal fee? I am not aware of any. It is true, undoubtedly, that after the requirement of division has been complied with and the application has reached the stage for full consideration upon its entire merits a rejection of one or all the claims may follow, and the applicant, if he still persists, be put to the trouble and expense of a second appeal. This, however, is due not to the Office or its practice, but to the applicant himself, who has presented his application under such conditions.

The present application is remanded to the examiner, with instructions to determine whether the case is one within the principle herein announced. Is it a case where, in his opinion, the combination claim is illegitimate and stands as an obstruction to the requirement of division between separate inventions which are embraced as elements in the claimed combination? If it be such, he will then reject it upon its merits as constituting a vital objection to the consideration of any proper claims and in order to enable the Office to make the requirement of division between the independent inventions. In making this preliminary rejection the examiner may assign all causes of rejection. It is not probable that any valid references can be found for an illegitimate combination. If it be not such a case, the examiner will proceed in accordance with the suggestions of the Examiners-in-Chief and act upon the whole application.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

ROOT *v.* THIRD AVENUE RAILROAD COMPANY.

Decided February 5, 1889.

1. PUBLIC USE.
   Use of an invention for business purposes or profit and in which the test of its success and value was only incidental will defeat a patent if it occurred more than two years before application.
2. FORMER DECISIONS CONSTRUED.
   Smith & Griggs Manufacturing Co. v. *Sprague* and *City of Elizabeth* v. *Pavement Co.* applied and explained.
3. ROOT—CABLE RAILWAYS.
   Letters Patent No. 262,162, granted August 1, 1882, to Henry Root, for an improvement in the construction of cable railways, declared invalid by reason of public use more than two years prior to application.

Mr. George Harding and *Mr. George J. Harding* for the complainant.

Messrs. Lauterbach & Spingarn, Messrs. Frost & Coe, and *Mr. Harry E. Knight* for the defendant.

WALLACE, *J.*:

The complainant sues for infringement of Letters Patent granted to him August 1, 1882, (No. 262,162,) for an improvement in the construction of cable railroads. His application for the patent was filed September 3, 1881.

The California Street Railroad, a cable railway in the city of San Francisco, was built by the patentee, completed, and went into regular operation prior to April 11, 1878, and as constructed embodied the invention described in the patent in suit. The defendants insist that this is a public use of the patented invention more than two years prior to the patentee's application for his patent, and consequently invalidates the patent. The complainant contends that this was an experimental use of the invention, and that the application was filed within two years after the patentee became satisfied that the invention was a practical success.

It is conceded that the road as built embodied the invention of the patent; that Mr. Root had complete charge of the construction of the road and built it for the projectors, and that it has been operated ever since April, 1878, as built, without any changes or modifications in plan or details. The evidence is, that in the early part of 1876 the projectors obtained a franchise to lay and operate a cable railway in California street, one of the public thoroughfares of the city of San Francisco. In the expectation of being employed as the consulting engineer to build the road, the complainant investigated the subject of cable roads and matured the invention in controversy between May and September, 1876. In September, 1876, he disclosed the invention to the projectors; between that time and January, 1877, made a model of it; and in February, 1877, laid down an experimental section of the cable railway embodying the invention in the yard of the Central Pacific Railway Company in San Francisco. His invention was adopted by the projectors, and work was commenced upon the structure in July, 1877. The road cost, with the equipment, $418,000. It was about two miles in length, and the road-bed and tunnel construction cost about two hundred and twenty-five thousand dollars. From April 9, 1878, the structure has been in regular successful use as a street-railway, carrying passengers for pay. Up to the time when the complainant made application for the patent in suit and until 1883 the complainant was superintendent of the road for the owners.

In explanation of his delay in making the application for patent, the complainant testifies that he did not wish to patent the invention if the structure proved weak or undesirable and he did not feel sufficiently certain of the durability and general practicability until the year 1881; that there was no way but by trial in a public street, through a long period of time, to determine to what extent the moving of cars and the street traffic over a rail connected to iron work without the intervention of any wood would affect the durability of the structure, or to what extent changes of temperature and the effect of water and rust would tend to separate the iron work from the concrete in which it was embedded; and that while he believed there was more than an even chance of its proving a durable and desirable structure he had some doubts in his own mind, and was influenced also by the doubts expressed by others in whose judgment he had confidence. He admits that he never expressed these doubts to the projectors, either while discussing with them the features of his invention, or while the road was being built, or while he remained its superintendent and after it was completed. In answer to a question whether he had any doubts of the durability of the structure after the road was completed, he states that in the spring of 1879, while making an extension of the railway, some parts of the structure were exposed, and he then saw some indications of the loosening of the yokes in the concrete, and "had some little fear at that time" that trouble might arise in that respect.

Manifestly the complainant received a consideration for devising and consenting to the use of an invention which was designed to be a complete, permanent structure, which was to cost a large sum of money,

and which he knew would not meet the expectation of those who had employed him unless it should prove to be in all respects a practically operative and reasonably durable one. If he had entertained any serious doubts of its adequacy for the purpose for which it was intended it would seem that he would not have recommended it in view of the considerable sum it was to cost. At all events, he did not treat it as an experimental thing, but allowed it to be appropriated as a complete and perfect invention, fit to be used practically, and just as it was, until it should wear out or until it should demonstrate it own unsuitableness. He turned it over to the owners without reserving any future control over it, and knowing that except as a subordinate he would not be permitted to make any changes in it by way of experiment, and at the time he had no present expectation of making any material changes in it. He never made or suggested a change in it after it went into use, and never made an examination with a view of seeing whether it was defective or could be improved in any particular.

In *Smith & Griggs Manufacturing Co.* v. *Sprague* (41 O. G., 1037, 123 U. S., 249) it was held that when it is clearly established that there was a public use of the invention by the inventor for more than two years prior to his application for a patent for it the burden is on him to show by convincing proof that the use was not a public use in the sense of the statute, but that it was for the purpose of perfecting an incomplete invention by tests and experiments. And in defining the distinction between a public and an experimental use the Court in that case used the following language:

A use by the inventor for the purpose of testing the machine, in order by experiment to devise additional means for perfecting the success of its operation, is admissible; and where, as an incident to such use, the product of its operation is disposed of by sale, such profit from its use does not change its character, but where its use is mainly for the purpose of trade and profit, and the experiment is merely incidental to that, the principle and not the incident must give character to the use. The thing implied as excepted out of the prohibition of the statute is a use which may be properly characterized as substantially for the purposes of experiment. Where the substantial use is not for that purpose, but is otherwise public, and for more than two years prior to the application, it comes within the prohibition.

Tested by the rule thus stated, the proofs do not show a use substantially for experiment, but show such a public use of the invention as must defeat the patent. The facts are in marked contrast with those in the case of *Elizabeth* v. *Pavement Co.*, (97 U. S., 126.) There the use was solely for experiment. In the language of the opinion in that case—

Nicholson wished to experiment on his pavement. He believed it to be a good thing, but he was not sure, and the only mode in which he could test it was to place a specimen of it in a public roadway. He did this at his own expense, and with the consent of the owners of the road. He wanted to know whether his pavement would stand and whether it would resist decay. Its character for durability could not be ascertained without its being subjected to use for a considerable time. He subjected it to such use in good faith for the simple purpose of ascertaining whether it was what he claimed it to be.

A decree is ordered dismissing the bill, with costs.

U. S. Circuit Court—Northern District of Illinois.

SCHLICHT & FIELD COMPANY *v.* CHICAGO SEWING MACHINE COMPANY *et al.*

Decided November 5, 1888.

1. SMITH AND SHANNON—PAPER-HOLDERS.

The first, second, third, fourth, fifth, and seventh claims of Patent No. 217,909, issued July 29, 1879, to Frederick W. Smith and James S. Shannon, for an improvement in paper-holders, sustained, (citing *Shannon* v. *Printing Company*, 9 Fed. Rep., 205,) and *Held* to be infringed by a letter-file having its receiving-wires arranged to rock forward instead of backward out of contact with its arched wires.

2. INFRINGEMENT—CHANGE OF LOCATION OF PARTS.

A change in the position of a part of a machine will not avoid infringement where the part transposed continues to perform the same function as before. (Citing *Adams* v. *Manufacturing Company*, 3 Banning & A, 1.)

3. JOINT INVENTOR CANNOT IMPEACH HIS OATH TO DESTROY ANOTHER'S INTEREST IN THE PATENT.

A party applying for a patent as a joint invention of himself and another should be estopped as against a *bona fide* owner of the patent from defeating it by proof tending to show that he took a false oath or otherwise imposed upon the Patent Office. Having given life to the patent by one oath, he cannot be heard to destroy it by another.

4. JOINT INVENTORS.

Where two parties work together in the making of an invention, each making suggestions to the other, the invention covered by a joint patent will generally be considered as the result of their joint efforts or contributions.

Messrs. Banning & Banning & Payson for the complainant.

Mr. M. W. Robinson and *Mr. C. M. Hardy* for the defendants.

BLODGETT, *J.*:

The bill in this case asks for an injunction and an accounting by reason of the alleged infringement of Patent No. 217,909, granted July 29, 1879, to Frederick W. Smith and James S. Shannon, for an improvement in paper-holders. The invention covered by this patent is described by the patentees in their specification as follows:

Our invention relates to that class of paper-files or temporary binders adapted, by having separable uniting-wires, to allow of the withdrawal of any one of many papers thereon held, or the insertion of papers between those already on the file, without disturbing the order in which the others are placed.

The object of our invention is to provide a file more prompt and positive in its action, less calculated to tear the papers filed thereon, more convenient of manipulation, and adapted, in its double form especially, to serve as a writing-tablet for the lap or desk.

It consists, first, in a paper-holder with duplex parallel hinged transfer-wires made from one piece; second, in a paper-holder having the fixed wires and movable wires secured to the same connecting-plate, whereby those parts may be separately packed and attached to any desired base-board; third, in the structure of the puncturing-wire; fourth, in a felt or plush covering for the bottom of the base-board; fifth, in the stop to limit the movement of the hinged wires.

This patent was before this court in the case of *Shannon* v. *Printing Co.*, reported in 9 Fed. Rep., 205, in which the validity of the patent was sustained, and nothing shown in the record in the present case induces me to in any degree modify or change the conclusions there arrived at.

Infringement is charged in this case of the first, second, third, fourth, fifth, and seventh claims of the patent, which are:

1. The combination, in a paper-holder, of a base-board, two parallel fixed puncturing-wires, and two parallel hinged transfer-wires, made in a single piece, arranged thereon, as shown, to form two parallel rings, adapted to be opened and closed at pleasure, substantially as and for the purposes set forth.

2. In combination with the duplex file or paper-holder, substantially as shown, a rigid connecting part, joining the hinged wires, so that both may be rotated or held by applying force for the purpose to either, substantially as set forth.

3. In combination with the fixed wires T and the movable wires H, the plate P, constructed to give hinged support to H at *h h*, and to have the central bearing-spring, S, all arranged and adapted to operate substantially as described.

4. The combination, with the fixed wires T and hinged wires H, of the plate P, having the hinge-arms R, and the spring-tongue S, and supporting said wires T and H in working position, whereby the working parts of the file or paper-holder are adapted to be applied to any tablet by screws *a a*, substantially as and for the purposes specified.

5. In a paper-holder having a tubular puncturing-wire, sharpened by having its end beveled from one side to the other, and a second wire entering the tube to serve as a transfer-wire, the inwardly bent or curved form of the beveled point of the tube, whereby the said point may lie close to the transfer-wire, substantially as described, and for the purpose set forth.

7. In combination with the hinged wires H and a spring operating them, as described, a stop, *s*, or stops *s* and *s'*, arranged to arrest the throw of the wires H, substantially as and for the purpose set forth.

Defendants deny infringement of the patent, and also attack the validity of the patent upon the ground that Smith, one of the patentees, has testified in this case that he was the only inventor of the devices covered by the patent, and that Shannon, the other patentee and alleged inventor, had nothing to do with the invention.

In regard to the second matter of defense, which was not considered in the former case, I will merely say that Smith, having applied for a patent as the joint invention of himself and Shannon, should be estopped, as against any *bona fide* owner of the patent, from now defeating it by proof tending to show that he took a false oath or imposed upon the Patent Office for the purpose of obtaining the patent. Proof that Smith was the sole inventor is undoubtedly admissible to defeat the patent; but it must come from some one else than himself, because he has given the patent life by one oath and cannot now be heard to destroy it by another oath. Certainly as much faith must be placed in the affidavit which the law required him to make at the time he applied for the patent, showing that the device covered by the application was the joint invention of himself and Shannon, as should now be given to his deposition in this case, wherein he claims to be the sole inventor. So that it may be said, for the purposes of this question of fact, that the testimony of Smith is neutralized by his conduct in applying for and obtaining a patent, and this leaves the question as to whether or not Smith was the sole inventor to the testimony of Blades, the other witness called by the defense upon this point, and Blades's testimony goes to show that Shannon and Smith were consulting together and acting together in perfecting and completing the invention. Smith was a mechanic, and it would seem both from his own testimony and that of Blades that he was attempting to invent a letter-file, and that what he was doing was done under the constant supervision and criticism of Shannon, and from the testimony it would seem that suggestions were made from time to time by Shannon; and the court at this time, and in the light of the testimony before it, cannot see but what the ideas embodied in the machine were as essentially those of Shannon as of Smith. Hence the defense that the patent is void because of Smith being the sole inventor is not sustained.

The defendants manufacture and sell a letter-file consisting of receiving-wires, upon which the papers to be filed are strung, and arched wires adapted to come in contact with the receiving-wires, so as to form with the receiving-wires a continuous ring or arch, upon which the papers may be turned for the purpose of inspection or examination, the same as is provided for in the complainant's patent; but in the defendants' device the receiving-wires are so arranged that they rock forward from out of contact with the arched wires. This seems to me to be merely a colorable change in the construction of the device. The transfer of the function of movement from the vibrating wires to the receiving-wires is merely such a change as, with the complainant's patent before him, any mechanic might readily make, and is but an attempt at an evasion of the idea covered by the complainants' patent. The case seems to me to come closely within the principle announced in *Adams* v. *Manufacturing Co.*, (3 Ban. & A, 1,) where it was said:

Changing the position of a part of a machine does not avert infringement where the part transposed performs the same function as before.

I therefore find that the complainant's patent is valid, and that the defendants infringe, and a decree may be prepared accordingly.

AMENDMENTS

TO THE

ENGLISH PATENT LAW.

CHAPTER 50.

An Act to Amend the Patents, Designs, and Trade Marks Act, 1883. [24th December, 1888.]

ARRANGEMENT OF SECTIONS.

1. Register of patent agents.
Amendments of 46 & 47 Vict. c. 57.
2. s. 7, as to applications.
3. s. 9, as to disclosure of reports of examiners.
4. s. 11, as to opposition to grant of patent.
5. s. 18, as to amended specification.
6. s. 52, as to inspection of designs.
7. s. 58, as to piracy of registered designs.
8. s. 62, as to application for registration.
9. s. 63, as to limit of time for proceeding with application.
10. s. 64, as to fancy words.
11. s. 67, as to colours of trade marks.
12. s. 68, as to advertisement of applications.
13. s. 69, as to opposition to registration.
14. s. 72, as to restrictions on registration.
15. s. 73, as to restriction on registration.
16. s. 74, as to additions to trade marks.
17. s. 75, as to effect of registration.
18. Certificate as to exclusive use and costs thereon.
Amendments of 46 & 47 Vict. c. 57.
19. s. 79, as to removal of trade mark from the register.
20. s. 81, as to Sheffield marks.
21. s. 87, as to entry of assignments, &c.
22. s. 88, as to inspection.
23. s. 90, as to rectification of register.
24. s. 91, as to correction of errors.
25. Proceedings of Board of Trade.
26. Jurisdiction of Lancashire Palatine Court.
27. Construction of principal Act.
28. Commencement of Act.
29. Short title.

Whereas it is expedient to amend the Patents, Designs, and Trade Marks Act, 1883, hereinafter referred to as the principal Act:

Be it therefore enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

1.—(1.) After the first day of July one thousand eight hundred and eighty-nine a person shall not be entitled to describe himself as a patent agent, whether by advertisement, by description on his place of business, by any document issued by him, or otherwise, unless he is registered as a patent agent in pursuance of this Act.

(2.) The Board of Trade shall, as soon as may be after the passing of this Act, and may from time to time, make such general rules as are in the opinion of the Board required for giving effect to this section, and the provisions of section one hundred and one of the principal Act shall apply to all rules so made as if they were made in pursuance of that section.

(3.) Provided that every person who proves to the satisfaction of the Board of Trade that prior to the passing of this Act he had been bona fide practicing as a patent agent shall be entitled to be registered as a patent agent in pursuance of this Act.

(4.) If any person knowingly describes himself as a patent agent in contravention of this section he shall be liable on summary conviction to a fine not exceeding twenty pounds.

(5.) In this section "patent agent" means exclusively an agent for obtaining patents in the United Kingdom.

2. For section seven of the principal Act the following section shall be substituted, namely:—

"**7.** (1.) If the examiner reports that the nature of the invention is not fairly described, or that the application, specification, or drawings has not, or have not, been prepared in the prescribed manner, or that the title does not sufficiently indicate the subject-matter of the invention, the comptroller may refuse to accept the application, or require that the application, specification, or drawings be amended before he proceeds with the application; and in the latter case the application shall, if the comptroller so directs, bear date as from the time when the requirement is complied with.

"(2.) Where the comptroller refuses to accept an application or requires an amendment, the applicant may appeal from his decision to the law officer.

"(3.) The law officer shall, if required, hear the applicant and the comptroller, and may make an order determining whether, and subject to what conditions, (if any,) the application shall be accepted.

"(4.) The comptroller shall, when an application has been accepted, give notice thereof to the applicant.

"(5.) If, after an application for a patent has been made, but before the patent thereon has been sealed, another application for a patent is made, accompanied by a specification bearing the same or a similar title, the comptroller, if he thinks fit, on the request of the second applicant, or of his legal representative, may, within two months of the grant of a patent on the first application, either decline to proceed with the second application or allow the surrender of the patent, if any, granted thereon."

3. In sub-section five of section nine of the principal Act the words "other than an appeal to the law officer under this Act" shall be omitted.

4. In sub-section one of section eleven of the principal Act the words from "or on the ground of an examiner" to "a previous application," both inclusive, shall be omitted, and there shall be added in lieu thereof the following words, namely, "or on the ground that the complete specification describes or claims an invention other than that described in the provisional specification, and that such other invention forms the subject of an application made by the opponent in the interval between the leaving of the provisional specification and the leaving of the complete specification."

5. For sub-section ten of section eighteen of the principal Act the following sub-section shall be substituted, namely:—

"(10.) The foregoing provisions of this section do not apply when, and so long as any action for infringement or proceeding for revocation of a patent is pending."

6. After sub-section one of section fifty-two of the principal Act the following words shall be added; namely,

"Provided that where registration of a design is refused on the ground of identity with a design already registered, the applicant for registration shall be entitled to inspect the design so registered."

7.—(1.) In section fifty-eight of the principal act the words "or cause to be applied" shall be added after the word "apply."

(2.) To the same section the following words shall be added: "Provided that the total sum forfeited in respect of any one design shall not exceed one hundred pounds."

8.—(1.) In sub-section two of section sixty-two of the principal Act for the words "the patent office in the prescribed manner" shall be substituted the words "such place and in such manner as may be prescribed."

(2.) To the same section of the principal Act the following sub-section shall be added:—

"(6.) Where an applicant for the registration of a trade mark otherwise than under an international convention is out of the United Kingdom at the time of making the application he shall give the comptroller an address for service in the United Kingdom, and if he fails to do so the application shall not be proceeded with until the address has been given."

9. In section sixty-three of the principal Act for the words "the application shall be deemed to be abandoned" shall be substituted the words "the comptroller shall give notice of the non-completion to the agent employed on behalf the applicant, and, if at the expiration of fourteen days from that notice the registration is not completed, shall give the like notice to the applicant, and if at the expiration of the latter fourteen days, or such further time as the comptroller may in special cases permit, the registration is not completed, the application shall be deemed to be abandoned."

10.—(1.) For section sixty-four of the principal Act the following section shall be substituted, namely—

"**64.**—(1.) For the purposes of this Act, a trade mark must consist of or contain at least one of the following essential particulars:

"(a.) A name of an individual or firm printed, impressed, or woven in some particular and distinctive manner; or

"(b.) A written signature or copy of a written signature of the individual or firm applying for registration thereof as a trade, mark; or

"(c.) A distinctive device, mark, brand, heading, label, or ticket; or

"(d.) An invented word or invented words; or

"(e.) A word or words having no reference to the character or quality of the goods, and not being a geographical name.

"(2.) There may be added to any one or more of the essential particulars mentioned in this section any letters, words, or figures, or combination of letters, words, or figures, or of any of them, but the applicant for registration of any such additional matter must state in his application the essential particulars of the trade mark, and must disclaim in his application any right to the exclusive use of the added matter, and a copy of the statement and disclaimer shall be entered on the register.

"(3.) Provided as follows:

"(i.) A person need not under this section disclaim his own name or the foreign equivalent thereof, or his place of business, but no entry of any such name shall affect the right of any owner of the same name to use that name or the foreign equivalent thereof:

"(ii.) Any special and distinctive word or words, letter, figure, or combination of letters or figures, or of letters and figures used as a trade mark before the thirteenth day of August, one thousand eight hundred and seventy-five, may be registered as a trade mark under this part of this Act."

11. In section sixty-seven of the principal Act the words "or colours" shall be added after the word "colour" in each place where that word occurs.

12. In section sixty-eight of the principal Act after the word comptroller shall be added the words "unless the comptroller refuse to entertain the application."

13.—(1.) In sub-section one of section sixty-nine of the principal Act for the words "two months" shall be substituted the words "one month or such further time, not exceeding three months, as the comptroller may allow."

(2.) In the same sub-section the word "first" shall be omitted.

(3.) In sub-section two of the same section for the words "two months" shall be substituted the words "one month."

(4.) For sub-sections three and four of the same section the following sub-sections shall be substituted; namely,

"(3.) If the applicant sends such counter-statement the comptroller shall furnish a copy thereof to the person who gave notice of opposition, and shall, after hearing the applicant and the opponent, if so required, decide whether the trade mark is to be registered, but his decision shall be subject to appeal to the Board of Trade, who shall, if required, hear the applicant and the opponent and the comptroller, and may make an order determining whether, and subject to what conditions (if any), registration is to be permitted.

"(4.) The Board of Trade may, however, if it appears expedient, refer the appeal to the court, and in that event the court shall have jurisdiction to hear and determine the appeal, and may make such order as aforesaid.

"(5.) If the applicant abandons his application after notice of opposition in pursuance of this section he shall be liable to pay to the opponent such costs in respect of the opposition as the comptroller may determine to be reasonable.

"(6.) Where the opponent is out of the United Kingdom he shall give the comptroller an address for service in the United Kingdom."

14. In sub-section two of section seventy-two of the principal Act, the following words shall be added at the beginning of the sub-section, namely, "except as aforesaid," and for the words "so nearly resembling" shall be substituted the words "having such resemblance to."

15. In section seventy-three of the principal Act the word "exclusive" shall be omitted.

16. For sub-section two of section seventy-four of the principal Act the following sub-section shall be substituted; namely,

"(2.) The applicant for registration of any such addition must, however, state in his application the essential particulars of the trade mark, and must disclaim in his application any right to the exclusive use of the added matter, and a copy of the statement and disclaimer shall be entered on the register.

"Provided that a person need not under this section disclaim his own name or the foreign equivalent thereof, or his place of business, but no entry of any such name shall affect the right of any owner of the same name to use that name or the foreign equivalent thereof."

17. For section seventy-five of the principal Act the following section shall be substituted; namely,

"Application for registration of a trade mark shall be deemed to be equivalent to public use of the trade mark, and the date of the application shall for the purposes of this Act be deemed to be, and as from the first day of January one thousand eight hundred and seventy-six to have been, the date of the registration."

18. After section seventy-seven of the principal Act the following section shall be added and numbered 77A; namely,

"In an action for infringement of a registered trade mark the court or a judge may certify that the right to the exclusive use of the trade mark came in question, and if the court or a judge so certifies, then in any subsequent action for infringement the plaintiff in that action, on obtaining a final order or judgment in his favour, shall have his full costs, charges, and expenses as between solicitor and client, unless the court or judge trying the subsequent action certifies that he ought not to have the same."

19.—(1.) In sub section five of section seventy-nine of the principal Act, for the words "the five years" shall be substituted the words "one year."

(2.) To the same sub-section the following words shall be added; namely, "unless it is shown to the satisfaction of the comptroller that the non-payment of the fee arises from the death or bankruptcy of the registered proprietor, or from his having ceased to carry on business, and that no person claiming under that proprietor or under his bankruptcy is using the trade mark."

20.—(1.) For sub-section two of section eighty-one of the principal Act the following sub-section shall be substituted:

"(2.) The Cutlers' Company shall enter in the Sheffield register, in respect of metal goods as defined in this section, all the trade marks entered before the first day of January one thousand eight hundred and eighty-nine in respect of metal goods either in the register established under the Trade Marks Registration Act, 1875, or in the register of trade marks under this Act, belonging to persons carrying on business in Hallamshire or within six miles thereof. The Cutlers' Company shall also, on request made in the prescribed manner, enter in the Sheffield register, in respect of metal goods, all the trade marks which shall have been assigned by the Cutlers' Company and actually used before the first day of January one thousand eight hundred and eighty-four, but which have not been entered in either of the said other registers."

(2.) In sub-sections three and eight of the same section, for the words "on cutlery, edge tools, or on raw steel, or on goods made of steel, or of steel and iron combined, whether with or without a cutting edge," shall be substituted the words "on metal goods."

(3.) For sub-section seven of the same section the following sub-section shall be substituted:

(7.) The provisions of this Act and of any general rules made under this Act with respect to the registration of trade marks, and all matters relating thereto, shall, subject to the provisions of this section, apply to the registration of trade marks on metal goods by the Cutlers' Company, and to all matters relating thereto; and this Act and any such general rules shall, so far as applicable, be construed accordingly with the substitution of the Cutlers' Company, the office of the Cutlers' Company, and the Sheffield Register, for the Comptroller, the Patent Office, and the Register of Trade Marks, respectively; and notice of every entry, cancellation, or correction made in the Sheffield Register shall be given to the Comptroller by the Cutlers' Company: Provided that this section shall not affect any life estate and interest of a widow of the holder of any Sheffield mark which may be in force in respect of such mark at the time when it shall be placed upon the Sheffield Register.

(4.) To the same section the following sub-sections shall be added; namely,—

(14.) For the purposes of this section the expression "metal goods" means all metals, whether wrought, unwrought, or partly wrought, and all goods composed wholly or partly of any metal.

(15.) For the purpose of legal proceedings in relation to trade marks entered in the Sheffield register a certificate under the hand of the master of the Cutlers' Company shall have the same effect as the certificate of the comptroller.

21. In section eighty-seven of the principal Act, after the words "subject to," shall be added the words "the provisions of this Act and to."

22. In section eighty-eight of the principal Act, after the words "subject to," shall be added the words "the provisions of this Act and to."

23. In section ninety of the principal Act, after the words "of the name of any person," shall be added the words "or of any other particulars."

24. To section ninety-one of the principal Act the following sub-section shall be added; namely,

"(d.) Permit an applicant for registration of a design or trade mark to amend his application by omitting any particular goods or classes of goods in connexion with which he has desired the design or trade mark to be registered."

25. After section one hundred and two of the principal Act the following section shall be added and numbered 102A; namely,

"(1.) All things required or authorised under this Act to be done by, to, or before the Board of Trade, may be done by, to, or before the President or a secretary or an assistant secretary of the Board.

"(2.) All documents purporting to be orders made by the Board of Trade and to be sealed with the seal of the Board, or to be signed by a secretary or assistant secretary of the Board, or by any person authorised in that behalf by the President of the Board, shall be received in evidence, and shall be deemed to be such orders without further proof, unless the contrary is shown.

"(3.) A certificate, signed by the President of the Board of Trade, that any order made or act done is the order or act of the Board, shall be conclusive evidence of the fact so certified."

26. After section one hundred and twelve of the principal Act the following section shall be added and numbered 112A; namely,

"The Court of Chancery of the County Palatine of Lancaster shall, with respect to any action or other proceeding in relation to trade marks the registration whereof is applied for in the Manchester Office, have the like jurisdiction under this Act as Her Majesty's High Court of Justice in England, and the expression 'the court' in this Act shall be construed and have effect accordingly.

"Provided that every decision of the Court of Chancery of the County Palatine of Lancaster in pursuance of this section shall be subject to the like appeal as decisions of that court in other cases."

27. The principal Act shall, as from the commencement of this Act, take effect subject to the additions, omissions, and substitutions required by this Act, but nothing in this Act shall affect the validity of any act done, right acquired, or liability incurred before the commencement of this Act.

28. This Act shall, except so far as is by this Act otherwise specially provided, commence and come into operation on the first day of January one thousand eight hundred and eighty-nine.

29. This Act may be cited as the Patents, Designs, and Trade Marks Act, 1888, and this Act and the Patents, Designs, and Trade Marks Acts, 1883 to 1886, may be cited collectively as the Patents, Designs, and Trade Marks Acts, 1883 to 1888.

PATENT LAW OF ECUADOR.

The following translation of the Patent Law of 1880 *has been made by Messrs. W. P. Thompson & Co., of Liverpool, Manchester, and London.*

Law of November 3, 1880.

The Congress of the Republic of Ecuador consider that it is important to regulate the mode and form of grant of patents of invention in order to avoid their being transformed into a species of monopoly and to facilitate the acquisition of them if useful to science, art and industry. It is decreed—

Article 1. The law assures to every inventor the full and entire enjoyment of his own invention, provided that it be not contrary to the laws or good morals.

Art. 2. The following shall be considered as inventions,—the means or methods which may be discovered for the improvement of any manufacture or industry.

Art. 3. The following shall not be considered as inventions,—those which consist in theoretical modifications or objects of pure ornament.

Art. 4. The State shall have power to buy for public use the secret of any invention useful to industry.

Art. 5. To assure the author of an invention or of an improvement, the enjoyment of his exclusive property, a patent is to be conceded to him of which the duration shall not be less than ten (10) years or more than fifteen (15.)

Art. 6. It is unlawful to grant patents to inventors of secret remedies; they ought to publish the composition of these under the reserve of a just indemnity.

Art. 7. The introducers of machines or of new methods of manufacture, or industry unknown heretofore in the Republic, will have the right of obtaining exclusive patents which will be conceded upon the following scale:

Art. 8. If the establishment of the machine or industry imported requires a capital or an advance of 25,000 pesos the patent will be granted for three years; if this capital be raised to 50,000 pesos it will be granted for six years; and if the same capital amounts to 100,000 pesos or more, it will be granted for ten years.

Art. 9. The patent conceded to introducers of machines or of novel methods of manufacture or of industry already known and employed abroad will only effect for the locality where the machine will be worked or the territory necessary for its exploitation.

MANNER OF OBTAINING PATENTS OF INVENTION, IMPROVEMENT OR IMPORTATION.

Art. 10. The applicant for a patent in any one of these classes must present to the Executive an application in which he will explain what the invention or improvement consists in, reserving to himself the secret of the method of the substances or of the ingredients which he makes use, or of the instrument which he employs. This application must be accompanied by a specimen of the article, of the metal worked, or of the improved invention.

Art. 11. When an application is made for a patent of importation the interested party will add to his application drawings or models of the machine which he proposes to establish or a detailed specification describing the principles, methods, and processes of the industry which he desires to establish in the territory of the Republic as well as the product which he proposes to manufacture.

Art. 12. The government will then name a commission of three competent persons to judge of the matter and examine the process or secret constituting the invention, improvement, or importation.

Art. 13. This commission will be always presided over by the political chief of the canton where the patent is to be worked; and if the patent be taken for the entire Republic, by the chief of the canton where the application shall be presented and by two members of the municipal council who will proceed to the examination of the matter set forth in the preceding article.

Art. 14. The two members of the municipal council and the three members of the commission named by the government will take before the same political chief an oath not to reveal the secret of the invention or improvement and to conscientiously perform their mission.

Art. 15. The commission and the two members of the municipal council will then discuss (the interested party not being present) the advice which they ought to present, taking care to set forth all the divergences of opinion which may occur between themselves.

Art. 16. The advice or report mentioned in the preceding article will be remitted under sealed cover with "communication réservée" to the Minister of the Interior. In the same envelope will

be inclosed the description of the manufacture, machine or other details which constitute the invention, the improvement, or importation.

Art. 17. Within a maximum period of three months after the receipt of the report of the commission charged to examine the invention, improvement, or importation of the new industry, the Executive Power will remit to Congress the papers furnished by the applicant as well as the report cited above.

The Congress after examination will concede or refuse the patent. In the first case it will return the papers presented by the Executive Power, and the latter will send the patent upon stamped paper of the 10th class, and cause to be registered at the Ministry of the Interior the application or specification spoken of in Art. 11.

Art. 18. In order to avoid the abuse which owners of patents can make of their patents the Government will declare upon the same that it does not guarantee either the reality, the merit, or the utility of the invention, improvement or importation, and that the interested party will work the same at his own risk and peril.

Art. 19. The owner of a patent who shall desire to make changes in his invention or in his original application before obtaining his patent or before the expiration of the term of his patent must make a declaration in writing accompanied by the description of his new methods in the form and fashion prescribed in Art. 10 in order to obtain a corresponding alteration in his patent of which the duration shall not in the meantime be prorogued.

THE RIGHTS OF OWNERS OF PATENTS.

Art. 20. The owner of a patent shall enjoy exclusively the benefit of an invention, improvement, or importation made the object of his patent.

Art. 21. He shall have the right of forming establishments in all parts of the Republic, if his invention is taken for the whole extent of it, or all of the localities to which he shall be limited or to authorize parties to employ his methods as well as to dispose of his right as personal property.

Art. 22. The owner of a patent shall not be able to assign it in whole or in part except by a notarial act under pain of losing all rights to his patent.

Art. 23. In case of an interference or doubt between the authors of two applications, the priority of application for a patent shall be decided by the certificate of the Under Secretary of State for the Interior, who shall inscribe the date and hour of the presentation of the respective applications.

ON THE DURATION OF PATENTS.

Art. 24. The duration of patents of invention, improvement, or importation shall commence to run from the date of the decree of their grant.

Art. 25. The Letters Patent once accorded by the Government shall be registered in a special book at the Ministry of the Interior. At the same Ministry shall remain also filed until the expiration of the term of the patent the original application, the specification and other papers spoken of in Art. 10.

Art. 26. The grant of patents shall be communicated officially by the Minister of the Interior to the governors of the cantons and published in the Official Journal, it shall also be transcribed in the collections of laws and decrees.

CONCERNING THE RIGHTS OF THE NATION AT THE EXPIRATION OF THE TERM OF THE PATENT.

Art. 27. When the term of duration of a patent has expired the invention, the improvement or the importation of the new industrial process for which such patent has been granted will become public property.

Art. 28. At the expiration of a patent the specification and other documents mentioned in Art. 10 will be published and deposited in the public library of the Capitol of the Republic.

Art. 29. When a patent shall be declared void from any of the causes mentioned in the law it shall likewise be published and deposited in the Public Library with the object mentioned in Art. 27.

Art. 30. The Government will print the specifications and drawings required for the understanding of the process when it shall become public property and will forward a sufficient number of copies to the governors of Provinces.

CONCERNING GUARANTEES FOR THE PATENT AGAINST FRAUD.

Art. 31. The patentee, if he can show sufficient cause, may, by provisional mandate, require the sequestration of machinery, instruments or products, used or manufactured in infringement of his rights; observing with regard thereto the provisions of the laws as in force.

Art. 32. The proprietor of such goods shall, if proved guilty of fraud, be condemned to the confiscation of the goods seized, for the benefit of the patentee, and also to the payment, to the latter, of damages and interest in proportion to the importance of the fraud.

Art. 33. If the offense be not proved the (patentee) plaintiff shall pay the defendant for the damages caused by the seizure, and further a fine equal to that which would have been imposed on the defendant if he had been convicted of fraud.

Art. 34. If the patentee be disturbed in the exercise of his exclusive rights he may bring any persons so disturbing him before the ordinary tribunals by which the penalties provided by the preceding articles may be imposed. But if he shall raise any discussion as to the validity of the patent judgment must be given by the administration in the person of the Minister of the Interior.

Art. 35. In case of dispute between two patentees, with regard to two exactly similar inventions, the patent first granted shall be considered valid.

Art. 36. The second patentee shall in this case be considered as improver of the invention.

CONCERNING GUARANTEES FOR THE NATION AGAINST ABUSES BY THE PATENTEES.

Art. 37. Shall be declared void, all patents granted for an invention, improvement or importation which the tribunals shall condemn as contrary to the laws of the State, to public safety or to police regulations. The patentee will in this case forfeit all claim to an indemnity.

Art. 38. The patents shall also be declared to have lapsed in the following cases: 1st. If the inventor be proved to have concealed in his specification the true method of working his invention. 2nd. If the inventor be proved to have used secret processes which have not been detailed in his specification nor in the declaration which, by Art. 19, he is allowed to make to modify the same. 3rd. If the inventor or one pretending to be such be proved to have obtained a patent for an invention which has already been described and published through the press in the Republic or elsewhere. 4th. If the patentee has allowed a year and a day to pass from the date of granting the patent without having worked his invention and without having justified himself in view of the circumstances as allowed by the laws. 5th. If the inventor or the licensee of his rights, on any grounds, shall violate the obligations attached to the use of his patent.

Art. 39. In all cases where the patent shall go void or lapse, from any cause, the provision of Art. 27 will be applied.

Art. 40. Every patentee must undertake to submit to the laws of the country on all occasions with regard to his patent and must expressly reject all complaint or diplomatic intervention.

Art. 41. All patentees who have patents already in the Republic are subject, as regards the conditions involving the lapse of such patent, to the provisions of this present law.

THE OFFICIAL GAZETTE

OF THE

United States Patent Office.

[BY AUTHORITY OF CONGRESS.]

VOL. 46—No. 12. TUESDAY, MARCH 19, 1889. PRICE—$5 per year.

Errata.

In OFFICIAL GAZETTE, March 5, 1889, Commissioner's Decision, *McDonough* v. *Gray* v. *Bell* v. *Edison*, page 1251, second column, lines 10, 11, 12, and 13, the clause—

"by means of the variable resistance, whether effected upon the principle of the microphone or the liquid of high resistance,"—

should read—

whether effected by means of an armature in the presence of a magnet in the circuit, or other inductive means, or by the introduction as part of the circuit of a liquid of high resistance, whereby the resistance could be varied.

Page 1252, second column, line 14 from the bottom, the word "simplifying" should read *amplifying*.

Page 1265, first column, line 30, the word "condoning" should read *condemning*.

Page 1266, second column, lines 11 and 12 from the bottom, the case cited, "*The People's Telephone Company* v. *The American Bell Telephone Company*" should read *The American Bell Telephone Company* v. *The People's Telephone Company*.

Page 1267, second column, the answer to question 576 should terminate with the words "Mr. Brown" and the date "March 12, 1883," following, should head the testimony which follows.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified and subclassified in the Scientific Library for convenient and ready reference.

DESIGNS.

18,963.—MIRROR-FRAME.—*Henry Berry*, Shelton, Conn., assignor to *The Derby Silver Company*, same place. Application filed February 16, 1889. Serial No. 300,172. Term of patent 7 years.

18,964.—DESK.—*Francis A. Coffin*, Indianapolis, Ind. Application filed January 24, 1889. Serial No. 297,441. Term of patent 7 years.

18,965.—COLLAR.—*Charles W. Dater*, Brunswick, N. Y. Application filed December 22, 1888. Serial No. 294,428. Term of patent 7 years.

18,966.—REVOLVER-HANDLE.—*Charles A. Davis*, Washington, D. C. Application filed February 7, 1889. Serial No. 299,061. Term of patent 14 years.

18,967 and 18,968.—TYPE.—*Charles E. Heyer*, Chicago, Ill., assignor to *Barnhart Bros. & Spindler*, same place. Applications filed January 26, 1889. Serial Nos. 297,728 and 297,729. Term of patents 14 years.

18,969 to 18,971, inclusive.—TYPE.—*Ernst Lauschke*, Chicago, Ill., assignor to *Barnhart Bros. & Spindler*, same place. Applications filed January 26, 1889. Serial Nos. 297,725 to 297,727, inclusive. Term of patents 14 years.

18,972.—HANGING STAND.—*John L. Leavitt*, Grant, N. Mex. Application filed February 19, 1889. Serial No. 300,492. Term of patent 7 years.

18,973.—SCREW-HEAD.—*Edward G. Soltmann*, New York, N. Y. Application filed January 29, 1889. Serial No. 298,023. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,386.—TONIC EMMENAGOGUE.—*William Thos. Batterson, Millard F. Welsh*, and *John F. Funk*, Springfield, Ohio. Application filed February 21, 1889. Used since December 25, 1888.

"The letters and figures 'LUNAR—28.'"

16,387.—METAL-WORKING TOOLS, BRASS AND COPPER SUPPLIES, AND PLATERS' AND POLISHERS' SUPPLIES.—*Charles H. Besly & Co.*, Chicago, Ill. Application filed December 24, 1888. Used since February 3, 1888.

"The representation of a cube or the word 'CUBE.'"

16,388.—COTTON LININGS.—*Burton Bros. & Co.*, New York, N. Y. Application filed February 9, 1889. Used since January 2, 1889.

"The word 'NUBIAN.'"

16,389.—COTTON LININGS.—*Burton Bros. & Co.*, New York, N. Y. Application filed February 9, 1889. Used since January 2, 1889.

"The representation of two bees."

16,390.—SHOTGUN-CARTRIDGES.—*The Chamberlin Cartridge Company*, Cleveland, Ohio. Application filed February 2, 1889. Used since October 1, 1888.

"The word 'RABBIT' and the representation of a rabbit."

16,391.—SHOTGUN-CARTRIDGES.—*The Chamberlin Cartridge Company*, Cleveland, Ohio. Application filed February 2, 1889. Used since October 1, 1888.

"The word 'KANGAROO' and the representation of a kangaroo."

16,392.—FEBRIFUGES OR FEVER CURATIVES.—*Farbenfabriken, vormals Fr. Bayer & Co.*, Elberfeld, Prussia, Germany. Application filed January 30, 1889. Used since January, 1888.

"The word 'PHENACETIN-BAYER.'"

16,393.—CIGARS.—*Antonio Fernandez Garcia*, Havana, Cuba. Application filed December 18, 1888. Used since November 8, 1878.

"The words 'LA FLOR DE A. FERNANDEZ GCIA.'"

16,394.—WASH-BOARDS.—*Charles D. Fuller* and *Frank D. Fuller*, Kalamazoo, Mich. Application filed February 11, 1889. Used since December, 1888.

"The words 'THE CELERY CITY PROTECTOR.'"

16,395.—WASH-BOARDS.—*Charles D. Fuller* and *Frank D. Fuller*, Kalamazoo, Mich. Application filed February 11, 1889. Used since December, 1888.

"The words 'THE UNIVERSAL PROTECTOR.'"

16,396.—MEATS, VEGETABLES, FRUITS, OYSTERS, AND FISH.—*L. P. Haviland & Co.*, Camden, N. Y. Application filed January 17, 1889. Used since August, 1888.

"The word 'ARGOSY.'"

16,397.—REFINED PETROLEUM.—*Alfred Hopps & Sons* and *Samuel Banner & Co.*, Liverpool, England. Application filed February 14, 1889. Used since October, 1885.

"The word 'JESSAMINE.'"

16,398.—NEWSPAPER OR WEEKLY PAMPHLET.—*Kansas City Times Newspaper Company*, Kansas City, Mo. Application filed February 11, 1889. Used since September 21, 1868.

"The words 'KANSAS CITY TIMES.'"

16,399.—MEDICINAL PREPARATION FOR THE TREATMENT OF GENERAL DEBILITY AND BRAIN AND NERVE DISEASES.—*Robert David Lalor*, London, England. Application filed February 11, 1889. Used since 1862.

"The word 'PHOSPHODYNE.'"

16,400.—EXTERNAL REMEDIES.—*James H. McGuinness*, New York, N. Y. Application filed February 19, 1889. Used since January 1, 1889.

"The word-symbol 'UN-X-L-ED,' or the word 'UNEXCELLED.'"

16,401.—BOOTS AND SHOES.—*Parker, Holmes & Co.*, Boston, Mass. Application filed January 25, 1889. Used since January 1, 1889.

"The letters and character 'P. H. & Co.'"

16,402.—STITCHING-HORSES.—*Randall & Co.*, Cincinnati, Ohio. Application filed February 4, 1889. Used since January 1, 1889.

"The words 'RANDALL & Co.' surrounded by an inverted equilateral triangle."

16,403.—RUBBER AND COTTON HOSE METAL-COVERED.—*Revere Rubber Company*, Boston, Mass. Application filed February 13, 1889. Used since January 1, 1889.

"The words 'STEEL ARMOR PROTECTED.'"

16,404.—RUBBER, LINEN, OR COTTON HOSE.—*Revere Rubber Company*, Boston, Mass. Application filed February 13, 1889. Used since December 1, 1888.

"The word 'PROTECTIVE.'"

16,405.—NERVINE.—*Samuel A. Richmond*, Tuscola, Ill. Application filed February 18, 1889. Used since 1884.

"The bust portrait of DR. S. A. RICHMOND associated with the representation of four globes."

16,406.—MEDICAL COMPOUNDS TO CURE DISEASES OF THE NERVES, LIVER, AND STOMACH.—*Henry R. Rogers*, Boston, Mass. Application filed February 18, 1889. Used since November 1, 1888.

"The word 'ROYAL.'"

16,407.—CIGARS.—*William Schliep*, Mount Pleasant, Iowa. Application filed February 2, 1889. Used since January 10, 1872.

"The word-symbol 'LA FLOR DE MAYO" and the initials 'W. H. S.'"

16,408.—HEEL-SHAVES.—*Varanus Snell*, Brockton, Mass. Application filed January 26, 1889. Used since February, 1881.

"The letters 'O. E. D.'"

16,409.—LININGS AND SUMMER COATINGS.—*C. E. Parkinson & Co.*, Bradford, county of York, England. Application filed January 31, 1889. Used since December 1, 1888.

"The word 'ETHEL.'"

16,410.—MEDICINAL PETROLEUM PRODUCTS.—*Terraline Company*, Washington, D. C. Application filed February 20, 1889. Used since September 1, 1886.

"The word 'TERRALINE.'"

16,411.—DIE-PLATES FOR THREADING STEAM, GAS, AND OTHER PIPES.—*Walworth Manufacturing Company*, Boston, Mass. Application filed January 5, 1889. Used since 1860.

"The word 'WALWORTH'S.'"

16,412.—HORSESHOE-NAILS.—*Samuel G. Wintermitz & Bro.*, Baltimore, Md. Application filed September 20, 1888. Used since January 1, 1880.

"The letter 'P,' formed of a horseshoe as its bow and a horseshoe-nail as its stem, inclosed within a frame formed of crossed horseshoe-nails."

LABELS.

5,847.—Title "DR. BALL'S CREAM." (FOR THE TOILET.)—*Joseph G. Ball*, Boston, Mass. Application filed February 1, 1889.

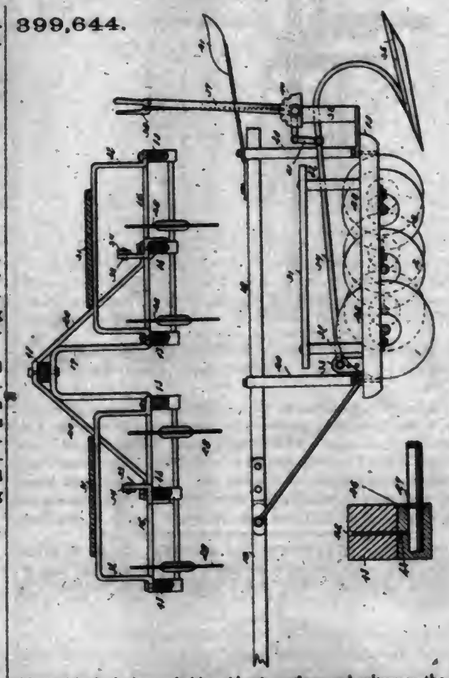
5,848.—Title: "NON-POROUS" (FOR PAINT.)—*Charles W. Bruce*, Philadelphia, Pa. Application filed February 27, 1889.

5,849.—Title: "M. F. CONINE'S GERMAN SCROFULAR SALVE."—*Martin F. Conine*, Plainwell, Mich. Application filed February 23, 1889.

5,850.—Title: "TAPEWORM SPECIFIC."—*Jennie G. Egersdorff*, Kansas City, Mo. Application filed February 18, 1889.

5,851.—Title: "DR JAMES' SURE CURE" (FOR REMEDY FOR CATARRH, COUGH AND CONSUMPTION.)—*Charles A. James*, San Francisco, Cal. Application filed February 25, 1889.

5,852.—Title: "CONDENSED COFFEE."—*John Lorentzen*, Chicago, Ill. Application filed February 20, 1889.



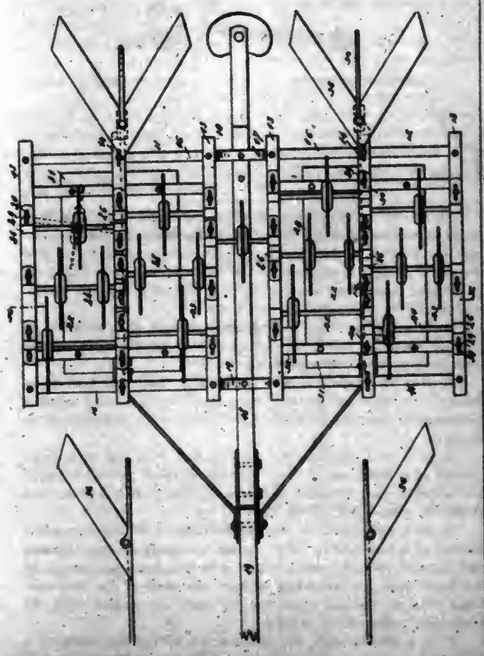
5,853.—Title: "OVAL HEADS AND FORGED NUTS," (FOR CARRIAGE BOLTS.)—*Oliver Iron and Steel Company*, Pittsburg, Pa. Application filed February 13, 1889.

PATENTS

GRANTED MARCH 19, 1889.

399,644. ROLLING HARROW AND CULTIVATOR. ANDREW J. ADAMSON, Sabetha, Kans. Filed May 22, 1888. Serial No. 274,633. (No model.)

399,644.



Claim.—1. A harrow-section divided into longitudinal sub-sections provided with non-aligning shafts journaled in said sub-sections and colters on the said shafts, the colters of one shaft being intermediate of those on the adjacent shafts, substantially as and for the purpose specified.

2. In a harrow, a harrow-section provided with longitudinal sub-sections, non-aligning shafts adjustably journaled in the said sub-sections, and colters on the said shafts, the colters on one shaft being intermediate of those on the adjacent shafts, substantially as and for the purpose specified.

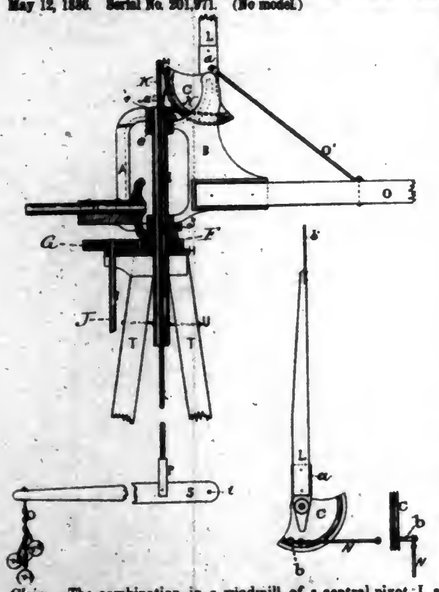
3. A harrow-section divided into longitudinal sub-sections, non-aligning shafts adjustably journaled in said sub-sections, colters rigidly attached to the said shafts, the colters on one shaft being intermediate of those upon the adjacent shafts, and the forward colters being of a greater diameter than the remaining colters, as and for the purpose specified.

4. The combination, with harrow-sections united by a yoke and divided into longitudinal sub-sections, and non-aligning shafts adjustably journaled in said sub-sections, of colters fixed upon said shafts, the colters on one shaft being intermediate of those on the adjacent shafts and the forward colters of greater diameter than the remaining colters, a shovel-carrying bar adjustably pivoted to each section extending rearwardly from the same, shovels attached to the said bar, and means, substantially as shown and described, for raising and lowering said shovel-carrying bar, as and for the purpose specified.

5. A harrow-section divided into longitudinal sub-sections provided with shafts journaled in said sub-sections and colters on the said shafts, the colters of one shaft being intermediate of those on the adjacent shaft, substantially as and for the purpose specified.

6. In a harrow, a harrow-section provided with longitudinal sub-sections, shafts adjustably journaled in the said sub-sections, and colters on the said shafts, the colters on one shaft being intermediate of those on the adjacent shafts, substantially as and for the purpose specified.

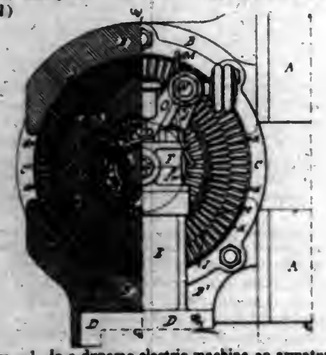
7. A harrow-section divided into longitudinal sub-sections, shafts adjustably journaled in said sub-sections, colters rigidly attached to the said shafts, the colters on one shaft being intermediate of those upon the adjacent shafts, and the forward colters being of a greater diameter than the remaining colters, as and for the purpose specified.



8. The combination, with harrow-sections united by a yoke and divided into longitudinal sub-sections, and shafts adjustably journaled in said sub-sections, of colters fixed upon said shafts, the colters on one shaft being intermediate of those on the adjacent shafts and the forward colters of greater diameter than the remaining colters, a shovel-carrying bar adjustably pivoted to each section extending rearwardly from the same, shovels attached to the said bar, and means, substantially as shown and described, for raising and lowering said shovel-carrying bar, as and for the purpose specified.

9. In a harrow, a harrow-section provided with longitudinal sub-sections, shafts adjustably journaled in the said sub-sections to shift them from a transverse to a diagonal position, and colters on said shafts, substantially as and for the purpose specified.

10. The combination, with harrow-sections united by a yoke extended above the harrow and divided into longitudinal sub-sections, shafts adjustably journaled in said sub-sections, colters fixed upon

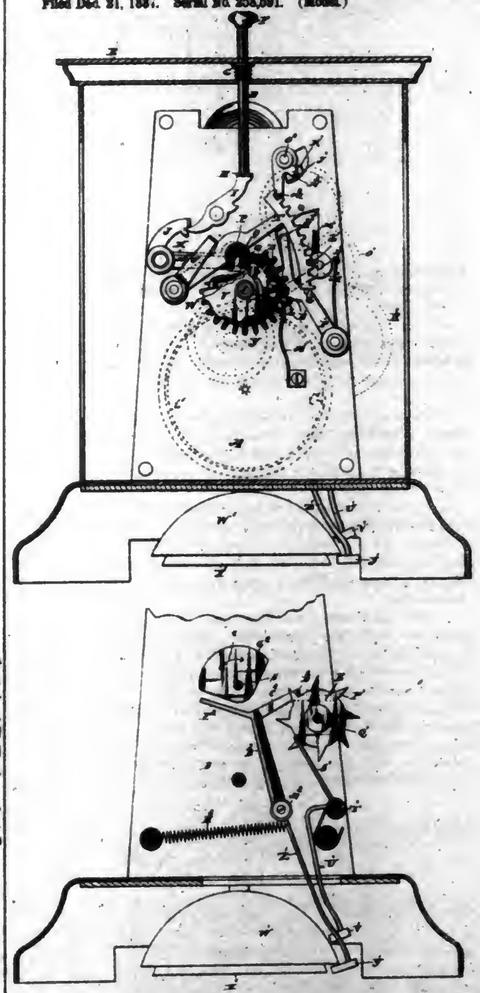


said shafts, a shovel-carrying bar adjustably pivoted to each section extending rearwardly from the same, shovels attached to the said bar, and means, substantially as shown and described, for raising and lowering said shovel-carrying bar, as and for the purpose specified.

399,645. WINDMILL. WILLIAM H. ALDRICH, Keokuk, Iowa. Filed May 12, 1886. Serial No. 201,971. (No model.)

Claim.—The combination, in a windmill, of a central pivot, I, a collar, *c*, rigidly secured thereto, wind-wheel and tail castings A B, wheel-shaft D, provided with bevel gear-wheel E, meshing with bevel-gear upon wheel F, loosely secured to said central pivot, a side shaft, J, provided with a pinion, G, meshing with gearing upon said wheel F, and mechanism, substantially as described, for regulating the speed of the wind-wheel, all arranged and adapted to operate as described.

399,646. DYNAMO-ELECTRIC MACHINE. JOSEPH W. RALEY, New York, N. Y., assignor of one-half to Robert Dunlap and Lutke F. Comans, same place. Filed Feb. 1, 1888. Serial No. 262,634. (No model.)



Claim.—1. In a dynamo-electric machine, an armature-core provided with longitudinal grooves extending inward from the periphery thereof to a depth much greater than the diameter of the conductor, and a conductor arranged at the bottom of the grooves and in close proximity to the walls of the grooves, substantially as specified.

2. In a dynamo-electric machine, the combination, with the hollow armature-core, of collars arranged to partly support the armature-core and provided with apertures and inclined wings *h* for introducing air into the interior of the armature, substantially as specified.

3. In a dynamo-electric machine, the combination, with the field-magnets A, provided with polar extremities B, adapted to inclose the sides of the armature, of the armature having the laminated longitudinally-grooved core K, the grooves extending inward from the periphery of the core to a depth much greater than the diameter of the conductor, the conductor in the bottom of the said grooves, and the commutator and electrical connections, substantially as described.

399,647. REPEATING-CLOCK. ARCHIBALD RAMSAYTHE, Waterbury, Conn., assignor to the Waterbury Clock Company, same place. Filed Dec. 21, 1887. Serial No. 258,691. (Model.)

Claim.—1. In a repeating-clock, the combination, with a spring-actuated push-rod mounted in the top of the clock-case, of a repeating-lever pivoted to the front frame-plate and engaged by the said rod and a lifting-arm engaged by the said repeating-lever and made in the same piece with the operating-lever of a rack, and snail repeating mechanism, substantially as set forth.

2. In a striking-clock, the combination, with an hour-wheel, of an hour star-wheel and a snail rigidly secured together and coupled with the hour-wheel, substantially as set forth.

3. In a striking-clock, the combination, with the hour-wheel thereof, of a snail and an hour star-wheel rigidly secured together and mounted upon the same arbor as the hour-wheel, substantially as set forth.

4. In a striking-clock, the combination, with the hour-wheel thereof, of a snail and an hour star-wheel rigidly secured together and mounted upon the same center as the hour-wheel and coupled therewith, substantially as set forth.

5. In a striking-clock, the combination, with the hour-wheel thereof, of a snail and an hour star-wheel rigidly secured together and mounted upon the same center therewith, and a pin carried by the hour-wheel and extending between the teeth of the hour star-wheel, whereby the said wheel and the snail are coupled with the hour-wheel, substantially as set forth.

6. In a striking-clock, the combination, with a time-train, of a strike-train, a single spring operating both trains, and rack and snail striking mechanism, the snail and the hour star-wheel being mounted on the same center as and coupled with the hour-wheel of the time-train, substantially as set forth.

7. In a striking-clock, the combination, with the hour-wheel thereof, of an hour star-wheel and a snail rigidly secured together and coupled with the hour-wheel and hourly-actuated thereby, and a spring applied to the hour star-wheel and completing its hourly movement and that of the snail, substantially as set forth.

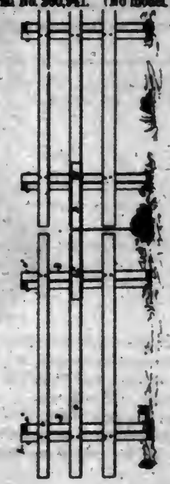
8. In a striking-clock, the combination, with a snail and an hour star-wheel rigidly secured together, of a spring entering between the teeth of the hour star-wheel and provided with a lip for engaging with the face of the same and holding the snail and wheel in place upon their center, substantially as set forth.

9. In a chiming-clock, the combination, with a time-train, of a strike-train, a striking-hammer actuated by the strike-train, a chiming-hammer also actuated by the strike-train, and an independent chiming-cam driven by the time-train and operating to cut in and cut out the chiming-hammer, substantially as set forth.

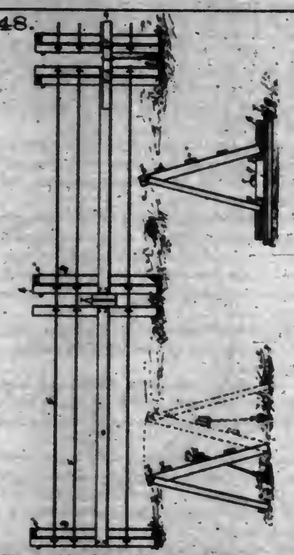
10. In a clock, the combination, with a strike-train, of a time-train, a striking-cam actuated by the time-train and releasing the strike-train, a striking-hammer, a chiming-hammer, a hammer-wheel driven by the strike-train and operating first one hammer and then the other, and a chiming-cam actuated by the time-train and cutting out the chiming-hammer from the hammer-wheel and releasing it for operation thereby, substantially as set forth.

11. In a chiming-clock, the combination, with a strike-train, of a time-train which releases the striking-train, a striking-hammer, and a chiming-hammer actuated by the strike-train, and an independent chiming-cam located upon the center arbor of the clock and rotating therewith and operating to release the chiming-hammer for operation by the strike-train and to cut it out, so that it will not be operated thereby, substantially as set forth.

12. In a chiming-clock, the combination, with a time-train, of repeating mechanism, a striking-hammer and a chiming-hammer actuated by the strike-train, and a chiming-cam driven by the time-train and constructed to periodically release the chiming-hammer, so that for a part of the time it will follow the striking-hammer in repeating the hour, substantially as set forth.



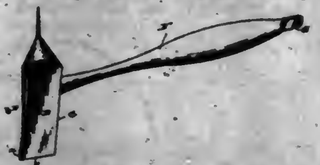
13. In a clock, the combination, with a repeating mechanism, of a chiming mechanism including a chiming-cam automatically operated by the time-train and arranged to bring the chime into play in signaling the half-hour and thereafter in repeating until the conclusion of the hour, substantially as set forth.



14. In a clock, the combination, with a time-train and a strike-train, of a chiming-cam driven by the time-train, a hammer-wheel operated by the strike-train, and a spring-actuated two-armed chiming-lever engaged by the said cam and wheel and carrying a bell-hammer, substantially as set forth.

15. In a clock, a friction-pinion mounted upon the center arbor and having an extended sleeve, which is split and grips the arbor, substantially as set forth.

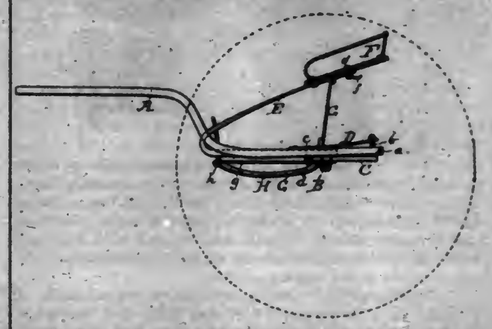
16. In a striking-clock, the combination, with a strike-train, of a striking mechanism having a rack, a pin carried by one of the wheels of such train, a rotatable staff, and two detents carried by such staff and respectively arranged to be engaged with the toothed edge of the rack and the pin, whereby the said rack and pin are each directly held, substantially as set forth.



399,648. FENCE. HENRY W. BARBER, Rock Creek, Ohio. Filed Jan. 16, 1888. Serial No. 260,941. (No model.)

Claim.—The combination, with a fence panel, posts, and braces pivoted to the upper ends of the posts, of a cross-piece pivoted at its center to a blocking, said cross-piece having mortises therein adapted to receive the ends of the posts and braces, substantially as set forth.

399,649. COMBINED TOOL. GEORGE H. BACON, Morganfield, Ky. Filed Oct. 17, 1888. Serial No. 288,282. (No model.)



Claim.—1. In the within-described tool, the hammer-head A, formed with sides inclined inwardly from its rear toward its front, and at the end opposite the driving end with the awl-point E, substantially as described.

2. In the within-described tool, the hammer-head A, formed with sides inclined inwardly from its rear toward its front, and having the front *a* of said head extended forward of the upper portion of the head, substantially as and for the purpose set forth.

3. The within-described tool having the hammer-head A formed with sides inclined inwardly from its rear toward its front, with the portion *a* extended forward of the upper portion of the head, and with the awl-point E at the end opposite to the driving end, substantially as and for the purpose set forth.

399,650. TWO-WHEELED VEHICLE. IRA BROWN, Milford, Ill. Filed Jan. 16, 1888. Serial No. 260,907. (No model.)

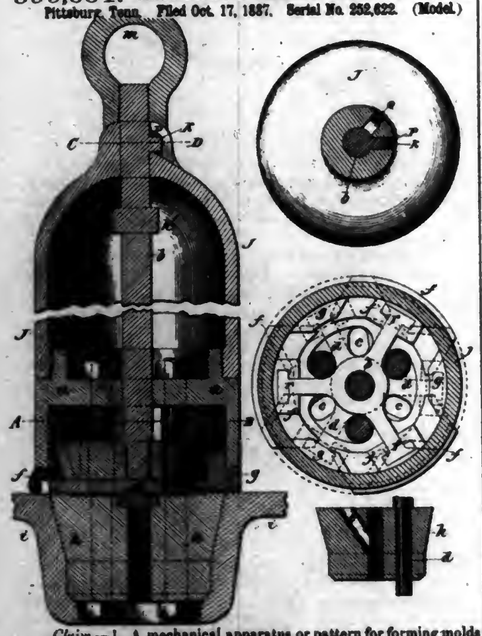
Claim.—1. A two-wheeled vehicle provided with a suitable seat, springs for supporting said seat above the axle, and said axle, in combination with the shafts, the rear ends of which extend back of the axle and have vertical apertures therein, and arms C C, having

studs *b* rising from their rear ends, and having their forward ends bent at right angles to its length, as set forth.

2. A two-wheeled vehicle provided with a longitudinally-adjustable seat, springs for supporting said seat above the axle, and said axle, in combination with shafts A, having their rear ends extended back of the axle and provided with holes *a'* therein, arms C C, and studs *b*, arising from their rear ends, as set forth.

3. A two-wheeled vehicle provided with a suitable seat, springs for supporting said seat, and axle upon which said springs rest, in combination with arms C C, having studs projecting from their rear ends, and springs D, as set forth.

4. A two-wheeled vehicle having a suitable seat, springs supporting said seat, and axle to which said springs are clipped, in combination with arms C C, as described, having studs *b* rising from their rear ends, shafts A, the rear ends of which extend back of the said axle and through which said studs pass vertically, and springs D, substantially as described.

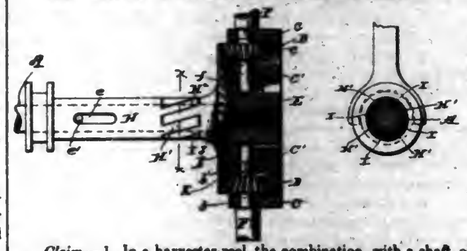


5. In a two-wheeled vehicle, the combination, with the seat, of the <-shaped supporting-springs, the axle, the springs *g g*, and the basket H, as set forth.

6. In a two-wheeled vehicle, the combination, with the shafts, arms C, having studs *b* and fulcrumal projections *d*, and springs D, of the axle, flat springs *g*, springs E, the seat F, and the basket H, as set forth.

7. The combination, in a two-wheeled vehicle, with the shafts, arms C, having studs *b* and fulcrumal projections *d*, and springs D, of the axle, springs E, and seat F, said seat being provided with longitudinal slots in its side frames and secured to springs E by bolts and thumb-nuts, as set forth.

8. In a two-wheeled vehicle, the combination, with the shafts and axle, of <-shaped springs and the seat secured thereto, said springs having their lower ends clipped to the axle, pursuing a forward course a suitable distance, and then bent back toward the rear, extending obliquely in toward each other and upward at a suitable angle, as set forth.



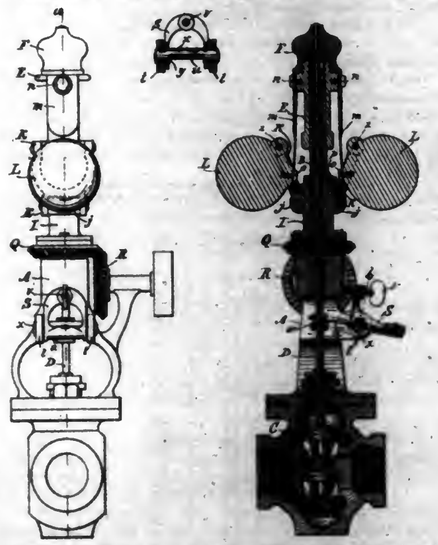
399,651. PIPE-MOLDING APPARATUS. AVERY C. BROCK, South Pittsburg, Tenn. Filed Oct. 17, 1887. Serial No. 252,622. (Model.)

Claim.—1. A mechanical apparatus or pattern for forming molds for casting pipe, consisting of the casing *a* and J, an operating-rod, *b*, having inclined T-shaped heads passing through said casing, sliding female bead-formers *f f f*, having inclined slots, rotary shouldered plate *g*, capable of being revolved about one-sixth of a revolution within casing *a*, shouldered bolts *d d d*, print *h*, and chill-plate *i*, to operate as and for the purposes specified.

2. The combination, in an apparatus for forming pipe-molds, of cylinder *a* and J, having slots P Q, vertical sliding rod *b*, having eye *m*, collar *b'*, lug K, and T-shaped inclined heads with sliding bead-formers *f f f*, having inclined slots, rotary plate *g*, shouldered bolts *d d d*, print *h*, and chill-plate *i*, to operate as and for the purposes specified.

399,652. HARVESTER-REEL. ALVIN O. CARMAN, Potterville, Mich. Filed Oct. 15, 1887. Serial No. 252,452. (No model.)

Claim.—1. In a harvester-reel, the combination, with a shaft, of a flanged plate secured to the end of the latter, reel-arms journaled in the flanges, pinions fixed on the arms, and means for actuating said pinions, substantially as set forth.



2. In a harvester-reel, the combination, with a shaft and a flanged plate secured to the end thereof, of a series of reel-arms journaled in the flanges of the plate, pinions fixed on said arms, a toothed wheel or disk loosely mounted on the shaft to engage said pinions, and means for actuating said wheel, substantially as set forth.

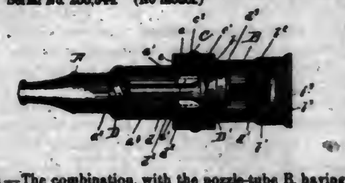
3. In a harvester-reel, the combination, with a shaft and a plate secured to one end thereof and provided with two annular flanges, one within the other, of a series of arms journaled in said flanges, these arms having blades thereon, pinions on the arms between the flanges, and means, substantially such as described, for actuating said pinions to incline the blades, substantially as set forth.

4. In a harvester-reel, the combination, with a shaft having a head secured thereon, and arms journaled in the head and provided with pinions, of a gear-wheel loosely mounted on the shaft with its teeth meshed with the teeth of the pinions, and a sliding sleeve mounted on the shaft and interlocked with the gear-wheel, and adapted by its sliding movement to turn the gear-wheel, substantially as set forth.

5. In a harvester-reel, the combination, with a shaft and a flanged plate secured at one end thereof, of a series of arms journaled in the flanges of the plate, pinions on these arms, a gear-wheel loosely mounted on the shaft adapted to mesh with said pinions, said toothed wheel having inclining fingers thereon, and a sleeve adapted to slide on the shaft, said sliding sleeve also having inclining fingers adapted to interlock with the fingers on the toothed wheel, and mechanism for sliding the sleeve, substantially as set forth.

399,653. STEAM-ENGINE GOVERNOR. OLIVER H. CASTLE, Indianapolis, Ind. Filed July 13, 1888. Serial No. 279,727. (No model.)

Claim.—1. In a governor, the combination of the following elements, namely: a main frame terminating in a hollow shaft, a reciprocating valve-stem mounted in said frame and passing through said shaft, a valve attached to said valve-stem, a sleeve attached to the valve-stem and arranged to turn and to slide longitudinally on the shaft, a pair of flat springs secured to opposite sides of said sliding sleeve, balls secured to the free ends of the springs, a sleeve mounted



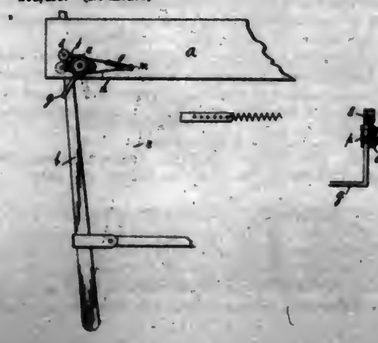
on the shaft so as to turn thereon, but fixed as to longitudinal movement, a driving-wheel secured to said fixed sleeve, and a pair of links, each pivoted at one end to the fixed sleeve and pivoted at the other end to a ball at a point beyond the point of attachment of the ball to the flat spring, all arranged to co-operate substantially as set forth.

2. In a governor, the combination, with the main frame, the valve, the stem for operating the valve arranged to slide longitudinally in said frame, and means for reciprocating the stem in the frame, and thereby opening and closing the valve, of a two-armed bracket pivoted to the frame, a set-screw mounted in one arm of the bracket and arranged to engage the frame, and a flat spring secured at one end to the other arm of the bracket, and having its free end connected to the reciprocating valve-stem, whereby the sliding of the valve-stem in one direction is adjustably resisted, substantially as and for the purpose specified.

3. In a governor, the combination of the main frame having lugs *t t*, bracket S, set-screw *v*, spring *u*, and pivot *x*, having notch *y*, all substantially as specified.

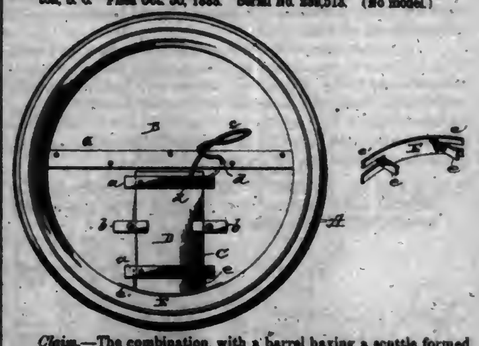
4. In a governor, the combination of a pair of revolable sleeves, one of which is free to move longitudinally and the other of which is fixed as to longitudinal movement, a pair of links, each of which is pivoted at one end to said fixed sleeve, so as to swing thereon in a path at right angles to its path of rotation, a pair of weights pivoted to the free ends of said links, so as to swing thereon in the same plane therewith, and a pair of flat springs rigidly secured at opposite ends, respectively, to said weights and the sliding sleeve, whereby the sliding sleeve is moved longitudinally by the combined swinging movement of the links and weights, substantially as and for the purpose specified.

399,654. HOSE-NOZZLE. JOHN CLIFFORD, Chicago, Ill., assignor to the L. Wolff Manufacturing Company, same place. Filed Nov. 22, 1887. Serial No. 255,844. (No model.)



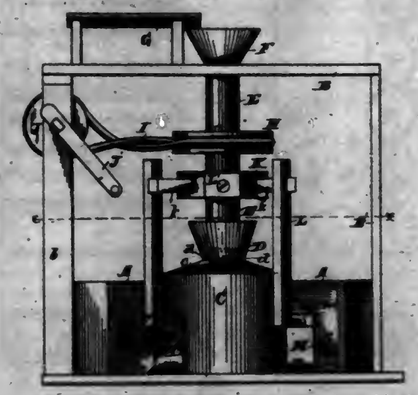
Claim.—The combination, with the nozzle-tube B, having screw-threaded end *b* and axial nut *b'*, of revolvable barrel A, having collar *a* and internal grooves, *a'*, valve-seat *a*^{3}, screw-threaded coupling-sleeve C, having flange *c*, packing-ring *c*^{2}, spirally-grooved spraying-piston D, valve D', and stem *d*, connecting said spraying-piston and valve, and having screw-threads *d'*, fitting in said axial nut *b'*, and provided with guide arms or wings *d*^{2}, fitting in said grooves *a'*, substantially as specified.

399,655. WATCH-MAKER'S AND JEWELER'S PLIERS. JOSEPH DANIELS, Cleveland, Ohio. Filed Oct. 31, 1887. Serial No. 253,839. (No model.)



Claim.—In pliers, a lower jaw having a sharp-edged end diagonal to the sides of the body part and longitudinally corrugated, an upper jaw constructed to touch the lower one only at its extremity, and both jaws curved laterally and downwardly, substantially as set forth.

399,656. PICKER-CHECK FOR LOOMS. JAMES DAVIDSON and JESSE BANISTER, New Bedford, Mass. Filed Dec. 1, 1888. Serial No. 292,453. (No model.)



Claim.—A buffer for looms, consisting of a lever carrying a pawl to engage a ratchet and an arm to project under the lathe to receive the blow of the picker-stick in its backward motion, a ratchet and pulley pivoted to the lathe, with said pawl engaging the ratchet, a strap or band attached to the lathe and wrapped around said pulley, and a spiral spring attached to the lathe and to the end of the strap, substantially as and for the purpose shown and described.

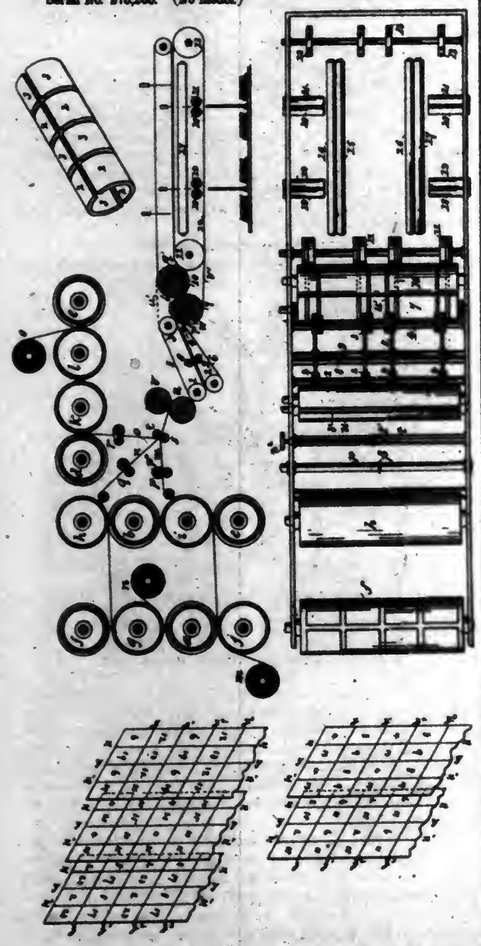
399,657. SCUTTLE FOR BARRELS. JOSEPH B. NATHAN, Charleston, S. C. Filed Oct. 30, 1888. Serial No. 289,513. (No model.)

Claim.—The combination, with a barrel having a scuttle formed in one head of the barrel and extending to one edge thereof and a stay-plate, E, secured to the inner wall of the barrel near the chine, said stay-plate having stops *c c*, formed integral therewith, which engage the walls of the scuttle adjacent to its outer edge, of a lid constructed to be removably secured to the head of the barrel and cover the scuttle, substantially as set forth.

399,658. ORE-SEPARATOR. ALMA RUDOLPH, Galena, Kans. Filed Apr. 9, 1888. Serial No. 270,013. (No model.)

Claim.—1. In an ore-separator, the combination, with the vertically-arranged revolving water-pipe, of the ore-receptacle at the lower end of and concentrically arranged around said pipe, the latter having escape-orifices, through which the water passes first directly to the ore-receptacle, and said ore-receptacle having escape-passages for the mingled materials, the stationary distributer, the tank, and the agitators in the tank and remote from the stationary distributer, substantially as set forth.

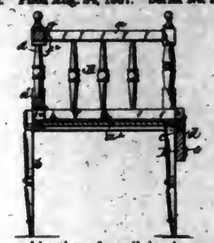
2. In an ore-separator, the combination, with the vertically-arranged revolving water-pipe and the ore-receptacle arranged concentrically around the lower end of said pipe, the latter having escape-orifices, through which the water passes first directly to the ore-receptacle, and said ore-receptacle having escape-orifices for the mingled materials, of the stationary downward-flaring distributer having its operative surface immediately under the last said orifices from which it receives simultaneously the water and ore, the cylindrical distributer below the flaring part, the tank, and the agitators revolving in the tank and remote from the flaring distributer, substantially as set forth.



3. In an ore-separator, the combination, with the tank, the cylindrical distributer rising above the bottom of the tank, the downward-flaring distributer at the top of the cylindrical part, the agitators arranged substantially as set forth, to affect the material only in the tank, the receptacle above the flaring distributer for the mingled ore,

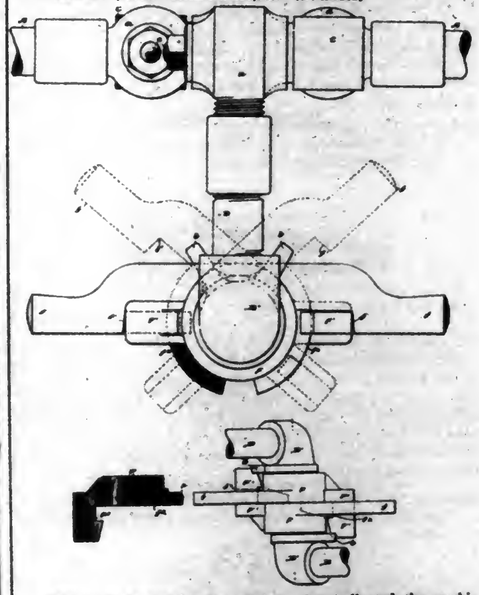
earth, and water, and having escape-passages through which the material passes over the said flaring distributer in an undisturbed state, and the central vertical water-pipe having escape-passages, through which the water passes first directly to the ore-receptacle, substantially as set forth.

4. The combination of the tank A, the distributer with vertical walls above the bottom of the tank, the flaring distributer above said vertical walls, the receptacle for the ore and water above the flaring distributer, the central vertical water-pipe which discharges directly into the said receptacle, and the agitators arranged within the tank below the flaring distributer and formed with the flexible sweeps M, substantially as set forth.



5. The combination of the tank, the distributer above the bottom of the tank and having a downward-flaring surface, the ore-receptacle above the said flaring surface, the water-pipe arranged concentrically within the said receptacle, the means for revolving the said water-pipe, the adjustable hub K, secured to the revolving pipe, and the agitators situated in the tank below the flaring distributing-surface and supported from the said hub, substantially as described.

399,659. METHOD OF PRINTING NEWSPAPERS OR PAMPHLETS. JOSEPH I. FIRR, Jersey City, N. J. Filed May 28, 1888. Serial No. 275,265. (No model.)



Claim.—The improvement in the art of printing newspapers or pamphlets, which consists in printing on a plurality of webs, so that certain pages belonging to the same pamphlet succeed each other longitudinally on the same web—*i. e.*, follow each other lengthwise of the web—and bringing the said webs one over another, then severing said webs transversely between the succeeding pages, then superposing the successive cuts on said webs over one another, substantially as described, whereby the various pages may be assembled in proper order without turning or reversing.

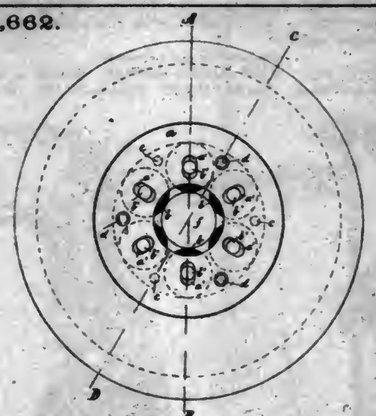
399,660. CRIB ATTACHMENT FOR BEDSTEADS. VIOLA FIFE, Richmond, Ind. Filed Aug. 24, 1887. Serial No. 247,734. (No model.)

Claim.—The combination of a crib having a complete set of supporting-legs pivoted thereto, leaves hinged to the side rail of said crib, and a bedstead provided with keepers on the inner side of the side rail thereof, whereby the crib may be attached to and detached from the bedstead and used either in connection with or independently of the same, substantially as described.

399,661. PIPE-COUPLING. THOMAS FLEMMER, Dunkirk, N. Y. Filed Nov. 7, 1887. Serial No. 254,545. (No model.)

Claim.—1. In pipe-coupling of the variety indicated, the combination, with locking-levers, of lugs or stops connected with the respective members of the coupling for engaging and automatically unlocking the levers when the coupling shall have reached a predetermined degree of extension, substantially as set forth.

2. In pipe-coupling, the combination, with locking-lever, substantially as indicated, of spring for engaging and pressing the levers apart and thereby drawing the members of the coupling toward each other, substantially as set forth.

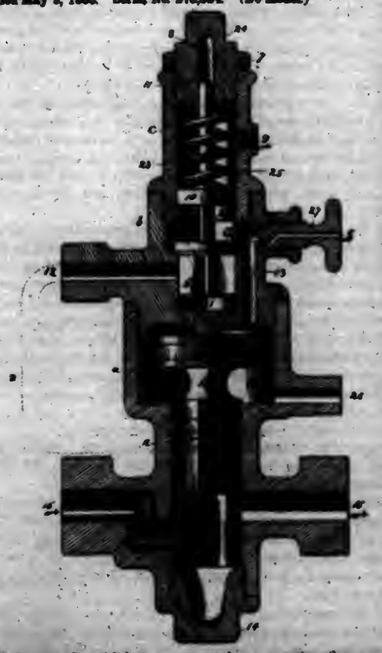


3. In pipe-coupling, the combination, with locking-levers and springs, substantially as indicated, of wedge-shaped flanges for engaging the hook of opposing locking-levers, whereby in locking the levers the springs are compressed, substantially as set forth.

4. The combination, with pipe-coupling, substantially as indicated, of segmental flanges projecting from the face of the respective members of the coupling, said flanges being adapted to interlock, and one flange having a journal bearing in the supporting member of the coupling, substantially as set forth.

399,662. ANTI-FRICTION BEARING. THOMAS R. PERRALL, Boston, Mass. Filed Sept. 5, 1888. Serial No. 284,693. (No model.)

399,662.

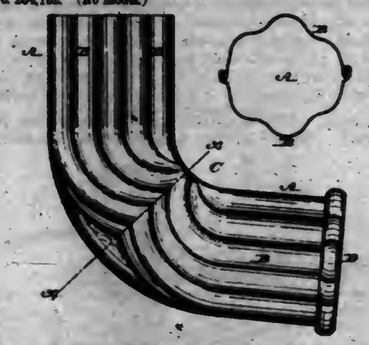


Claim.—1. In an anti-friction bearing, a pair of perforated washers, *a a*, and a series of anti-friction rollers journaled in perforations in said washers, combined with a series of stay bolts or wires, *c c c*, having their ends resting in recesses *a'' a''* on the inside of the washers *a a*, and a series of rivets, *d d d*, riveted to the said washers, substantially as and for the purpose set forth.

2. In an anti-friction bearing, the metal washers *a a*, having the radial perforations *a' a' a'*, as described, and having the anti-friction rollers *b b b* loosely journaled in said perforations, combined with the alternate stay bolts or wires *c c* and rivets *d d*, substantially as and for the purpose set forth.

3. The radially-perforated annular metal washers *a a* and the anti-friction rollers *b b*, having their end trunnions, *b' b'*, loosely journaled in said perforated washers, combined with the centrally-perforated part *c*, and the washer-holding device consisting of alternate stay bolts or wires *c c c*, having their ends resting in recesses on the interior of the washers *a a*, and the rivets *d d d*, substantially in a manner and for the purpose as specified.

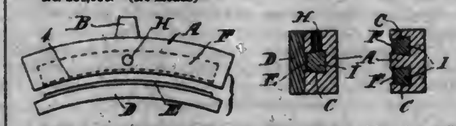
399,663. PRESSURE-REGULATOR. JOHN C. CLARK, Verona, Pa. Filed May 9, 1888. Serial No. 273,234. (No model.)



Claim.—1. In a high-pressure regulator, a main valve constantly exposed to the high-pressure fluid, a piston the area of which is larger than the main valve, low-pressure-fluid connections with one side of the piston, and an auxiliary valve controlling the flow of low-pressure fluid to the main valve and operated thereby, substantially as described.

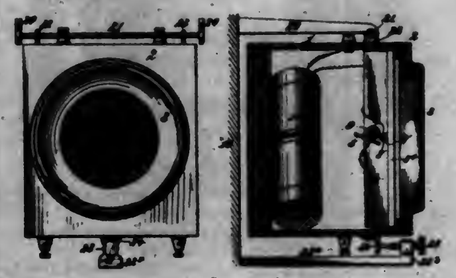
2. In a high-pressure regulator, a main valve and its cylinder, a valve-piston of larger area than the valve and its cylinder, low-pressure-fluid connections with one side of the piston-cylinder, and an auxiliary valve controlling the flow of low-pressure fluid to the main valve and operated thereby, whereby a rise of pressure of the low-pressure fluid will open the auxiliary valve and operate the piston and main valve, substantially as described.

3. In a high-pressure regulator, a main valve constantly exposed to the high-pressure fluid, a piston the area of which is larger than the main valve, low-pressure-fluid connections with one side of the piston, an auxiliary valve controlling the flow of low-pressure fluid to the main valve and operated thereby, and a relief-valve between the auxiliary valve and piston, substantially as described.



399,664. SHEET-METAL PIPE-ELBOW. WILLIAM J. GORDON and EDMUND D. GILBERT, Philadelphia, Pa. Filed Aug. 30, 1888. Serial No. 284,182. (No model.)

Claim.—1. A corrugated sheet-metal pipe-elbow, the corrugations whereof are converged at the center of the bend of the elbow, in the manner and for the purpose described.



2. A sheet-metal pipe-elbow having converging corrugations at the central portion of the bend thereof, substantially as and for the purpose described.

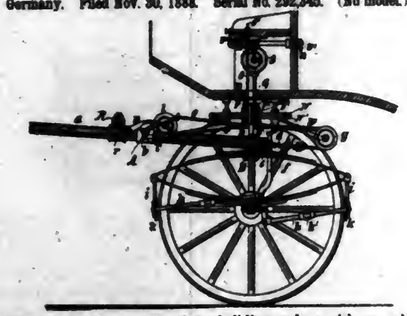
399,665. BRAKE-SHOE. SAMUEL HATT, Montreal, Quebec, Canada, assignor to George Sanderson, same place. Filed July 26, 1888. Serial No. 281,106. (No model.)

Claim.—The combination of the body A, cast with a dovetailed groove, F, with a core of chilled metal, I, cast within said groove F, the whole substantially as described.

399,666. TELEPHONE-TRANSMITTER. CHARLES A. HITCHCOCK, North East, Pa., assignor of two-thirds to Samuel A. Davenport and William Barnley, same place. Filed Feb. 12, 1887. Serial No. 227,404. (No model.)

Claim.—In a telephone-transmitter, the combination of the supporting-arms, the transverse wire or rod, the transmitter-box having eyes turning on said wire or rod, the stationary inclined platform, the loose electrode, the diaphragm and its electrode, the bottom projection on the transmitter-box, and a horizontal bar having a set-screw for adjusting the transmitter-box and holding it at different angles relatively to the plane of the horizon, as and for the purpose herein set forth.

399,667. SAFETY-PIN. WILLIAM F. HYATT, Brooklyn, N. Y. Filed Sept. 1, 1888. Serial No. 284,320. (No model.)

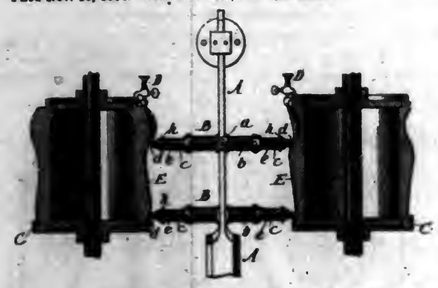


Claim.—1. A safety-pin having a shield provided with a narrow opening and made wider at that side which receives the pointed limb of the pin than that at the opposite side, which is rigidly secured to the unpointed limb, the inner edge of the wide side of the shield being curved downwardly, inwardly, and upwardly, substantially as specified.

2. A safety-pin having a shield rigidly secured to a limb of the pin, and having a wide retaining portion for the pointed limb of the pin, the edge of said wide portion adjacent to the narrow opening curved downwardly, inwardly, and upwardly, forming the curved extension, and the said edge extended laterally, substantially as specified.

3. A safety-pin having a shield provided with a narrow opening having its edges substantially parallel and standing at an angle to the length of the pin, the said shield being wider at that side which receives the pointed limb of the pin than at the opposite side, which is secured to the unpointed limb of the pin, substantially as specified.

399,668. VEHICLE-BRAKE. ADOLF JERNEL, Breslau, Prussia, Germany. Filed Nov. 30, 1888. Serial No. 292,345. (No model.)



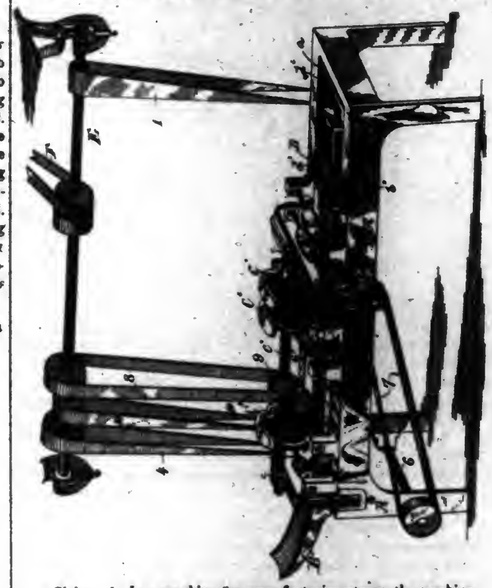
Claim.—1. The combination of sliding pole *a* with cross-bar *e*, levers *f*, rods *h*, and brake-shoes *k*, substantially as specified.

2. The combination of shaft *a* and stop *r* with sheaves *l*, secured to the carriage-body, and with cords *o*, wound on sheaves *l* in opposite directions, and with click *n* on shaft *l'* of sheaves *l*, substantially as specified.

3. The combination of bar *e*, rods *h*, and brake-shoes *k* with straps *w*, sheave *t*, worm-wheel *s*, worm *v*, and handles *v'*, substantially as specified.

399,669. BURNISHING-MACHINE. GEORGE R. KELLEY, Rockford, Ill., assignor to the Rockford Silver Plate Company, same place. Filed Nov. 19, 1888. Serial No. 291,194. (No model.)

Claim.—1. The combination of the tool-holders *c c* and spring *g* with the tube *b*, substantially as specified.



2. The combination of the tool-holders *c c*, having the slots *e* with the tube *b*, pins *f*, and spring *g*, substantially as specified.

3. The combination of the rod A, one or more tubes, *b*, having a boss, *a*, the tool-holder, *c c*, and spring *g*, substantially as and for the purpose specified.

4. In a burnishing-machine, a cylinder or drum, C, in combination with a clamp, D, consisting of a bracket, *i*, stem *j*, head *k*, spring *l*, set-screw *q*, and head *m*, adapted to receive the article to be burnished, substantially as and for the purpose specified.

5. In a burnishing-machine, a cylinder or drum, C, in combination with a clamp, D, consisting of a bracket, *i*, stem *j*, set-screw *q*, head *m*, adapted to receive the article to be burnished, and provided with a projection, *o*, and the plane portion *p*, substantially as and for the purpose specified.

399,670. STAVE-MAKING MACHINE. WILLIAM L. KELLOGG, Mound City, Ill. Filed Sept. 29, 1888. Serial No. 286,769. (No model.)

Claim.—1. In a machine for manufacturing staves, the combination of the frame-work, a longitudinal shaft arranged above said frame-work and carrying a cutter-head, a bed-plate formed with a notch beneath said cutter-head, into which the rear end of the stave may fall as it leaves said cutter-head, and an inclined end for guiding said stave out of the machine, substantially as set forth.

2. The combination, in a machine for dressing staves, of the frame, the cutter-head arranged to operate transversely of said bed-plate, and said bed-plate formed with a short abrupt incline in front of said cutter-head, and a longer incline terminating in another abrupt incline beyond said short inclines, substantially as set forth.

3. In a stave-dressing machine, the combination of the frame-work, a bed-plate mounted thereon formed with a notch, into which the rear end of the stave may drop as it leaves the cutter-head, an upwardly-inclined end beyond said notch, and a cutter mounted above and arranged to operate transversely of said bed-plate and above said notch, substantially as described, and for the purposes specified.

4. In a machine for dressing staves, the combination of the frame, a shaft journaled above said frame and extending longitudinally thereof, a series of cutter-heads thereon arranged to cut to different depths, and suitable feeding and driving mechanism, substantially as set forth.

5. In a machine for dressing staves, the combination of the frame, the bed-plate for guiding the staves, a cutter-head formed to dress one side of said stave, mounted beneath said bed-plate, a series of cutter-heads arranged to cut into the block different depths for dressing the other side of said stave mounted above said bed-plate, and an adjustable table for receiving the stave-blocks and suitable mechanism for carrying them forward, substantially as set forth.

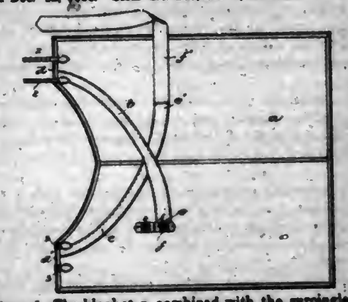
399,671. PAPER-BAG AND TWINE HOLDER. CHAMBERS E. KEMLE, Wilmington, Del. Filed July 7, 1888. Serial No. 279,286. (No model.)

Claim.—1. A combined paper-bag and twine holder consisting of a suspending-rod, a twine-holder secured to the lower end thereof, and a paper-bag holder surrounding said twine-holder and depending below the same, said bag-holder being swiveled upon the lower end of said rod above the point of attachment of the twine-holder, substantially as set forth.

2. In a combined paper-bag and twine holder having a suspending-rod, and the twine-holder and paper-bag holder suspended therefrom, the suspending-rod formed in two parts, *g h*, one part attached at the upper end to the support above and the other attached to the twine-holder at the lower end, and one sliding adjustably on the other.

3. In a combined paper-bag and twine holder having a suspending-rod, and the paper-bag holder and twine-holder suspended therefrom, the twine-holder fixedly attached to the lower end of the sus-

399,671.



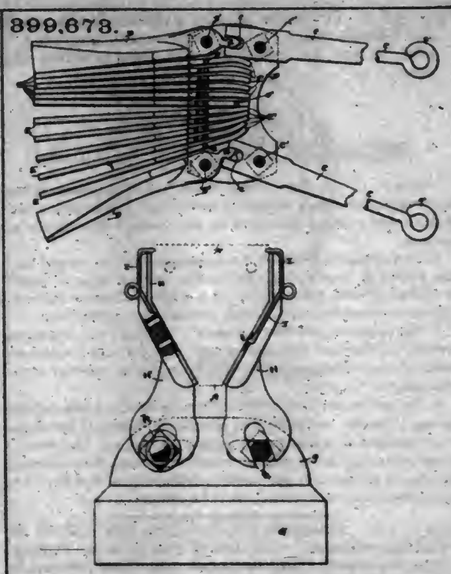
pending-rod, and the paper-bag holder being adapted to swivel around and slide on the suspending-rod above the twine-holder, as set forth.

4. The paper-bag holder having a body, C, of polygonal form, and bag-hooks pivoted in pairs on the respective sides of the same, and having their points swung against the said sides and held in catch-notches thereof, substantially as herein specified.

5. The paper-bag holder having a body, C, in combination with the bag-hooks, each having a vertical axis or pivot part by which it is pivoted to said body, and each having a hook part projecting from the axis at a sharp angle and a steep inclination, substantially as set forth.

399,672. HORSE-BLANKET. ARTHUR H. KINDER, Boston, Mass. Filed Dec. 12, 1888. Serial No. 293,355. (No model.)

Claim.—1. The blanket *a*, combined with the surcingle permanently attached to it, and composed of stays or stripe crossing the shoulder portions and extended to the front edges of the blanket, substantially as shown and described.



2. The blanket *a*, combined with the stripe *b c*, attached to it, extending from the front edges, *d d'*, across the shoulder portions and crossing each other at the median line of the back portion, and the clasp for engaging the free end *f'* of the strip *c*, substantially as described.

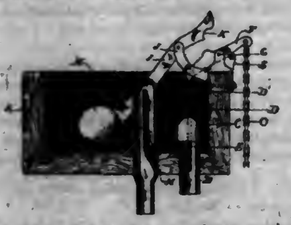
3. The blanket *a*, and stripe or stays *b c*, secured thereto, as shown and described, one of said stripe or stays, as *c*, having the free end *f* combined with the clasp, comprising the corrugated hinged plates and the fastening therefor, substantially as described.

4. The blanket *a*, and stripe or stays *b c*, secured thereto, as shown and described, one of said stripe or stays, as *c*, having the free end *f'* combined with the clasp, comprising the corrugated hinged plates and the fastening therefor, one of said corrugated plates having teats and the other having sockets or recesses to receive said teats, substantially as described.

399,673. APPARATUS FOR TEMPERING MOWING-MACHINE SECTIONS. LEVI L. LANE, Akron, Ohio, assignor to the Whitman & Barnes Manufacturing Company, same place. Filed Sept. 27, 1888. Serial No. 286,506. (No model.)

399,673.

Claim.—1. In so-called multiple tongs for holding a series of mowing-machine sections, the combination, with hand-levers and arms adapted to co-operate with such levers at the sides of the tongs, substantially as indicated, of a series of fingers pivoted to the head of the tongs between the pair of hand-levers and pair of arms aforesaid, the arrangement of parts being substantially as shown, whereby the fingers are opened and closed by corresponding movements of the hand-levers, substantially as set forth.



2. The combination, with hand-levers and arms adapted to co-operate with such levers, substantially as indicated, of a series of fingers pivoted to the head of the tongs and provided with projecting shanks, the hand-levers actuating the shanks of the fingers in distending the tongs, and the arms actuating the fingers proper inclosing the tongs, substantially as set forth.

3. The combination, with a pair of angle-plates located in reverse position and held separate, forming the head of the tongs, substantially as indicated, of hand-levers, arms adapted to co-operate with such levers, and a series of fingers pivotally connected with the angle-plates to form so-called multiple tongs, substantially as set forth.

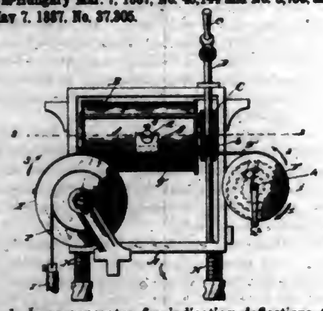
4. The combination, with tongs adapted to grasp a series of mowing-machine sections, substantially as indicated, of holder for assembling such sections for supplying the tongs, such holder having fixed jaws for receiving the sections, and yielding jaws for holding the sections separated, the one from the other to correspond with the distended fingers of the tongs, substantially as set forth.

5. The combination, with base having stationary jaws adjustably secured thereto, of movable spring-actuated jaws mounted on such stationary jaws, such movable jaws having teeth for holding the sections separated, such teeth in the normal or closed position of the movable jaws overhanging the inner faces of the stationary jaws, substantially as set forth.

399,674. FLUSH-TANK. JAMES LAWSON, Denver, Colo. Filed Aug. 13, 1888. Serial No. 282,572. (No model.)

Claim.—In a flush-tank for water-closets, a valve, C, provided with a suitable stem, a lever, F, connected with the stem of valve C and provided with a lug, L, float H, provided with a lever, I, having a support, J, for its fulcrum, the short arm of lever I being provided with a notch, K, and a discharge-siphon, M, substantially as described, and for the purpose set forth.

399,675. DEVICE FOR SHAPING MATERIAL TO THE ARC OF ANY DESIRED CIRCLE. PULASKI LEWIS, Louisville, assignor to R. T. Miller, Covington, Ky. Filed Nov. 22, 1888. Serial No. 291,612. (No model.)



Claim.—1. In a slot-cutting device, the combination of the hinged bed-plates, carriers adapted to slide in said slots formed in said bed-plates, and a husk-box secured to said carriers, substantially as described.

2. In a slot-cutting device, the combination of the hinged bed-plates, slotted as described, with the carriers adapted to move in said slots of the bed-plates and carrying the husk-box, and means for regulating the movement of said carriers, substantially as described.

3. The combination of the bed-plates *a a'*, hinged and slotted, as described, the carriers *c c'*, furnished with studs *d d'*, and a husk-box pivoted upon said studs and carrying the blank to be operated upon, substantially as described.

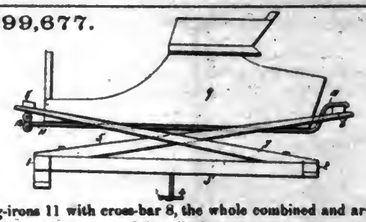
4. The herein-described device for cutting slots, consisting of the following elements: bed-plates *a a'*, hinged and slotted, as described, having perforations *p* near the hinge-joint, carrier *c c'*, husk-box *f*, secured to the carriers by means of studs *d d'*, means for producing movement to carriers *c c'*, and means, substantially as described, for securing the blank to be slotted into the husk-box.

399,676. APPARATUS FOR INDICATING THE FLEXION OF BRIDGES, RAILS, &c. OSCAR LEUNER, Dresden, Saxony, Germany. Filed Jan. 26, 1887. Serial No. 225,559. (No model.) Patented in England Oct. 28, 1886, No. 13,544; in Belgium Nov. 15, 1886, No. 74,936, in Austria-Hungary Mar. 7, 1887, No. 43,144 and No. 3,739, and in Germany May 7, 1887, No. 37,305.

Claim.—1. In an apparatus for indicating deflections, the combination, with an indicator-drum on a rotative shaft, of a rotative spring-drum, a pulley provided with a pendent weight, a band connected with said spring-drum and pulley, and a head provided with a marking-pencil and secured to the said band, substantially as and for the purposes described.

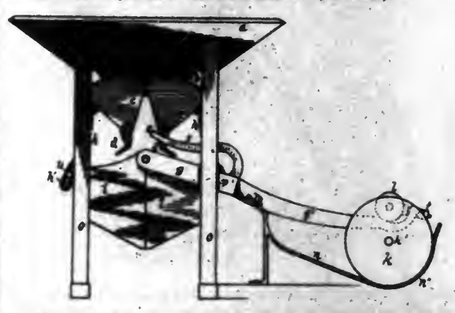
2. The combination, with an indicator-drum on a rotative shaft, of a spring-drum on a shaft provided with ratchet-wheels, pawls engaging with said ratchet-wheels, a stepped pulley and a weight connected therewith, a band which is connected with said pulley and with said spring-drum, a sliding head secured to said band, and a rod, *f*, on which said head moves, said band rotating the indicator-drum, substantially as and for the purposes described.

3. The combination, with the rotative indicator-drum, of two rotative cylindrical devices, a band connected with said devices and carried near said drum, a fixed rod, and a movable head provided with a pencil, the said movable head being mounted on said rod and secured to the said band, substantially as and for the purposes described.



4. The combination, with the shaft *a*, an indicator-drum on said shaft, the shaft *D*, and the worm *b* on said shaft, of a fixed rod, *f*, a movable head provided with a pencil and mounted on said rod, a band, *g'*, which is secured to said movable head, and mechanism, substantially as described, for drawing said band in either of two opposite directions, substantially as and for the purposes described.

399,677. VEHICLE-SPRING. JOHN R. LINTON, New Bedford, Mass. Filed Aug. 3, 1888. Serial No. 281,885. (No model.)



Claim.—1. The combination, with the side bars, 3, of the wooden springs supported thereon near the ends of the said bars 3, extending thereabove at an angle, and passing each other near their centers, substantially as shown and described.

2. In a device of the character herein specified, head-block 1, rear axle, 2, curved side bars, 3, wooden springs 5 and 7, connecting cross-bars 6 and 8, hanging-irons 10 and 11, and links 12, connecting hanging-irons 11 with cross-bar 8, the whole combined and arranged substantially as shown and described.

399,677.

399,678. AUTOMATIC GRAIN-SCALE. JAMES LOCHER, Decatur, Ill. Filed May 1, 1888. Serial No. 272,480. (No model.)

Claim.—1. In automatic grain-scales, in combination, a bivalvular cut-off on a permanent pivot, a bivalvular weighing-receptacle pivoted in a scale-beam below the cut-off, and arms connecting the receptacle with the cut-off, as and for the purpose set forth.

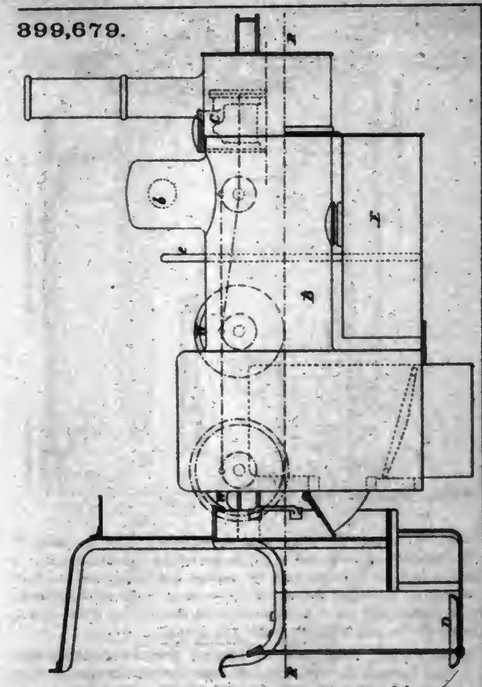
2. In automatic grain-scales, in combination, a bivalvular cut-off on a permanent pivot, a scale-beam having two pivotal points, a bivalvular weighing-receptacle pivoted in the scale-beam, arms connecting the receptacle with the cut-off, and a stop partaking of the motion of the scale-beam and adapted to temporarily prevent complete closing of the cut-off, as and for the purpose set forth.

3. In automatic grain-scales, in combination, a bivalvular cut-off on a permanent pivot, a scale-beam having two pivotal points and a shifting weight, a bivalvular weighing-receptacle pivoted in the scale-beam, arms connecting the receptacle with the cut-off, and a stop partaking of the motion of the scale-beam and adapted to temporarily prevent complete closing of the cut-off, as and for the purpose set forth.

4. In automatic grain-scales, in combination, cut-off *c c*, scale-beam *g g'*, having pivots *q* and *r*, weighing-receptacle *i i*, pivoted in the scale-beam, arms *h h*, slotted at *N' N'*, weight *k k' l* on beam *g g'*, legs *d d* on the cut-off, and roller *e* on arm *f*, as and for the purpose set forth.

5. In automatic grain-scales, in combination with a weighing-receptacle, beam *g*, curved at *g'*, and provided with upward projection *g''*, the weight comprising the opposed disks internally recessed and the interposed sheave, and the adjusting device *s t*, as and for the purpose set forth.

6. In automatic grain-scales, in combination with a weighing-receptacle, beam *g g g'*, weight *k k l*, and incline *m*, as and for the purpose set forth.



7. In automatic grain-scales, in combination with a weighing-receptacle, beam *g g g'*, weight *k k l*, inclines *m* and *n*, and stop *n'*, as and for the purpose set forth.

399,679. LOCOMOTIVE FOR SINGLE-RAIL RAILWAYS. ANATOLE MALLET, Paris, France. Filed July 27, 1886. Serial No. 209,245. (No model.) Patented in England June 10, 1886, No. 7,810.

Claim.—1. The combination, with the single supporting-rail R of a single-rail elevated railway, of a locomotive having a pair of supporting-wheels in line upon the upper side of said rail, and provided with a boiler, B, and water-tank E at each side, all of which depend below the wheel-supporting rail at opposite sides thereof and serve to keep the center of gravity low, a pair of cylinders, C, at opposite sides of the rail working one of the supporting-wheels, and connections between the latter and the other supporting-wheel, substantially as described.

2. The combination, with the single supporting-rail R and side rails, G, below the same of a single-rail elevated railway, of a locomotive having a pair of supporting-wheels in line upon the upper side of said rail, and provided at each side with a boiler, B, and water-tank E, all of which depend below the wheel-supporting rail at opposite sides of the side rails to keep the center of gravity low, a pair of

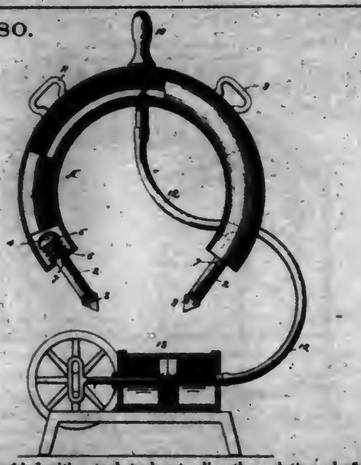
399,679.

cylinders, C, at opposite sides of the rails working one of the supporting-wheels, connections between the latter and the other supporting-wheel, and the side wheels, *g g*, bearing against the opposite rails G below the supporting-rail R, substantially as described.

3. The combination, with the single supporting-rail R, of a single-rail elevated railway, of a locomotive having at each side a depending boiler, B, and water-tank E, all of which hang below said rail, two wheels, W W', arranged in line on the rail, the axles A A', carrying the wheels, the cylinders C at opposite sides of the rail driving one of the axles, and connections between the latter and the other axle, said axle A' having a spherical boss, N, rotating but sliding with it, and the wheel W' having a hollow hub provided with internal spherical surfaces fitting the boss and rotating and sliding with the latter, substantially as described.

4. A locomotive for a single-rail elevated railway, consisting of a depending boiler, B, and water-tank E at each side, a pair of side cylinders, C, an axle, A, having a supporting-wheel, W, and driven by the cylinder-pistons, an axle, A', connected with and driven by the other axle, and having the boss N rotating but sliding with it and provided with studs *n*, and the supporting-wheel W', having a hollow hub provided with internal spherical surfaces fitting the boss, substantially as described.

5. A locomotive for a single-track elevated railway, comprising a depending boiler, B, and water-tank E at each side, a pair of side cylinders, C, a shaft, A, carrying a supporting-wheel, W, and driven by the cylinder-pistons, a shaft, A', driven by the other shaft and having a spherical boss, N, sliding on it, and provided with studs *n*, the supporting-wheel W', having a hollow hub and rotating and sliding with the boss, and the swinging fork F, having eyes in which journals on the wheel revolve, substantially as described.



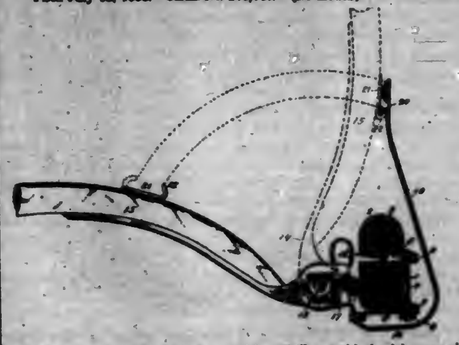
399,680. IMPLEMENT FOR CUTTING STONE, &c. JAMES W. MALOY, Marietta, Ga. Filed July 12, 1888. Serial No. 279,760. (No model.)

Claim.—1. An implement for cutting stone, consisting of a hollow frame having converging arms, each provided with a sliding piston or hammer, and with a tool-stock arranged to be struck by said hammer, and projecting beyond the end of the arm with a retracting-spring, and with a port for the admission and discharge of air for actuating the hammer, substantially as set forth.

2. The combination, in a stone-reducing implement, of a frame having two converging hollow arms, a tool-stock extending through the ends of the arms, a sliding hammer within each arm, and a pump connected with the chambers in the arms through a flexible pipe, substantially as set forth.

3. A stone-cutting implement consisting of a frame provided with hollow arms hinged together, each containing a reciprocating hammer and provided with a tool-stock extending through the end of the arm in position to be struck by the hammer, and a spring for retracting the stock, and a port for the admission and discharge of air into and from the hollow arms, substantially as set forth.

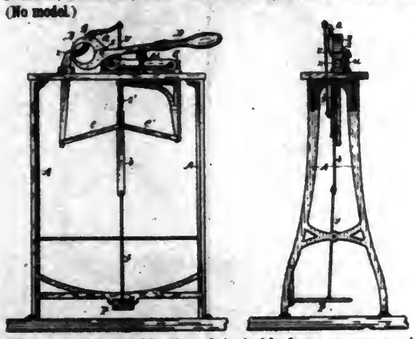
399,680.



399,681. CLOSURE FOR CHURNS. JOHN MCDERMAID, Rockford, Ill. Filed Jan. 23, 1888. Serial No. 297,322. (No model.)

Claim.—In combination, a churn having cover-retaining lugs secured to the outside of and projecting above the chine of the same, a ring-head set into the chine thereof and having cover-guide lugs extending from the top of the latter along said chine, a cover fitted to the chine-ring, and suitable fastenings for retaining said cover thereon, substantially as described, and for the purpose specified.

399,682. THILL-COUPLING. FRANCIS J. MILLER, Carrollton, Ky. Filed July 12, 1888. Serial No. 279,747. (No model.)



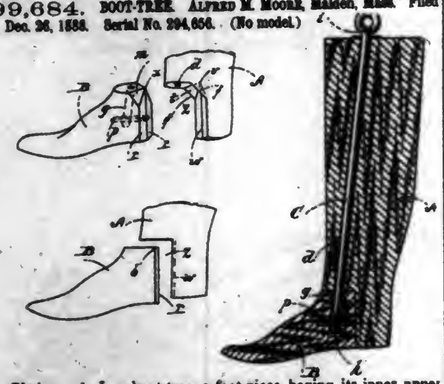
Claim.—1. The combination, with a thill provided with a catch and its shackle, of a spring anti-rattler consisting of an open loop or bow portion inserted between the thill-iron and the shackle, one member of the loop resting against the inner face of the shackle passing under the same to the rear and above and terminating in a catch, and the other member of the loop resting against and partly embracing the thill-iron, substantially as specified.

2. The combination of the axles 1 and 2, having the shackle herein described, consisting of the upper and lower plates, 3 and 4, and embracing the metal portion 1 of the axle, and formed with the perforated projections 10, connected to the axle by the clip 9, and perforated projections 6, bound together by the bolt 7, having the nut 8 at the opposite side, and having the forwardly-projecting lugs or ears 12, substantially as specified.

3. The combination of the axles 1 and 2, having the shackle herein described and consisting of the plates 3 and 4, binding-bolt 7, and binding-clip 9, arranged as specified, and having the opposite lugs 12, thill-iron 14, bolt 13, and thill 15, having the catch 21, with the interposed spring 16, bent, as at 17, to embrace the thill-iron bent

upon itself, as at 18, to the rear and upwardly, as at 19, and terminating in the catch 20, substantially as specified.

399,683. MACHINE FOR BENDING METAL SASH. WILLARD F. MILLS, Kalamazoo, Mich. Filed June 12, 1888. Serial No. 276,840. (No model.)



Claim.—1. The combination of a suitable frame or support, jaws pivoted to open and close and having their gripping ends curved, a clamp for clamping the sash on each flanged side, and means for operating said clamp, substantially as set forth.

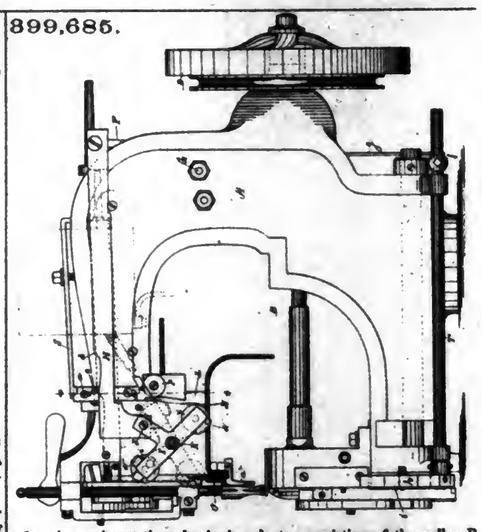
2. The combination of a suitable support, the jaws having their gripping ends curved, said jaws mounted upon said supports, one of the jaws being pivoted to the other, the latter being stationary, a clamp on each side of the jaws for clamping the flanged sides of the sash, and an adjustable stop to limit the play of the movable jaw, substantially as set forth.

3. The combination of a suitable support, the jaws having the curved ends, the pivoted clamp-levers arranged to clamp the sash in the jaws between them, the vertically-playing rod attached to the end of one of the clamp-levers, a treadle to which the other end is attached, a spring forming a resistance to the downward movement of said rod, a toggle-bar pivoted to the end of the other clamp-lever and to the vertically-playing rod, and a toggle-bar pivoted to said rod at one end and to a suitable support at the other end, substantially as set forth.

399,684. BOOT-TREE. ALFRED M. MOORE, Malden, Mass. Filed Dec. 26, 1888. Serial No. 294,656. (No model.)

Claim.—1. In a boot-tree, a foot-piece having its inner upper corners beveled, substantially as and for the purpose described.

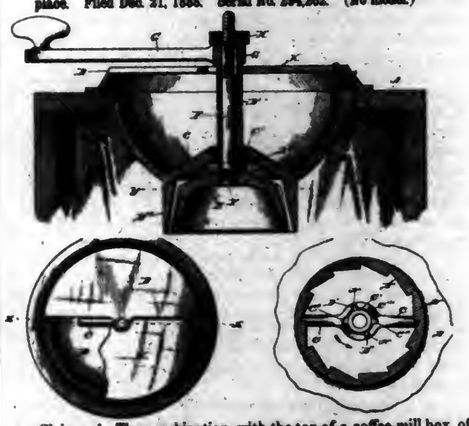
2. In a boot-tree, the combination of a foot-piece having beveled upper corners, a leg portion provided with a chamber having converging walls for receiving the beveled portion of said foot-piece, and means for detachably locking said foot-piece to the leg, substantially as described.



399,685. TAKE-UP DEVICE FOR SEWING-MACHINES. LEE E. MOORE and WILLARD A. DAVIS, Boston, Mass., (Charles P. Gaither executor of Lee E. Moore, deceased,) assignors to the Davis-Moore Sewing Machine Company, Saco, Me. Filed Nov. 5, 1886. Serial No. 218,108

Claim.—1. In a sewing-machine, the combination, with an intermittent thread-gripping device, of a take-up lever having two oppositely-extending thread-carrying arms.

2. In a sewing-machine, the combination, with the sliding bar H and its operating mechanism, of the three-armed take-up lever pivotally connected with said bar to be operated thereby, the sheaves or rollers *i*, carried by the two opposite arms of said lever, and the guards N, overlapping said sheaves or rollers.



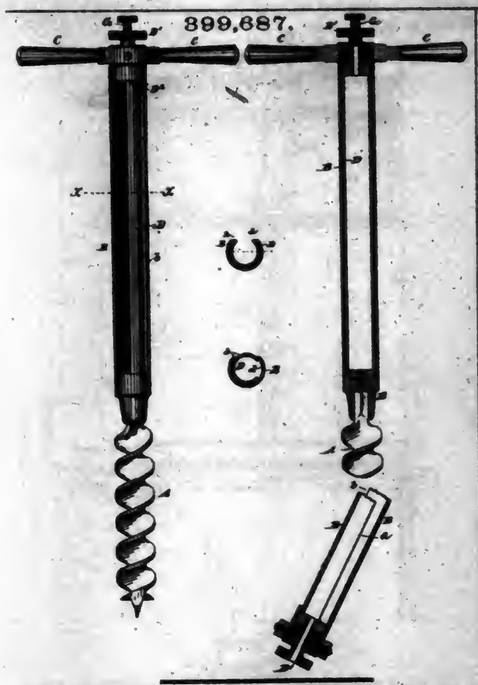
3. In a sewing-machine, the combination, with a take-up lever,

399,685.

of an intermittent thread-gripping device consisting of the pulley P, the vertically-movable sliding bar R, having a projection, as pin *c*, a spring, as S, for pressing said bar against said pulley, and the horizontally-reciprocating sliding bar H, having an incline or shoulder, as *d*, to engage said pin or projection and lift the said bar R out of contact with the said pulley to release the thread.

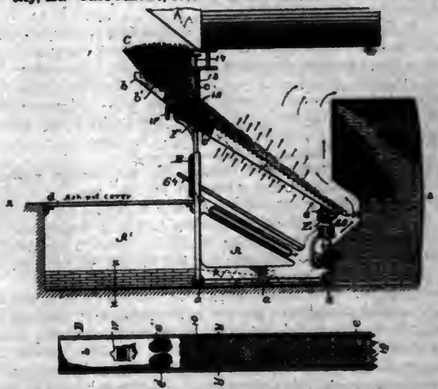
399,686. COFFEE-MILL. EDGAR H. MORGAN and CHARLES MORGAN, Freeport, Ill. assignors of one-third to Albert Baumgarten, same place. Filed Dec. 21, 1888. Serial No. 294,262. (No model.)

Claim.—1. The combination, with the top of a coffee-mill box, of a grinding-shell lying below the top and a cover lying above the top, said shell being provided with a diametrical bridge having a central opening and said cover with a central tube adapted to pass through said opening and to lock the parts together when they are rotated with reference to each other.



2. The combination, with the top A, and the hopper B, lying below the top and having the grinding-shell B″, and the bridge C, formed with the central opening, C′, and notches C″, of the cover D, resting upon the top and provided with a central tube, D′, formed with lugs D″, adapted to pass through the opening in the bridge and to lock the bridge and cover together upon the rotation of the cover with reference to the bridge, substantially as set forth.

399,687. GRAIN-SAMPLER. BENJAMIN F MORNINGSTAR, Brooklyn, N. Y. Filed Mar. 1, 1888. Serial No. 265,879. (No model.)



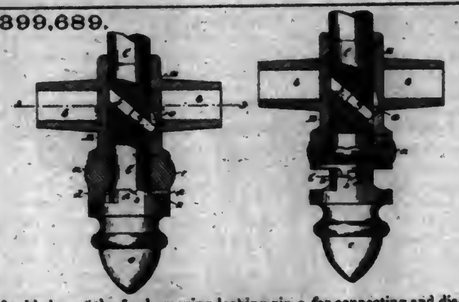
Claim.—1. The sample-trier described, having, in combination with the boring-bit A and hollow tubular shank B, with its open side *b*, the internal close-fitting tube, D, having an open side, *d*, and means, as the button D′, for turning it, all arranged for joint operation as herein specified.

2. In a sample-trier, the plug G, in combination with the boring-bit A, shank B *b*, handle C, internal tube, D *d*, and turning means D′, for the latter, all arranged to serve substantially as herein specified.

399,687.

399,688. FURNACE-GRATE. MAXIMILIAN H. MOSKOVITS, Kansas City, Mo. Filed June 21, 1888. Serial No. 277,733. (No model.)

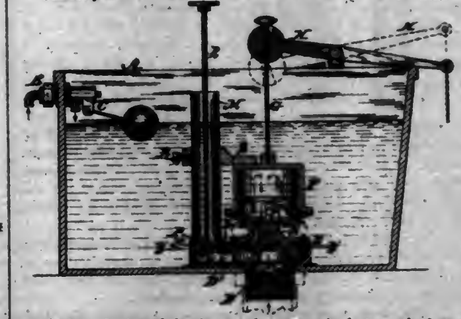
Claim.—1. The improved grate-bar constructed solid for a considerable portion of its length and with the remaining portion of its length in the form of a fire-surface composed of short zigzag webs which are disposed transversely, the upper surface of said bar being stepped or corrugated, substantially as described.



2. The combination of inclined grate-bars provided with suitable bearing-sockets near each end, friction-balls located in these sockets, a transverse bearing-bar, E, provided with depending shanks 60 and upon which the lower ends of said grate-bars rest, cams 62, which engage the lower ends of said shanks to raise and lower same, and a hand-lever for rotating said cams, substantially as described.

399,689. POWER-FAN. PETER MURRAY, Jr., Newark, N. J. Filed Nov. 22, 1887. Serial No. 255,846. (No model.)

Claim.—1. In a power-fan, the combination, with the driven shaft C and the loosely-mounted vertically-moving hub B, for carrying the



399,689.

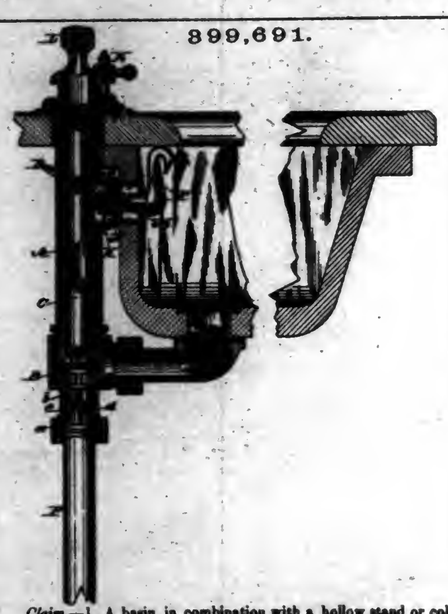
fan-blades, of the freely-moving locking-pin *g*, for connecting and disconnecting the shaft and hub, substantially as described.

2. In a power-fan, the combination, with the shaft C and the loosely-mounted hub B, said shaft and hub being provided, one with the recess *e* and the other with the freely-moving locking-pin *g*, of the head *c* and loose collar *a*, having the coacting inclines *d*, for raising and lowering the hub, substantially as described.

399,690. TANK OR WATER-VALVE. WILLIAM H. NEWELL, Philadelphia, Pa. Filed Dec. 3, 1887. Serial No. 256,864. (No model.)

Claim.—1. A tank having a valve-seat raised above the bottom thereof, an outlet, D, within said valve-seat, a guiding chambered plunger connected to said seat by the neck K and having an opening in the top, openings in the bottom, and an inner passage leading from the chamber thereof, the hollow valve F, closed at the top and adapted to cover said plunger when seated, the tube L, and chamber D′, connecting said inner passage of plunger and said outlet D, said parts being combined substantially as described.

2. The combination of a tank having a valve-seat, with the outlet D leading from within said seat, with the stationary plunger J, connected to said valve-seat and having the chamber *b* in its upper part, with openings at top and bottom, the passage *a*, leading from said chamber and communicating with said outlet D, and a cup-shaped valve closed at top and open below, and adapted to closely encircle said plunger J and rest on said valve-seat, substantially as and for the purpose set forth.



3. The valve-seat with outlet-pipe D leading from within the same, the chambered guiding-plunger J, connected by the neck K to said seat and having openings at top and bottom, the passage *a*, leading from the plunger-chamber, the chambered valve F, closed at the top and inclosing the plunger, the tube L, and chamber D′, said parts being combined substantially as and for the purpose set forth.

4. A tank with valve-seat and outlet, the said valve-seat having connected therewith a guiding-plunger having an open top and bottom, and the chamber *b* and passage *a*, the valve F, the tube L, with valve-seat N, the valve P, connected to rod R, the overflow-tube M, with rod R therein, and the chamber D′, leading from tube L to outlet D, said parts being combined substantially as and for the purpose set forth.

5. A tank with a raised valve-seat and an outlet leading from within said seat, a chambered plunger secured by a neck to said seat and having a passage leading from said chamber, a valve covering said plunger, mechanism, substantially as described, for raising and lowering said valve, a tube connected with said passage in said plunger and provided with an adjustable valve, and a chamber directly connecting said tube with the tank-outlet, said parts being combined substantially as described.

399,691. SECRET SUPPLY, WASTE, AND OVERFLOW FOR BASINS AND BATHS. WILLIAM H. NEWELL, Philadelphia, Pa. Filed May 22, 1888. Serial No. 274,063. (No model.)

899,691.

Claim.—1. A basin, in combination with a hollow stand or column having overflow openings, a tube within said column, having openings corresponding to the overflow-openings of the stand, a nozzle leading from said overflow-openings, supply-pipes leading into said nozzle, and a pipe leading from said basin to said column, substantially as and for the purpose set forth.

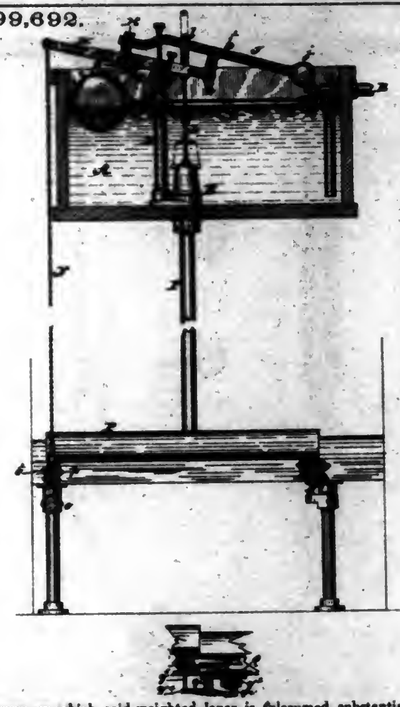
2. A stand having an overflow-collar, a valve and a supply-pipe, and a nozzle which passes through the covering cap or strainer of said collar and is connected with said supply-pipe, said parts being combined and operating substantially as described.

3. The confluent supply-pipes united at the overflow-collar of the stand and connected with a discharge-nozzle which passes through the strainer of said collar, substantially as described.

4. The combination of a basin with a stand-pipe having a valve-seat in the lower part thereof, an outlet-pipe and overflow-openings in the top, a tube within said stand-pipe having overflow-openings, a valve seated on said seat in the lower part of the stand-pipe, confluent pipes leading from said overflow-openings to a nozzle discharging within the basin, and a pipe connecting said basin and stand-pipe, substantially as described.

899,692. TANK AND WATER-VALVE. WILLIAM H. NEWELL, Philadelphia, Pa. Filed May 22, 1888. Serial No. 274,695. (No model.)

Claim.—1. A tank with an inlet and an overflow pipe, a lever pivoted to bearings secured to a cross-bar on the upper part of the tank, and having a chain secured to one end and provided at its other end with a slot and an upright, a second lever pivoted in said upright of first lever and having a weighted end, a slotted guide secured to said cross-bar, and a discharge-pipe with controlling-valve, having a rod with slotted or bifurcated upper end, said parts being combined substantially as described.



2. A tank with the lever H pivotally secured to the upper part thereof, and having the slot A and upright A', the weighted lever J, fulcrumed to the upright A', a discharge-pipe for said tank, a valve controlling said discharge-pipe and having a rod with slotted upper end, and a slotted guide, in which the light end of said lever J operates, said parts being combined substantially as described.

3. A basin with a discharge-pipe, a pivoted lever with chain at one end and a slot and upright at the other end, a weighted lever pivoted to said upright, a valve with stem having bifurcated upper end, a guide in which the light end of said weighted lever operates, a pivoted lever connected to the lower end of the chain, and a seat-lid bearing on one end of said lever, said parts being combined substantially as and for the purpose set forth.

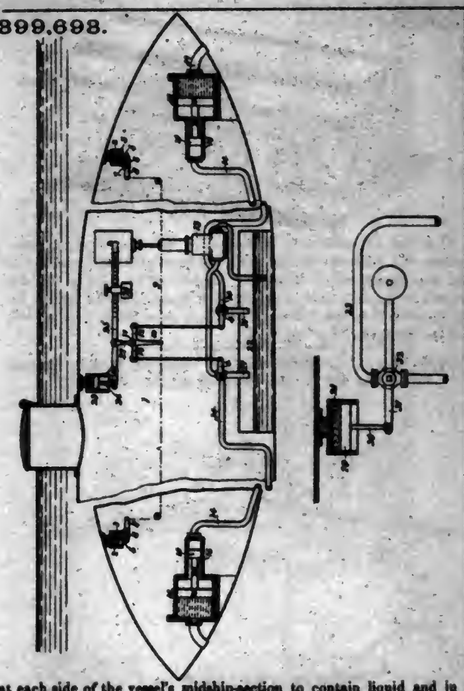
4. In a device of the character named, the plate Q, having lug q and socket q', the lever q^4, pivoted to the lug q, the receding tube q^5 and spring q^6, and the arm q^4, adapted to bear against the seat, said parts being combined substantially as described.

5. The combination, with the rod carrying the valve, having a bifurcated end, of the weighted lever passing through said bifurcated end forming a loose connection between the said rod and lever, and

899,692.

a lever on which said weighted lever is fulcrumed, substantially as and for the purpose described.

6. The combination, with the lever carried by the closet, of the lever fulcrumed to the tank connected therewith, said lever having an arm, a weighted lever fulcrumed to said arm, the rod carrying the valve loosely connected with the weighted lever, the slotted guide for guiding and limiting the movement of the end of the weighted lever, and the screw for regulating the throw of said weighted lever, all arranged and adapted to serve substantially as described.



899,693. SUBMARINE VESSEL. GRATTON POOLE and WILLIAM C. STOREY, London, County of Middlesex, England. Filed Feb. 6, 1888. Serial No. 263,113. (No model.) Patented in England Mar. 21, 1887, No. 4,227; in France Jan. 23, 1888, No. 183,279; in Belgium Jan. 24, 1888, No. 80,364; in Germany Jan. 28, 1888, No. 44,063; in Italy Mar. 31, 1888, XLV, 218; in Austria-Hungary May 27, 1888, No. 4,533, and in Spain June 7, 1888, No. 7,905.

Claim.—1. In a submarine vessel, the combination of pistons or their equivalent, subject on one side to the pressure of the water in which the vessel is placed and arranged to be capable of moving under the differential action of the water-pressure thereon, chambers arranged at each side of the vessel's midship-section to contain liquid, a fluid-pressure generator adapted to supply fluid under pressure, pipes connecting said generator with said chambers, and a valve or valves to control the passage of fluid under pressure from said generator to one of said chambers and the escape of fluid from the other of said chambers, said valve or valves being arranged to be operated by movement of said pistons or equivalent due to difference of pressure thereon, for the purpose specified.

2. In a submarine vessel, the combination of pistons or their equivalent, subject on one side to the pressure of water in which the vessel is placed, and so connected and arranged as to be operated by the difference in water-pressure upon them, a fluid-pressure generator adapted to supply fluid under pressure, chambers arranged at each side of the vessel's midship-section, and each in communication at one end with a liquid-supply and at the other end with said fluid-pressure generator, pistons arranged to travel in said chambers, and a valve or valves adapted to control the passage of fluid from said generator to each of said chambers, and also the escape of such fluid therefrom, said valve or valves being in connection with said pistons or their equivalent, and arranged to be operated thereby, substantially as described.

3. In a submarine vessel, the combination of a piston or equivalent, subject on one side to pressure of the external water, a loaded lever connected at one end to said piston or equivalent, a fluid-pressure generator adapted to supply fluid under pressure, chambers arranged

899,693.

at each side of the vessel's midship-section to contain liquid and in communication with said generator, and a valve or valves to control the passage of fluid under pressure from said generator to said chambers, and the escape of fluid therefrom, said valve or valves being connected to said loaded lever, substantially as described, for the purpose specified.

4. In a submarine vessel, the combination, with pistons or their equivalent, connected to move together and arranged at opposite sides of the vessel's midship-section and subject on one side to the pressure of the water in which the vessel is placed, a loaded lever, a piston or equivalent, also subject on one side to the pressure of the external water and connected to one arm of said lever, a fluid-pressure generator, chambers arranged at opposite sides of the vessel's midship-section to contain liquid, and each in communication at one end with said fluid-pressure generator, and at the opposite end with a liquid-supply, and a valve or valves adapted to control the passage of fluid under pressure from said generator to one of said chambers and the escape of fluid from the other of said chambers, said valve or valves being connected with said loaded lever and with the connected pistons, substantially as described, for the purpose specified.

5. In a submarine vessel, the combination of chambers 2, arranged at opposite sides of the vessel's midship-section and in free communication at one end with the external water, pistons 3, or their equivalent, adapted to move in said chambers, a pump, 13, adapted to supply fluid under pressure, pipes 14, in communication with said pump and adapted to conduct said fluid from one part of the vessel to another, valves 4, adapted to control the passage of said fluid through said pipes 14, and means for connecting said pistons 3 with said valves 4, substantially as herein described, for the purpose set forth.

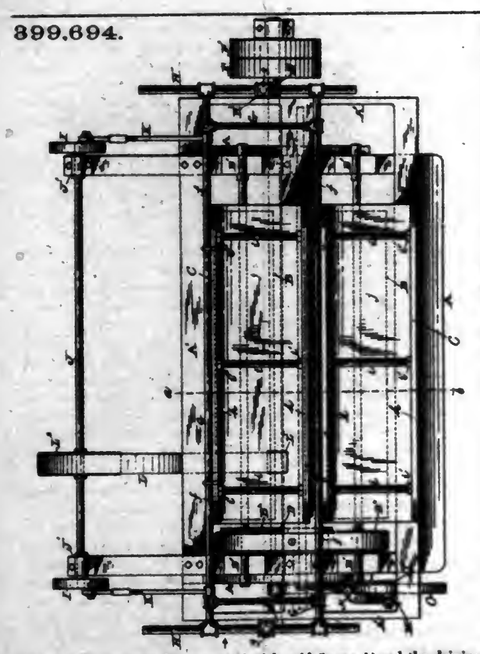
6. In a submarine vessel, the combination of chambers 2, each in communication at one end with the external water, pistons 3, or equivalent, arranged to move in said chambers, levers 6 8, and chain 9, or equivalent, connecting said pistons, a double bell-crank lever, 10 12, pivoted at 11 and connected with said chain 9, a pump, 13, adapted to supply fluid under pressure, pipes 14, in communication with the delivery side of said pump and capable of conducting said fluid from one part of said vessel to another, a tank, 22, containing fluid and placed in communication with the suction side of said pump, and valves 4, connected with said double bell-crank lever 10 12 and adapted to control the passage of fluid through said pipes 14, all substantially as herein described.

7. In a submarine vessel, the combination of chambers 2, each in free communication at one end with the external water, pistons 3, or equivalent, arranged to move in said chambers, a pump, 13, adapted to supply fluid under pressure, pipes 14, in communication at one end with said pump, valves 4, adapted to control the passage of said fluid through said pipes 14, means for connecting said pistons with said valves 4, cylinders 15 16, located at each side of the vessel's midship-section, and each in communication at one end with one of said pipes 14, and at the other end with the external water, connected pistons 18 19, adapted to move in said cylinders 15 and 16, respectively, a tank, 22, in communication with the exhaust side of said pump, and pipes 21, adapted to place said pipes 14 in communication with said tank, substantially as herein described, for the purposes set forth.

8. In a submarine vessel, the combination of chambers 2, each in free communication at one end with the external water, pistons 3, or equivalent, arranged to move in said chambers, a pump, 13, adapted to supply fluid under pressure, pipes 14, in communication at one end with said pump, valves 4, adapted to control the passage of said fluid through said pipes, a double bell-crank lever, 10 12, pivoted at 11 and connected with said pistons 3 and with said valves 4, a piston, 23, acted upon by pressure of external water, a lever, 25, connected to said piston 23, and provided with an adjustable balance-weight, 26, or a spring, a link, 27, whereby said double bell-crank lever 10 12 is suspended to said lever 25, cylinders 15 and 16, located at each side of the vessel's midship-section, and each in communication at one end with one of said pipes 14, and at the other end with the external water, connected pistons 18 19, adapted to move in said cylinders 15 and 16, respectively, a tank, 22, in communication with the suction side of said pump, and pipes 21, adapted to place said pipes 14 in communication with said tanks, substantially as herein described, for the purpose set forth.

9. In a submarine vessel, a cylinder, 28, in free communication at one end with the water in which said vessel is placed, a piston, 29, or equivalent, arranged to move in said cylinder, a loaded lever, one arm, 31, of which is in connection with said piston, or equivalent, a vessel containing liquid under pressure, a pipe, 33, in communication with said vessel containing liquid under pressure and with the water external to said submarine vessel, and a valve, 32, connected to said lever and arranged to control the passage of liquid under pressure through said pipe 33, substantially as herein described, for the purpose set forth.

10. In a submarine vessel, the combination of chambers 2, each in free communication at one end with the external water, pistons 3, or equivalent, arranged to move in said chambers, a pump, 13, adapted to supply fluid under pressure, pipes 14, each in communication at one end with said pump, a double bell-crank lever, 10 12, pivoted at 11, means for connecting said pistons 3 with said bell-crank lever, valves 4, connected with said double bell-crank lever and arranged to control the passage of fluid through said pipes 14, a piston, 23, acted upon by pressure of external water, a lever, 25, connected to said piston 23, and provided with an adjustable weight, 26, or a spring, a link, 27, whereby said double bell-crank lever 10 12 is suspended to said lever 25, cylinders 15 and 16, located at each side of the vessel's midship-section, and each in communication at one end with one of said pipes 14, and at the other end with the external water, connected pistons 18 19, adapted to move in said cylinders 15 and 16, respectively, a tank, 22, in communication with the suction side of said pump, and pipes 21, adapted to place said pipes 14 in communication with said tanks, a cylinder, 28, in free communication at one end with the water in which said vessel is placed, a piston, 29, or equivalent, arranged to move in said cylinder, a loaded lever, one arm, 31, of which is in connection with said piston, or equivalent, a vessel containing liquid under pressure, a pipe, 33, in communication with said vessel containing liquid under pressure and with the water external to said submarine vessel, and a valve, 32, connected to said lever and arranged to control the passage of liquid under pressure through said pipe 33, substantially as herein described, for the purpose set forth.

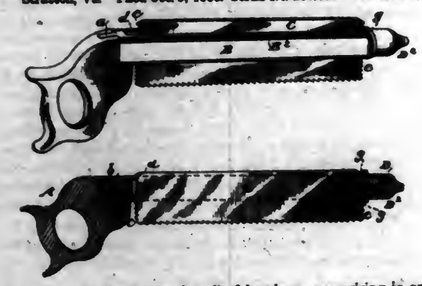


899,694. CARD-GRINDING MACHINE. SAMUEL A. PRESCOTT, Wilkinsonville, Mass. Filed July 19, 1888. Serial No. 280,352. (No model.)

Claim.—1. In a card-grinding machine, the grinders C C, frame G, fitted to slide longitudinally on suitable supports and upon which said grinders are mounted, and eccentrics I I, operatively connected with said frame G and the driving mechanism for imparting longitudinal reciprocating movements to the grinders, in combination with frame A', fitted to slide laterally in suitable supports and operated by a cam, M, operatively connected with said frame A' and the driving mechanism for imparting lateral reciprocating movements to the grinders, substantially as shown and specified.

2. In a card-grinding machine, the grinders C C, in combination with frame G, fitted to slide longitudinally on suitable supports, and upon which said grinders are mounted, said frame-supports, and the eccentrics I I, operatively connected with said frame G and the driving mechanism, whereby longitudinal reciprocating movements may be imparted to the grinders, substantially as shown and specified.

3. In a card-grinding machine, the combination of the supports upon which the grinder-frame G slides longitudinally, with the frame A', fitted to slide laterally in suitable supports, said frame-supports

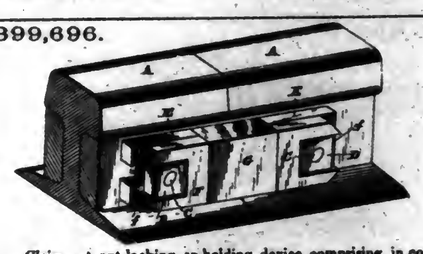


399,694.

and cam M, operatively connected with said frame A' and the driving mechanism, whereby lateral reciprocating movements may be imparted to said grinder-frame supports, and from thence through the other connections described to the grinders, substantially as shown and specified.

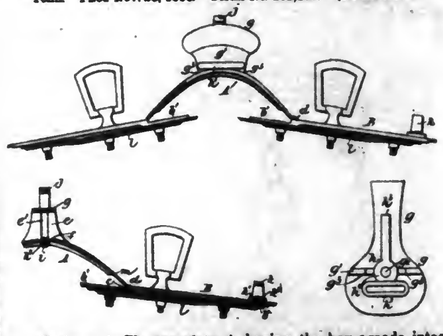
4. In a card-grinding machine, the grinders C C, in combination with frame G, fitted to slide upon suitable supporting rods or bars, H H, arranged longitudinally at an angle to the machine, and upon which frame the grinders are mounted, said rods or bars and their supports, and the eccentrics I I, operatively connected with said frame G and the operating mechanism, whereby both longitudinal and lateral reciprocating movements are imparted to the grinders, substantially as shown and specified.

399,695. ATTACHMENT FOR HANDSAWS. NOAH W. RASSICK, Stratton, Va. Filed Oct. 3, 1888. Serial No. 287,061. (No model.)



Claim.—1. The herein-described handsaw, comprising in combination a handle, a vertically-slotted bar secured at one of its ends to the handle and provided at its opposite end with a screw-threaded neck, a screw-threaded cap to engage said neck, and a saw-blade fitted within the vertical slot and adapted to be retained therein by the cap, substantially as described.

2. In a device for the purpose described, a handle, a vertically-slotted bar having one of its ends secured to the handle and its opposite end provided with an adjustable cap or nut, the inner end of which is provided with an annular extension or collar, as described, a saw-blade having its inner end provided with a series of notches to engage lugs provided within the end of the vertical slot adjacent to the handle, and its opposite end furnished with similar notches to engage the collar upon the cap, substantially as and for the purpose described.



399,696. NUT-LOCK. ADOLPH RASSMUSS, Louisville, Ky., assignor to himself, Pierre Marvonnot, and Louis Nicolas, same place. Filed Nov. 3, 1888. Serial No. 289,966. (No model.)

399,696.

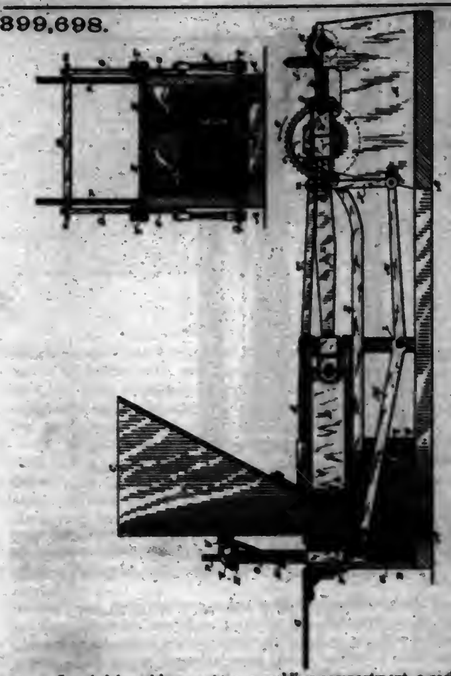
Claim.—A nut locking or holding device comprising, in combination, the following elements: a plate having notches or apertures for the passage of the bolts and adapted to be held by the nuts screwed upon said bolts, a second plate having angular notches for locking the nuts, and a U-shaped holding-clamp fitting over the two plates, substantially as described.

399,697. HARNESS-SADDLE. FREDERICK RENKOFF, Memphis, Tenn. Filed Nov. 28, 1888. Serial No. 292,119. (No model.)

Claim.—1. The top plate, A, having the box *e* made integral therewith, and having the slot *f*, in combination with the piece *g*, having the rib *g'* and pin *g²*, and the tail-piece A, having the loop or ring h^3, and the projection h^2, serving as the journal of a friction-roller, substantially as described.

2. In combination, the top plate, A, having the slot *f*, the side plates, B, each having a slot, h^3, and the loops *k*, adapted to be fastened to said plates, and provided with the integral rods *k'*, for forming the journals of friction-rollers, substantially as described.

3. In combination, the piece A, having the tongues *d* and friction-roller *i*, the side pieces, B, having the journals *c* and slots, as described, and also having the loops *k*, friction-rollers k^2, and the extension *b'*, and the perforated plates *l*, adapted to be secured to a pad and to the side pieces, B, all substantially as set forth.



399,698. BRICK-MACHINE. ROBERT F. ROBISON, Kansas City, Kans. Filed Oct. 2, 1888. Serial No. 286,905. (No model.)

Claim.—1. In a brick-making machine, a molding-compartment having an open top and a feed-hopper above said compartment communicating therewith, in combination with a horizontally-reciprocating presser moving in said compartment and beneath said hopper, said presser constituting one end of said compartment and controlling the communication between said compartment and hopper, a vertically-reciprocating cover which opens and closes the open top of said compartment, a vertically-reciprocating follower which reciprocates crosswise of the compartment beneath said cover, and which lifts the finished bricks out from said compartment, and a swinging finger which swings between said cover and said follower when the same are elevated, and which removes the bricks from said follower, substantially as set forth.

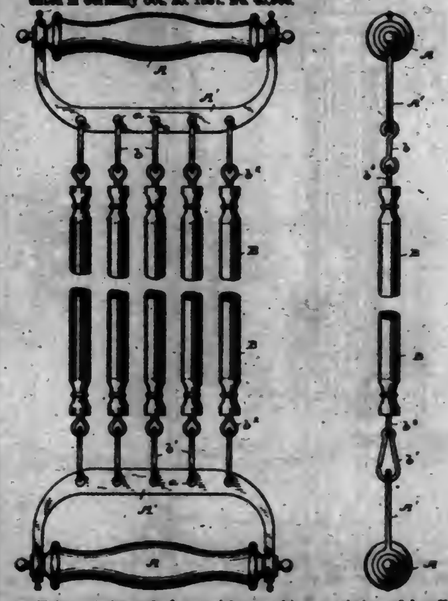
2. In a brick-making machine, the brick-forming mechanism thereof, in combination with a crank-shaft which actuates said mechanism, a large pinion, *e*, on said shaft, a rotating drive-shaft, a small pinion, *d*, thereon, and a large pinion, *f*, and a small pinion, *g*, connected so as to rotate together, said large pinion *f* meshing with the small pinion *d* in the drive-shaft, and said small pinion *g* meshing with said large pinion *e* on the crank-shaft, substantially as set forth.

3. In a brick-making machine, the brick-forming mechanism thereof, a crank-shaft which actuates said mechanism, a large pinion, *e*, on said shaft, a rotating drive-shaft, and a small pinion, *d*, thereon, in combination with a rotatable shaft, *h*, having eccentric bearing-studs *i i*, a shifting-lever for rotating said shaft, and a large pinion, *f*, and a small pinion, *g*, connected together and rotating on said shaft *h*, said pinions *f* and *g* co-operating with said pinions *d* and *e*, respectively, substantially as set forth.

399,698.

4. In a brick-making machine, a molding-compartment, a reciprocating presser moving in said compartment, and a vertically-reciprocating follower moving crosswise of said compartment, in combination with a rotating crank-shaft, a connecting-rod connecting the crank of said shaft with said presser, an oscillating lever connected at one end with said follower, and a connecting-bar connected at one end with said oscillating lever and at the other end with said connecting-rod near the crank-shaft, substantially as set forth.

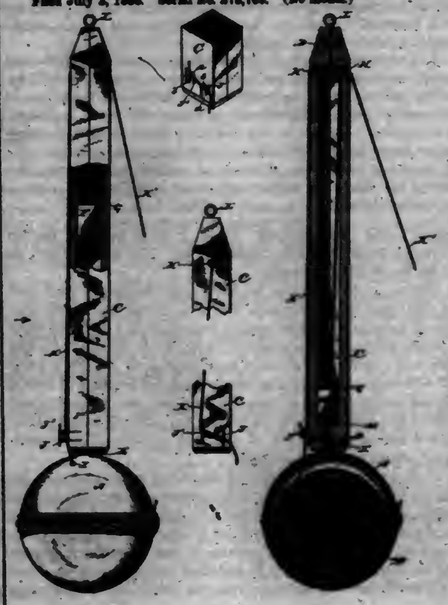
5. In a brick-making machine, a molding-compartment, a horizontally-reciprocating presser moving therein, and a vertically-reciprocating follower moving crosswise of said compartment, in combination with a rotating crank-shaft, a connecting-rod connecting the crank of said shaft with said presser, a stud, *s*, on said rod near said crank, an oscillating lever connected at one end with said follower and extending beneath said connecting-rod, and a vertically-extending bar pivotally connected at its lower end with the end of said oscillating lever, and having a longitudinally-extending slot in its upper end embracing said stud on said connecting-rod, substantially as set forth.



6. In a brick-making machine, a molding-compartment having an open top, a reciprocating presser moving in said compartment, and a vertically-reciprocating cover which opens and closes the open top of said compartment, in combination with a rotating crank-shaft, a connecting-rod connecting the crank of said shaft with said presser, a rock-shaft beneath said compartment, said rock-shaft having a central crank-arm, *q*, and crank-arms P P on its ends, a connecting-bar, R, connecting said crank-arm *q* and said connecting-rod, and levers O O, connecting said crank-arms P P and said cover, substantially as set forth.

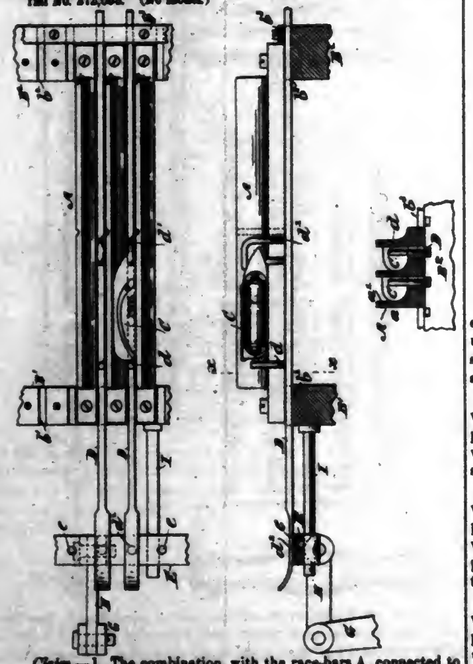
7. In a brick-making machine, a molding-compartment having an open top, a reciprocating presser moving in said compartment, and a vertically-reciprocating cover which opens and closes the open top of said compartment, in combination with a rotating crank-shaft, a connecting-rod connecting the crank of said shaft with said presser, a stud, *s*, on said connecting-rod, a rock-shaft beneath said compartment, said rock-shaft having central crank-arm, *q*, and end crank-arms, P P, levers O O, connecting said crank-arms P P and said cover, and a connecting-bar, R, connected at one end to said crank-arm *q*, and having at its other end a cam-slot, *r*, embracing said stud *s*, substantially as set forth.

8. In a brick-making machine, a molding-compartment having an open top and a vertically-reciprocating cover which opens and closes said open top, said cover having projecting studs *u* on opposite ends, in combination with locking-slides having projecting locking-tongues *t t*, adapted to said studs *u*, a rotating shaft, eccentric studs on said shaft, and bars T T, connecting said eccentric studs and said locking-slides, substantially as set forth.



9. In a brick-making machine, a molding-compartment having an open top, a vertically-reciprocating cover which opens and closes said open top, and a vertically-reciprocating follower moving crosswise of said compartment beneath said cover, in combination with a rock-shaft, U, a downwardly-depending finger, H, thereupon, said finger being adapted to swing between said cover and said follower when the same are elevated, and an arm, V, on said rock-shaft projecting outwardly above said cover and in the path thereof, substantially as set forth, whereby said shaft is rocked by the contact of said cover with said projecting arm.

399,699. EXERCISING APPARATUS. WILLIAM SAMM, Berlin, Germany. Filed June 28, 1888. Serial No. 278,195. (No model.) Patented in Germany Oct. 25, 1887. No. 43,300.



Claim.—A dynamical exercising-machine consisting of handles A A, hoops A' A', secured thereto, said hoops being provided with suitable holes, and a series of elastic cords or their equivalents provided with fastening devices on each end adapted to be detachably connected with the holes in the hoops, all substantially as described.

399,700. TWINE-HOLDER. PETER F. RAW, Humboldt, Iowa. Filed July 2, 1888. Serial No. 278,788. (No model.)

Claim.—The combination, with the ball-receptacle A, of the two-part tube C, closed at each end and transversely perforated near its top, the weight F, sliding but not revolubly in the tube C, the revolubly-adjustable doubly-bent tension-screw hooks J J', each having its two heads at different distances from its axis of rotation, the eye L, and the non-resonant plate M, fixed in the bottom of said tube, substantially as set forth.

399,701. SHUTTLE-DRIVING MECHANISM FOR SEWING-MACHINES. LOUIS SCHULTZ, New York, N. Y. Filed Apr. 27, 1888. Serial No. 272,093. (No model.)

Claim.—1. The combination, with the race-bars A, connected to the stationary bearer-bars B' B², and having sides *a'*, provided with concavities, and opposite plane or flat sides, *a*, of the shuttle carrier or driver-rods D, provided with hooks and working in grooves provided in the stationary bearer-bars B' B², a cap-plate on the bearer-bar B² holding the shuttle carrier or driver rods D, and the reciprocating bar E, to which said shuttle carrier or driver rods are detachably connected, substantially as specified.

2. The combination, with the race-bars A, connected to the stationary bearer-bars B' B², and having sides *a'*, provided with concavities, and opposite plane or flat sides, *a*, of the shuttle carrier or driver rods D, having resilient ends provided with hooks and working in grooves provided in the stationary bearer-bars B' B², a cap-plate on the bearer-bar B² holding the shuttle carrier or driver rods, and the reciprocating bar E, furnished with holes or cavities for receiving the pins in the resilient ends of said shuttle carrier or driver rods, substantially as and for the purpose set forth.

399,702. PEA-HULLER. ROBERT P. SCOTT, Baltimore, Md., and JOHN A. CRESSLER, Oakville, Ontario, Canada. Filed Oct. 10, 1888. Serial No. 287,743. (No model.)

Claim.—1. In a machine for hulling and separating green peas upon the vines, the combination, with a revolving perforated separating-cylinder having a feed-opening at one end and a discharge-opening at the other end, of a revolving hulling-drum which is arranged within said cylinder and provided with brackets at one end, a transverse adjustable bar arranged at its other end and formed with slotted ends, and impact openers or beaters having their ends secured in said brackets and said adjustable slotted bar and adapted to be variably adjusted obliquely to the axis of said drum and upon the periphery thereof, substantially as described.

2. In a machine for hulling and separating green peas upon the vines, the combination, with a revolving perforated separating-cylinder having a feed-opening at one end and a discharge-opening at the other end, of a revolving hulling-drum which is arranged within said cylinder and provided with slotted brackets at one end thereof, a transverse bar formed with slots in its ends and provided with set-screws for adjustably securing the same upon the drum-shaft at the other

end of said hulling-drum, and flat impact openers or beaters arranged upon the periphery of said drum and having their ends secured in said slotted brackets and said adjustable slotted bar, substantially as described.

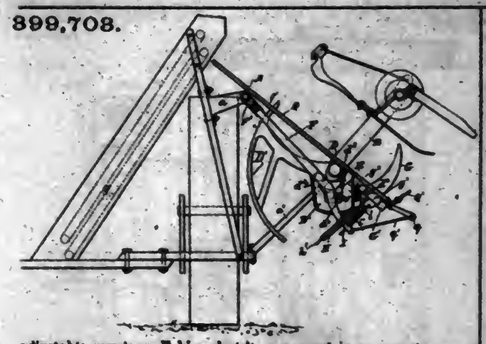
3. In a machine for hulling and separating green peas upon the vines, the combination of a revolving perforated separating-cylinder provided with one or more interiorly-arranged knives for cutting the vines, and a revolving hulling-drum arranged within said cylinder, substantially as described.

4. In a machine for hulling and separating green peas upon the vines, the combination of a revolving perforated separating-cylinder provided with one or more interiorly-arranged knives for cutting the vines, and a revolving hulling-drum arranged within said cylinder and provided with impact openers or beaters extending from end to end thereof, substantially as described.

5. In a machine for hulling and separating green peas upon the vines, the combination of a revolving perforated separating-cylinder provided with one or more interiorly-arranged knives for cutting the vines, and a revolving hulling-drum arranged within said cylinder and provided with adjustable impact openers or beaters upon its periphery, which are arranged slightly oblique to its axis, substantially as described.

6. In a machine for hulling and separating green peas upon the vines, the combination of a revolving perforated separating-cylinder provided with curved knives arranged upon opposite sides thereof, and a revolving hulling-drum arranged within said cylinder and provided with impact openers or beaters which are secured upon its periphery, arranged slightly oblique to its axis, and formed with notches which register with said curved knives, substantially as described.

7. In a machine for hulling and separating green peas upon the vines, the combination of a revolving perforated separating-cylinder provided with curved knives arranged upon opposite sides thereof near its feed end, one of said knives being arranged in advance of the other, and a revolving hulling-drum arranged within said cylinder and provided with impact openers or beaters which are secured upon its periphery, arranged slightly oblique to its axis, and formed with notches which register with said knives, substantially as described.



8. In a machine for hulling and separating green peas upon the vines, the combination of the revolving perforated prismatic cylinder having feed and discharge openings and the longitudinal bars or ribs 11, the curved knives 21, secured near the feed end to pairs of said longitudinal bars or ribs, and the revolving hulling-drum 13, provided with the impact openers or beaters 16, which are secured upon its periphery, arranged slightly oblique to its axis, and formed with the notches 22 for the passage of said knives 21, substantially as described.

399,703. GRAIN-BINDER. JOHN F. SEIBERLING, Akron, Ohio. Filed May 23, 1888. Serial No. 274,654. (No model.)

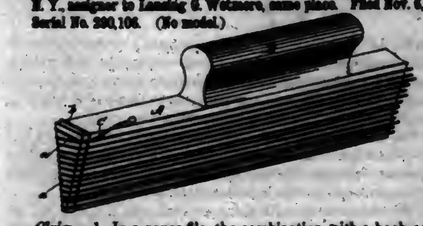
Claim.—1. The combination, with the needle and its shaft, of the cam rigidly secured thereto, the cam-lever pivoted on the frame, the yoke pivoted thereto, and the compressor connected to and supported by said yoke and also pivoted to the needle, substantially as described.

2. The combination of the needle-shaft, the needle secured to said shaft, the cam secured to the heel end of the needle, the pivoted and

399,703.

adjustable cam-lever F, hinged at its upper end at or near the upper side of the binder-frame and supported at its lower end and actuated by a cam-roller on said lever engaging the cam on the needle, the compressor, and the pivoted and yielding connection between the cam-lever and compressor, substantially as described.

3. The combination of the needle-shaft, the needle secured to said shaft, the cam on the needle, the compressor-arm hinged to the needle below the shaft, the spur on the needle supporting the compressor in position to receive the grain, the compressor connected to said compressor-arm, the cam-lever, the hinged connection between the cam-lever and compressor-arm, permitting said arm to yield, the supporting-spring *f*, and the spring-rod I, hinged to the compressor-arm and connected with the cam-lever F, in the manner substantially as described.



4. The combination of the yoke H, the spring h^2 in said yoke, the rod K, provided with the hook or pin engaging the compressor-arm, the cam-lever F, hinged to the yoke, the compressor-arm G', and the compressor G, substantially as described.

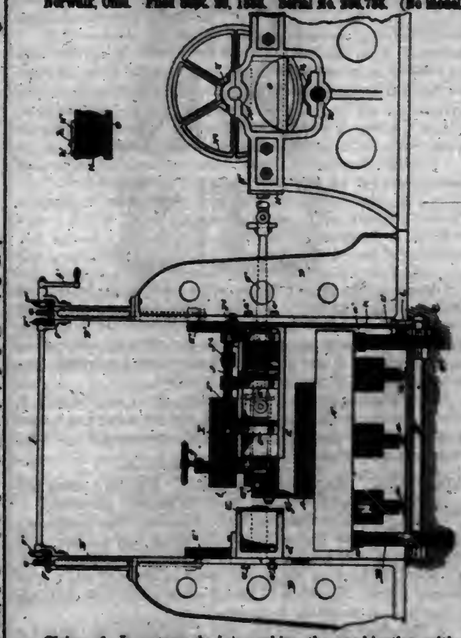
5. The combination, with the needle and the cam formed on the heel end thereof, and the compressor-arm connected to the heel of the needle, of the compressor-actuating lever F and yoke H, connecting said lever and compressor-arm and having the trunnions h h, journaled in said lever, the rod K, spring h^2, and the adjustable nuts k^2 and k^3 on the rod K, one to preserve the proper distance between the cam-lever and compressor-arm and the other to adjust the spring to its proper tension, substantially as described.

6. The combination, with the needle, the cam rigidly secured thereto, and the compressor, of the cam-lever carrying the cam-roller and made adjustable in length to preserve the cam-roller in proper relation to the cam, substantially as described.

7. The combination, with the needle, the adjustable compressor, and the compressor-arm connected with said needle, of the pivoted cam-lever F, the double switch E, and its spring *e'*, the yoke H, and connections interposed between said lever F and the compressor, and the cam-roller *f* on the cam-lever F, substantially as described.

399,704. NEWSPAPER-FILE. HERBERT A. SHEARER, Rochester, N. Y., assignor to Lansing G. Watmore, same place. Filed Nov. 6, 1888. Serial No. 290,108. (No model.)

Claim.—1. In a paper-file, the combination, with a back or strip having two faces arranged at an angle to each other, of a cord or wire extending longitudinally around the strip one or more times, passing over said faces, substantially as described.



2. In a paper-file, the combination, with a back or strip having two faces arranged at an angle to each other, of wires or cords on which the papers are mounted, extending longitudinally over said faces, being rigidly spaced at the ends of the strip, substantially as described.

3. In a paper-file, the combination, with a back or strip having two faces at an angle to each other, of a continuous cord or wire wound around the strip and passing longitudinally across said faces, substantially as described.

4. In a paper-file, the combination, with the triangular back or strip, of a cord or wire wound around it longitudinally one or more times, passing lengthwise of two of its faces, substantially as described.

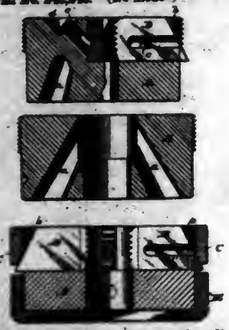
5. In a paper-file, the combination, with the back or strip having two faces at an angle to each other, of the continuous cord or wire wound around the strip and passing longitudinally across said faces, and the loops *b b*, substantially as described.

399,705. STONE-PLANING MACHINE. WILLIAM R. SIDDELL, Norwalk, Ohio. Filed Sept. 20, 1888. Serial No. 286,736. (No model.)

Claim.—1. In a stone-planing machine, the combination, with a car and feed mechanism substantially as indicated, and ways located above and crosswise of the car and having vertical adjustment, of a cross-head bearing cutting-tools, said cross-head being mounted on the ways, a plunger operating horizontally and at right angles to the movement of the car, and a pitman connecting the plunger and cross-head for operating the latter at different elevations, substantially as set forth.

2. The combination, with horizontally-reciprocating plunger, the latter being cylindrical and having a flatted upper side, said plunger being connected by pitman with the cross-head of the machine, substantially as indicated, of corresponding cylindrical ways for supporting said plunger, whereby the plunger is self-adjusted on its axis, substantially as set forth.

3. The combination, with cylindrical plunger having a flatted upper side, a corresponding way for supporting such plunger, of rack and dog mounted on the upper side of the plunger, the latter having a longitudinal groove for securing the dog, the latter being adjustable lengthwise of the groove to give the different length of stroke, substantially as set forth.



4. In a stone-planing machine, the combination, with a rock-shaft and attached rock-arm and connecting mechanism, substantially as indicated, for feeding the car by the action of such rock-arm, of reciprocating cross-head and inclined way connected with the cross-head for actuating such feed mechanism, substantially as set forth.

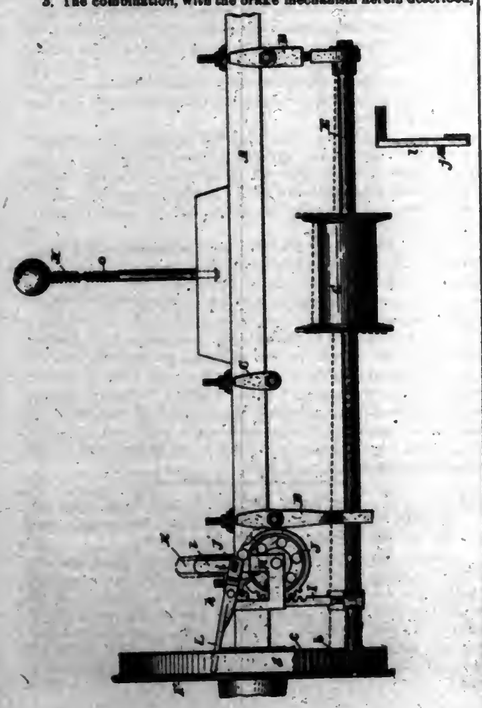
5. In a stone-planing machine, the combination, with a cross-head bearing an inclined way and rock-shaft arranged parallel with the line of the cross-head, such rock-shaft having attached two or more rock-arms that present toward the line of the cross-head, said arms being adjustable lengthwise of the rock-shaft, of removable plug adapted to engage and interchangeable with such rock-arms, said plug having a head adapted to operate in the inclined way of the cross-head, substantially as set forth.

399,706. PROCESS OF EXTRACTING ZINC FROM ORES CONTAINING PRECIOUS METALS. HENRY B. SLATER, Detroit, Mich. Filed Mar. 30, 1886. Serial No. 263,886. (No specimens.)

Claim.—The herein-described process of separating zinc from ores containing precious metals, consisting in, first, crushing the ore; second, roasting the ore; third, moistening the mass to convert it to the woolly condition; fourth, subjecting the mass to the action of free chlorine in a pure condition and continuing the operation of chlorination only until all of the oxide of zinc is converted into chloride of zinc, and, fifth, leaching the ore with cold water, substantially as specified.

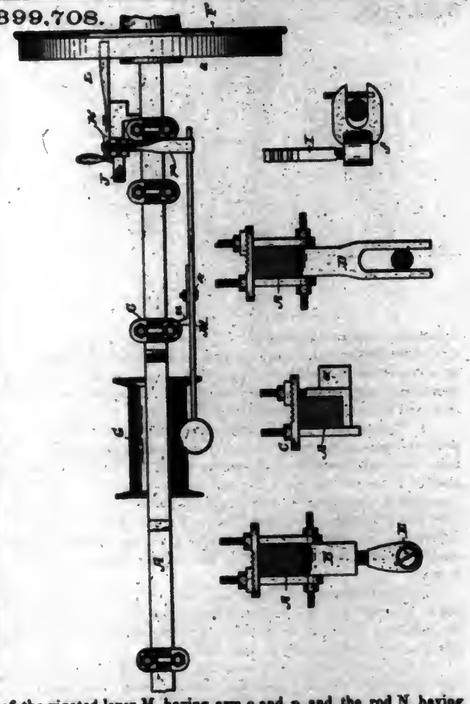
399,707. SCREW-CUTTING DIE. THOMAS L. SMITH, Roxbury, Wis., assignor to the Pratt & Whitney Company, Hartford, Conn. Filed Aug. 30, 1887. Serial No. 248,240. (No model.)

Claim.—1. The combination, in a screw-cutting die of the class specified, of the collet having radially-disposed chaser-receiving slots, chasers in said slots, each having a groove longitudinally on one side thereof, and set-screws set obliquely in said die-body and bearing against the chasers in said grooves, said screws being accessible from the face of the die, all substantially as described.



2. The combination, in a screw-cutting die, of the die-body A, chasers B, having the V-shaped groove *d'*, and the set-screws *c*, bearing against the rear face of said groove, all arranged and operating substantially as shown and described.

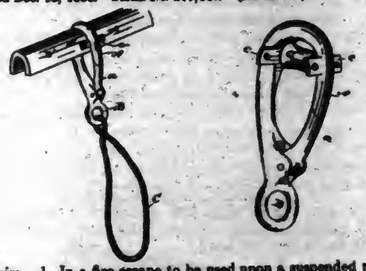
399,708. HORSE-CHECKING DEVICE. WILLIAM P. SMITH, Renton, Wash. Filed Nov. 8, 1888. Serial No. 290,259. (No model.)



Claim.—1. The combination, with a wagon or other vehicle, of a ring surrounding the hub of one of the wheels and toothed on its inner surface, a shaft supported in hangers from the vehicle, and having a pinion adapted to engage the teeth of the ring and a drum arranged thereon, the wheel J, having notch *g*, the lock-plate, and the foot-lever, substantially as described.

2. The combination, with the shaft E, of the rack-bar shaped or constructed at its lower end to embrace said shaft, and having its upper end free, the case H, the wheel for engaging the rack-bar having the notch *g*, the locking-plate, the sliding plate *l*, having stud *j*, and the pivoted foot-lever having a slot working on said stud, substantially as described.

3. The combination, with the brake mechanism herein described,



399,708.

of the pivoted lever M, having arm *o* and *p*, and the rod N, having retracting-spring O, substantially as described.

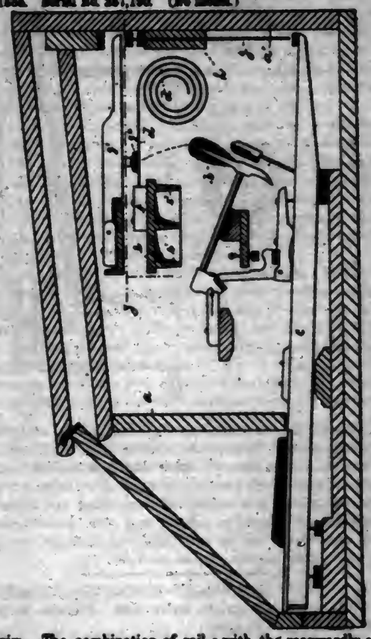
399,709. FIRE-ESCAPE. WILFRED J. SMITH, Rochester, N. Y. Filed Dec. 13, 1888. Serial No. 293,447. (No model.)

Claim.—1. In a fire-escape to be used upon a suspended rope or cable, the combination, with a loop or belt arranged to be applied to the person of the operator, of an open-sided suspending-hook attached thereto for engaging the rope and an open-sided brake for operating on the rope when in the hook, substantially as described.

2. The combination, with the hook adapted to be applied to a rope or cable from the side, and a loop or belt arranged to be applied to the person of the operator secured thereto, of an open-sided collapsible brake secured to the hook, substantially as described.

3. The combination, with the snap-hook and the loop or belt arranged to be applied to the person of the operator, of the open-sided collapsible brake secured to the hook, substantially as described.

4. The combination, with the hook and the loop or belt arranged to be applied to the person of the operator, of the open-sided pieces of collapsible material secured on opposite sides of the hook, substantially as described.



5. The combination, with an open-sided hook and the roller journaled in the upper portion thereof, adapted to operate on the top of the suspending-rope, of a loop or belt arranged to be applied to the person of the operator, substantially as described.

6. The combination, with an open-sided hook and a roller journaled in the upper portion thereof, adapted to operate on the top of the suspending-rope, and an open-sided brake secured to the hook, of a loop or belt arranged to be applied to the person of the operator, substantially as described.

7. The combination of the hook having lugs on the side thereof, the pieces of collapsible material secured thereto, and the loop or belt

arranged to be applied to the person of the operator, substantially as described.

399,710. PIANO. GEORGE SENK, New York, N. Y. Filed Oct. 4, 1888. Serial No. 287,189. (No model.)

Claim.—The combination of rail *c* with the rearwardly-extending coiled springs *d*, secured thereto, and with hammers *b* and damper lifters *g* at opposite sides of the spring-heads, the spring, damper lifter, and hammer of each note being in line with each other, substantially as specified.

399,711. PLANING-MACHINE. MARTINUS STEENBD, Seattle, Wash. Filed Mar. 20, 1888. Serial No. 267,857. (No model.)

Claim.—1. In a planer, the planing apparatus consisting of the block A, flanged pocket C, having blade-opening *o*, and carrying wedge projections over the blades, and the sockets *p p* in the casting, the blade B, provided with slots *x x* and slots S' S', counter-blade B', provided with slots *x x*, screws S' S', wedges W W, bed-plate K, carrying two sets of supports, H H, and journals J J, the screws D D, carrying collars L L, and nuts N N, provided with nuts *n n*, the rollers R R, axle *q*, levers V V, stationary axle *z*, horizontal rod T, handle M, spring Q, flanges F F, provided with slots *y y* and clamping-bolts I I, and the guide-pieces P P, substantially as herein described.

2. In a planer, the block A, in combination with the flanged cast-iron pocket C, provided with wedge projections *y y* over the blades and formed with blade-opening O and sockets *p p* in the casting, the blade B, provided with the slots *x x* and slots S' S', the counter-blade B', provided with slots *x x*, the wedges W W, screws S' S', the bed-plate K, carrying two sets of supports, H H, and journals J J, the screws D D, carrying collars L L, and nuts N N, provided with nuts *n n*, acting upon the blade B through the slots S' S', substantially as herein set forth.

3. In a planer, the combination, with block A, formed with opening O, of the flanged cast-iron pocket C, fitted into said opening, said pocket C provided with wedge projections *y y* over the blades B B' for the wedges W W, blade-opening *o* for the blade B, and sockets *p p* for the adjusting-screws D D in the casting, substantially as herein set forth.

4. In a planer, the combination, with pocket C of block A, said pocket formed with wedge projections *y y*, and the blades B and B', of the wedges W W, which operate in said wedge projections *y y* of said pocket over the blades, substantially as herein shown.

5. In a planer, the block-pocket C, provided with sockets *p p* in the casting, and the planing-blade B, provided with slots S' S' above the counter-blade, in combination with adjusting-screws D D, screw-nuts N N, projected through said blade-slots, and the nuts *n n*, substantially as herein shown.

6. In a planer, the combination, with the cutting-blade B, slotted above the counter-blade B', of an independent bed-plate, K, attached to the top of the block A, and provided with two upright sets of supports, H H, having journals J J, and the collared screws D D and their parts, and the nuts *n n*, adjustable in the slots of the cutting-blade, constituting the adjusting mechanism or means for properly supporting and co-ordinating the said screws in the adjustment of the cutting-blade above the counter-blade, substantially as herein shown.

7. In a planer, the adjusting mechanism for the planing-blade, consisting of the combination, with block A and blade B, provided with slots S' S' above the counter-blade, of the pocket C, provided with sockets *p p* in the casting, bed-plate K, attached to the block, double supports H H upon the bed-plate, the screws D D, provided with collars L L, and projected nuts N N, provided with other nuts, *n n*, which said projected nuts operate through the blade-slots S' S' above the counter-blade, all substantially as herein set forth and explained.

8. In a planer, the combination, with the block A and its adjustable planing apparatus, of the rollers R R, axle *q*, levers V V, stationary axle *z*, horizontal rod T, double-shouldered handle M, and spring Q, coacting to move the planing-machine backward after a progression or propulsion, substantially as herein set forth.

9. In a planer, the uplifting and depressing mechanism for the rollers R R, consisting of the combination, with the block A, of the levers V V, stationary axle *z*, horizontal rod T, handle M, and spring Q, acting upon the rollers, substantially as herein set forth.

10. In a planer, the combination, with the block-rollers R R, movable around the axle *q* under the block A, of the uplifting and depressing roller mechanism, consisting of the levers V V, axle *z*, and rod T, and the handle M, double-shouldered for retaining the rod T in each of its positions, and the spring Q, all substantially as herein described.

11. In a planer having rollers and roller-operating handles, the mechanism for connecting the operating-handle with the rollers, consisting of levers attached to the axle of the rollers and movable around a stationary axle, in co-operation with the rod T, uniting the levers substantially as herein shown.

12. In a planer constructed with the roller-operating handle M, and having levers attached to the roller-axle, as shown, the rod T, uniting such levers and connecting them united with the operating-handle, substantially as herein set forth.

13. In a planer having rollers, the double-shouldered handle M for operating the roller mechanism, substantially as herein described.

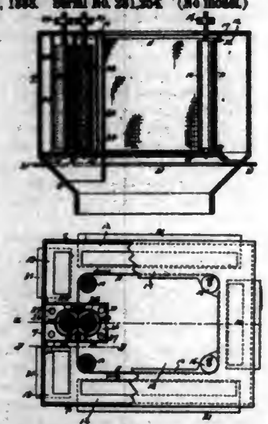
14. In a planer of the character described, the combination, with the double-shouldered handle M and the roller mechanism set forth, of the spring Q for rendering the roller mechanism undetachable from the operating-handle, substantially as herein shown.

15. In a planer, the flanges F F, provided with slots *y y*, said flanges so constructed as to run on both sides of the block A the length of the block, and the clamping-bolts I I, which pass through the block and the flange-slots, said flanges bent inward under the block A and forming angle-irons and adjustable under the block A, and the guide-pieces P P, attached to the flanges F F and flush with their lower surfaces, substantially as herein described.

16. In planers, the combination, with block A and cutting-blade B, of the adjustable flanges F F, provided with slots *y y* and clamping-bolts I I, passing through the slots, said flanges bent inward under the block, forming angle-irons and carrying the guide-pieces P P, made as long as the flanges and flush with their lower surfaces, all substantially as herein shown.

17. The combination, with planers having adjustable flanges of the character described, of the attached flanged guide-pieces P P, made as long as the flanges and flush with their lower surfaces, constituting an arrangement which gives large adjustable guiding-surfaces on both sides of the planer, substantially as herein set forth.

399,712. TUNING-PIN FOR MUSICAL INSTRUMENTS. VICTOR VON FRANKENBERG, Fine Knuf, Ark. Filed June 11, 1888. Serial No. 276,880. (No model.)

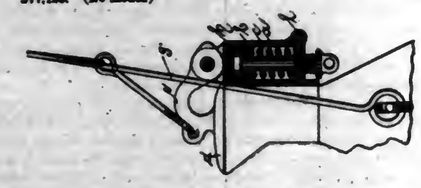


Claim.—1. A tuning-pin provided with the square foot C, middle part, B, and head part A, the parts A and B being of different sizes

and having their threads cut in opposite directions, for the purpose set forth.

2. The combination, with a tuning-pin, of a head-screw, having wings W, threaded part A', and nose N, for the purpose set forth.

3. The combination, with a tuning-pin having foot C, middle part, B, and head part A, the last two parts being of different sizes and having their threads cut in different directions, of a tube having a polygonal head, D, top table, T, threaded part B', and knob K, and a head-screw consisting of threaded part A', wings W, and nose N, as and for the purpose specified.



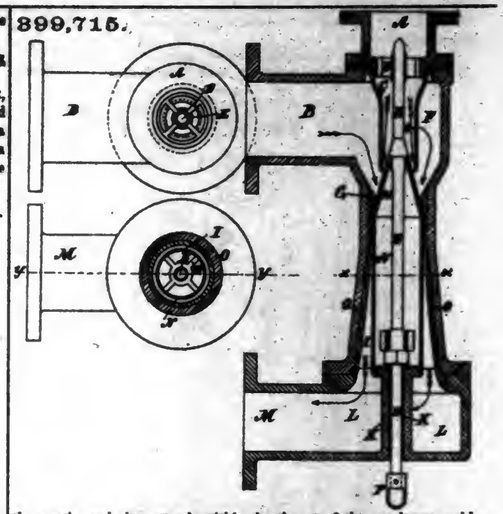
899,713. DUST-COLLECTOR. TALBOT WATSON, Baltimore, Md. Filed July 27, 1888. Serial No. 281,254. (No model.)

Claim.—1. In a dust-collector, the combination, with an upright dust-arresting cloth, means for directing the dust-laden air against one side thereof, a rotating brush for dislodging the dust therefrom, and a roller for dislodging the dust from the said rotating brush, for the purpose set forth.

2. In a dust-collector, the combination, with an upright dust-arresting cloth, means for directing the dust against one side thereof, a rotating brush for dislodging the dust therefrom, a shield, 24, provided with the opening 25 therein, placed around the said brush, and a still-air compartment formed by the walls 30, which completely incases the said brush and shield 24, for the purpose set forth.

899,714. MECHANICAL LID-SHUTTER FOR CANS. BRUNO WHEELMANN, Hamburg, Germany. Filed June 14, 1888. Serial No. 277,122. (No model.)

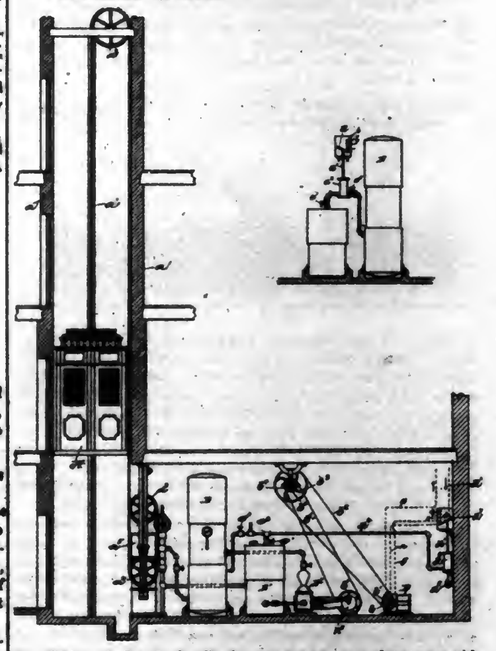
Claim.—The combination of a vessel having chamber *b*, a lid having a bow, *c*, with an eccentric end, a cap, A, spring *c*, a bolt, *a*, movable lengthwise in the chamber, and means for fixing the bolt in an advanced position, all for the purpose set forth.



899,715. EJECTOR-CONDENSER. NORMAN W. WHEELER, New York, N. Y. Filed May 8, 1888. Serial No. 273,282. (No model.)

Claim.—1. In an ejector-condenser, the combination of a nozzle for admitting the condensing-water and a cone or conoid which projects within the nozzle, and also extends within the throat of the condenser, said throat being formed so as to contract about said cone, and also to extend parallel or approximately parallel to the axis of the same, whereby the stream of water is deflected and the throat sealed, substantially as described.

2. In an ejector-condenser, the combination of a nozzle for admitting the condensing-water, a cone or conoid which projects within the nozzle, and also extends within the throat of the condenser, said throat being formed so as to contract about said cone, and also to extend parallel or approximately parallel to the axis of the same, and an adjustable rod adapted to support said cone, whereby said cone is raised and lowered and the nozzle or throat contracted or enlarged simultaneously, substantially as described.



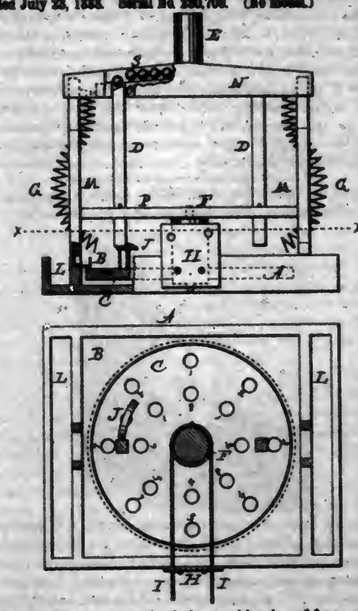
3. In an ejector-condenser, the combination of a nozzle for admitting the condensing-water, a cone or conoid which projects within

899,715.

the nozzle, and also extends within the throat of the condenser, said cone being provided with a cylindrical projection and said throat being formed so as to contract about said cone, and also to extend parallel or approximately parallel to the axis of the same, a retarding-pipe extending from said throat and surrounding said cylinder, and an adjustable rod adapted to support said cone, whereby said cone is raised and lowered and the nozzle or throat contracted or enlarged, substantially as and for the purpose set forth.

899,716. ELECTRICALLY-CONTROLLED HYDRAULIC ELEVATOR. CHARLES WHITTIER, Boston, Mass. Filed Jan. 26, 1887. Serial No. 225,433. (No model.)

Claim.—1. In a hydraulic-elevator system, a regulator operated by changes in pressure of the fluid used to actuate the elevator, a pump, and an electric motor, combined with a switch controlled by the regulator to affect the circuit of the electric motor to start or stop the pump according to the pressure of the fluid employed, substantially as described.



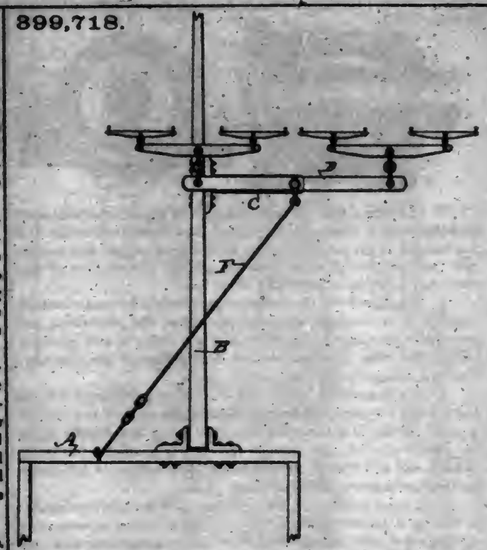
2. In a system for actuating hydraulic elevators, the following instrumentalities, viz: a closed tank to contain a fluid under pressure, a pump to force the fluid into the said tank, and an electrically-actuated motor to operate the said pump at intervals, combined with a regulator under the control of the fluid under pressure in the tank, and with a switch to control the circuit of the electric motor, the said instrumentalities operating substantially as described.

3. In a system for actuating hydraulic elevators, a closed tank to contain a fluid under pressure, a pump to force the fluid into the said tank, and an electrically-actuated motor to operate the said pump at intervals, combined with a regulator under the control of the fluid under pressure in the tank, and with a resistance and a lever co-operating therewith and controlled by the said regulator to affect the circuit of the electric motor, as and for the purpose specified.

4. In a system for actuating hydraulic elevators, a tank to contain a fluid under pressure, a pump, and an electric motor, a resistance and a lever co-operating therewith, and a piston connected to the said lever and actuated by fluid from the pressure-tank to move the said lever, combined with a relief-valve to control the fluid actuating the said piston, and with means, substantially as described, to move the piston in a direction opposite to that in which it is moved by the actuating-fluid, as and for the purpose specified.

5. In a system for actuating hydraulic elevators, a tank to contain a fluid under pressure, a pump, and an electric motor, a resistance and a lever co-operating therewith, a regulator in operative connection with the said lever, a pipe connecting said regulator with the pressure-tank, and a branch pipe forming a discharge-pipe for the said regulator, combined with a relief-valve to control the admission of fluid to the said regulator, and with a valve in the branch pipe to control the passage of fluid from the said regulator, as and for the purpose specified.

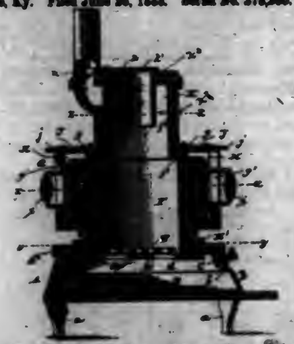
899,717. GAME-WHEEL. GOTTLIEB WILKENING, Dayton, Ohio. Filed July 23, 1888. Serial No. 280,708. (No model.)



Claim.—1. In a game-wheel, the combination of frame A, having a channeled top for the conveyance of marbles, wire conduits G G to convey said marbles from said channels to the wheel, discharging-bars D D, operated by projection J of the wheel, and the revolving wheel C, provided with numbered cavities to receive said marbles, substantially as shown and described.

2. In a game-wheel, the combination of frame A, having a channeled top for the conveyance of marbles, wire conduits G G to convey said marbles from said channels to the wheel, discharging-bars D D, operated by projection J of the wheel, the revolving wheel C, provided with numbered cavities to receive said marbles, and cords I I, attached to the shaft of said wheel to produce alternating rotary motions thereof, substantially as shown and described.

899,718. FOUR-HORSE EQUALIZER. ANDREW C. WILSON, Victor, Iowa. Filed Nov. 5, 1888. Serial No. 290,044. (No model.)



Claim.—The four-horse draft-equalizer composed of a pole, B, hinged to a reaper-frame, A, a branch, C, fixed to the pole and provided with a large perforation or slot in its free end, an evener, D, pivoted to the end of the said branch by means of a clevis, doubletrees and singletrees connected with the ends of the evener, and a

899,718.

rod, F, connected with the clevis at the end of the branch C and with the frame A, substantially as shown and described, to operate in the manner set forth.

899,719. STOVE FOR HEATING SAD-IRONS. JOHN S. WHITE, Louisville, Ky. Filed June 26, 1888. Serial No. 278,206. (No model.)

Claim.—In a stove for heating sad-irons, the combination, with a cylindrical drum forming the fire-chamber and provided with a circumferential shoulder, of a rotatable drum encompassing the said fire-chamber, provided with a flange at its upper edge adapted to rest upon said shoulder, and with a series of individual vertically-disposed chambers, each of which has a top door with a projecting lug and a side slot, and having open backs, whereby the irons are brought in contact with the heating-surface of the stove, substantially as described.

899,720. THIMBLE FOR COUPLING LEAD AND CAST-IRON PIPES. LEWIS WOLFF, Chicago, Ill., assignor to the L. Wolff Manufacturing Company, same place. Filed Feb. 13, 1888. Serial No. 263,769. (No model.)

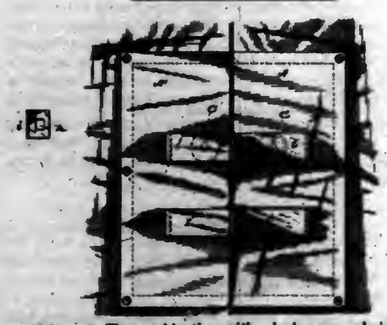
Claim.—A cast-iron thimble having a soft-iron or steel band fusibly united therewith, said band being coated on the outside with tin or an alloy thereof, substantially as specified.

899,721. JOURNAL-BOX. WILLIAM W. WORSWICK, Cleveland, Ohio. Filed Feb. 3, 1888. Serial No. 262,921. (No model.)

Claim.—1. In a journal-box, the combination, with a stationary bearing located within the box and a rotary bearing, the working-faces of said stationary and rotary bearings being located in the same horizontal plane, of a plain-faced journal portion having direct engagement with both said bearings, substantially as set forth.

899,721.

2. In a journal-box, the combination of an axle-journal, stationary bearings located within said journal-box, and against which said axle has bearing at the inner and outer ends, respectively, of said journal-box, and anti-friction roller-bearings located intermediate of said stationary bearings, substantially as set forth.



3. In a journal-box, the combination of flange and washer located, respectively, at the inner and outer portions of the journal-box and provided with openings, stationary bearings fitting in said openings, and friction-roller bearings located intermediate of said stationary bearings, substantially as set forth.

4. In a journal-box, the combination of an axle-journal, a flange and a washer located, respectively, on opposite sides of the journal-box, the horizontal distance between them being least slightly below the center of said axle-journal, and thence gradually increasing upward, and anti-friction rollers located intermediate of said flange and washer, substantially as set forth.

5. In a car journal-box, the combination of the bearing-chamber F, the cap N, secured to the outer face of said bearing-chamber, said cap provided with the chamber N', which communicates with said bearing-chamber, the diameter of said two chambers being substantially equal, the axle-journal D, journaled in said bearing-chamber, and the washer *n*, rigidly secured to the axle of said journal within said chamber N', midway between the outer and inner walls of said chamber and free from engagement with said walls, a clear space being left on either side of said washer intermediate of the said respective walls and washer, the diameter of said washer being slightly less than that of said chamber, substantially as set forth.

899,722. SEAL-LOCK. CARL SWINKARZ, Sahrwedel, Prussia, Germany. Filed June 9, 1886. Serial No. 204,663. (Model.) Patented in Germany Apr. 17, 1886, No. 39,052, and in France Apr. 21, 1886, No. 176,664.

Claim.—1. The combination, with a lock-case made in two parts and provided with a securing-bolt, of two heads placed in sockets and provided with arms *d*, two slits, and two pivoted levers provided with tongues which are in position to engage the seals *i*, said two levers being adapted to be engaged by the arms of said heads, substantially as and for the purposes described.

2. In combination with a lock-case provided with a slit, E, and a lock-bolt, a head placed in a socket and provided with an arm, *d*, and a projection adapted to retract the lock-bolt, and a pivoted lever, *f*, provided with a spring and a tongue, *g*, which is in position to engage seal *i*, substantially as set forth and described.

3. The combination, with the lock-casing divided into two parts, each having a slit, E, of a seal provided with perforated extremities adapted to be inserted in the slits, and devices, substantially as described, adapted to engage said extremities, substantially as and for the purposes described.

899,723. WHEELBARROW. JOSEPH ABEL, Brooklyn, N. Y. Filed May 20, 1868. Serial No. 275,472. (No model.)

Claim.—1. In a wheelbarrow or truck of substantially the described kind, the combination, with a sheet-metal tray, A, mounted on handle-bars B and adapted to dump sidewise, of the longitudinal brace-bars *m m*, fixed to the bottom of the tray on the dumping sides between the handle-bars and its dumping-edge, substantially as shown and described.

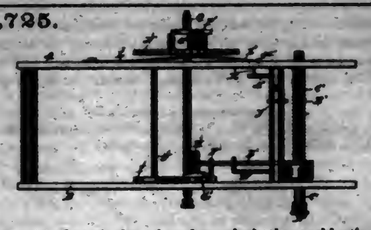
2. A metallic wheelbarrow-tray, A, formed with the central longitudinal bar, *k*, and longitudinal side bars, *m m*, substantially as and for the purpose set forth.

3. The metallic wheelbarrow-tray A, formed with the marginal binding *i*, central longitudinal brace-bar, *k*, and side longitudinal brace-bars, *m m*, arranged on the under side of the tray and operating substantially as and for the purpose set forth.

4. The combination, with the tray of a wheelbarrow, of the central longitudinal bar, *k*, and the transverse clip-bars *c c*, the one bent to overlap the other, substantially as shown and described.

5. In a metallic wheelbarrow, the combination, with the sheet-metal tray A, of the handle-bars B B, secured to and underlying the same, the marginal binding *i*, the central bar, *k*, secured longitudinally to the tray between the handle-bars and the side bars, *m m*, secured to the dumping sides of the tray between the marginal band and the handle-bars, substantially as herein shown and described.

899,724. SHUTTER-FASTENER. JOSEPH A. RAGSDALE, Austin, Tex. Filed Aug. 17, 1888. Serial No. 283,021. (No model.)



Claim.—1. The combination, with the plate A B C, secured to a sill, provided with suitable cavities or recesses and through-cut openings and ways, of the latches, movable horizontally in said ways by suitable springs toward a common point, of the plate D, secured to a shutter provided with suitable cavities or recesses and through-cut openings, and the vertically-movable bolt influenced by a suitable spring toward the center of approach for the three latches, as and for the purpose set forth.

2. The combination, with the vertically-movable bolt, suitably housed, having an inwardly-projecting pointed foot opposite recesses and a notch in its rear, substantially as described, of the horizontally-movable latches, suitably housed, two of which have their ends cut away to form a dovetail space, as set forth, and the three being provided with undercut notches, as and for the purpose specified.

899,725. ALARM-CLOCK. ARCHIBALD RAMSAYER, Waterbury, Conn., assignor to the Waterbury Clock Company, same place. Filed July 16, 1887. Serial No. 244,500. (Model.)

899,725.

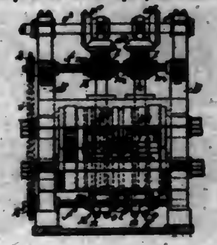
Claim.—1. In a single-spring alarm-clock, the combination, with a spring, of a time-train and an alarm-train driven thereby, and alarm stop-work for holding the alarm-train, such stop-work being entirely independent of the time-train of the clock and adapted for direct manual operation in unlocking the alarm-train, substantially as set forth.

2. In a single-spring alarm-clock, the combination, with a spring, of a time-train and an alarm-train driven thereby, and alarm stop-work having a rotatable and a longitudinally-movable push-staff carrying a lever, through which the alarm-train is automatically locked, the said train being unlocked by manually moving the staff endwise and thus shifting the lever, substantially as set forth.

3. In a single-spring alarm-clock, the combination, with a manual push-staff carrying a stop-lever, of a rotary stop actuated from the mainspring and engaging with the said stop-lever, which is disengaged from the stop when the said staff is manually moved endwise, and an arm carried by the verge-staff and engaged by the stop-lever when the same is lifted by the rotary stop, substantially as set forth.

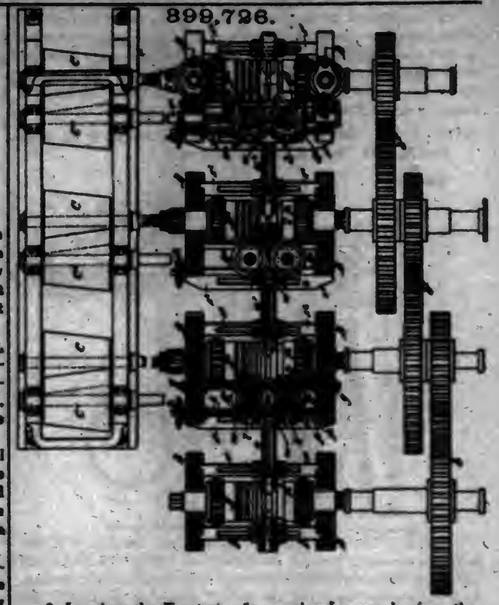
4. In a single-spring alarm-clock, the combination, with a spring-actuated manual push-staff carrying a stop-lever, of male and female rotary stop-pieces driven by the mainspring, a stop-pin carried by the female stop-piece and rotated in range of the said stop-lever, a stop-arm carried by the verge-staff in position to be operated by the stop-lever, and a locking-arm also carried by such staff and controlled by the alarm-train, substantially as set forth.

5. In a single-spring alarm-clock, the combination, with a spring, of a time-train and an alarm-train driven thereby, and alarm stop-work made entirely independent of the time-train and having two rotary stop-pieces always rotated in the same direction by the alarm-train, which is stopped through them, one of such rotary pieces carrying a pin operating a stop-lever, substantially as set forth.



6. In a single-spring alarm-clock, the combination, with a spring, of a time-train, an alarm-train provided with a verge-staff having a stop-arm and a locking-arm, and alarm stop-work having a push-staff adapted for direct manual operation, and carrying a stop-lever which co-operates with the stop-arm to stop the alarm-train, the said locking-arm being connected with the time-train, which automatically holds and releases it, substantially as set forth.

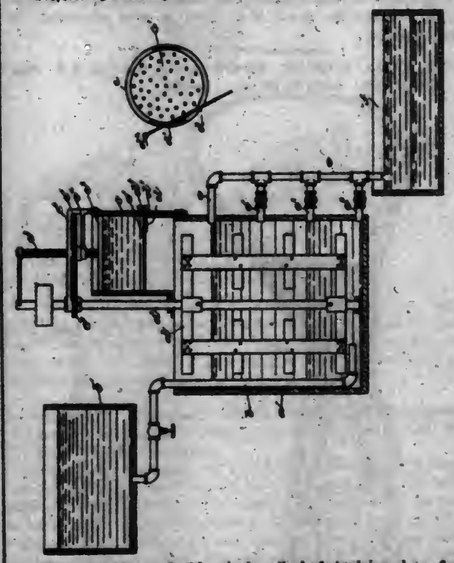
7. In a clock, the combination, with a spring, of a time-train driven by said spring, an alarm or escape train geared to the said spring and normally cut out of action, and manual let-off or stop mechanism entirely independent of the time-train and manually operated to release the escape-train, whereby the spring may be run down without disturbing the time-train, substantially as set forth.



8. In an alarm-clock, the combination, with the time-train thereof, of a sleeve-cam carried by a wheel driven by such train, an independent rotatable set-staff extending through such cam which rotates around the staff, and a flat collar having a finger projecting from its edge in the same plane therewith, such collar and finger being made from one piece of sheet metal and the finger bearing flatwise on the edge of the cam, substantially as set forth.

899,726. UNIVERSAL ROLLING-TRAIN. WILHELM BARNER, Kattowitz, Prussia, Germany. Filed Jan. 7, 1888. Serial No. 260,000. (No model.)

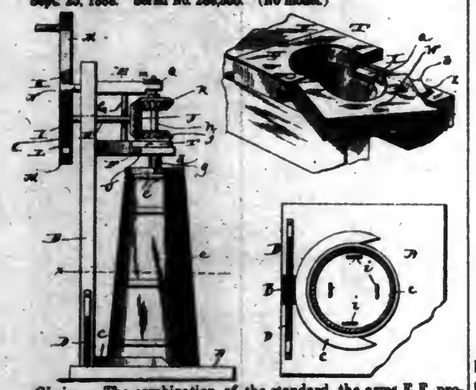
Claim.—1. In universal rolling-trains for round and square bar-iron, the combination of the horizontal grooved rolls A A A' A' A² A² A³ A³, placed one behind the other, with the vertical plain rolls B' B' B² B² B², driving-cones C C, shafts *c d d*, and bevel-wheels *d d' d² d² d³ d³*, substantially as and for the purpose described.



899,726.

2. In universal rolling-trains for round and square bar-iron, the combination of the horizontal grooved rolls A A A' A' A² A² A³ A³, placed one behind the other, with the vertical plain rolls B' B' B² B², driving-cones C C, shafts *c d d*, and bevel-wheels *d d' d² d² d³ d³*, substantially as and for the purpose described.

3. In universal rolling-trains for round and square bar-iron, the combination of the horizontal grooved rolls A A A' A' A² A² A³ A³, placed one behind the other, with the vertical plain rolls B' B' B² B², driving-cones C C, shafts *c d d*, and bevel-wheels *d d' d² d² d³ d³*, screws *f' f'*, nuts *l l*, and bearings *k k'*, having the slit *n* and lock-nuts *m m*, substantially as and for the purpose described.

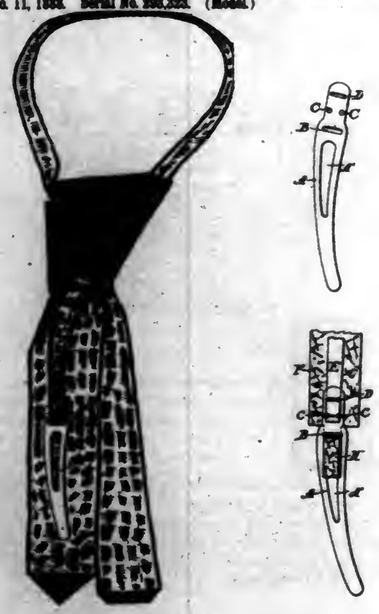


899,727. METHOD OF OBTAINING GLUTEN AND STARCH. HERMAN BARKER, Somerville, Mass. Filed June 25, 1888. Serial No. 278,163. (No model.)

Claim.—1. The method herein described of obtaining gluten from cereals, which consists in adding water to the granulated or pulverized cereal to form a semi-fluid or pasty mass, dividing the said pasty mass into small independent pieces or particles, disintegrating the said independent pieces in liquid to set free the gluten, and thereafter collecting the gluten by subsidence.

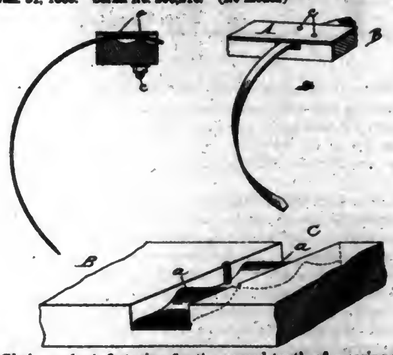
2. The method herein described of obtaining starch from cereals, which consists in adding water to the granulated or pulverized cereal to form a semi-fluid or pasty mass, dividing the said pasty mass into small independent pieces or particles, disintegrating the said independent pieces in liquid to set free the starch, and thereafter collecting the starch by subsidence.

399,728. CHURN. PELEG C. BARLOW, Buckhannon, W. Va. Filed Sept. 25, 1888. Serial No. 286,355. (No model.)



Claim.—The combination of the standard, the arms E F, projecting horizontally forward therefrom and having their front ends bifurcated, the dashers inserted through said bifurcated ends, the plate U, secured to the lower arm, the plate W, hinged to the plate U, and the spring secured to said arm and engaging the plate W, the said plates U W encircling the outer dasher, as set forth.

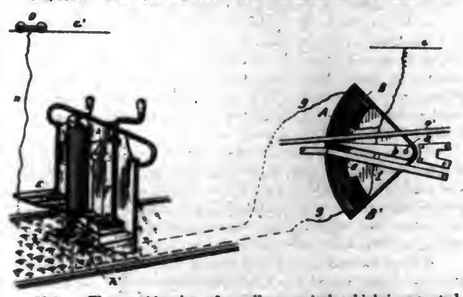
399,729. SWEAT-BAND FOR HATS. WILLIAM F. BEARDSLEE, Boston, Mass., assignor to the Hat Sweat Manufacturing Company, New York, N. Y. Filed Mar. 12, 1887. Serial No. 230,863. (No model.)



Claim.—The combination, with a hat sweat-leather, D, of a spring, A, soft covering B, spirally-laid thread C, and a line of stitches formed by a separate thread, E, arranged to serve substantially as herein specified.

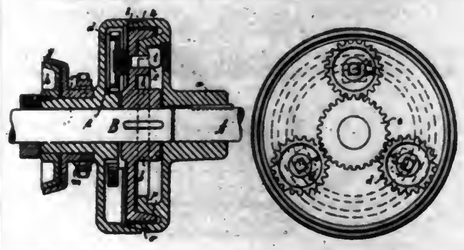
399,730. SCARF-TIP. EDWIN S. BELLOWS, New York, N. Y. Filed Dec. 11, 1888. Serial No. 293,323. (Model.)

Claim.—The tip or leader for the end of a neck band, constructed, substantially as described, of a thin flat plate having converging sides and a parallel-sided head transversely slotted with dual slots B and D and having intermediate perforations, C, therein, for the purpose set forth.



399,731. HARROW. CLARENCE E. BENEDICT, Lansing, Mich. Filed Jan. 31, 1889. Serial No. 298,210. (No model.)

Claim.—1. A fastening for the curved tooth of a spring-tooth harrow, consisting of a supporting frame-piece provided with a gain to receive the shank of the tooth, which gain has a transversely corrugated or grooved bottom, so as to provide transverse knife-edge supports or ridges *a*, and a clip arranged to bear upon the outer face of the tooth at a point between the points where the inner face of the tooth meets the said supports *a*, substantially as described.



2. The combination of the frame-piece, formed with a tooth-receiving gain having a bottom transversely corrugated or grooved, so as to provide the knife-edge supports or ridges *a*, and a clip formed of the iron plate A, held to the frame-piece and against the tooth by conically-headed bolts fitting in conical counter-seats in said plate, substantially as hereinbefore set forth.

399,732. ELECTRIC-RAILWAY SWITCH. EDWARD BLAKE, Boston, Mass. Filed Oct. 22, 1888. Serial No. 288,576. (No model.)

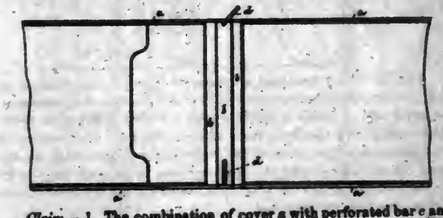
Claim.—The combination of a railway-switch which is actuated in both directions by an electro-motive agency with electric conductors extending from such electro-motive agency to contact-makers set near the railway-track, a railway track and car, and means attached to the car for making connections through such contact-makers with said conductors, respectively, so as to complete an electric circuit through either of them at will, and thereby to move the switch in either direction.

399,733. FRICTION-CLUTCH. EMIL BOEHME, Breslau, Prussia, Germany, assignor to Stanislaus Leutner & Co., same place. Filed Aug. 21, 1888. Serial No. 283,208. (No model.) Patented in Germany Nov. 4, 1887, No. 44,460.

Claim.—1. A friction-clutch consisting of two parts, one carried by the driving-shaft and the other by the shaft to be driven, said L-shaped screws connecting said parts and serving to draw them together.

2. In a friction-clutch, the combination of two parts, one a driver and the other to be driven, screws extending from one of said parts and adapted to engage the other, nuts applied to said screws, and a wheel connected with the driving-shaft and serving to rotate the nuts, whereby the screws are caused to draw the parts together or to release them, as required.

3. In a friction-clutch, the combination of a main clutch consisting of a driver and a driven part, screws extending from one of said parts to the other, toothed nuts applied to said screws, a toothed wheel meshing with said toothed nuts, and a secondary friction-driver carried by the driving-shaft, and serving to rotate the toothed wheel and through it the nuts.



4. In a friction-clutch, the combination of a driver, a driven part adapted to be locked thereto, screws extending from one of said parts to the other, toothed nuts applied to said screws, a toothed wheel meshing with said toothed nuts, and a brake arranged to act upon the toothed wheel and to hold it against rotation while the toothed nuts rotate about it.

5. In a friction-clutch, the combination of a driver and a driven part, screws extending from one of said parts to the other, nuts applied to said screws, a wheel engaging with and serving to rotate said nuts, a secondary clutch or connection serving to connect said wheel with the driver, and a brake arranged to act upon said wheel and prevent its rotation with the driver when not coupled thereto by the secondary clutch.

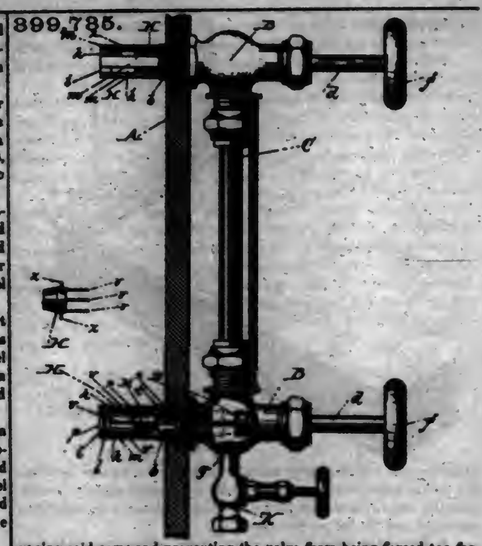
6. In a friction-clutch, the combination, with a driving-shaft, A, and a driven shaft, B, of two parts, as *a* and *b*, secured, respectively, to the shafts A B, and one of said parts having an undercut flange, screws *c*, carried by one of said parts and having undercut heads to engage the flange on the other part to draw the parts together, and means for actuating the screws.

7. In a friction-clutch, the combination, with a driving-shaft carrying one part of the clutch, of a shaft to be driven carrying the other part of the clutch, and screws carried by one of said parts and adapted to directly engage the other part to connect the said parts.

399,734. BOOK-COVER. FRANCIS F. BRAILLARD, Brooklyn, N. Y. Filed Dec. 4, 1888. Serial No. 292,568. (No model.)

Claim.—1. The combination of cover *a* with perforated bar *c* and with the hooks *d*, the shanks of which pass through said perforated bar, substantially as specified.

2. The combination of cover *a* with perforated bar *c* and with hooks *d*, having reduced shanks *d'*, and washers *e*, substantially as specified.

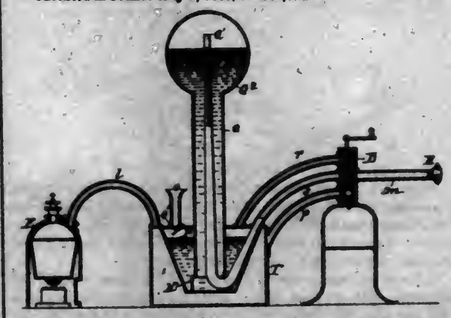


3. The combination of cover *a* and lining *b*, forming a pocket between them, with the perforated bar *c* within said pocket, and with the hooks *d*, the shanks of which pass through said perforated bar, substantially as specified.

399,735. AUTOMATIC SAFETY-VALVE FOR WATER-GAGES. WILLIAM H. BRAY, Boston, and CORNELIUS ECKERSON, Chelsea, Mass. Filed Jan. 10, 1888. Serial No. 295,990. (No model.)

Claim.—1. In a valve for water-gages, the combination of a body provided with an exteriorly-threaded tube for securing it to the boiler, said tube projecting within the boiler and provided with longitudinal slots, a stop in the outer end of said tube, an automatic valve fitted to slide in said tube and provided with rearwardly-projecting arms for engaging said stop, a seat for said valve, a main valve and seat in said body, and a spindle on said main valve for engaging the automatic valve, substantially as described.

2. In a valve for water-gages, the combination of a body provided with an exteriorly-screw-threaded pipe projecting into the boiler, a main valve and seat in said body, a spindle on said valve projecting into said tube, longitudinal slots in said tube within the boiler, an automatic valve fitted to slide in said tube and provided with pins projecting through said slots, a seat for said valve, horizontal arms on the automatic valve, and a stop in the inner end of the tube for engaging said arms and preventing the valve from being forced too far from its seat, substantially as described.

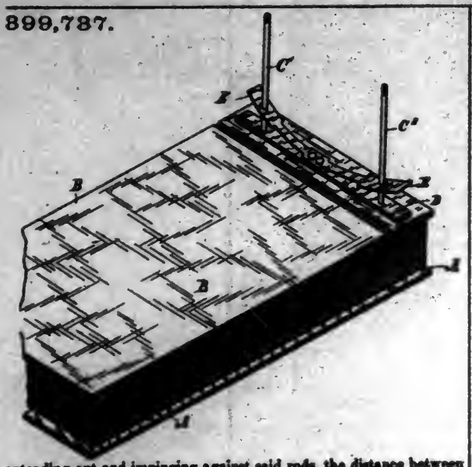


399,785.

3. In a valve for water-gages, the combination of a conical automatic valve fitted to slide in the main valve-tube, a seat for said valve, longitudinal slots in said tube, pins on said valve projecting through said slots, and rearwardly-projecting arms on said valve for engaging a stop in said tube, substantially as and for the purpose specified.

4. In a valve for water-gages, the combination of the body B, provided with the threaded tube *b*, having the slotted extension *m*, the main valve D, having the stem *d* and spindle *s* projecting into said tube, the conical valve H, fitted to slide in said tube and provided with pins *x*, projecting through the slots therein, the stops *i*, the arms *v* on said conical valve, engaging said stop, and the seat *t*, all being arranged to operate substantially as described.

399,736. INHALER AND RESPIRATOR. CHARLES BRAILLARD, Paris, France. Filed Aug. 20, 1887. Serial No. 248,200. (No model.) Patented in France May 2, 1885, No. 168,654.

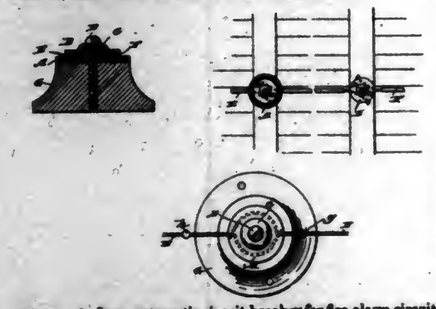


Claim.—The combination of the vessel P, arranged in the chamber T and provided with an inlet, *o*, having a valve, *o'*, globular pipe Q, and vacuum-source E by means of the pipe *l*, and a mouth-piece, R, by means of the pipes *r*, *s*, *p*, and *m*, and valve B, substantially as and for the purpose specified.

399,737. TEMPORARY BINDER. JOHN F. BROWN, Indianapolis, Ind., assignor to Albert R. Baker, same place. Filed Feb. 15, 1888. Serial No. 264,060. (No model.)

Claim.—1. In a temporary binder, the combination of a base, rods extending upwardly from said base, a clamp-bar provided with holes and mounted to slide on said rods, and a spring-clamp secured to said clamp-bar and also provided with holes which do not quite register with the holes in the bar, whereby, when the clamp-bar is slid to any position on said rods, said spring-clamp serves as a friction-brake and automatically secures it from any upward movement, substantially as set forth.

2. In a temporary binder, the combination of a base, rods extending upwardly from said base, a clamp-bar mounted to slide on said rods, and a spring-clamp secured to said clamp-bar at its center and



899,737.

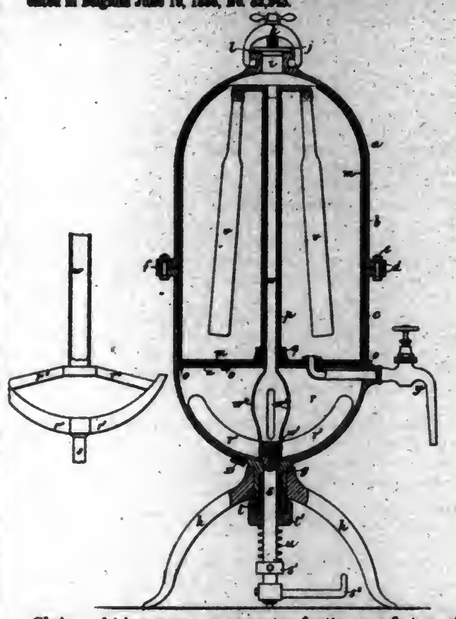
extending out and impinging against said rods, the distance between the points which impinge against said rods being slightly greater than the space between the perforations in clamp-bar, substantially as described, and for the purposes specified.

3. The combination, in a temporary binder, of the upper and lower file-boards, a lower clamp-bar having upwardly-projecting rods, an upper clamp-bar having holes and adapted to be placed over said rods, and a spring-clamp, E, secured to the upper clamp-bar and also having holes, which, however, are slightly farther from the center than the holes in the clamp-bar, substantially as shown and described.

899,738. COUPLING AND AUTOMATIC CIRCUIT-BREAKER FOR FIRE-ALARM CIRCUITS. JOHN J. CARNAR, Rochester, N. Y. Filed Jan. 26, 1888. Serial No. 297,676. (No model.)

Claim.—1. In an automatic circuit-breaker for fire-alarm circuits, the combination, with the base, of the plate for clamping the terminals of the line-wire, the fusible button resting on the plate, and the fastening device engaging the button to clamp the plate and base together to hold the said terminals, substantially as described.

2. In an automatic circuit-breaker for fire-alarm circuits, the combination, with the base, of the washer for clamping the terminals of the line-wire, the fusible button resting on the washer, and the screw passing through the button and washer and engaging the base and button for clamping the washer and base together to hold said terminals, substantially as and for the purpose set forth.



3. In an automatic circuit-breaker for fire-alarm circuits, the combination, with the base, of the washer having the relatively large apertures therein, the fusible button resting on the washer, and the screw passing through the button and washer and engaging the base for clamping the parts together and having the head of less diameter than the aperture in the washer, whereby the washer will drop off when the button is melted, substantially as described.

4. In a coupling and automatic circuit-breaker, the combination, with the base, of the washer resting thereon having the grooves in its under surface for the terminals of the line-wire, the fusible button resting on the washer, and the screw engaging the button and base for clamping the parts together, substantially as described.

5. In a coupling and automatic circuit-breaker, the combination, with the base, of the insulating-washer resting thereon and the metallic washer, between which the terminals of the line-wire are clamped, the superimposed fusible button, and the screw engaging the button and base to clamp the parts together, substantially as described.

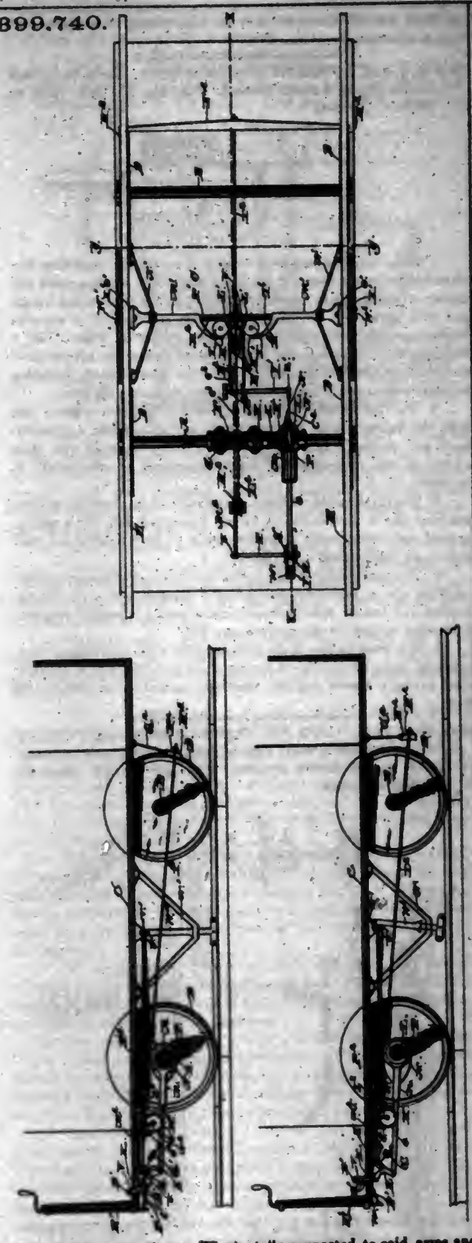
6. In a coupling and automatic circuit-breaker, the combination, with the base, of the insulating-washer resting thereon, and the metallic washer having the relatively large central aperture, the superimposed fusible button, and the screw passing through the button and washer and engaging the base for clamping the parts together, and having the head of relatively smaller diameter than the aperture in the metallic washer, whereby said washer will drop off when the button is melted, substantially as and for the purpose specified.

899,739. GASOGENE OR APPARATUS FOR MAKING AERATED BEVERAGES. LUTHER S. CHESBRO and SWARES M. CHESBRO, London, England. Filed Oct. 17, 1888. Serial No. 288,242. (No model.) Patented in Belgium June 19, 1888, No. 82,943.

Claim.—1. A gasogene or apparatus for the manufacture of aerated beverages, comprising a vessel divided into two compartments, the upper one of which is provided with a loosely-fitting glass chamber for containing the liquid to be aerated, while the lower serves for the generation of gas, each of the said chambers containing an agitator, the spindle carrying the upper agitator being made tubular for the introduction of the gas-producing materials into the lower chamber, substantially as described.

2. A gasogene having, in combination, a vessel, *a*, mounted on a stand and provided in its upper part with an interior upper glass chamber, *m*, for the liquid, and open at its top, and with a clear space between said vessel and chamber, said glass chamber having a central tube, *p*, extending nearly to its top, said vessel *a* having a gas-chamber, *r*, located beneath the chamber *m*, and a vertical tube, *w*, extending nearly through the tube *p* and surmounted by agitators, as set forth.

3. In combination, the stand A, vessel *a*, open-top glass chamber *m* for liquid and serving to equalize the gas-pressure, vertical tubes *p w*, vertical spindle *s* and its stuffing-box, gas-chamber *r* beneath chamber *m*, handle s^2 on the spindle *s* and beneath the stand, and agitators within each chamber, all substantially as and for the purposes set forth.



899,740. BRAKE FOR STREET-RAILWAY CARS. WALTER B. CLARK, Covington, Ky. Filed July 18, 1888. Serial No. 280,254. (No model.)

Claim.—1. In a car-brake, the combination of the cam-levers, means, substantially as set forth, to operate the same, and the rods M', attached to the cam-levers, and having the shoes or blocks adapted to engage the inner upper sides of the track-rails, substantially as described.

2. In a car-brake, the combination of the cam-levers, the brake-levers M', connected thereto and extending outward therefrom, and adapted to engage the inner sides of the track-rails, the suspended brake-levers W', adapted to engage the outer sides of the track-rails, and the rods D^2, connecting said brake-levers to the cam-levers, substantially as described.

3. In a car-brake, the combination of the rock-shafts T', having

899,740.

the arms, the brake-levers W', pivotally connected to said arms and suspended therefrom, means, substantially as set forth, to apply said brake-levers to the track-rails and release them therefrom, and means, substantially as described, to turn the rock-shafts and thereby raise or lower the brake-levers.

4. In a car-brake, the combination of the cam-levers, the brake-levers M', pivotally connected thereto and adapted to engage the inner sides of the track-rails, the arms R', extending from said brake-levers, and the springs bearing on said arms, substantially as described.

5. In a car-brake, the combination, with the cam-levers, of the spring-depressed brake-levers M', connected thereto and adapted to engage the track-rails, substantially as described.

6. The combination of the car, the hinged yokes N', suspended from the same, the brake-levers M', guided and supported by said yokes and adapted to engage the track-rails, and means, substantially as specified, to operate the said brake-levers.

7. In a car-brake, the combination of axle, the drum loose thereon, the cam-lever, connections between the same and the drum, the brake-levers, connected to and operated by the cam-lever, and the clutch devices to secure the drum to the axle, substantially as described.

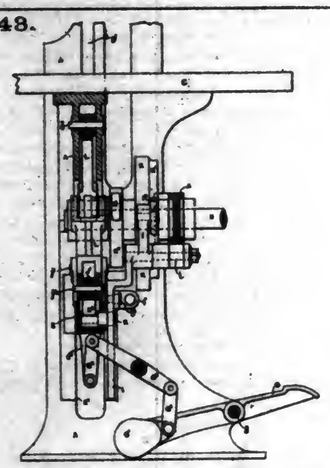
8. The combination, in a car-brake, of the rock-shafts T', the brake-levers W', connected thereto, adapted to be raised and lowered thereby, and having the shoes X' to engage the track-rails, the cam-levers, the rods connecting the same to the brake-levers W' to operate the latter, the crank-shaft Y', and connections, substantially as set forth, between the same and the rock-shafts, substantially as described.

9. The combination, in a car-brake, of the brake-levers, the cam-lever connected thereto and adapted to operate the same, the ratchet-wheel K^2, the chain connecting said ratchet-wheel to the cam-lever to operate the latter, the rocking levers R, having the arms U, the dog M^2, connected to said arms and engaging the ratchet-wheel, the link connecting the free end of the dog to the axis of the ratchet-wheel, the spring-pressed pawl pivoted to the dog and adapted to engage the wheels, and means, substantially as set forth, to operate the rocking lever, substantially as described.

899,741. CUP FOR FOOD-WARMERS. SAMUEL CLARKE, Childs Hill, County of Middlesex, England. Filed May 21, 1888. Serial No. 274,350. (No model.)

Claim.—A cup for food-warmers, having its lower portion circular in cross-section and of less diameter than the upper portion, and having also a projecting lip at the top and a cover extending over the top of the cup toward the front edge of the lip to reduce or regulate the size of the delivery-opening at the lip, and also extending in an opposite direction over a portion of the main body of the cup, said cup being formed with a tube or passage on its front side passing downwardly from the lip under the cover to near the bottom of the cup, substantially as described.

899,742. BEE-HIVE. FRANCIS M. CLEMENT, Marion, Ky. Filed Nov. 14, 1888. Serial No. 290,806. (No model.)



Claim.—An earthenware bee-hive comprising a conical brood-chamber closed at its bottom and open at its top, a vertical standard within said chamber, an apertured plate on top of said chamber, a conical surplus-honey chamber open at its bottom and having an aperture in its top, resting on said plate, and a honey-comb support inside the surplus-honey chamber, removably secured in the aperture in the top, the brood-chamber being surrounded by an embankment of earth having a perforated face-plate and provided with an entrance-tube leading through the embankment and said face-plate, substantially as described.

899,748. CLAMPING APPARATUS FOR PAPER-CUTTING MACHINES. GEORGE DARLING, Reddish, County of Lancaster, England. Filed Sept. 2, 1887. Serial No. 248,612. (Model.) Patented in England Dec. 9, 1884, No. 15,160.

Claim.—1. In combination, the supporting-frame, the press D, the wedge-frame E, and connecting-rods between them, the main shaft H, a series of cams on said shaft, a sliding wedge on the frame E, operating-connections between one of said cams on the main shaft and the sliding wedge for giving one part of the movement to the clamping apparatus, and an independent set of operating-connections between another of said cams on the main shaft and the sliding wedge

399,743.

for giving the final movement to the clamping parts, substantially as described.

2. In combination with the sliding press D, wedge-frame E, with connecting-bars between them, a stationary frame, A, the main shaft H in said frame, the sliding wedge on the wedge-frame, movable shoes J, engaging with said sliding wedge, operating-connections from the sliding wedge to the main shaft, and independent operating-connections between the movable shoes and the main shaft, whereby the wedge-frame and press D in operation move at varying rates of speed.

3. In combination, the supporting-frame, the press D, the wedge-frame E, and connecting-rods between them, the main shaft H, a series of cams on said shaft, a sliding wedge on the frame E, operating-connections between one of said cams on the main shaft and the sliding wedge for giving one part of the movement to the clamping apparatus, and an independent set of operating-connections between another of said cams on the main shaft and the sliding wedge for giving the final movement to the clamping parts, and a pawl engaging with the sliding wedge, and connections between said pawl and a third cam on the shaft H, whereby the parts are automatically locked in position, substantially as described.

4. In a clamping device, the combination of the frame E, the wedge E^2, adjustable thereon, the links J' J', the shoes J J, pivoted thereto, the jointed levers L L, the connecting-link L', having bowl L^2, and the cam K^5, substantially as described.

5. In combination with the sliding wedges E^2, the pin *e*, the rocking levers I I^2, and the spring-connection I' i^2, interposed between said levers, substantially as described.

6. In combination with the press D and wedge-frame E, with connections between them, the frame A, the main shaft, a sliding wedge moving in and supported directly by said wedge-frame, and operating-connections between the wedge and main shaft, substantially as described.

7. In combination with the press D and wedge-frame E, with connections between them, the frame A, the main shaft, a sliding wedge moving in and supported directly by said wedge-frame, said wedge-frame having a slot, *d'*, a pin, *e*, on the wedge projecting through said slot, an operating-lever, I, pivoted on the frame and provided with a slot, *i'*, through which the pin *e* projects, and suitable connections between the lever I and shaft H, substantially as described.

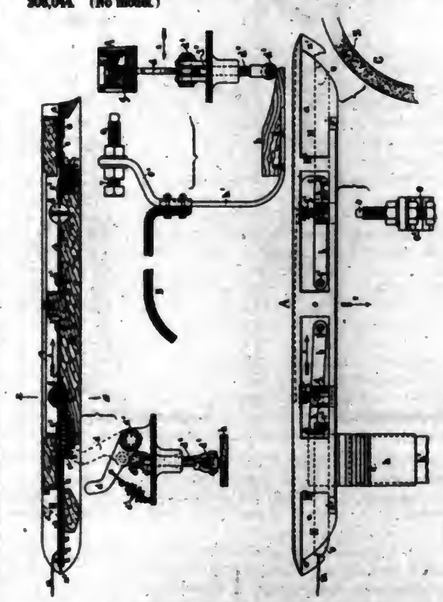
8. In combination, the wedge E^2, having the serrations e^2, the pawl M, slotted link M', oscillating lever M^2, bowl M^3, and cam-plate K^5, substantially as described.

9. In combination, the press D, the wedge-frame E, with connections between them, the supporting-frame A, the sliding wedge E^2 on said wedge-frame, the main shaft H, cams K K' on said shaft, the rocking lever I^2, pivoted to said supporting-frame, the rocking lever I, also pivoted to the main frame, the rod connecting the same, bowls on one end of said rocking levers engaging with the cams, respectively, and a spring, i^2, for keeping said bowls normally in engagement with the cams.

10. In combination, the supporting-frame, the press D, the slotted wedge-frame E, connecting-rods between them, a wedge, E^2, sliding on said frame and provided with a pin projecting through the slot thereof, a lever, I, pivoted on the frame and provided with a slot through which the pin *e* projects, an operating-shaft, H, a series of cams on said shaft, connections between said lever I and the cams on the shaft for moving the sliding wedge, movable shoes J in engagement with said sliding wedge, and connections between the cams on the shaft and the movable shoes for compressing them against the wedge, substantially as described.

399,744. OVEREDGE SEWING-MACHINE. DAVID R. DAWSON, Dundee, County of Forfar, Scotland. Filed Aug. 21, 1888. Serial No. 283,247. (No model.)

Claim.—1. The improved combination of parts, consisting of a thread-barrel made with a stepped end and with a spring-pressed end button, a pressing-plate shaped centrally to fit the front of the button and with a step-like depression round the middle part, a movable bracket carrying the pressing-plate and guided on a fixed bar, a weighted cord actuating the pressing-plate, and a ratchet-and-pawl device connected to the pressing-plate, the several parts operating together, substantially as and for the purposes herein set forth.



2. The combination of the thread-barrel, having a stepped end, with the helical needle of an overedge sewing-machine, a pressing-plate, and devices, substantially as described, to press the said plate up toward the stepped end of the thread-barrel, all substantially as set forth.

3. The combination of the helical needle of an overedge sewing-machine and a thread-barrel having a stepped end, and a spring-pressed end button, with a pressing-plate to bear against the said button, all substantially as set forth.

4. The combination of the helical needle of an overedge sewing-machine and a thread-barrel having a stepped end, and a spring-pressed end button, with a pressing-plate having a central step-like depression, as and for the purpose specified.

5. The combination of the helical needle of an overedge sewing-machine and a thread-barrel having a stepped end, with a pressing-plate having a central step-like depression, as and for the purpose set forth.

399,745. LOOM FOR WEAVING UNSPUN PLANT-STALKS. PAUL DE HEMPTINNE, Ghent, Belgium, assignor to the Flachsbau Gesellschaft, Cologne, Prussia, Germany. Filed July 14, 1888. Serial No. 208,044. (No model.)

Claim.—1. In combination with the shuttle-body, the fixed plate *a'*, and movable jaw-plate *c*, formed with projections *c'* and c^2, spring *f*, catch *b*, and the spring *g'*, substantially as described.

2. In combination with a shuttle-body, the fixed plate *a'*, movable jaw-plate *c*, catch *b*, pin *g*, and spring *g'*, and fixed bolt *e*, rod *d'*, breast-beam B, spring *f*, and the lathe, substantially as set forth.

3. In combination with a shuttle-body and movable jaw-plate, *c*, having projection *c'*, the elbow-lever *d*, situated in the shuttle-race, rod d^3, roller d^3, and inclined surface A, bar *h'*, breast-beam B, spring *f*, and the lathe, substantially as set forth.

399,746. MECHANICAL MOVEMENT. DARIUS W. DODSON, Wilkes-Barré, Pa., and FRANCIS H. RICHARDS, Springfield, Mass.; said Richards assignor to said Dodson. Filed Nov. 16, 1888. Serial No. 310,327. (No model.)

Claim.—1. The combination, with a revoluble shaft having an orbital movement, and having thereon a starting-arm and a segmental gear, of a latch interposable in the path of said arm for starting said shaft, and a repeating mechanism actuating a tooth or arc of gear interposable in the circuit of said gear, all substantially as and for the purpose described.

2. The combination of the revoluble shaft having thereon the gear 10, the stationary gear having teeth 11, tooth or teeth 20, constructed to have a reciprocating movement, a cam driven slower than shaft 5, and connections actuating said tooth or teeth from the cam, all substantially as described.

3. The combination, with shaft 5, having the segmental gear 10, of sleeve 23, carrying one or more teeth, 20, and cam 27, driven from said shaft and operatively connected with said sleeve, substantially as described.

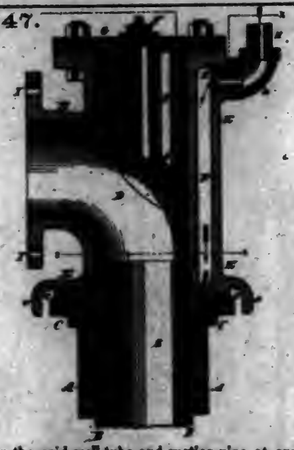
4. The combination, with a revoluble shaft having an orbital movement and having thereon the stop-arm; of a segmental rim intercepting the movement of said arm, all substantially as described.

5. The combination, with a revoluble shaft having an orbital movement and having thereon a starting-arm and a stop-arm, of a latch interposable in the path of said starting-arm for starting said shaft, and a segmental rim intercepting the movement of said stop-arm, all substantially as described.

6. The combination, with a revoluble shaft having an orbital movement and having thereon a starting-arm and a stop-arm, of a latch operating on said starting-arm to start said shaft, a segmental rim for intercepting said stop-arm to stop said shaft, and a detent operating to restrain the axial rotation of said shaft, all substantially as described.

7. The combination, with a revoluble shaft having an orbital movement and having thereon a segmental gear, of a repeating mechanism actuating a tooth or arc of gear interposable in the circuit of said gear, all substantially as described.

8. The combination, with a revoluble shaft having an orbital movement and having thereon a starting-arm, of means (as a shaft-starter) for starting said shaft revolving, and gearing, substantially as described, for continuing the said movement through two revolutions each time the shaft is started, all substantially as described.



9. The combination, with a revoluble shaft having an orbital movement, of a stationary gear concentric to said shaft's orbit, a segmental gear fixed and arranged on said shaft to run in mesh with said stationary gear, and having a tooth normally out of the plane of the stationary gear, and a cam moving simultaneously with said shaft and actuating said tooth to throw the same into mesh with said stationary gear, whereby said shaft is revolved twice each time it is started, substantially as described.

10. The combination, with a revoluble shaft having an orbital movement and having thereon a starting-arm, of a latch interposable in the path of said arm for starting said shaft, a stationary gear concentric to said shaft's orbit, a segmental gear fixed and arranged on said shaft to run in mesh with said stationary gear, and having a tooth normally out of the plane of the stationary gear, and a cam moving simultaneously with said shaft and actuating said tooth to throw the same into mesh with said stationary gear, whereby said shaft is revolved twice each time it is started, substantially as described.

399,747. DRIVEN-WELL HEAD. JOSEPH EDWARDS, Brooklyn, N. Y. Filed Dec. 31, 1888. Serial No. 294,960. (No model.)

Claim.—In pipe-wells, the combination of the well-tube A A, suction-pipe B B, and well-head E E E E, having the elbow D and the air-passage F, and the pipe H, whereby outer air is admitted to flow

399,747.

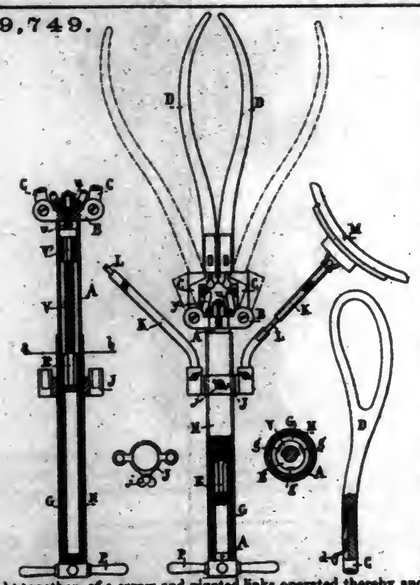
in between the said well-tube and suction-pipe at any necessary elevation above the top of the said well-tube to keep out therefrom all surface-water and other impurities, substantially in the manner and for the purpose set forth.

399,748. INCANDESCENT-ELECTRIC-LAMP SOCKET. CHARLES H. EBAN, Columbus, Ohio, assignor of one-tenth to E. W. Halley, Tipton, Ind. Filed July 11, 1888. Serial No. 279,612. (No model.)

Claim.—1. In an incandescent electric lamp, the combination of a socket adapted to fit over the stem of the lamp, spring-jaws provided with gripping-faces within the socket in permanent electrical connection with the opposite sides of the supply-circuit, and metallic projections on its stem in electrical connection with the filament adapted to be engaged by the jaws and hold the lamp firmly in the socket, whereby the lamp may be lighted or extinguished by rotating the globe.

2. In an incandescent electric lamp, the combination of a socket adapted to fit over the stem of the lamp, two or more pairs of diametrically-opposite spring-jaws within the socket, metallic projections on the stem in electrical connection with the filament adapted to be engaged by either pair of jaws, and conductors leading from one pair of jaws to the outside of the socket, whereby when the lamp is in a supply-circuit it may be lighted or extinguished by partially rotating the bulb.

3. In an incandescent electric lamp, the combination, with the socket, of two or more pairs of spring-jaws within the same, projections on the lamp-stem electrically connected with the filament adapted to be engaged by either pair of jaws, contacts in operative relation to one pair of jaws and engaged by the same when the filament is out of circuit, and a resistance equal to the lamp-filament between the contacts, whereby the lamp may be extinguished by partially rotating its bulb and the resistance thrown into circuit.



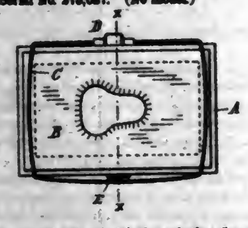
4. In an incandescent electric lamp, the combination of a socket adapted to fit over the stem of the lamp, spring-jaws within the socket, and metallic projections on the stem electrically connected with the filament, said jaws being provided with gripping-faces adapted to engage the projections when the lamp-globe is turned in either direction, whereby the lamp may be secured firmly in its socket, lighted or extinguished, and the current through the filament reversed by simply turning the globe, as and for the purpose set forth.

399,749. OPHTHALMIC FORCEPS. ARMANDO C. GALIANO, Madrid, Spain. Filed Oct. 10, 1888. Serial No. 287,770. (No model.) Patented in Spain Mar. 12, 1888, No. 4,090, and in England Sept. 21, 1888, No. 12,969.

Claim.—1. In mechanical forceps, the combination, with the arms or branches mounted on supports which can be extended and brought together, of a screw connected to said supports for moving the same and the head or nut on said screw and the movable tube or key engaging the same, substantially as described and illustrated.

2. In mechanical forceps, the combination, with the removable arms or branches mounted on supports which can be extended and

899,749.



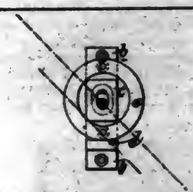
brought together, of a screw and pivoted links operated thereby and connected to the movable supports for moving the same and the head or nut on said screw and the movable tube or key engaging the same, substantially as described.

3. In mechanical forceps, the combination, with the inner longitudinally-movable tube provided with the internal spurs or teeth and the intermediate head having teeth for engagement therewith, of the screw V and nut E, substantially as and for the purpose herein described.

4. In mechanical forceps, the combination, with the supporting-tube, of the adjustable brackets thereon, bearing the extensible arms and pads which bear against the inguinal regions of the mother and serve as supports during the extraction of the child, substantially as described.

5. In an extracting mechanism, the combination, with the tube G, provided with spurs or teeth, of the nut E, engaging said spurs or teeth, the handles P, secured to tube G, and screw V, engaging said nut and carrying the arms or branches, whereby when the handle is turned the screw and the arms or branches are withdrawn, substantially as described.

899,750. VIGNETTE-HOLDER. ADELBERT L. GEER, Midland, Mich., assignor of one-half to Edwin C. Berryman, same place. Filed May 7, 1888. Serial No. 273,027. (No model.)

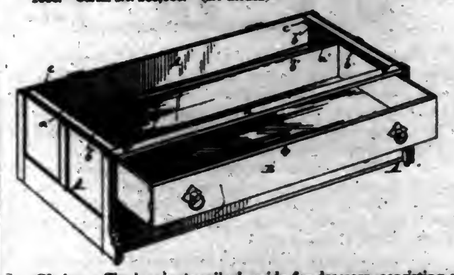


Claim.—1. The combination, with the printing-frame and a catch upon one side thereof, of a holder for vignettes, attached at its ends only to the opposite side of said frame, leaving all four sides of said holder free and providing greater elasticity from the hinge to the adjacent corners, substantially as and for the purpose specified.

2. In a vignette-holder, the combination, with the printing-frame, of the hinge-box D, adapted to be fastened to the sides of the frame, and provided with the recess *c*, of the four-sided spring-wire frame C, made of one piece of wire, with the upturned ends *a* and the catch E secured to the opposite side of the printing-frame, the parts being arranged to operate substantially as described.

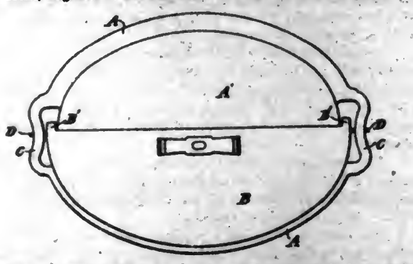
899,751. FRICTION-HINGE. EDWIN HAINES, Paddock Wood, County of Kent, England. Filed Nov. 5, 1888. Serial No. 290,012. (No model.)

Claim.—1. The stationary fitting *b*, with lugs *c* and *d*, in combination with the ring *a*, which is applied to a rotatable part working



899,751.

in connection therewith and works between the lugs *c* and *d*, substantially as and for the purpose set forth.



2. The fitting *b*, adapted to be fixed to a swing looking-glass stand and provided with lugs *d* and *c*, the latter having an oval hole for a pivot, *e*, that is secured to the looking-glass, in combination with a ring, *a*, that is adapted to be secured to the looking-glass and works between the lugs *c* and *d*, substantially as and for the purpose set forth.

899,752. DRAWER-GUIDE. WILLIAM HORNOCK, Herkimer, N. Y., assignor of one-half to Frank F. Lathrop, same place. Filed Sept. 10, 1888. Serial No. 285,060. (No model.)

Claim.—The herein-described guide for drawers, consisting of the two cords *b b'*, having their ends rigidly secured to the body A at front and rear and passed around the pulleys *a* and *a'* at opposite ends of the drawer B in reverse directions, substantially as shown and described.

899,753. COVERED DISH. GEORGE JONES, FRANCIS R. JONES, GEORGE H. JONES, HORACE O. JONES, and CHARLES S. JONES, Stoke-upon-Trent, England. Filed Oct. 22, 1888. Serial No. 288,949. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the dish having a portion of its cover formed integrally with its lower portion, the movable section of the cover, the downwardly projecting lugs thereof slotted, as described, the slotted handles of the dish, into which the lugs project, and the pivots for the downwardly-projecting lugs between the dish and the handles.

899,754. TESTING-MACHINE. WILLIAM J. KEEP, Detroit, Mich. Filed July 30, 1883. Serial No. 280,461. (No model.)

Claim.—1. In a testing-machine, the combination of a post to act on the article to be tested, a beam arranged over the post and bearing thereon, a weight running on the beam, and means, as the drum F and cords E E', for moving said weight along the beam, substantially as described.

2. In a testing-machine, the combination of a post to rest on the article being tested, a beam arranged over the post and bearing thereon, a diagram-paper holder, a pencil-holder, and means, as the drums F F and cords E E' I I', for giving simultaneous motion to the weight and diagram-paper holder, substantially as described.

3. In a testing-machine the combination of a traveling device, as the weight D, a cord attached to and moving the same, an endwise-moving drum which winds the cord, a shaft carrying said drum, provided with a screw-thread, and a fixed bearing for said shaft having a female thread corresponding to the thread on the shaft, and arranged to move said shaft and drum endwise as it revolves the drum and winds the cord thereon, substantially as described.

899,754.

4. In a testing-machine, the combination, with the beam resting on a fulcrum and constructed to bear on the article being tested, of a weight moved on the beam by a cord, and a drum having an endwise motion for coiling said cord, located below the beam and in the rear of the fulcrum, substantially as described.

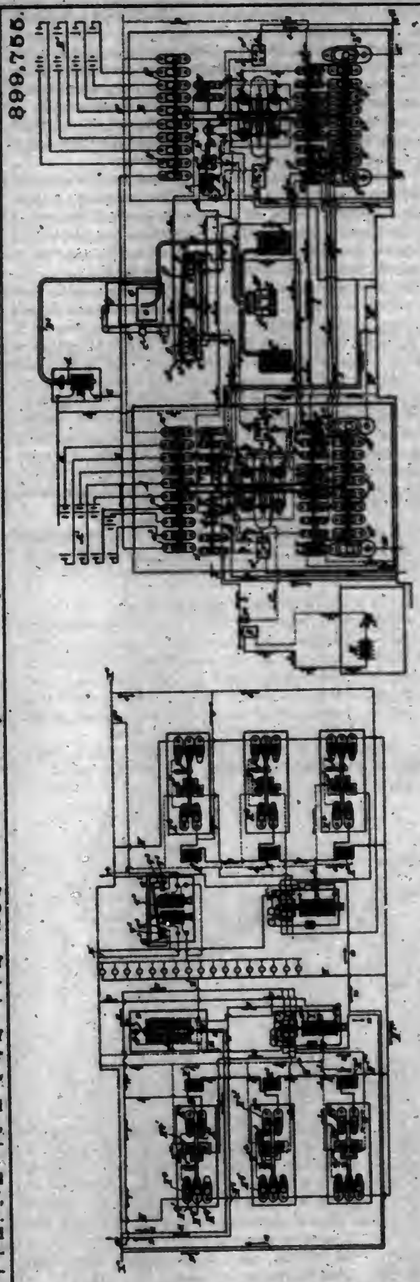
5. In a testing-machine, the combination, with a beam and a diagram-paper holder moving parallel with the same, of a fulcrum-support provided with an aperture to receive said paper-holder and the test-bar, substantially as described.

6. In a testing-machine, and in combination with the beam thereof, a support for the test-bar, and a diagram-holder constructed to slide parallel with the beam, a pencil-holder, and means, as the beams C, moving in unison with the test-bar to communicate motion to said pencil-holder, substantially as described.

7. In a testing-machine, and in combination with the beam thereof and a support for the test-bar, a pencil-holder attached to and carried by the beam and a diagram-paper holder constructed to slide parallel with the beam, substantially as described.

8. In a testing-machine, and in combination with the beam thereof and a pencil-holder attached thereto, a paper-holder, as M, ways for guiding the same, and means, as the revolving drum F and cords E E', for giving it motion, substantially as described.

9. In a testing-machine, and in combination with the beam and weight thereof, a retarding device, as the dog V, pivoted to the beam, and slotted arc U U', for stopping the motion of the beam, substantially as described.



10. In a testing-machine, and in combination with the beam and weight thereof, a dog, V, pivoted to the beam, and a slotted arc, U U', having chutes and steps, substantially as and for the purpose specified.

11. In a testing-machine, and in combination with the beam and weight thereof, a dog, V, pivoted to the beam, and a slotted arc consisting of the stationary section U and the pivoted section U', substantially as and for the purpose specified.

899,755. ELECTRICAL DISTRIBUTION BY SECONDARY BATTERIES. FRANK KIRK, Fulham, County of Middlesex, England. Filed Oct. 22, 1888. Serial No. 288,775. (No model.) Patented in England Dec. 7, 1887, No. 16,863.

Claim.—1. In apparatus for automatic electrical distribution and change of secondary batteries, the combination of a set or pair of switching apparatus for transferring the connection of a battery or set of batteries from series to parallel, and vice versa, and a resistance in a branch circuit having contacts controlled by said switching apparatus, whereby the continuity of the charging-circuit is maintained through said resistance while the batteries are being transferred, substantially as described.

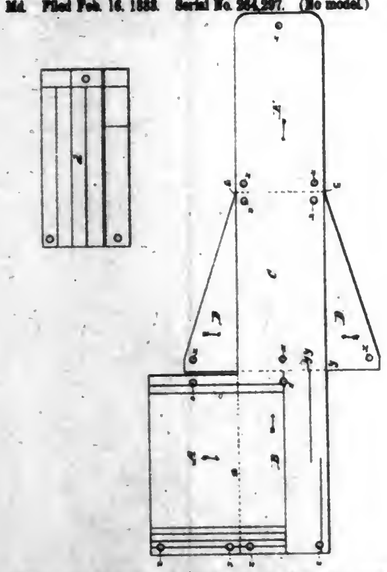
899,755.

2. The combination of switching apparatus A and B, batteries A' and B', gas-pipe-sealing apparatus E, gasometer C, and switch F, with their connecting-circuits, substantially as and for the purpose hereinbefore described.

3. The combination, with the switching apparatus A and B, batteries A' B', gas-collecting chambers, pipe-sealing apparatus E, and gasometer C, of the switch F and valve apparatus K^3 and their connecting-circuits, substantially as and for the purpose hereinbefore described.

4. In a system of electrical distribution, the combination, with the secondary batteries and distributing-main supplied thereby, of the electro-magnetic regulating apparatus Z, contacts actuated thereby, and counter-electro-motive-force cells and controlling apparatus for

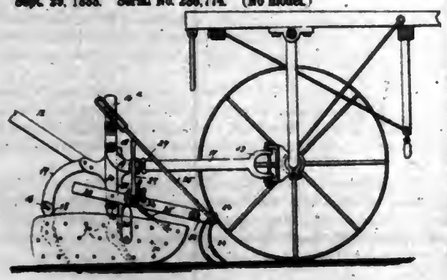
effecting the regulation of the electro-motive force in the said distributing-main, substantially as described.



5. The combination, with the switching apparatus A B for transposing the connections of a battery from parallel to series, and vice versa, of connections and circuits controlled directly by the movement of the said switches, an electro-magnetic device connected with the distributing-main, and circuits and contacts controlled by said device for regulating the electro-motive force in the discharging-circuit of said batteries, substantially as hereinbefore described.

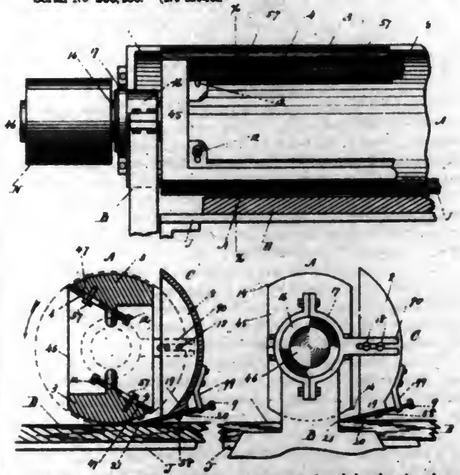
6. In a system of electrical distribution, means for insuring equality of discharge-current from two sources of electricity by the insertion in the respective circuits of a sufficient counter-electro-motive force, the said means consisting of the current-balance apparatus Q, in combination with the switching apparatus R^5 and R^6, and cells attached thereto, substantially as hereinbefore described.

7. The combination, with one or more pairs of batteries and one or more pairs of switches for transposing the connections of the said batteries from series to parallel, and vice versa, of a gasometer, C, gas-seal E, switch F, electro-magnetic valvular device K^3, regulating apparatus Z, counter-electro-motive-force cells R' R^2 R^3 R^4 R^5 R^6, and current-balance Q, with their connecting-circuits, substantially as and for the purpose hereinbefore described.



8. In a system of electrical distribution, the combination, with a set or sets of batteries provided with apparatus for automatically charging and discharging the said batteries, of cells used as counter-electro-motive force for the regulation of the electro-motive force in the discharge-circuit of the said batteries, substantially as hereinbefore described.

399,756. COMBINATION-TAG. WILLIAM H. LARSON, Baltimore, Md. Filed Feb. 16, 1888. Serial No. 264,297. (No model.)



Claim.—As an improved article of manufacture, a combination shipping-tag comprising the parts A and B, the part A, adapted to fold over the part B, the body C, attached to the part B, the oblong end flap, E, at the end of the body C, opposite to the part B, and the side flaps, D, on the body C, having their acute-angled points nearest the end flap, E, and holes or perforations, substantially as described.

399,757. CULTIVATOR. ENOS LANDIS, Reserve, Kans. Filed Sept. 29, 1888. Serial No. 286,774. (No model.)

399,758. CUTTER-HEAD FOR PLANING-MACHINES. VICTOR V. LAWRENCE, Waterford, Vt., assignor of one-half to Isaac F. Paul, Boston, Mass., and Amos H. Carpenter, Waterford, Vt. Filed Mar. 26, 1888. Serial No. 268,433. (No model.)

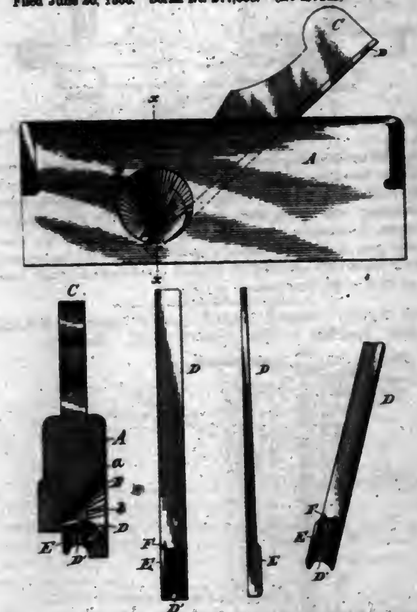
Claim.—1. The improved rotary cutter-head having heads or end pieces, 45, provided with short integral journals or gudgeons 46, projecting from their outer sides, and the parallel portions 3, which connect said end pieces, the same being separated by a clear space extending their whole length, and having flat inclined knife-beds 47, which are tangential to the axis of the cutter-head, as shown and described.

2. The cutter-head A, having the knife-carrying bar 3, said bar being constructed higher at its rear than at its front side to form the burnisher 48, substantially as described.

3. The end pieces, 45, provided with the gudgeons 46 and connected by the bars 3, the knives 4, secured to the front inner sides of said bars by the screws 58, the brackets 5, attached to said end pieces, and the adjusting-screws 12, mounted in said brackets and connected with said knives by the annular flanges 95, and slots 13, all being constructed, combined, and arranged to operate substantially as described.

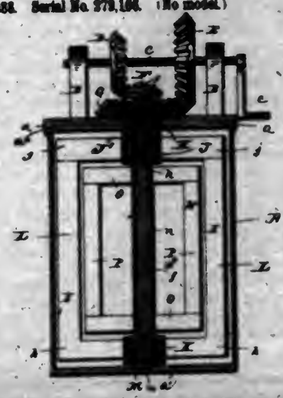
399,759. BOOK CARRIAGE AND PROTECTOR. LAWRENCE C. LEITE, Galveston, Tex. Filed July 25, 1888. Serial No. 280,979. (No model.)

Claim.—1. A roller platform-carriage for books, composed of a base-piece having a longitudinally-central raised table-piece adapted to support the leaves of the book, and a depressed-ledge portion outside thereof adapted to support the cover of the book, substantially as specified.



2. The within-described book carriage and protector, consisting

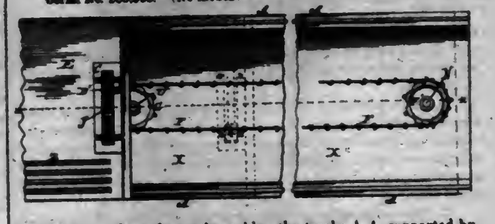
399,759.



of the base-piece A, having a raised table-piece, *b*, constructed to form or leave a depressed ledge, *h*, the rollers *c c*, and the front pull-piece, *d*, as and for the purposes herein set forth.

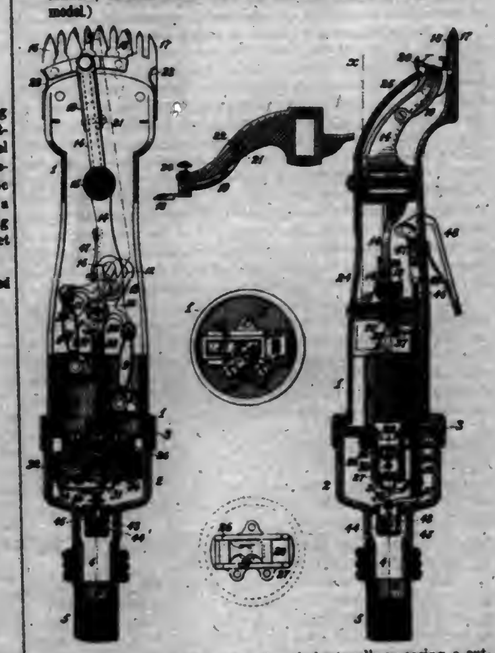
399,760. HEAD-PLANE. JAMES F. LEWALLEN, Wilmore, Ky. Filed June 20, 1888. Serial No. 277,006. (No model.)

Claim.—In a molding-plane, the combination of the stock having the oblique cone-shaped throat through one cheek thereof, and the bit-key C, having its lower end concavely beveled to conform to the bevel in the throat to form therewith a continuous deflecting discharge-orifice, of a bit having its cutting-edge of substantially ogee form, one side thereof being provided with an upturned cutting-flange, and a groove or depression adjacent thereto, said groove gradually merging in the bit-shank, substantially as described, and for the purpose set forth.



399,761. CHURN. WILLIAM D. MAKEMSON, Prescott, Kans. Filed July 6, 1888. Serial No. 278,166. (No model.)

Claim.—1. In a churn, the combination of the rectangular dasher-rod provided with a conical lower end, the inner dasher provided with a rectangular axial sleeve fitting on the dasher-rod, the loose circular sleeve H, mounted on an upper rounded portion of the dasher-rod, and the outer dasher provided at its upper end with a rectangular sleeve, J, embracing the lower squared extension of the sleeve H, and at its lower end with the sleeve K, having the inverted conical step mounted in a suitable socket in the churn-body and forming a bearing for the conical lower end of the dasher-rod, substantially as specified.



2. In a churn, the combination, with the churn-tub provided with a suitable cover having a central bearing, *c'*, of the vertical squared dasher-rod *f*, provided with a rounded portion, A, and a squared upper extremity, the removable gear-wheel F, fitting on the squared extremity of the dasher-rod, the gear-wheel G, above the churn-cover and provided with a circular sleeve, H, mounted in the bearing *c'*, and having a squared extension, J', on its lower end, the outer dasher provided with a rectangular sleeve, J, fitting on the squared extension J', the inner dasher provided with a square axial sleeve fitting on the dasher-rod below the sleeve J, and the horizontal shaft C, provided with the gear-wheels E and D, which mesh, respectively, with the gear-wheels G and F, substantially as specified.

399,762. RECIPROCATING TABLE FOR HOLDING MOLDINGS TO BE POLISHED. LOUIS MALMROW, Chicago, Ill. Filed Sept. 17, 1888. Serial No. 285,593. (No model.)

Claim.—In reciprocating tables, the tracks A-A, supported by suitable frame-work, and the table E thereon, in combination with the slotted guide portion C D', placed transversely on one end of the table, and the slide D in the guide, the reversing-link H K L I, with the pivot J, projecting into the slide, and the portion I, jointed to the chain F, the sprocket-wheels G F', with the endless chain thereon, and suitable gearing, N M O P', as and for the purpose specified.

399,763. SHEARING AND CLIPPING MACHINE. THOMAS A. MARTIN, Brainerd, Minn. Filed Oct. 1, 1888. Serial No. 286,634. (No model.)

Claim.—1. The combination of a tubular handle or casing, a cutter-lever pivoted thereto, a removable end plate connected to and closing one end of the handle, and a fluid-pressure motor secured to said end plate and having a piston or pistons coupled to the cutter-lever, substantially as set forth.

2. The combination of a tubular handle or casing which is open

at one of its ends, an end plate connected to and closing the opposite end of the handle, a cutter fitted to vibrate adjacent to the open end of the handle, and a fluid-pressure motor fixed to the end plate within the handle and having one or more pistons coupled to and actuating the cutter, and an exhaust-port for the discharge of motive-fluid into and through an open end of the handle, substantially as set forth.

3. The combination of a tubular handle or casing, a fluid-supply chamber connected thereto, an end plate interposed and fixed in position between the handle and supply-chamber, a cylinder fixed to said end plate within the handle and having its piston connected to a cutter-lever pivoted thereto, a valve-chest secured to the end plate within the supply-chamber, and a main or distribution valve working in said chest and governing the supply and exhaust of motive-fluid to and from the piston, substantially as set forth.

4. The combination of a handle or casing, a cylinder fixed thereto, a vibrating lever pivoted thereto and provided with a longitudinal slot, a piston fitting the cylinder and coupled to said vibrating lever, a cutter-lever pivoted to the handle and having a longitudinal slot in its arm adjacent to the vibrating lever, and a coupling-pin passing through the slot of the cutter-lever and secured adjustably in the slot of the vibrating lever, substantially as set forth.

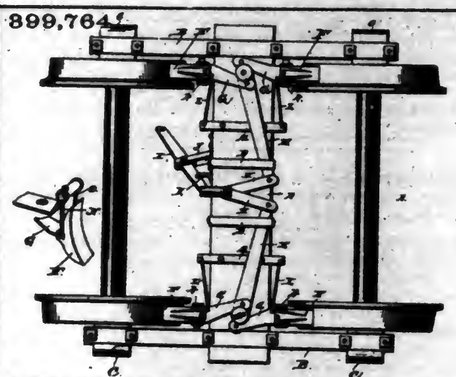
5. The combination of a handle or casing, a fixed cutter or comb secured thereto, a cutter-lever pivoted thereto, a cutter-carrier pivoted to said lever by a pin passing through a slotted hole therein, and a vibrating cutter secured to the free end of said carrier, substantially as set forth.

6. The combination of a handle or casing, a fixed cutter or comb secured thereto, a cutter-lever pivoted thereto, a cutter-carrier pivoted to the cutter-lever, a vibrating cutter secured to the free end of said carrier, and an adjusting-screw engaging a female thread in the cutter-lever and adapted to bear on the cutter-carrier, substantially as set forth.

7. The combination of a handle or casing, a cutter-lever pivoted thereto, a fluid-pressure motor secured thereto and having a piston or pistons coupled to the cutter-lever, and cushion-springs connected to the handle in position to bear against the cutter-lever at the opposite terminals of its traverse, substantially as set forth.

8. The combination of a handle or casing, a cylinder fixed thereto, a vibrating lever pivoted thereto, a piston fitting the cylinder and coupled to said vibrating lever, a main valve governing the supply and exhaust of motive-fluid to and from the cylinder, a valve-piston coupled to and actuating said main valve, and a supplemental valve actuated by the vibrating lever and effecting the supply and exhaust of motive-fluid to and from the valve-piston, substantially as set forth.

9. The combination of a handle or casing, a fluid-supply chamber connected thereto, an end plate interposed and fixed in position between the handle and supply-chamber, and having an exhaust-port leading from the chamber to the handle, a cylinder fixed to the end plate within the handle, a vibrating lever pivoted to the handle, a piston fitting the cylinder and coupled to said vibrating lever, a main or distribution valve working in the supply-chamber and controlling a supply-port in the cylinder and the exhaust-port of the end plate, a valve-piston working in a closed chamber within the supply-chamber and coupled to the main valve, a supplemental valve controlling the supply of motive-fluid to the valve-piston and its exhaust therefrom through the exhaust-port of the end plate, and a valve-stem coupled to the supplemental valve, said stem passing freely through the end plate and being adapted to be rocked in its bearing by the movements of the vibrating lever, substantially as set forth.

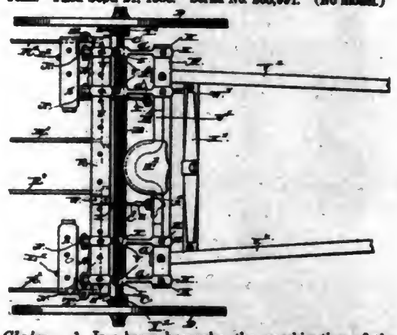


10. The combination of a handle or casing, a fixed cutter or comb secured thereto at one of its ends, a cutter-lever pivoted thereto and carrying a movable cutter, a pair of motor-cylinders fixed to the handle, a vibrating lever pivoted to the handle and having opposite arms coupled to pistons working in the motor-cylinders, and a pin coupling the cutter-lever to the vibrating lever between the piston-connections of said vibrating lever, substantially as set forth.

11. The combination of the handle, the end plate, the supply-chamber provided with induction-ports, the tubular valve-stem passing through the end plate, the regulating-valve controlling the induction-ports, and having a stem passing through the tubular valve-stem, and the valve-lever coupled to the handle and to the regulating valve-stem, substantially as set forth.

399,764. CAR-BRAKE. CHARLES MAYER, El Paso, Tex. Filed Dec. 31, 1888. Serial No. 293,094. (No model.)

Claim.—1. The combination, with the transverse truck-beam, of the levers pivoted on the under side thereof, the brake-shoes connected to said levers, the operating-lever mounted on the beam, the links connecting the lower end of the same with the inner ends of the pivoted levers, and the spring secured to the operating-lever and the beam, as set forth.



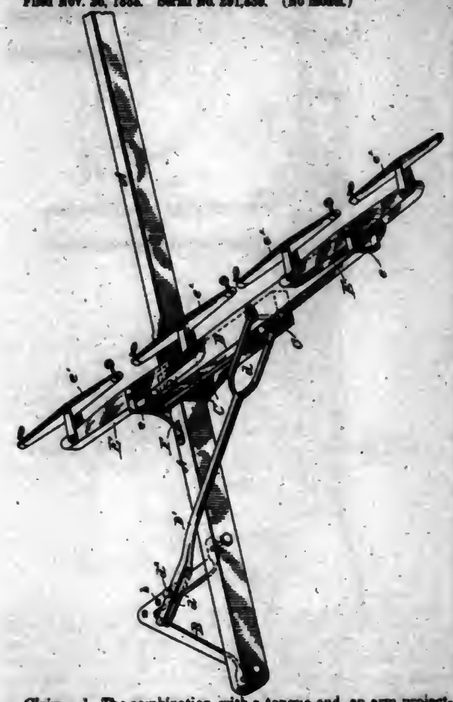
2. The combination, with the transverse beam of the truck, of the levers pivoted to the under side of the same, the brake-shoes, the pitmen connecting the brake-shoes with the levers, the straps M, secured to the beam, the retaining-rods having their ends pivoted to

the pitmen and the straps, and devices for operating the levers, as set forth.

3. The combination, with the beam, of the levers pivoted thereto, devices for operating the levers, the brake-shoes, the pitmen connecting the brake-shoes with the levers, the straps M, secured to the beam, the retaining-rods having their ends pivoted to the pitmen and the said straps, the metallic straps secured to the upper side of the beam, the pivot-pins secured in the ends of said straps, and the hangers having their upper ends mounted on the said pivot-pins and their lower ends pivoted to the brake-shoes, as set forth.

399,765. HORSE HAY-RAKE. JAMES M. MCCLINTOCK, McKenzie, Tenn. Filed Sept. 21, 1888. Serial No. 285,991. (No model.)

Claim.—1. In a horse hay-rake, the combination of the telescoping axle comprising the central tubular section and the sliding extension C therein, the horizontally-pivoted rake-head having the vertically-hinged extensions S, the bars G, through which the central section of the rake-head is pivoted to the central section of the axle, and the bars M', attached to and adjustable on the connecting-bars and having the discharge or clearing teeth, substantially as described.



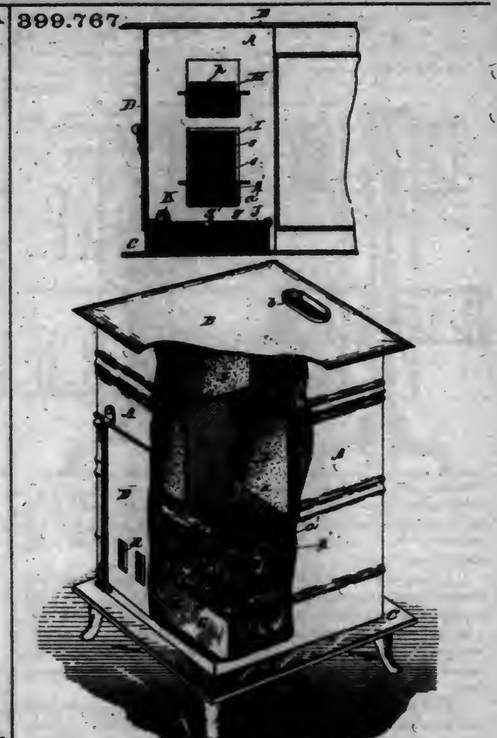
2. In a horse hay-rake adapted to be widened or contracted, the combination of the rake-head and axle, the bars G, the bars M', having slots N', the bolts attached to the bars G and extending through the said slots, and the clamping-nuts on said bolts, whereby the bars M' may be secured at any adjustment, the said bars having the clearing or discharge teeth R', substantially as described.

3. The combination, in a horse hay-rake, of the draft-bar F, the telescoping axle comprising the tubular section B and the end extensions, C, therein, the rake-head comprising the central section, R, and the extensions S vertically hinged to the ends thereof, the connecting-bars G, having their front ends provided with boxes H, in which the draft-bar is secured, provided further with the boxes I for the central tubular axle-section, and the extensions N, horizontally hinged to the rear end of bars G and having the boxes O, in which the central section of the rake-head is secured, substantially as described.

4. The combination, in a hay-rake, of the lever Z, fulcrumed to the frame, the rake-head hinged or pivoted to the frame, and thereby adapted to be raised or lowered, the casting W, secured to the rake-head and having the arms X and Y, and the rod C', attached to the lever and adapted to be connected to either of said arms, substantially as described.

5. In a horse hay-rake, the combination of the wheels having the ring swiveled to their hubs, the extensible axle on which the wheels are mounted, the rake-head having the hinged extensions, and the stay chains or rods attached to said extensions and having the hooks to engage the rings, substantially as described.

399,766. DRAFT-EQUALIZER. JONAS P. MCDOWELL, Foote, Iowa. Filed Nov. 26, 1888. Serial No. 291,830. (No model.)



Claim.—1. The combination, with a tongue and an arm projecting horizontally at a right angle to the same, of an evener centrally pivoted upon the outer end of the arm, a doubletree pivoted to said evener at the extremities, and a stop secured to the tongue limiting the inward movement of one extremity of the evener, substantially as shown and described.

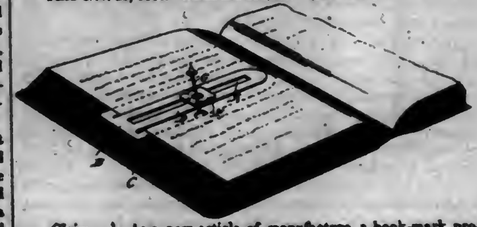
2. The combination, with a tongue, an arm projecting horizontally outward at a right angle from the right side of the tongue, and an evener centrally pivoted upon the free end of the arm, of a doubletree pivoted upon said evener at each extremity, clips embracing the evener and doubletrees, and a stop attached to the tongue limiting the rearward movement of the left-hand extremity of the evener, all combined for operation substantially as shown and described.

3. The combination, with a tongue, a horizontal apertured bracket secured at one side near the inner end, and a horizontal arm pivoted upon the tongue extending outward from the opposite side in advance of the bracket, of an evener pivoted upon the outer end of the arm, a doubletree pivoted upon the extremities of the evener, a stop secured to the tongue at the rear of the arm, and an adjustable connecting-rod uniting the evener, the arm, and the bracket, all combined for operation substantially as shown and described.

4. The combination, with a tongue, a horizontal apertured bracket secured to the left side of the tongue near the rear end, a pivoted arm extending at a right angle from the right-hand side of the tongue in advance of the bracket, and a strap limiting the movement of said arm, of an evener centrally pivoted upon the free end of the arm, a double-tree pivoted upon each extremity of the evener, a stop secured upon the tongue limiting the rearward movement of the left extremity of the evener, a connecting-bar having forked extremities uniting the arm and evener with the bracket, and a detachable pin passing through one forked end of the connecting-rod and one aperture in the bracket, all combined for operation substantially as shown and described.

399,767. STOVE. WILLIAM B. MCELHENY, Nevada, Mo. Filed Jan. 12, 1888. Serial No. 260,504. (No model.)

Claim.—1. In combination with a stove, a series of cartridges arranged one above another, one of the cartridges being removable, substantially as set forth.



2. In combination with a stove, a series of cartridges arranged one above another, and of which the upper one is removable, and the lower one is adapted to receive and retain material falling from the upper one, substantially as set forth.

3. The combination, with a stove, of the perforated trough, the cartridge supported in the trough, and the cartridge below the trough adapted to receive material flowing from the upper cartridge through the trough, substantially as set forth.

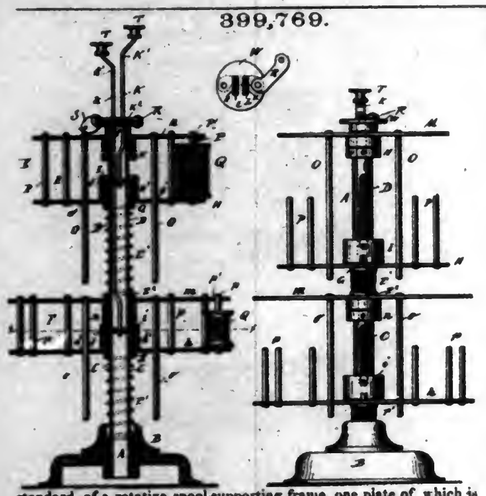
4. In combination with a stove, a series of cartridges, one above the other, the upper cartridge having perforations in its upper surface and one side of its casing, the second cartridge having perforations in only one of its sides, substantially as set forth.

5. In combination with a stove, a series of cartridges, of which the upper one has perforations in the upper surface or wall of its casing, and also in two or more of the sides of its casing, substantially as set forth.

399,768. BOOK-MARK. HENRIETTA L. MERRER, New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,612. (No model.)

Claim.—1. As a new article of manufacture, a book-mark provided with a slide, and a pointer pivoted on the said slide, substantially as shown and described.

2. A book-mark comprising two arms connected with each other at one end, a slide held to slide on one of the said arms, and a pointer pivoted on the said slide, substantially as shown and described.



3. In a book-mark, the combination, with an arm, of a slide fitted to slide on the said arm, and a pointer pivoted on the said slide, substantially as shown and described.

4. In a book-mark, the combination, with a slotted arm and a second slotted arm secured at one end on the said first-named arm and fitting in its slot, of a slide held to slide in the said second slotted arm and a pointer adapted to turn on the said slide, substantially as shown and described.

399,769. SPOOL-STAND. VINCENZ MEHAS, Brooklyn, N. Y. Filed Feb. 6, 1888. Serial No. 263,861. (No model.)

Claim.—1. In a spool-stand, the combination, with a tubular

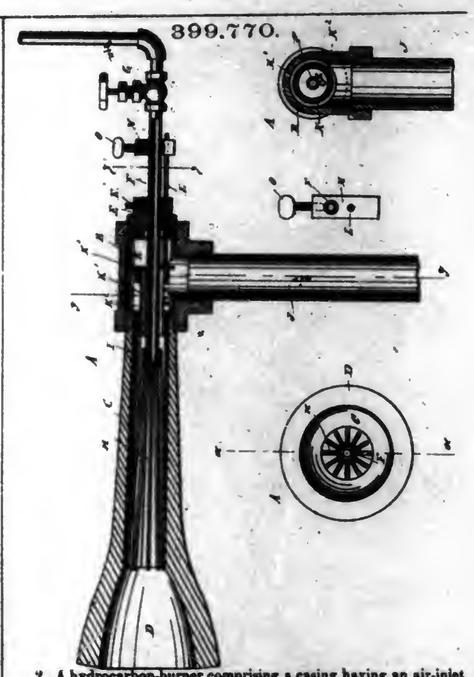
399,769.

standard, of a rotative spool-supporting frame, one plate of which is mounted to slide on the standard in the direction of the length of the standard, spool-supporting pins on one of said plates, and a push-rod connected with the sliding plate and passed through the standard, substantially as set forth.

2. In a spool-stand, the combination, with a tubular standard, of a rotative spool-supporting frame, one of the plates of which is mounted to slide on the standard in the direction of the length of the standard, a spring pressing said sliding plate toward the other plate, and a push-rod for said sliding plate, which push-rod passes through the tubular standard and is connected with the sliding plate, substantially as set forth.

3. In a spool-stand, the combination, with a tubular standard, of a rotative spool-supporting frame composed of top and bottom plates and spool-holding pins on said bottom plate, the top plate being mounted to rotate on a fixed collar on the standard and the bottom plate being mounted to turn on a sliding sleeve on the standard, a spring pressing said sliding bottom plate toward the top plate, and a push-rod connected with the sliding sleeve supporting the bottom plate and passed up through the tubular standard, substantially as set forth.

4. In a spool-stand, the combination, with a tubular standard having longitudinal slots, of a rotative spool-supporting frame composed of top and bottom plates and spools supporting pins, the top plate being mounted to turn on a fixed collar of the standard and the bottom plate being mounted to turn on a sliding sleeve on the standard, a pin passing through the sliding sleeve and through slots in the standard, and a push-rod connected with said pin and passing up through the tubular standard, and a spring for pressing the bottom plate upward, substantially as set forth.



5. In a spool-stand, the combination, with a tubular standard, of a rotative spool-frame composed of top and bottom plates, the bottom plate being mounted to slide on the standard in the direction of the length of the standard, spool-supporting pins on the bottom plate, and a push-rod extending from the bottom sliding plate up through the standard and through a slot in the top plate of the same, said push-rod being provided with a notch for engagement with one end of the slot in the top plate, substantially as set forth.

6. In a spool-stand, the combination, with a tubular standard, of a rotative spool-frame composed of top and bottom plates, the bottom plate being mounted to slide on the standard in the direction of the length of the same, spool-supporting pins on the bottom plate, a push-rod extending from the bottom sliding plate up through the standard and through a slot in the top plate of the same, said push-rod being provided with a notch for engagement with one end of the slot in the top plate, and a locking-lever on said top plate for keeping the notch in the push-rod engaged with the end of the slot in the top plate, substantially as set forth.

399,770. HYDROCARBON-BURNER. FRANK B. MEYERS, Fort Plain, N. Y., assignor of one-half to Charles S. Tanner, same place. Filed Nov. 30, 1888. Serial No. 292,271. (No model.)

Claim.—1. A hydrocarbon-burner comprising a casing having an air-inlet pipe, a burner proper comprising a tube connected at its inner end with said casing and having a bell-shaped mouth, and an oil-pipe passing through the inner end of said casing into the said tube, and carrying at its forward end a tubular series of rods extending to the juncture of the bell-shaped mouth with outer end of the tube, substantially as shown and described.

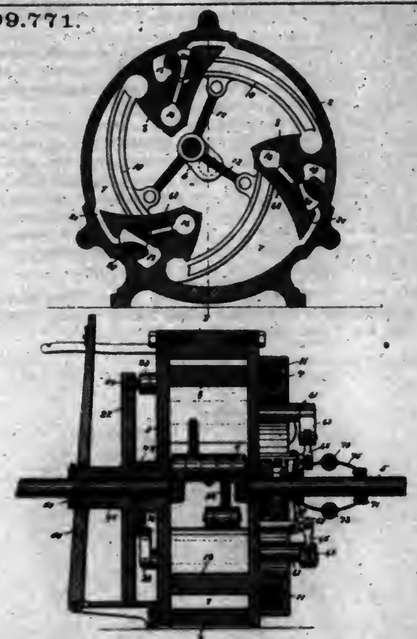
399,770.

2. A hydrocarbon-burner comprising a casing having an air-inlet pipe, a burner proper comprising a tube connected at its inner end with said casing and having a bell-shaped mouth, an oil-pipe passing through the said casing into the rear end of said tube, and carrying a tubular series of rods extending to the outer end of the tube at its juncture with the flaring mouth, and an air-supply regulator held in the said casing, substantially as shown and described.

3. In a hydrocarbon-burner, the combination, with a burner proper comprising a tube having a bell-shaped mouth, of an oil-pipe extending into the inner end of said tube, and provided with a tubular flaring series of rods extending along the inside of the tube to its outer end at the juncture of said bell-shaped mouth and serving to carry the oil to be atomized, substantially as shown and described.

4. In a hydrocarbon-burner, the combination, with the burner-tube connected with an air-supply, of an oil-pipe extending into the inner end of said burner-tube, and rods secured around the inner end of the said oil-pipe, and extending forwardly at an incline along the said tube to the inner end of the bell-shaped mouth, substantially as shown and described.

5. In a hydrocarbon-burner, the combination, with an oil-pipe closed at its discharge end, and provided near the same, on the top, with an opening, of rods secured on the discharge end of the said oil-pipe and projecting from the same, and serving to carry the oil discharged through the said pipe-opening, substantially as shown and described.



6. In a hydrocarbon-burner, the combination, with a casing having an air-inlet pipe, of a burner proper comprising a tube secured at one end to the said casing and carrying at its other end a bell-shaped mouth, an oil-pipe passing through the inner end of said casing into the said burner-tube, and rods secured in a tubular series to the said oil-pipe, and extending along the said burner-tube to the inner end of the bell-shaped mouth and receiving the oil from the said oil-pipe, substantially as shown and described.

7. In a hydrocarbon-burner, the combination, with a casing having an air-inlet pipe, of a burner proper comprising a tube secured at one end to the said casing and carrying at its other end a bell-shaped mouth, an oil-pipe passing through the said casing into the inner end of said burner-tube, rods secured in a tubular flaring series to the said oil-pipe, and extending along the said burner-tube to the inner end of the flaring mouth and receiving the oil from the said oil-pipe, and an air-regulator, K, held adjustably in the said casing, and provided with a rod extending through the end of the casing and having an adjusting-collar on the oil-pipe, substantially as shown and described.

399,771. STEAM-ENGINE. NILS NILSON, Minneapolis, Minn. Filed Mar. 26, 1888. Serial No. 268,497. (No model.)

Claim.—1. A steam-engine comprising a suitable casing provided with a series of curved abutments, as 8, a crank-shaft mounted in said casing, a series of three or more pistons pivoted in said casing opposite said abutments, arms connecting said pistons with said crank-shaft, and suitable ports admitting and exhausting the steam and operating to admit the steam to each piston before it ceases to act upon the next preceding piston, substantially as described.

399,771.

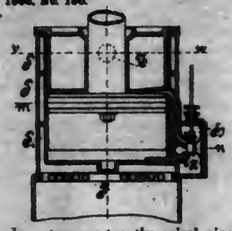
2. The combination, in a steam-engine, with the casing 2, provided with the abutments 8, of the series of oscillating pistons 10, mounted at equidistant points around said casing, the crank-shaft journaled in said casing, arms connecting said pistons with said crank-shaft, the induction and exhaust ports 16 and 18, and the valves 20, controlling said ports, substantially as described.

3. The combination, in a steam-engine, with the casing 2, provided with the abutments 8, having the ports 16 and 18 arranged therein, of the crank-shaft 5, journaled in said casing, and the series of oscillating pistons 10, pivoted within said casing and connected with said crank-shaft, substantially as described.

4. The combination, in a steam-engine, with the cylindrical casing 2, provided with the inlet and exhaust ports 16 and 18, of the pivoted piston 10, adapted to fit against the inner curved surface of the casing 2, the crank-shaft 5, and the arms 12, connecting said pistons with said crank-shaft, substantially as described.

5. The combination, in a steam-engine, with the casing 2, the crank-shaft journaled therein, and the oscillating pistons 10, connected with said crank-shaft, of the rotary valves 20, arranged to control the valve-ports and provided with the crank-arms 23, and the cam 22, secured upon the shaft 5 and controlling said valves 20, substantially as described.

6. The combination, in a steam-engine, with the casing 2 and the oscillating pistons 10, of the valves 20, arranged to control the supply of steam to said casing and provided with the crank-arms 23, the grooved cam 22, with which said crank-arms engage, provided with the projection 46, and the collar 44, secured upon said crank-shaft and provided with the projection 45, adapted to engage the projection 46, substantially as described.

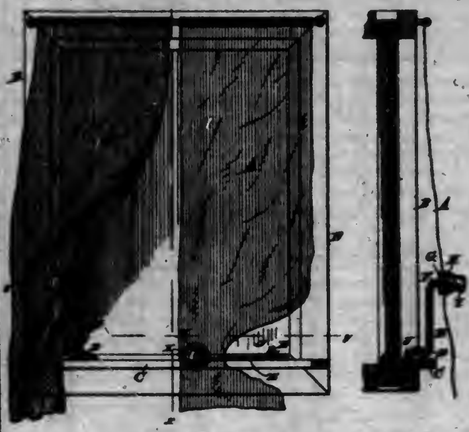


7. The combination, in steam-engine, with a series of valves, 20, and the main shaft 5, of the reversible grooved cam 22, mounted upon said shaft and engaging all of said valves, substantially as described.

8. The combination, in a steam-engine, with the crank-shaft 5, of the series of valves 20, the grooved cam 22, engaging said valve and having a hub, 47, provided with V-shaped recesses 48, the sliding clutch 51, having the V-shaped projections 49, adapted to engage the recesses of the collar 47, and the pivoted lever 50, engaging said collar, substantially as described.

9. The combination, in a steam-engine, with the casing 2, the crank-shaft, and the oscillating pistons, of the rotary valve 60, arranged to control the induction-ports in said casing, and the centrifugal governor mounted on said crank-shaft 5 and connected with said valve 60, substantially as described.

10. The combination, in a steam-engine, with the casing and the crank-shaft mounted therein, of the oscillating pistons connected with said crank-shaft, the induction-ports 16, the exhaust-ports 18, and the oscillating valves 20, adapted to connect either of said ports with the steam-chambers formed behind said pistons, substantially as described.



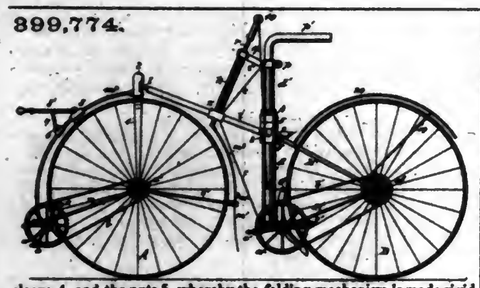
399,772. STEAM-MOTOR. OTTO HILL, Berlin, Germany, assignor to Theodor Schiller and Paul Brunstein, same place. Filed Jan. 3, 1887. Serial No. 223,903. (No model.) Patented in Belgium June 26, 1886, No. 72,623; in France June 26, 1886, No. 177,080; in Italy June 30, 1886, No. 20,157, and Oct. 20, 1887, No. 22,462/376; in Germany July 3, 1886, No. 41,817; in England July 13, 1886, No. 9,117; in Denmark Nov. 16, 1886, No. 857; in Spain July 14, 1886, No. 9,295, and in Norway July 21, 1886, No. 190.

Claim.—1. In a steam-motor, the spiral pipe F and the pump for supplying water thereto, in combination with a furnace below said coil, and a cylinder above said coil, into which the steam from the latter is discharged to work the engine or motor, substantially as set forth.

2. In a steam-motor, the spiral pipe F and the pump for supplying water thereto, in combination with a furnace below said spiral pipe, a cylinder supplied with steam by said coil, and a jacket surrounding said cylinder and communicating with said furnace, the said jacket being provided with a spiral passage through which the products of combustion pass in contact with said cylinder, for the purpose set forth.

399,773. CURTAIN-HOLDER. DAVID D. HELLEY and ROBERT L. WYATT, Wilson, N. C. Filed June 2, 1888. Serial No. 276,202. (No model.)

Claim.—1. In a curtain-holder, the combination, with an arm pivoted on the window-frame, of a pin formed on the free end of the said arm and engaging the curtain, and a handle held on the said pin for conveniently operating the arm, substantially as shown and described.



2. In a curtain-holder, the combination, with an arm pivoted on the window-frame and provided at its pivoted end with a lug and on its free end with a threaded pin, of washers held on the said pin to clamp the curtain, and a handle screwing on the said pin to press the washers onto the curtain, substantially as shown and described.

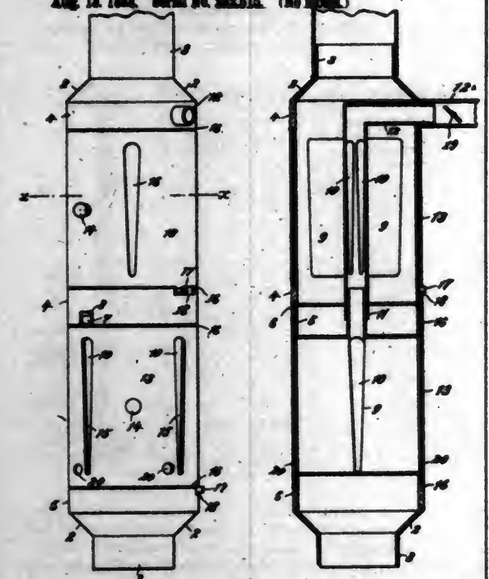
399,774. BICYCLE. THOMAS O'REILLY, New York, N. Y. Filed Aug. 2, 1883. Serial No. 261,817. (No model.)

Claim.—1. The combination, in a bicycle, with the wheels A B, of a frame composed of the tube *d*, the forks H H', tube *d'*, the arm *f'*, the tube K, the spring-bars *i i*, and the bracing-rods *c c*, the whole forming a bridge free from vibration, substantially as specified.

2. The combination, in a bicycle, with the wheels A B and the connecting-frame, of the tube *d*, which receives the tube *d'*, the threaded

399,774.

sleeve 4, and the nuts 5, whereby the folding mechanism is made rigid or loose, substantially as specified.



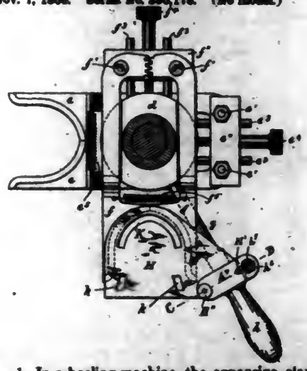
3. The combination, in a bicycle, with the wheels A B and the connecting-frame, of two spring-bars, *i i*, between which passes the steering-rod *r*, the mud-guard m^3, and the rods *d'*, which are free on the axle of the steering-wheel, substantially as specified.

399,775. SUSPENDER-HOOK. EDWARD F. PARADISE, Oconto, Wis. Filed Sept. 13, 1888. Serial No. 285,256. (No model.)

Claim.—A detachable fastening for suspenders, consisting of hook 1, constructed of a single piece of wire and formed with the rearwardly-projecting hooks 3, having pointed ends 4, and the laterally-swinging fastening-plate 2, pivoted to the back of hook 1, and having recesses 5, with which the points 4 are adapted to engage, substantially as shown and described.

399,776. HEAT-RADIATOR. ADAM PEARY, Corning, N. Y. Filed Aug. 13, 1888. Serial No. 282,515. (No model.)

Claim.—1. A heat-radiator consisting of a drum formed in sections having intersecting air-chambers in each section transverse thereto and connected together with openings in the sides of the drum-sections, and dampers movable over the air-chamber openings, substantially as described.



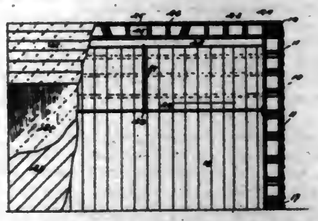
2. A heat-radiator consisting of a drum formed in sections having intersecting air-chambers in each section transverse thereto, connected together, and having an escape-pipe extending out of the drum, with openings in the sides of the drum-sections, and dampers movable over the air-chamber openings, substantially as described.

3. In a heat-radiator, a drum-section, 4, with narrow intersecting air-chambers 9, transverse to the drum-section and located at angles to each other, with openings 10 in the side of the drum-section, a rotary damper, 13, having a handle, 14, and openings 15, registering with openings 10, and an escape-pipe, 12, with damper 19, substantially as described.

4. In a heat-radiator, a drum having a series of narrow intersecting air-chambers transverse thereto and located at angles to each other, with openings in the side of the drum, and dampers for closing the openings, substantially as shown and described.

5. A heat-radiator consisting of drum 1, formed in sections 4 5, attached together and having narrow intersecting air-chambers 9 transverse thereto and located at angles to each other, with openings 10 in the side of the drum, and circular rotary dampers 13, with handle 14 and openings 15, movable over the openings 10, and openings 20 in lower section, 5, and in lower damper, 13, which register with openings 20 in lower section, 5, when the damper 13 is closed, the chambers 9 being connected by pipe 11 and having an escape-pipe, 12, with damper 19, substantially as shown and described.

399,777. HEEL-NAILING MACHINE. JOSEPH H. POPE, Brockton, Mass., assignor to the American Heeling Machine Company, of Maine. Filed Nov. 7, 1888. Serial No. 290,173. (No model.)

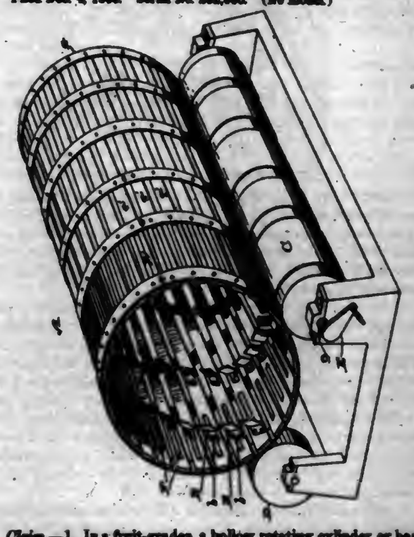


Claim.—1. In a heeling-machine, the expansive clamps *f f*, and the hub *d*, with its handle *h*, combined with the plate H, having the front and rear perforations, *K k k*, as and for the purpose set forth.

2. In a heeling-machine, the perforated spanker and slugger plate H and the holder h^1, secured together, as described, in combination with the handle *h*, the carrier h^2, laterally adjustable in guides in said handle and pivoted to the holder, and having means, substantially as described, for securing the said carrier and holder in an adjustable manner to the said handle, as and for the purpose set forth.

3. In a heeling-machine, the hub *d*, having the expansive clamps *f f*, and the rod *g*, secured to said hub, combined with the detachable handle *h* and the perforated spanker-plate H, secured to said handle in an adjustable manner, as and for the purpose set forth.

399,778. CONSTRUCTION OF BUILDINGS. JAMES R. RANKIN, Elk Rapids, Mich. Filed July 12, 1888. Serial No. 279,771. (No model.)



Claim.—1. A building adapted for use as a silo, constructed of a series of horizontally arranged and spaced rectangular frames, vertical linings secured to the inner faces of said frames, diagonally-arranged sheathing attached to the outer face of the said frame, a water-proof material secured to said sheathing, and clapboarding covering said water-proof material, all combined to operate substantially in the manner and for the purpose specified.

2. In a building adapted for use as a silo, the combination, with a series of horizontally arranged and spaced rectangular frames, vertical linings secured to the inner faces of said frames, diagonally-arranged sheathing attached to the outer face of the said frame, a water-proof material secured to said sheathing, and clapboarding covering said water-proof material, of a roof provided with a removable section, a perpendicular brace-rod projected from said roof, and horizontal brace-rods attached to the perpendicular rod and to the respective inner sides of the structure, substantially as and for the purpose specified.

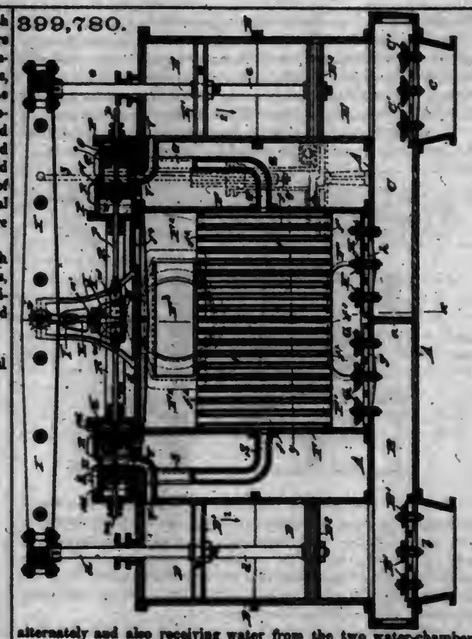
3. In a building adapted for use as a silo, the combination, with a series of rectangular-spaced frames, the sides of which frames are secured at their extremities through the medium of an angle-bar consisting of a body located between the contiguous faces of the sides, having the extremities bent in opposite directions to embrace the edges of the approaching sides, which clamping extremities are secured to the respective sides of the frame, of a vertical lining secured to the inner face of the frame, diagonally-arranged sheathing attached to the outer edges of the frames, water-proof material covering said sheathing, clapboarding covering said water-proof material, a roof provided with a detachable section, and perpendicular and horizontal brace-rods attached, respectively, to the inner sides of the structure and to said roof, as and for the purpose specified.

4. In a building adapted for use as a silo, the combination, with horizontally-arranged boards having their ends lapped at right angles, of a brace located between said lapped ends and having its extremities bent in opposite directions to embrace the outer edges of said boards, substantially as shown and described.

399,779. FRUIT-GRADER. VOLNEY RAYNAL, San Francisco, Cal. Filed Dec. 4, 1888. Serial No. 292,892. (No model.)

Claim.—1. In a fruit-grader, a hollow rotating cylinder or barrel having its periphery composed of longitudinal separated slats or bars of tapering form throughout, whereby the spaces between said slats or bars gradually increase in width from one end to the other, in combination with the independent guide-flanges secured separately to the inner surface of each slat or bar and arranged in a spiral course throughout the length of the cylinder or barrel, substantially as described.

2. In a fruit-grader, a hollow rotating cylinder or barrel having its periphery composed of longitudinal separated slats or bars the spaces between which gradually increase in width from one end to the other, in combination with an exterior rotating clearing drum or roll of uniform diameter throughout extending along the hollow cylinder or barrel and in contact with its periphery for pushing back the fruit which sticks between the slats, substantially as herein described.



3. In a fruit-grader, a hollow cylinder or barrel having its periphery composed of longitudinal separated slats or bars leaving interspaces which gradually increase in width from one end to the other, and the spirally-arranged flanges upon the inner surface of said slats or bars, in combination with the supporting rollers or wheels on one side and the frictional driving and clearing drum or roll on the other side, substantially as herein described.

399,780. DUPLEX PUMP AND CONDENSER. JOHN REID, Rio de Janeiro, Brazil. Filed May 2, 1888. Serial No. 272,540. (No model.)

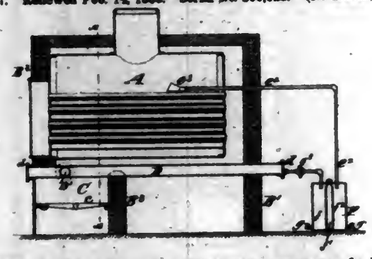
Claim.—1. A duplex pump and condenser constructed with two main valved steam and water cylinders, pistons operated therein, two valved water-chambers, one communicating with each cylinder, and an adjacent condenser receiving exhaust-steam from the two cylinders alternately and also receiving water from the two water-chambers alternately, substantially as herein set forth.

2. A duplex pump and condenser constructed with two main valved steam and water cylinders, pistons operated therein, two valved water-chambers, one communicating with each cylinder, an adjacent condenser receiving exhaust-steam from the two cylinders alternately and also receiving water from the two water-chambers alternately, and a pump discharging the water of condensation from the condenser, substantially as herein set forth.

399,780.

3. A duplex pump and condenser constructed with two main valved steam and water cylinders, pistons operated therein by rods connected to opposite ends of a walking-beam, two valved water-chambers, one communicating with each cylinder, an adjacent condenser receiving exhaust-steam from the two cylinders alternately and also receiving water from the two water-chambers alternately, and a pump operated by the walking-beam and discharging the water of condensation from the condenser, substantially as herein set forth.

4. A duplex pump and condenser constructed with two main valved steam and water cylinders, two spaced pistons working together in each main cylinder, two valved water-chambers, one communicating with each cylinder, and an adjacent condenser receiving exhaust-steam from the two cylinders alternately and also receiving water from the two water-chambers alternately, substantially as herein set forth.

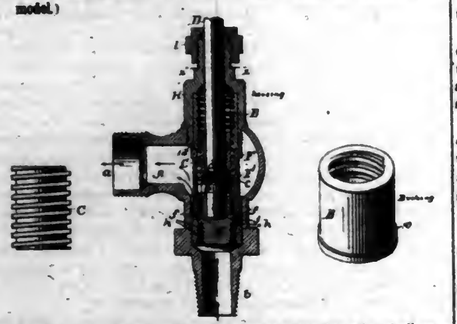


5. The combination, in a duplex pump, of a bed, A, having water-chambers B C, provided with openings *b c* and inlet-valves B' C', and having outlets *g h*, two main steam and water cylinders, D E, on the bed A, and provided with ports U V, respectively, and communicating with the chambers B C, pistons, as D' E', working in the cylinders D E, and connected by rods *d e* with a walking-beam, I, fulcrumed on the pump-frame, valve-cylinders M P, having inlet-ports *k n*, communicating with a steam-supply pipe, R, and exhaust-ports *l o*, communicating with steam-outlets, piston-valves K L, working in the cylinder M, and piston-valves N O, working in the cylinder P, and said valves having connected stems *m p*, and devices, substantially as described, connecting the valve-stems with the walking-beam for actuating the valves therefrom, substantially as herein set forth.

6. In a duplex pump, the combination, with two main steam and water cylinders, D E, and pistons, as D' E', fitted therein and having rods *d e*, a walking-beam, I, fulcrumed on the pump-frame and connected to said piston-rods, two valve-cylinders, M P, valves K L in cylinder M, and valves N O in cylinder P, and said cylinders M P having inlet and exhaust ports *k l n o*, and rods *m p*, connected to the valves K L N O, of a yoke, W, connecting the rods *m p*, a lever, X, engaging the yoke or cross-bars thereof, and an arm, Y, on the beam I, engaging the lever X, all arranged for operation substantially as herein set forth.

7. The combination, in a duplex pump and condenser, of a bed, A, having water-chambers B C, provided with openings *b c*, and inlet-valves B' C', and having outlets *g h*, valved at G H, two main steam and water cylinders, D E, on the bed A, and provided with main ports U V, respectively, and communicating with the chambers B C, pistons D' D^2 in the cylinder D and E' E^2 in the cylider E, a walking-beam, I, journaled on the frame, rods *d e*, connecting the pistons in the cylinders D E, respectively, to opposite ends of the beam I, valve-cylinders M P, having inlet-ports *k n*, communicating with a steam-supply pipe, R, and also having exhaust-ports *l o*, communicating with steam-out-

lets, piston-valves K L, fitted in the cylinder M, and piston-valves N O, fitted in the cylinder P, and said valves having connected stems *m p*, devices, substantially as described, connecting the valve-stems with the walking-beam for actuating the valves therefrom, a condenser, F, valves G H, controlling communication between the water-chambers B C and the condenser, and pipes S T, connecting the exhaust-ports *l o* of the valve-cylinders M P with the steam-chamber of the condenser, all arranged for operation substantially as described, for the purposes set forth.

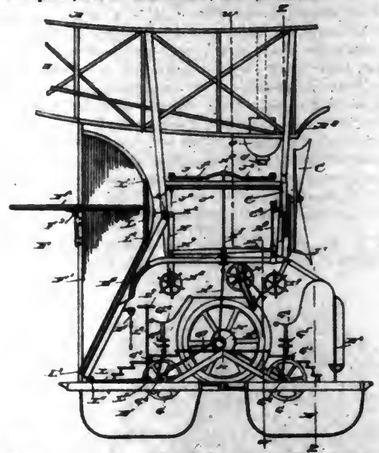


399,781. STEAM-GENERATOR. THOMAS J. REYNOLDS, Brooklyn, N. Y., assignor of one-half to Francis Nolan, same place. Filed Oct. 17, 1887. Renewed Feb. 14, 1889. Serial No. 299,925. (No model.)

Claim.—1. The combination, with a steam-generator, of a heater consisting of longitudinal tubes and a cross-tube connecting them near their end, said tubes being exposed to the heat of the furnace and having their ends exposed for cleaning, a feed-pipe connected with one end of the one longitudinal tube and a pipe leading from the corresponding end of the other longitudinal tube for delivering water from the heater, substantially as herein described.

2. The combination, with a steam-generator, of a filter, F, a feed-water heater outside the generator, exposed to the heat of the generator-furnace and comprising a straight tube, as D, having its ends exposed beyond the brick setting of the generator to afford facility for cleaning, pipes leading from one end of said tube to the receiving-chamber of the filter and from the delivery-chamber of the filter to the generator at about the water-line therein, and outlet-cocks in the receiving and delivery chambers of the filter, whereby provision for cleaning the filter or blowing off the generator from the surface is afforded, substantially as herein described.

399,782. STOP OR THROTTLE VALVE. FRANK W. RICHEY, Armourdale, Kans. Filed Jan. 31, 1888. Serial No. 262,497. (No model.)



Claim.—1. In a throttle-valve, the combination of a shell containing a removable cylinder provided with ports, a valve provided with packing-rings fitting within the bore of the cylinder, a stem in engagement with the valve and provided with external threads, a sleeve surrounding the stem and engaged by the threads, a bushing seated upon the upper extremity of the cylinder and the housing bored to receive and hold down the bushing, and hence the cylinder, substantially as described.

2. In a throttle-valve, a shell having a housing attached thereto, a bushing with a plain exterior located within the housing, a cylinder fitting loosely within the shell and held in place on a shoulder in the shell by the longitudinal pressure of the bushing which is seated upon it, said cylinder being provided with ports, a valve provided with packing-rings, and a threaded stem in engagement with the valve, whereby it is operated, all arranged to operate in the manner and for the purpose set forth.

3. In a throttle-valve, the combination of a shell, a removable cylinder provided with ports and fitting loosely within the bore of the shell, a sliding valve and stem operating within the cylinder, a housing secured to the shell, a bushing fitting loosely within the bore of the housing and seated upon the upper extremity of the cylinder, whereby the latter and the bushing are held together in operative adjustment, substantially as described.

399,783. AIR-SHIP. HERMAN A. J. RIECKERT, New York, N. Y. Filed Apr. 10, 1888. Serial No. 270,205. (No model.)

Claim.—1. In an air-ship, a balloon consisting of three compartments, of which the lowermost is stiffened by a frame-work and supports at its top the second compartment, the third compartment being formed on top of the second compartment and secured with its edges to the said frame-work, and being exposed to the action of the wind, substantially as shown and described.

2. In an air-ship, the combination, with a balloon, as described, of a closed basket supported on the under side of the said balloon, a suction-wheel mounted to rotate above the said basket at its rear, the said suction-wheel being provided with a central rim and a hub and operated from the motive power located within the said basket, a friction-wheel secured on a shaft mounted to rotate in a swinging bearing under the control of the operator in the basket, said friction-wheel being adapted to be thrown alternately into and out of contact with the said central rim and hub of the suction-wheel, and a propeller-wheel secured on the said shaft of the friction-wheel and rotating with the same, substantially as shown and described.

3. In an air-ship, the combination, with a closed basket supported on the under side of a balloon, of a steering device located in front of the said basket, and consisting of a vertical wing mounted to swing, and a disk-wing pivoted on the said vertical wing and mounted to swing, substantially as shown and described.

4. In an air-ship, the combination, with a closed basket supported on the under side of a balloon, of a steering device located in front of the said basket, and consisting of a vertical wing mounted to swing, and a disk-wing pivoted on the said vertical wing and mounted to swing, and ropes extending into the said basket for operating the said wings of the steering device, substantially as shown and described.

5. In an air-ship, the combination, with a balloon having three compartments located one above the other, of a filling-receptacle provided with an inlet-pipe and three outlet-pipes formed on the said filling-receptacle, and leading to the said three compartments of the balloon, substantially as shown and described.

6. In an air-ship, the combination, with a balloon having three compartments located one above the other, of a filling-receptacle secured in the bottom of the lowermost compartment, an inlet-pipe held on the said receptacle and adapted to be connected with the source of gas-supply, and outlet-pipes extending from the top of the said receptacle, and leading, respectively, to the said three compartments, substantially as shown and described.

7. In an air-ship, the combination, with a balloon having three compartments located one above the other of a filling-receptacle secured in the bottom of the lowermost compartment, an inlet-pipe held on the said receptacle and adapted to be connected with the source of gas-supply, outlet-pipes extending from the top of the said receptacle, and leading, respectively, to the said three compartments, and apertured slides held in the said receptacle to control the inlet of the gas to the said outlet-pipes and the outlet of the air from the said three compartments, substantially as shown and described.

8. In an air-ship, the combination, with a closed basket, of wheels mounted to rotate in the said basket, crank-arms connected with the said wheels, treadles connected with the said crank-arms, a central fly-wheel located between the said wheels and connected with the said crank-arms, so that a rotary motion is imparted to the said main fly-wheel when the treadles are operated, an eccentric secured on the shaft of the said main fly-wheel, an eccentric-rod extending upward from the said eccentric, a lever connected with the said rod, a suction-wheel operated from the said lever, and flapping wings operated from the said rod, substantially as shown and described.

9. In an air-ship, the combination, with the main fly-wheel, of a starting device operating on the said main fly-wheel, and consisting of a friction-wheel adapted to engage the periphery of the said fly-wheel, a swinging arm in which the said friction-wheel is mounted, a crank-arm operated by a rod, and a shaft carrying the said crank-arm and provided with a pulley connected by a belt with a pulley on the said friction-wheel, substantially as shown and described.

10. In an air-ship, the combination, with the main fly-wheel, of a starting device operating on the said main fly-wheel and consisting of a friction-wheel adapted to engage the periphery of the said fly-wheel, a swinging arm in which said friction-wheel is mounted, a crank-arm operated by a rod, a shaft carrying the said crank-arm and provided with a pulley connected by a belt with a pulley on the said friction-wheel, and a handle for pressing the said swinging arm toward or from the said fly-wheel, so as to connect the said fly-wheel with the friction-wheel or disconnect it from the same, substantially as shown and described.

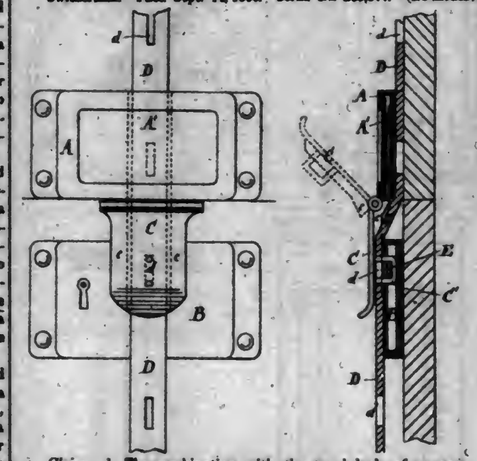
11. In an air-ship, the combination, with a suction-wheel mounted to rotate and provided with a central hub and a middle rim, of a friction-wheel held between the said central hub and the middle rim, a shaft on which the said friction-wheel is secured and carrying a propeller-wheel, a pivoted bearing carrying the said shaft, and a lever pivotally connected with the free end of the said pivoted bearing, so as to throw the latter up or down to alternately engage the said friction-wheel with the said central hub and the said middle rim or disengage it from the same, substantially as shown and described.

12. In an air-ship, the combination, with a suction-wheel mounted to rotate and provided with a central hub and a middle rim, of a friction-wheel held between the said central hub and the middle rim, a shaft on which the said friction-wheel is secured and carrying a propeller-wheel, a pivoted bearing carrying the said shaft, a lever pivotally connected with the free end of the said pivoted bearing, so as to throw the latter up and down to alternately engage the said friction-wheel with the said central hub and the said middle rim or disengage it from the same, and a rope mounted on pulleys and passing over a drum operated by a hand-wheel, said rope being connected with the lower end of the said lever, substantially as shown and described.

13. In an air-ship, the combination, with a suction-wheel mounted to rotate and provided with a central hub and a middle rim, of a friction-wheel held between the said central hub and the middle rim, a shaft on which the said friction-wheel is secured and carrying a propeller-wheel, a pivoted bearing carrying the said shaft, a lever pivotally connected with the free end of the said pivoted bearing, so as to throw the latter up and down to alternately engage the said friction-wheel with the said central hub and the said middle rim and disengage it from the same, a link pivotally connected with the said bearing, and a pivoted brake-shoe pivotally connected with the said link and adapted to engage the periphery of the said friction-wheel, substantially as shown and described.

14. In an air-ship, the combination, with sets of double wings, of beams carrying the said sets of wings and mounted to swing, levers each provided on one end with a pocket, said pockets engaging the inner ends of the said beams, and a rod having an up-and-down movement and connected with the inner ends of the said levers, substantially as shown and described.

15. In an air-ship, the combination, with sets of double wings, of beams carrying the said wings and mounted to swing, levers each provided on one end with a pocket, said pockets engaging the inner ends of the said beams, a rod having an up-and-down movement and connected with the inner ends of the said levers, blocks adapted to slide longitudinally and forming pivots for the said levers, and a fixed frame carrying the said blocks and the said beams, substantially as shown and described.



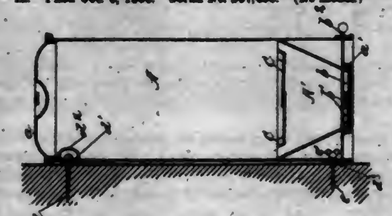
16. In an air-ship, the combination, with wings, of beams carrying the said wings and mounted to swing, levers each provided on one end with a pocket, said pockets engaging the inner ends of the said beams, a rod having an up-and-down movement and connected with the inner ends of the said levers, blocks adapted to slide longitudinally and forming the pivots for the said levers, a screw-rod adapted to be turned and screwing in the said blocks, said screw-rod being provided with right and left hand threads, so that it moves the said blocks simultaneously toward or from each other, and a fixed frame carrying the said blocks, substantially as shown and described.

17. In an air-ship, the combination, with wings, of beams carrying the said wings and mounted to swing, levers each provided on one end with a pocket, said pockets engaging the inner ends of the said beams, a rod having an up-and-down movement and connected with the inner ends of the said levers, blocks adapted to slide longitudinally and forming the pivots for the said levers, a screw-rod adapted to be turned and screwing into the said blocks, said screw-rod being provided with right and left hand threads, so that it moves the said blocks simultaneously toward or from each other, a pulley secured on the said screw-rod, a rope passing over the said pulley, a drum provided with a hand-wheel on which the said rope winds, and a fixed frame carrying the said blocks, substantially as shown and described.

18. In an air-ship, a wing having an up-and-down movement and comprising a frame having a central partition, slats secured to the said frame and central partition, and a canvas strip secured by one end to one of the said slats and by its sides to the said frame-work and the said central partition, the other end of the said canvas strip being bagged directly under the next following slat, substantially as shown and described.

19. In an air-ship, a wing provided with transverse slats and a canvas strip secured by one end to one of the said slats and by its sides to the frame-work of the wing, the other end of the said canvas strip being bagged directly under the next following slat, so that when the wing moves upward the bag is opened, but when the wing moves downward the bag closes onto the next following slat, substantially as shown and described.

399,784. LOCK FOR TRUNKS, &c. JOHANN J. SAGER, Berne, Switzerland. Filed Sept. 14, 1888. Serial No. 285,277. (No model.)

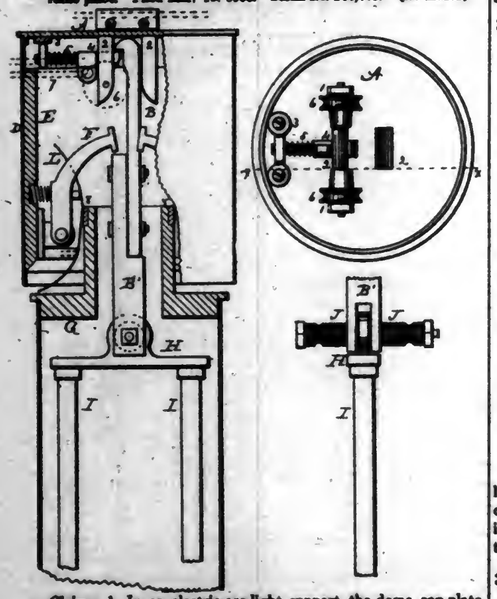


Claim.—1. The combination, with the trunk-lock, of an open-faced frame, A, and a hasp, C, pivoted thereto, said frame having an open lower edge for the insertion of an address-card, a spring within said frame for retaining the address-card in place, and projections upon the hasp engaging the lower edge of the frame A to prevent the removal of the address-card when the parts are locked, substantially as set forth.

2. The combination, with the trunk-lock, of a frame, A, having a groove or recess formed therein across the back, the hasp C, having longitudinal projections *e*, and a trunk-strap, D, having longitudinal openings at *d* and passing through the groove of the frame A and behind the hasp and between its projections, the staple of the hasp passing through one of the openings of the strap into the lock, substantially as set forth.

3. The combination, with the trunk-lock, of a frame, A, and the hasp C, pivoted thereto and having longitudinal projections *e* for stiffening the same and forming stops against the lower edge of the frame A, substantially as set forth.

399,785. FLOUR-BIN. FREDERICK SANDERSON, Prospect Park, Ill. Filed Oct. 6, 1888. Serial No. 287,403. (No model.)



Claim.—1. The combination of a cylindrical bin, a hollow truncated cone secured within the bin near its base, a sleeve secured horizontally in the bottom of the cone, an open-work vibrator placed on the sleeve having a handle extending beyond the bin, cross-pieces

secured within the bin a short distance above the cone, a round-headed screw and a screw-threaded nail having a thumb-piece passing through a side of the cylinder, respectively near its upper and lower ends, and a section of strap-iron soldered to the outside of the bin near said nail at right angles to the longitudinal axis of the bin and having its outer surface plane, substantially as and for the purposes specified.

2. The combination of a flour-bin, A, formed with the holes d' and d^3 in its side in a line parallel with its longitudinal axis, the cap d^3, secured to the side of the bin to cover the hole d' and being made with a lateral diameter greater than that of the hole, the round-headed screw d, having its head enter said hole, the screw-threaded nail e, made with the thumb-piece e' and passing through the hole d^2 from within the bin, the hollow truncated cone A', secured in the bin near its lower end, the sieve b, secured in the cone at its bottom, and the vibrator b', made with the handle b^2 and placed on the sieve, substantially as and for the purposes specified.

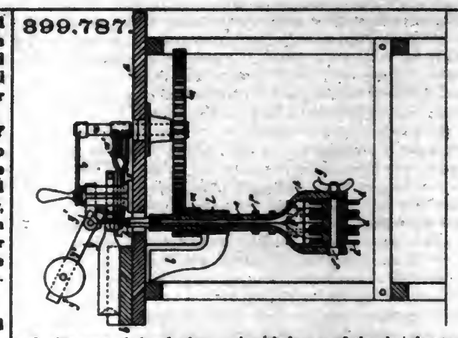
399,786. ELECTRIC-LIGHT SUPPORT.

BENJAMIN SCHARDT and GIDEON JONES, Dayton, Ohio, assignors of one-third to John B. Fletcher, same place. Filed Mar. 19, 1888. Serial No. 267,773. (No model.)

Claim.—1. In an electric-arc-light support, the dome cap-plate A, having lugs 2 and 3, holding the spring-actuated catch 4, in combination with a shouldered arm-support attached to the top of an arc lamp to support the same in an electric circuit formed through the connective parts of said dome, substantially as set forth.

2. In an electric-arc-light support, the dome cap-plate A, with supporting-lugs to retain a horizontally-sliding catch held in a locking position by a spiral spring, which surrounds the rear part of said catch, to engage a supporting-arm attached to an electric-arc lamp, substantially as set forth.

3. In an electric-arc-light support, the dome-plate having lugs 2 2, with rounded ends, to guide the arm attached to an arc lamp, thereby engaging the spring-actuated catch held in said lugs, substantially as set forth.

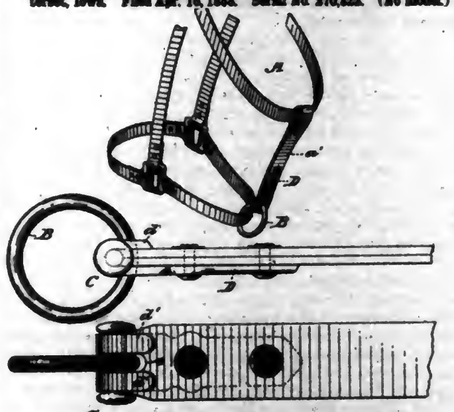


399,787. MACHINE FOR WIRING BOTTLES.

ALWIN SCHRADER and OTTO STURM, Dessau, Anhalt, Germany. Filed July 11, 1888. Serial No. 279,680. (No model.)

Claim.—1. A machine for wiring bottles, comprising a revolving wire-supply, c, having the twisting-head A, the tongs $y\,y'\,y^2\,y^3$, for holding the wires so arranged that some of the wires may be passed around the neck of the bottle, while other wires may be passed over the cork, and the shearing-tongs x, all substantially as and for the purpose set forth.

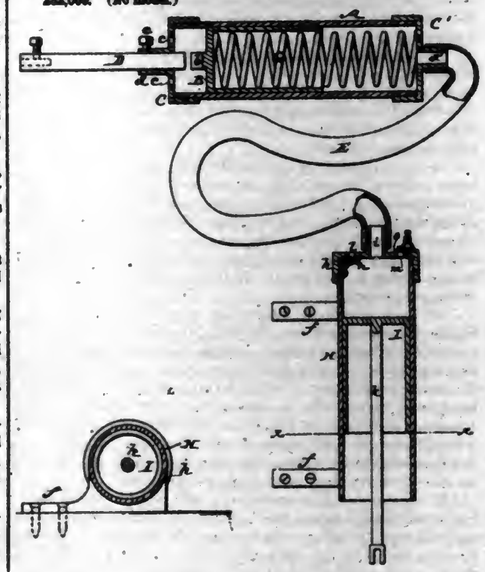
2. In a machine for wiring bottles, the combination of the revolving wire-supply c, having the twisting-head A, the treadle e, pivoted at i, and connected by means of link r and lever q to the wire-supply, and the tongs $y\,y'y^2y^3$, all substantially as and for the purpose set forth.



3. In a machine for wiring bottles, the combination of wire-supply c, tongs y, shearing-tongs x, and revolving head A, substantially as set forth, with crank o, wheels n m, to turn the hollow spindle c,

and with arms $r'\,r'$ and pins $w\,w'$, with legs x of the shearing-tongs, to cut off the twisted wire, all substantially as described.

399,788. HALTER BOLT-CLIP.



CHRISTIAN C. SCHWABE, Winterset, Iowa. Filed Apr. 16, 1888. Serial No. 270,822. (No model.)

Claim.—The combination, with the clip, bifurcated and bent into hooks at one end, of the ring and headed bolt secured in the bifurcated and hooked portion of the clip, and the bifurcated strap having the ends of the bifurcated portion setting well up against the bolt, to prevent rattling and wear, substantially as specified.

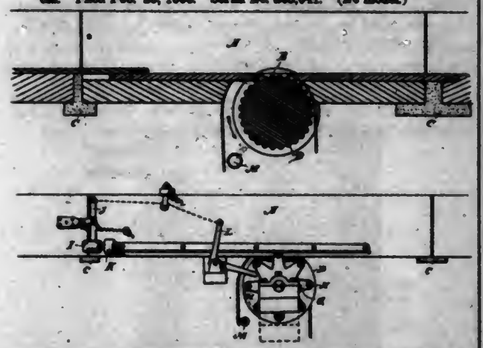
399,789. PNEUMATIC DEVICE FOR TRANSMITTING POWER.

WILLIAM G. SCOTT, Startville, Miss. Filed Aug. 6, 1888. Serial No. 282,060. (No model.)

Claim.—In a pneumatic device for transmitting power, the combination, with a fixed air-compressing cylinder and its piston, of a loose cylinder, a flexible tube or hose connecting the latter in its rear with the fixed compressing-cylinder, a spring-controlled piston within the loose cylinder provided with a head-piece or hammer-head on its front face, a bar or device connected with the forward end of the loose cylinder and adapted to be struck by the head-piece of the piston in the loose cylinder, and spring-controlled air inlet and outlet valves applied to the compression end of the fixed cylinder, substantially as specified.

399,790. MEAT-CUTTER.

ABEL SHEPARD, Plainville, assignor to the Peck, Stow and Wilcox Company, Southington, Conn. Filed Aug. 1, 1888. Serial No. 281,984. (No model.)



Claim.—1. In a meat-cutter having a perforated plate and knives in contact with said plate and a case provided with stationary forcing-ribs, the rotary forcing device whose ribs and core gradually thicken toward the discharge end, while the spaces between its forcing-ribs gradually diminish toward the discharge end of the case and substantially vanish at their junction with the perforated plate, substantially as described, and for the purpose specified.

2. In a meat-cutter having a case, stationary and moving forcing-ribs, and a rotatory perforated plate, a cylindrical flange, e, at the discharge end of the case, and the separately-formed ring C, fitted within said flange and having the knives c on one side of said ring for contact with the perforated plate, substantially as described, and for the purpose specified.

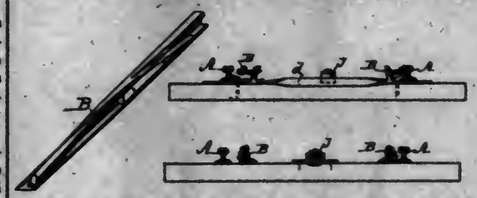
3. In a meat-cutter having a case provided with stationary forcing-ribs and knives at the discharge end of said ribs, a forcing device within the ribs of the case, and a perforated plate at the end of said forcing device whose perforations are outside the greatest diameter of said forcer, while the inner face of said perforated plate and perimeter of said forcer meet each other at an angle, substantially as described, and for the purpose specified.

399,791. CONCENTRATOR.

FREDERICK SLETCHER, San Francisco, Cal. Filed Feb. 23, 1888. Serial No. 265,041. (No model.)

Claim.—1. A concentrator comprising a converging sluice or flume having an independent or movable section in its length, inverted-T-shaped springs or cushions between the ends of said section and the adjacent ends of the flume or sluice, whereby they serve as rests and elastic joints, a transverse opening in the bottom of the movable section, a drum or roller revolving with its upper periphery in said opening, and means for imparting an end motion to said section, substantially as herein described.

2. A sluice or flume having an independent movable section, a transverse opening, and a drum rotated with its upper surface within this opening, in combination with ⊥-shaped cushions at the ends of the movable section and serving as rests and elastic joints, a hammer or hammers and mechanism for operating the same, and lugs upon the side of the movable flume-section upon which the hammers fall when released, substantially as herein described.



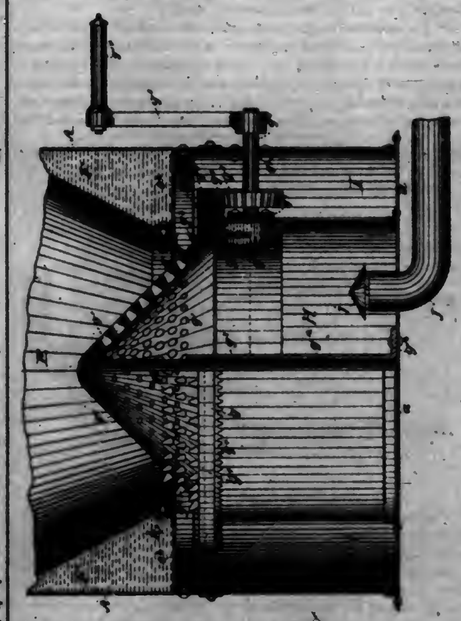
3. An independent movable flume-section having the transverse opening, a drum revolving with its upper periphery within this opening, a toothed wheel or wheels, and a lever operated by the teeth, in combination with yielding ⊥-shaped cushions at the ends of the movable sections, serving as rests and elastic joints, the hammer or hammers connected with the lever, and a lug or lugs upon the side of the movable flume-section, upon which the hammers fall, so as to give blows in the direction of the downward flow of the pulp or water, substantially as herein described.

4. A flume or sluice having a movable section interposed in its length, in combination with inverted-T-shaped elastic cushion-rests interposed between the ends of the movable and stationary portion of the flume, whereby a tight but elastic joint is formed, substantially as and for the purpose described.

5. The flume having the movable interposed section provided with lugs, ⊥-shaped elastic cushions at the ends of the movable section serving as rests and elastic joints, a transverse slot or opening in the bottom of the movable section, and the drum revolving with its upper periphery within this opening, in combination with the hammer or hammers and operating mechanism whereby the hammers strike upon said lugs and produce a jarring motion in the direction of its length, and the water-tube with its jets discharging upon the drum, substantially as described.

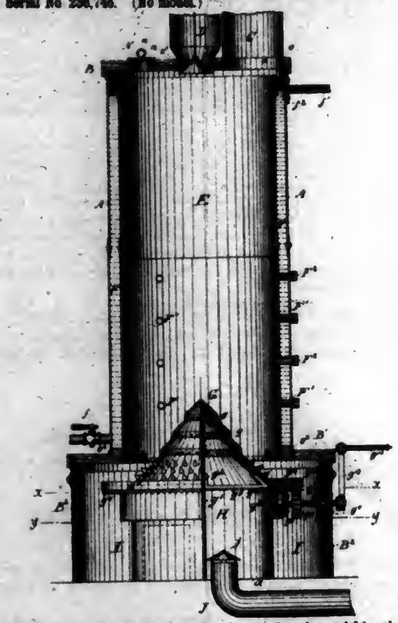
399,792. RAILWAY-SWITCH.

SHAW STEWART, Stuart, Iowa, assignor of two-thirds to J. G. Crockett, same place, and Shaw Stewart, Sr., Chicago, Ill. Filed May 17, 1887. Serial No. 238,555. (No model.)



Claim.—1. A twisted switch-rail having a groove in the side of its ball and a tapering bar fixed to its web to produce an inclined plane, for the purposes stated.

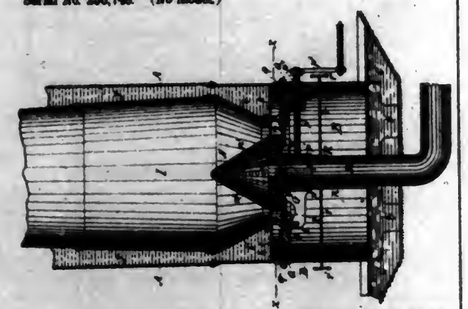
2. In a railway-switch, the combination of twisted switch-rails with fixed track-rails, for the purposes stated.



399,793. GAS-PRODUCER.

WILLIAM J. TAYLOR, Chester, assignor to the Taylor Gas Producer Company, Camden, N. J. Filed Dec. 31, 1888. Serial No. 293,112. (No model.)

Claim.—The herein-described gas-producer with a bottom having narrow openings therein arranged in radial rows and mounted on a post which is supported in a housing, a cylindriform casing beneath the bottom forming an air or steam and air chamber, a pipe extending upward into said chamber, and means, as described, for rotating said bottom, substantially as and for the purposes set forth.



399,794. GAS-PRODUCER. WILLIAM J. TAYLOR, Chester, assignor to the Taylor Gas Producer Company, Camden, N. J. Filed May 2, 1887. Serial No. 236,746. (No model.)

Claim.—1. A gas-producer having a chamber within the ash-chamber thereof and a receptacle formed around the upper exterior portion of the casing of said chamber, in combination with a blast-pipe extending upward into said chamber, a bottom with a flange projecting into said receptacle and forming a seal, a post supporting said bottom, and mechanism, as described, for rotating said bottom substantially as and for the purposes set forth.

2. The combination, in a gas-producer, of a conical-shaped bottom having radial rows of small openings therein and a flange formed therewith, a vertical post for supporting said bottom, a chamber with a channel formed around the upper portion of the casing of said chamber, a pipe extending into said chamber, and mechanism, as described, for rotating said bottom, substantially as and for the purposes set forth.

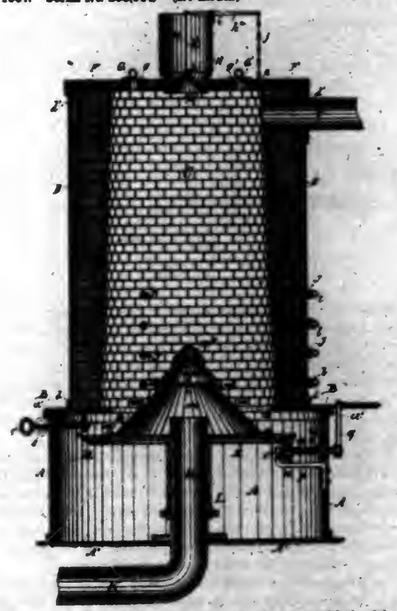
399,795. GAS-PRODUCER. WILLIAM J. TAYLOR, Chester, assignor to the Taylor Gas Producer Company, Camden, N. J. Filed May 2, 1887. Serial No. 236,748. (No model.)

Claim.—1. The combination, in a gas-producer, of a stationary conical-shaped device having radial rows of narrow perforations therein, a blast-pipe formed integral with said device and supporting the same in position, a bracket secured to said pipe having guide-rollers journaled in said brackets, a circular bottom with points arranged around the top surface of said bottom, and means, substantially as described, for rotating said bottom, substantially as and for the purposes set forth.

2. The combination, in a gas-producer, of a conical-shaped stationary device having radial rows of narrow openings therein, a blast-pipe secured to said device and supporting the same in position, a circular depending flange formed with the base of said device, a bracket secured to said pipe having supporting and guide rollers, a circular bottom with an inner vertical flange mounted on said bracket and guided by said rollers, and means, as described, for rotating said bottom, substantially as and for the purposes set forth.

3. The combination, in a gas-producer, of a conical-shaped device having a series of narrow V-shaped openings therein, a blast-pipe secured to said device and supporting the same in position, a bracket having guide-rollers journaled thereto and said bracket secured to said pipe, a circular bottom with radial rows of points cast therewith, rollers journaled in brackets secured to the inner edge of said bottom, and means, as described, for rotating said bottom, substantially as and for the purposes set forth.

4. The combination, in a gas-producer, of one or more scrapers secured to the base-plate of the producer, a stationary conical-shaped device having radial rows of narrow openings therein, a blast-pipe formed integral with said device and supporting the same in position, a bracket with horizontal arms and to which guide-rollers are journaled, a circular flat bottom, and means, as described, for rotating the same, substantially as and for the purposes set forth.

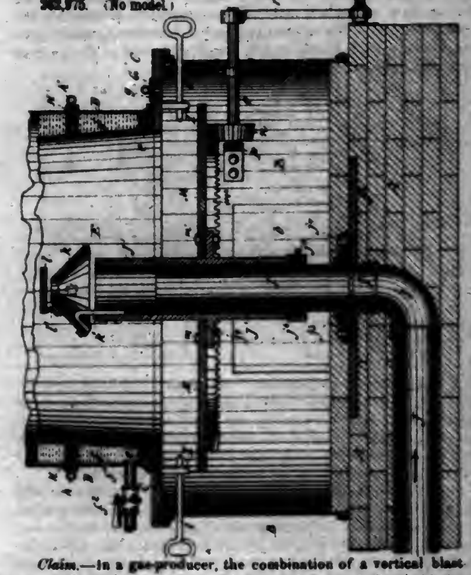


5. The combination, in a gas-producer, of a conical-shaped stationary device having radial rows of narrow openings therein and a blast-pipe formed integral with said device and supporting the same in position, a bracket having rollers journaled thereto and said bracket secured to said pipe, a circular solid bottom having radial rows, points cast with the same, means, as described, for rotating said bottom, and a series of points secured to the plate supporting the combustion-chamber and depending therefrom, substantially as and for the purposes described.

6. The combination, in a gas-producer, of a conical-shaped stationary device having radial rows of narrow openings therein, and a blast-pipe formed integral with said device and supporting the same in position, one or more dampers in said blast-pipe having rods and handles for opening and closing said dampers, substantially as and for the purposes set forth.

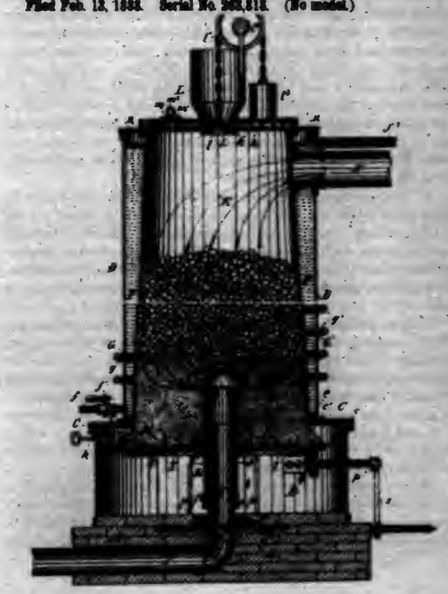
7. The combination, with a gas-producer mounted in a receptacle, C, for containing water, of a blast-pipe provided with a stationary device having rows of narrow openings therein and extending upward through said receptacle into the combustion-chamber thereof, a bracket secured to said pipe having rollers journaled thereto, a circular solid bottom mounted thereon, and means, as described, for rotating said bottom, substantially as and for the purposes set forth.

8. In a gas-producer, the stationary device N, formed integral with the conduit M, the bracket O, rigidly secured to said conduit, the solid bottom P, mounted on said bracket, and means, as described, for rotating the same, and the curved scrapers T, substantially as and for the purposes set forth.



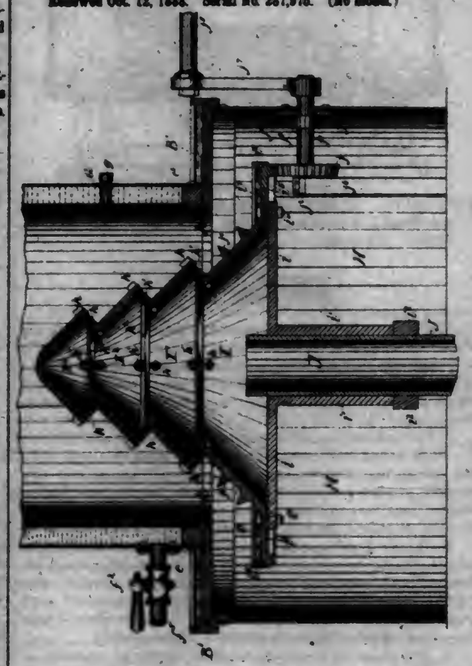
399,796. GAS-PRODUCER. WILLIAM J. TAYLOR, Chester, assignor to the Taylor Gas Producer Company, Camden, N. J. Filed May 21, 1887. Serial No. 238,964. (No model.)

Claim.—1. In combination, a gas-producer provided with a vertical blast-pipe having a flange which rigidly supports said pipe in the base of the ash-chamber thereof, a collar supported in position on said pipe by means of screws, a bottom with a sleeve fitting onto said pipe, and means, as described, for rotating said bottom, substantially as and for the purposes set forth.



2. The combination of a gas-producer provided with a rotatable bottom, depending eyes r, and agitating-bars s, supported in said eyes above said bottom, said bars operating to cause accumulating non-combustible material in the combustion-chamber of the producer to be ground downward faster in one place than another over said bottom, and means, as described, for revolving said bottom, as shown and described, and for the purposes set forth.

399,797. ROTARY BOTTOM OR GRATE APPLICABLE TO FURNACES, &c. WILLIAM J. TAYLOR, Chester, assignor to the Taylor Gas Producer Company, Camden, N. J. Filed Feb. 4, 1888. Serial No. 262,975. (No model.)

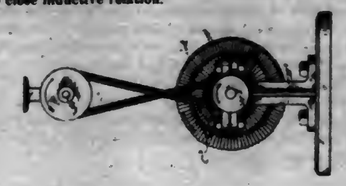


Claim.—In a gas-producer, the combination of a vertical blast-pipe, a collar held to place on said pipe, a sleeve encircling said pipe and having a flange, a solid bottom rigidly secured to the flange of said sleeve, and means, as described, for rotating said bottom to cause non-combustible material supported on said bottom to be discharged over the periphery thereof, substantially as shown and described.

399,798. METHOD OF MAKING GAS. WILLIAM J. TAYLOR, Chester, assignor to the Taylor Gas Producer Company, Camden, N. J. Filed Feb. 13, 1888. Serial No. 263,818. (No model.)

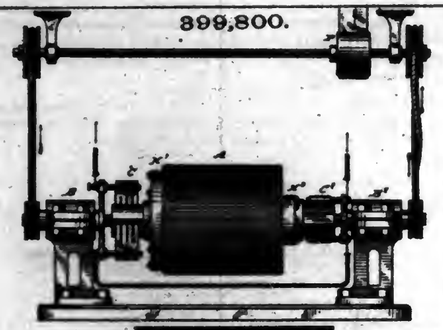
Claim.—The method of making gas, which consists in placing and then maintaining a deep bed of ash under a bed of incandescent fuel and blasting through the ash and fuel, substantially as and for the purposes set forth.

399,799. GAS-PRODUCER. WILLIAM J. TAYLOR, Chester, assignor to the Taylor Gas Producer Company, Camden, N. J. Filed May 2, 1887. Renewed Oct. 12, 1888. Serial No. 287,976. (No model.)



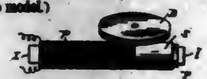
Claim.—1. The combination of a bottom composed of two or more frustums of cones, sleeves between the frustums, bolts inserted through the sleeves and frustums, a plate having a depending sleeve connected with the lower frustum, a blast-pipe on which said bottom is mounted, and means, as described, for rotating said bottom, substantially as and for the purposes set forth.

2. The combination of a bottom composed of two or more frustums and a hood, sleeves and bolts between said frustums and hood, a base-plate attached to the lower frustum, a blast-pipe extending upward into said bottom, a collar adjustable on said pipe, and mechanism, as described, for rotating said bottom, substantially as and for the purposes set forth.



3. In a gas-producer, the combination of a bottom consisting of two or more hollow frustums of cones and a hood, bolts inserted through sleeves between the frustums and hood, a base-plate secured to the lower frustum with a sleeve, a blast-pipe extending upward through said sleeve, and a collar secured to said pipe, all arranged for supporting fuel and permitting of the admission of the air or steam and air directly into the combustion-chamber, and means, as described, for rotating said bottom, and thereby permitting of the discharge of accumulating non-combustible material over the periphery of the bottom while the producer is in operation.

399,800. DYNAMO-ELECTRIC MACHINE. ELIHU THOMSON, New Britain, Conn., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed May 25, 1888. Serial No. 94,062. (No model.)



Claim.—The combination, substantially as described, with two systems of coils, each system wound over a suitable core or cores and revolving in opposite directions, of a commutator for each system and a stationary bridge-piece or pieces of iron for bringing the two systems into close inductive relation.

399,800.

399,801. ALTERNATE-CURRENT INDUCTOR. ELIHU THOMSON and MERLE J. WEBSTHAM, Lynn, Mass. Filed Aug. 3, 1888. Serial No. 282,376. (No model.)

Claim.—1. The combination, with a pulsating or alternating inductor, of a modifier or retarder of the inductive action applied in the field of said inductor for causing a lagging of the pulsations in a portion of the field or fields of induction, thus producing a compound field of induction having inductive waves or pulsations displaced in phase.

2. The combination, with an alternating-current coil or conductor, of a closed-circuit conductor subjected to the action of a part of the field of induction of said coil or conductor and concentric or substantially concentric with the magnetic axis, whereby the field of induction may have adjoining parts whose phases of alternation are displaced, as and for the purpose described.

3. The combination, with an alternating inductor consisting of a coil or conductor traversed by alternating currents, of a locally-applied modifier or retarder of the alternations placed in the field of action of said inductor for producing a compound field having sets of alternations displaced in phase, as described, and an armature in the influence of both phases of alternations of said compound field.

4. As a means for producing a field of electric or magnetic induction having two sets of alternations whose respective phases are displaced, a coil traversed by alternating electric currents and a closed-circuit conductor concentric with the magnetic axis or extension of the magnetic axis in said coil and applied to the part thereof over which the portions of field having its alternations retarded are to be produced.

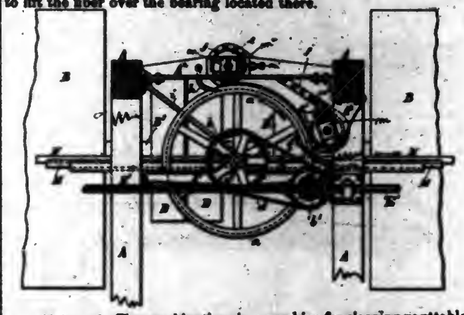
5. The combination, with an alternating-current coil, of a closed induced circuit applied to a part of the magnetic field or electric field of induction of said coil and concentric with the magnetic or extension of the magnetic axis, and an armature in the influence of the parts of field thus produced and which have alternations displaced in phase.

6. The combination, with an alternating-current coil and an induction-retarder concentric with the magnetic axis or extension of magnetic axis for said coil, of a closed-circuit armature mounted so as to be within the inductive field or extension of the inductive field of the retarder and the coil.

7. The combination, with the alternating inductor, of two retarders each consisting of a closed inductive circuit, an armature, and means for closing either inductive circuit at will to determine the direction of revolution of the apparatus.

8. A single alternating-current coil or conductor having adjoining fields of induction, electric or magnetic, displaced or differing in phase, in combination with an armature acted upon by portions of said field differing in phase.

9. The combination, with an alternating coil having an iron core, of a closed induced circuit concentric with said core or extension thereof and a closed-circuit armature in the field of said induced-circuit conductor as well as the field of a free portion of the alternating-current coil.



10. The combination of an alternating-current coil, a closed-circuit conductor in which alternations are set up directly by said coil, and an armature exposed simultaneously to the alternating inductive actions whose alternations are the resultant, respectively, of the action of the alternating coil and of the closed-circuit conductor in which said coil induces alternations.

11. The combination, with the alternating inductor having a closed-circuit modifier, of the closed-circuit armature and means for changing the relation of the closed-circuit modifier and armature, as and for the purpose described.

12. The combination, with an alternating inductor, of a local phase distorter or modifier and an armature subjected to the simultaneous action of the inductor and the distorter or modifier.

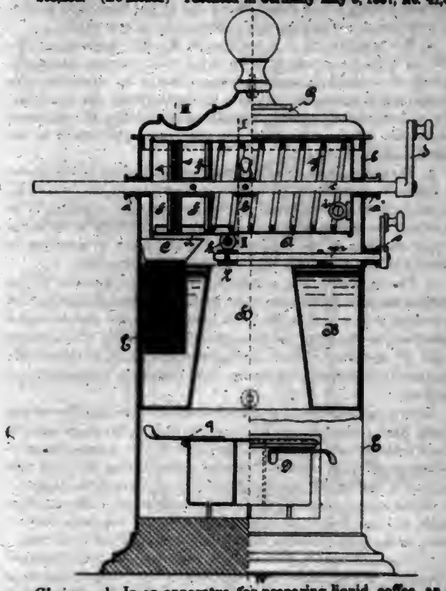
399,802. MACHINE FOR CLEANING VEGETABLE FIBER. THEOTEO VILLARREAL, Merida, Yucatan, Mexico. Filed Sept. 20, 1888. Serial No. 286,729. (No model.)

Brief.—One end of the leaf having been cleaned by the first machine, the other end is guided by a finger into the nip between a grooved wheel and chain, which draw the leaf through the carrying-chains, which for the proper interval relax their grip upon the leaf. The leaf being carried along, an inclined arm engages the bight of the leaf between the wheel and carrying-chains and throws the leaf over upon guide-arms, when the end is released from the grooved wheel and its chain, and by said arms the uncleaned end is directed into the second machine. The actuating-pulleys of the carrying-chains have equal speeds, and a looped wire is placed at the end of the machine to lift the fiber over the bearing located there.

Claim.—1. The combination, in a machine for cleaning vegetable fiber, with the scrapers and traveling chains or conveyor, of the grooved wheel *a* and devices for rotating said wheel, and an endless chain, *f*, moved around a portion of the circumference thereof, for grasping and elevating the stalk or leaf, and with curved or inclined arms for engaging and turning over the leaf, substantially as set forth.

2. The combination, in a machine for cleaning vegetable fiber, with the scraping-wheels and endless chains or conveyers, of the grooved wheel *a* and devices for rotating said wheel, the endless chain or conveyer *f*, engaging the grooved wheel *a* for a portion of its circumference, said wheel and conveyer moving in line with and at one side of the main chains or conveyer, a curved arm or finger, *g*, for guiding the stalk or leaf between the grooved wheel and chain *f*, a downwardly-inclined arm, *i*, the segmental scraping-board D^3, and arms connected to one side of the same and adapted to receive the unfinished end of the stalk or leaf as it falls, substantially as and for the purposes set forth.

3. The combination, in a machine for cleaning vegetable fiber, with the scraping-wheels and endless chains or conveyers, of the grooved wheel *a* and devices for rotating said wheel, the endless chain or conveyer *f*, engaging the grooved wheel *a* for a portion of its circumference, said wheel and conveyer moving in line with and at one side of the main chains or conveyer, a curved arm or finger, *g*, for guiding the stalk or leaf between the grooved wheel and chain *f*, a curved finger, *h*, for removing the same from the grooved wheel, a downwardly-inclined arm, *i*, the segmental scraping-board D^3, and the arms *k*, extending out from one side of the same and adapted to receive the unfinished end of the stalk or leaf as it falls, substantially as and for the purposes set forth.

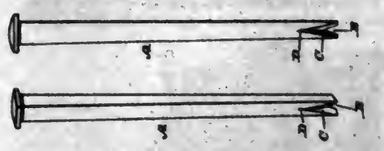


4. The combination, with the main frame A, the cross-frame A^2, and bracket A^3, of the endless chain or conveyer *f*, rollers *e f* for the same, sliding blocks, screw-bolts, and springs forming adjustable bearings for the shafts of said rollers, the grooved wheel *a*, supporting-frames and bearings for the shaft of said wheel, and mechanism, substantially as specified, for operating said wheel, substantially as set forth.

5. In a machine for cleaning vegetable fiber, the combination, with the scraping-wheels B, of the shaft B' for both of said scrapers, the pulleys D and band H, for operating said scrapers, the pulleys B^2 B^3, the belt G, the shafts F E E' E^2, and the bevel-wheels connecting the ends of said shafts, the shafts *c* and *d* the toothed wheels *b b'*, and chain *d*, the grooved wheel *a*, and the endless chains or conveyers N, M, and *f*, and their respective pulleys, and the arms *g*, *h*, *i*, and *k*, the parts being connected and operated in substantially the manner and for the purposes herein shown and described.

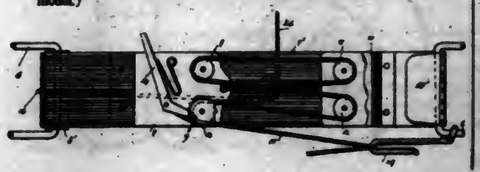
6. In a machine for cleaning vegetable fibers, the combination, with the conveying-belts L and the two scraping-wheels B and their segmental scraping-boards, of the endless chains or conveyers N M, passing entirely through the length of the double machine, the pulleys I, I^1, and K, around which said chains pass, and mechanism, substantially as shown and described, for revolving said pulleys at a uniform speed, substantially as set forth.

7. In a machine for cleaning vegetable fibers, the combination, with the scraping-wheel and endless chains or conveyers and their pulleys, of the bent or loop wire *e*, upon which the cleaned fiber is raised and turned over after being scraped, substantially as set forth.



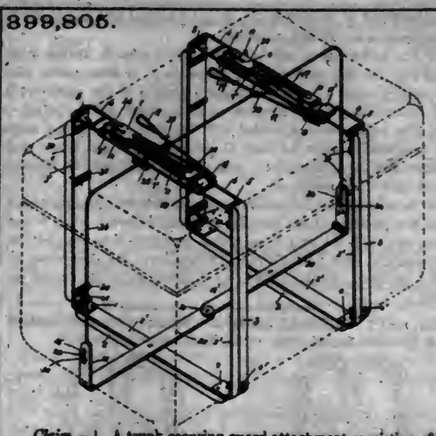
399,803. APPARATUS FOR PREPARING LIQUID COFFEE. CARL WAGNER, Dresden, Saxony, Germany. Filed Mar. 23, 1888. Serial No. 268,232. (No model.) Patented in Germany May 3, 1887, No. 41,642.

Claim.—1. In an apparatus for preparing liquid coffee, an inclosing-case, a drum for roasting the green berries, a grinding device in connection with the drum, a boiler below the grinding device with a passage thereto for delivering the ground coffee into the water, a heating device below the boiler, and a flue leading to the roasting-drum, substantially as described, for the purpose specified.



2. In an apparatus for preparing liquid coffee, an inclosing-case, a drum for roasting the green berries, a grinding device in connection with the drum, a boiler below the grinding device, a strainer within the boiler having its upper end below the grinding device, a passage from the grinding device to the said strainer, a heating device below the boiler, and a flue leading to the drum, substantially as described for the purposes specified.

399,804. NAIL. ADAM S. WALL, Oakland, Cal. Filed Jan. 2, 1889. Serial No. 295,215. (No model.)



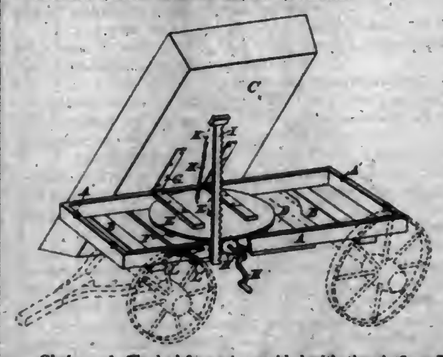
Claim.—A nail the point of which has a central V-shaped notch diverging from the apex so as to form two cutting-edges at the end, and having a longitudinal converging channel extending up the sides of the nail upon each side of the central apex, substantially as and for the purpose herein described.

399,805. TRUNK-SECURING GUARD ATTACHMENT. JOSEPH WARE, Brooklyn, N. Y. Filed Nov. 14, 1888. Serial No. 290,890. (No model.)

399,805.

Claim.—1. A trunk-securing guard attachment consisting of battens connected together to extend over a trunk, and blocks and tackles connecting two of the battens together for tightening and securing the battens to the trunk, substantially as shown and described.

2. A trunk-securing guard attachment consisting of battens connected together to extend over a trunk, with elastic cushions upon their inner surface to bear against the trunk, and blocks and tackles connecting two of the battens together for tightening and securing the battens to the trunk, substantially as shown and described.



3. A trunk-securing guard attachment consisting of folding battens hinged together to extend over a trunk, a bar connecting the battens together, and blocks and tackles connecting two of the battens together for securing and tightening the battens and their connecting-bar on a trunk, substantially as specified.

4. In a trunk-securing guard attachment, the combination, with battens 1 and 3, hinged to batten 2, and having loops 6 at their upper end, of a tackle consisting of a block, 10, with horizontal pulleys 11 and 12, a block, 7, with horizontal pulleys 8 and 9, and a pawl, 14, engaging a ratchet on pulley 9, the blocks 7 and 10 being connected by a strap, 7', extending over one of the loops 6, and the bracket 10 having a hook, 10', engaging the other loop 6, with a rope, 17, connected to block 7, and passing over pulleys 11, 8, 12, and 9, substantially as described.

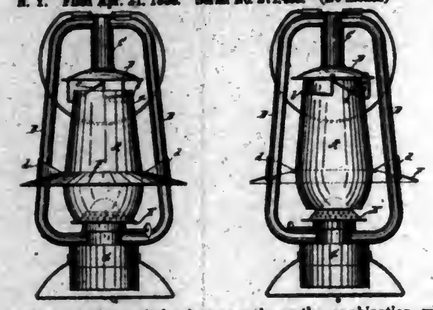
5. In a trunk-securing guard attachment, battens connected together with elastic cushions on their inner surface, and means for securing the battens to a trunk, substantially as shown and described.

6. In a trunk-securing guard attachment, a block and tackle consisting of a pair of blocks having pulleys, and a tackle connecting the blocks and passing over the pulleys, one of the pulleys having a ratchet engaging a pawl on the block, the pawl having a projection which bears against the tackle and prevents the point of the pawl from slipping past the teeth of the ratchet, substantially as described.

399,806. COAL-WAGON. HENRY P. WAYMAN, Trenton, N. J. Filed Dec. 4, 1888. Serial No. 292,734. (No model.)

Claim.—1. The bed-frame A, provided with the platform D, in combination with the circular platform E, pivoted upon said platform D and provided with the bearing-wheels F and bearing the body C, connected to said circular platform E by the hinges G, and the chain K, as shown and described.

2. The bed-frame A, provided with the catches L, having stops L', in combination with the body C, pivoted thereto by means of the



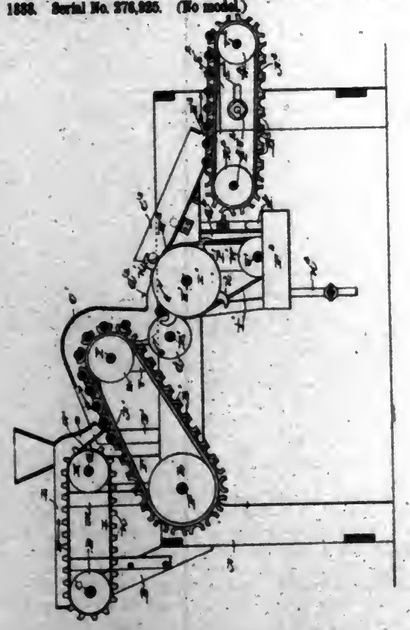
platforms D and E, pivot E', hinge G, and provided with the chain K, substantially as shown and described.

3. The bed-frame A, provided with the catches L, having stops L', and also provided with the bearing-wheels A', in combination with the body C, pivoted to such bed-frame by means of the platforms D and E, pivot E', and hinge G, substantially as shown and described.

4. The bed-frame A, provided with the catches L, having stops L', in combination with the body C, pivoted thereto, as shown and described, and the hoisting-bar I, gear-wheel H', and crank H, substantially as shown and described.

5. In combination, the bed-frame A, provided with bearing-wheels A' and the platform D, the circular platform E, having pivot E' and bearing-wheels F, the body C, connected by hinges G to the platform E, the chain K, with hooks K', the hoisting-bar I, the gear-wheel H', and the catches L, having stops L', all substantially as shown and described.

399,807. TUBULAR LANTERN. William Whitlaks, Brooklyn, N. Y. Filed Apr. 21, 1888. Serial No. 271,455. (No model.)



Claim.—1. In a tubular lantern or lamp, the combination, with the globe having a projection at top, of the two inclined ways secured to the dome, the said ways being separated from each other at the front and arranged to operate substantially as shown and described.

2. In a tubular lantern or lamp, the combination of an annular reflector surrounding the globe mounted upon the side tubes above the position of the flame and below the top of the globe, the oil-pot, and an open base applied on said oil-pot, substantially as and for the purposes explained.

3. In a tubular lantern or lamp, the combination of an annular reflector mounted upon the side tubes, contracted bottom plate, contracted oil-pot, and open base secured to the oil-pot, substantially as and for the purposes set forth.

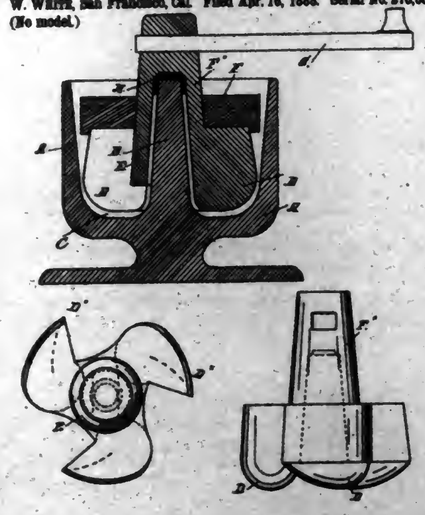
399,808. MACHINE FOR DIPPING CIGARETTES. Charles H. Whitaker and Walter B. Whitaker, Durham, N. C. Filed June 13, 1888. Serial No. 276,925. (No model.)

Claim.—1. The combination, in a machine for dipping cigarettes, of the revolving disks G', the revolving drum I', in proximity thereto having the peripheral fingers K', and means, substantially as set forth, to apply the paraffine to the cigarettes while the same is revolving in contact with the drum and disks.

2. The combination of the revolving disks, the revolving drum in proximity thereto, whereby a cigarette fed to said drum and disks will be positively rotated by frictional contact with their moving surfaces, the trough or vessel to contain melted paraffine, and the endless belt working on a pulley in the contents of the said trough or vessel and passing over a pulley at one end of the drum and in contact with the revolving cigarette, substantially as described.

3. The combination, in a machine for dipping cigarettes, of the revolving disks, the revolving drum in proximity thereto, means, substantially as set forth, to apply melted paraffine to the cigarettes while the same are in succession revolving in contact with the drum and disks, and the conveyer having the holders B', to deliver the cigarettes in succession between the disks and the drum, substantially as described.

4. The combination, in a cigarette-dipping machine, of the revolving disks, the drum in proximity thereto and having the fingers K', and the inclined delivery-table having its upper end in proximity to one side of the revolving drum, and means, substantially as set forth, to apply paraffine to the cigarette while the latter is revolving in contact with the drum and disks, substantially as described.



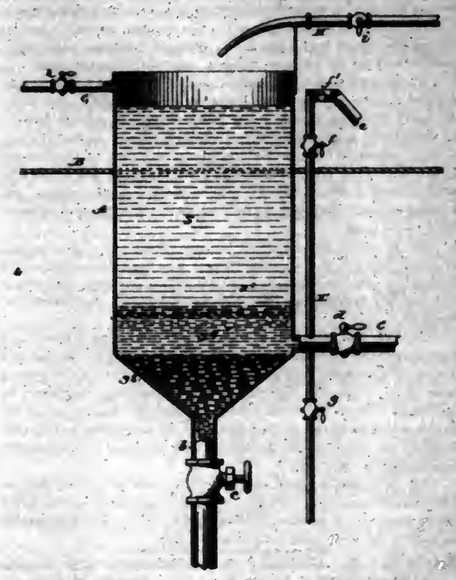
5. The combination, in a machine for dipping cigarettes, of the revolving drum I' and the revolving disks in proximity thereto, with the inclined delivery-table, the latter having its upper end arranged in proximity to the drum and being provided at one side with a groove or slot, F⁵, and the conveyer having the holders B', to deliver the cigarettes in succession between the disks and drum, substantially as described.

6. In a cigarette-machine, the combination of the paraffine trough or case having the surrounding case F³, whereby a steam-space is formed between said trough and said case F³, the steam-pipe communicating with said case, the drum or pulley having its lower side arranged in the trough, the revolving drum I', having the pulley L', the endless belt connecting said pulley with the pulley in the paraffine-trough, and the disks in proximity to one side of the drum and revolving in the same direction therewith, substantially as described.

7. The combination, with the disks and fingered drum arranged in proximity to each other and revolving in the same direction, of the conveyer having the holders B', to deliver the cigarettes in succession between the disks and drum, the inclined delivery-table having its upper end bearing against one side of the drum, and the endless belt or carrier A⁵, arranged below the lower end of the delivery-table, substantially as described.

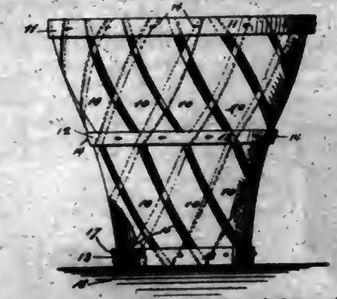
8. The combination, in a machine for dipping cigarettes, of the disks and drum arranged in proximity to each other and revolving in the same direction, the pulley at one end of the drum, the paraffine-feeding belt passing over said pulley, the conveyer A', and the guide C', to deliver the cigarettes from the conveyer between the disks and the drum, and the gage-plates G² on opposite sides of the drum and pulley, substantially as described.

399,809. GRINDING AND AMALGAMATING MORTAR. George W. White, San Francisco, Cal. Filed Apr. 16, 1888. Serial No. 270,856 (No model.)



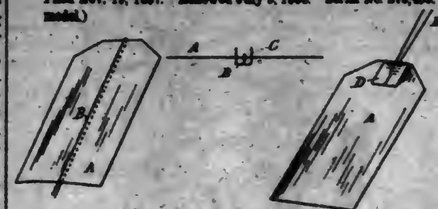
Claim.—1. In an ore grinder and amalgamator, the combination, with a mortar provided with an upright journal and an annular groove surrounding the base of said journal, of the triturating-muller having two or more pear-shaped grinding-faces with circulating channels or passages between them, journaled upon the journal of the mortar, and working in the groove thereof, as set forth.

2. In an ore grinder and amalgamator, the combination, with a suitable mortar, of a muller composed of two or more pear-shaped grinding-faces cast with wings or stirrers and connected by webs, whereby channels or ore-circulating passages are formed between the wings and underneath the webs, in the manner described.



3. In an ore grinder and amalgamator, the combination of a mortar provided with an upright shaft or journal, a grinding and amalgamating muller rotating thereon, and the adjustable thimble for raising or lowering the muller, substantially as described.

399,810. RENDERING. Frederick Wetter, Allegheny, Pa. Filed Mar. 10, 1888. Serial No. 266,833. (No specimens.)

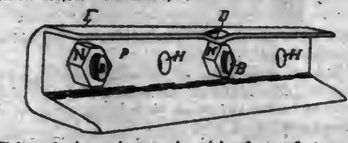


Claim.—In the process herein described of manufacturing neutral stock from crude animal fat, first reducing the fat to a pulp, then passing the same onto a body of heated water, next subjecting the fat to a stream of heated water from above, whereby the melting of the fat is completed, and slush, tissue, and foreign matters soluble in water are washed out of and removed from the fat, and subsequently, and after settling, drawing off the clear fat, essentially as set forth.

399,811. BASKET OR CARRIER. Isaac J. W. Adams, Laurel, Del. Filed Nov. 2, 1888. Serial No. 289,800. (No model.)

Claim.—A carrier comprising a body formed of two series of inner and outer oppositely-inclined crossing slats 10, the hoops 11 12, fastenings driven through said hoops and through the slats at their points of crossing, the bottom 15, the hoop 16 under it, the outer hoop, 13, the fastenings 17 driven through said hoop and lower overlapped ends of the slats into the bottom, and other fastenings driven through the hoop 13 and said overlapped lower ends into the inner hoop, 16.

399,812. SHIPPING-TAG. Frank R. Aldrman, Denver, Mich. Filed Nov. 19, 1887. Renewed July 9, 1888. Serial No. 279,490. (No model.)



Claim.—1. The combination, with a tag, of a wire embracing the end of said tag and a staple securing said wire in place within the loops of the return-bends thereof upon opposite sides of the tag, thus forming double strands of the wire above the point of attachment, substantially as described.

2. In a tag, the combination of a tag, a wire embracing the end of said tag, a staple clinched through the tag and embracing the wire within the return-bends thereof, and a re-enforcing tab, substantially as described.

3. In a shipping-tag, the combination of the tag A, attaching-wire B, staple C, and a re-enforcing tab, D, the parts being constructed, arranged, and operating substantially in the manner and for the purposes described.

4. The combination, with the blank of a shipping-tag, of an attaching wire or cord formed in one piece, with a central loop adapted to embrace the edge of the blank to form means for securing it thereto without passing it through the blank, forming double strands of the wire upon each side of the blank, and means, as the staple C, for securing the wire or cord to the blank, substantially as described.

399,813. NUT-LOCK. Homer H. Allen, Hanover, assignor of one-half to Julius C. Brown, Los Angeles, Cal. Filed Oct. 16, 1883. Serial No. 288,665. (No model.)

Claim.—1. As an improved article of manufacture, a fish-plate provided with a pliable laterally-extending flange adapted to be bent down upon the nut to be locked.

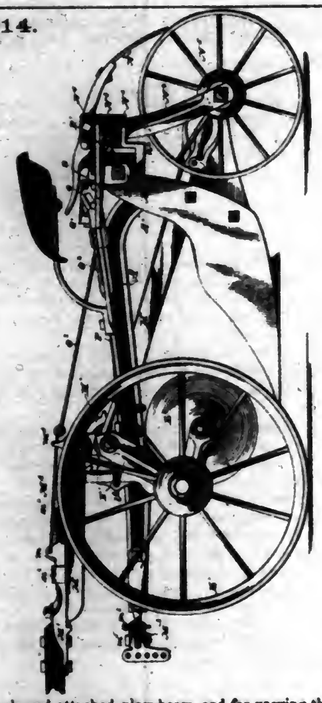
2. In combination with the rails, the fish-plates applied thereto, a bolt extending through the plates and rails and provided with a nut, and a pliable laterally-extending flange projecting from the upper edge of one of the plates and adapted to be bent down upon the nut, all substantially as shown.

399,814. SULKY-PLOW. Charles Anderson, South Bend, Ind., assignor to the South Bend Iron Works, same place. Filed Nov. 1, 1888. Serial No. 289,736. (No model.)

Claim.—1. In a sulky-plow, the combination, with a sectional crank-axle, and wheels and plow-beam secured to the axle, of lever mechanism for moving the wheels forwardly and rearwardly relative to the point of attachment of the beam to the axle and for inclining one of said wheels, substantially as set forth.

2. In a plow, the combination, with a beam, an axle, and wheels, of a lever for moving one or both of the wheels relative to the axle and regulating the inclination of one wheel.

3. In a plow, the combination, with a beam, an axle, and wheels, of a hand-lever for moving one or both of the wheels to raise or lower the plowshare and change the inclination of one wheel, and a foot-lever adapted to act in conjunction with the hand-lever.



4. In a plow, the combination, with a beam, a crank-axle, and wheels, of a single hand-lever for adjusting the crank-axle, whereby the plow is raised and lowered and also for changing the angle of the furrow-wheel relative to the axle.

5. In a plow, the combination, with a crank-axle made in sections, a box mounted thereon and carrying the plow-beam, and wheels mounted on the ends of the axle, of a hand-lever rigidly secured to one section of the axle and detachably connected to the other section, and devices for locking the lever to the box, substantially as set forth.

6. In a plow, the combination, with a box and an axle mounted thereon, of a saddle adapted to be adjusted laterally on the box, and a plow-beam adjustably secured to the saddle, substantially as set forth.

7. In a plow, the combination, with a crank-axle, a saddle adapted to be adjusted laterally thereon, a plow-beam secured to the saddle and adapted to be adjusted longitudinally therein, and wheels on the ends of the crank-axle, of a single hand-lever for raising and lowering

899,814.

the crank-axle and attached plow-beam and for varying the inclination of the furrow-wheel.

8. In a plow, the combination, with a beam, a swivel caster-wheel, and adjustable tongue, of means for locking said wheel and tongue in alignement with each other and means for breaking the locks simultaneously, substantially as set forth.

9. In a plow, the combination, with a beam, a swivel caster-wheel at one end and a jointed tongue at the other, of devices for locking said wheel and tongue in alignment, and a link connecting said devices whereby the two locking devices may be drawn simultaneously.

10. In a plow, the combination, with a crank-axle made in sections and wheels journaled on said axle, of foot and hand levers rigidly secured to one of said sections, the hand-lever being detachably connected to the other section.

11. In a plow, the combination, with a sectional crank-axle and a box mounted thereon, of a saddle adjustably secured to the box and a plow-beam adjustably secured to the saddle.

12. In a plow, the combination, with a beam, a sectional crank-axle, a box thereon, and saddle for securing the beam to the box, of a sector fixed to the box, a sector loosely mounted on one section of the axle and connected to the other, and a lever secured to one section of the axle and adapted to be detachably connected to the loose sector.

13. In a plow, the combination, with a crank-axle, of a box journaled thereon, a saddle adapted to be adjusted laterally on the box, and a plow-beam adapted to be adjusted longitudinally in the saddle, the saddle, box, and beam being secured together by one set of clips or bolts, substantially as set forth.

14. In a plow, the combination, with an axle and a box thereon, of a laterally-adjustable saddle secured on the box, a sod-cutter carried by the saddle, and a plow-beam secured to the saddle, substantially as set forth.

15. In a plow, the combination, with an axle, a box, a saddle adjustably secured thereto, and a beam secured to the saddle, of a tongue-supporting arm pivoted to the saddle and a tongue-socket pivoted to said arm, and means for locking the arm and socket together.

16. In a plow, the combination, with a beam, a saddle having lugs on its lower face to straddle the beam and admit of longitudinal adjustment thereon, and clips for holding the saddle, of a tongue-arm pivoted to the saddle, a tongue-socket pivoted on the forward end of the arm and having a rounded notched rear end, a spring-latch adapted to engage said notch, and means for withdrawing the latch, substantially as set forth.

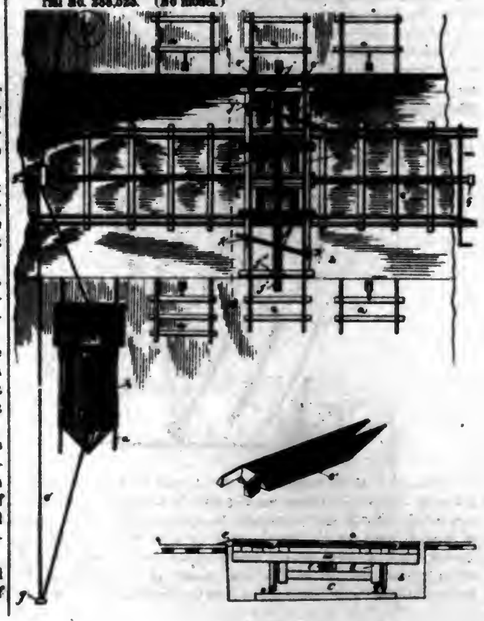
17. In a plow, the combination, with a sectional crank-axle, and wheels journaled thereon, of a foot-lever adjustably secured to one of said sections, and a hand-lever secured to the same section and detachably connected to the other section, substantially as set forth.

18. In a plow, the combination, with a section of a crank-axle, a box mounted on said section and provided with an inclined projection, and a section of the axle loosely mounted on the projection, of a rigid sector, a loose sector connected to the section of the axle having the inclined projection, a hand-lever, and means for locking the same to either sector, substantially as set forth.

19. In a plow, the combination, with an axle having spindles, and sleeves loosely mounted on said spindles and provided with screw-threaded outer ends, of keys for locking the sleeves on the spindles, and wheels secured to the sleeves and caps covering the keys and ends of the spindles and secured to the screw-threaded ends of the sleeves, substantially as set forth.

20. In a plow, the combination, with a crank-axle, wheels and plow-beam secured to said axle, of a rearwardly-extending seat-frame secured to the axle and to the plow-standard, substantially as set forth.

21. In a plow, the combination, with a beam and a plow proper having an integral upwardly-projecting arm, of a swinging bracket, a caster-wheel pivotally supported in this bracket, means for locking the wheel-support to the bracket in different positions, and a draw-bolt for locking the swinging bracket, substantially as set forth.



22. In a plow, the combination, with a beam and a plow proper secured thereto, and having an upwardly-projecting arm, of a swinging bracket having crown-teeth on its upper arm and a notch forward of these teeth, a bifurcated arm pivotally supported in the bracket, a wheel journaled between the branches of said arm, an arm secured to the bifurcated arm and carrying a mud-scraper, and a gravity-latch adapted to engage the crown-teeth on the swinging bracket, and a spring-actuated draw-bolt for locking the swinging bracket, substantially as set forth.

23. In a plow, the combination, with a beam and a plow proper, of a swinging bracket swiveled thereto, a spring-actuated draw-bolt for locking said bracket, and a lever having a cam-slot, with which the bolt has engagement for withdrawing the bolt, substantially as set forth.

24. In a plow, the combination, with a beam, a plow proper, and a tongue-supporting arm and pivoted socket and device for locking said socket, of a swinging bracket, a draw-bolt for locking the bracket, a lever having a cam-slot with which the draw-bolt has engagement, an adjustable wrist on the lever, and a link connecting said wrist and the device which locks the pivoted socket to the tongue-supporting arm, whereby the two locking devices may be unlocked simultaneously, substantially as set forth.

25. In a plow, the combination, with a crank-axle, a box thereon, and a saddle mounted on the box, of a beam adjustably secured to the saddle, and a seat-supporting frame mounted on the axle and adjustably secured to the plow, substantially as set forth.

899,815. SWITCHING OR TRANSFERRING CARS. JACKSON ARNIL and ROBERT M. SEEBER, Nevada, Mo. Filed Oct. 13, 1888. Serial No. 288,523. (No model.)

899,815.

Claim.—1. A car-transferring apparatus comprising a truck operating in a lowered way severing several tracks, a transverse track-section carried by the truck to register with the track-sections, locking-levers pivoted at one end at each severed track to allow their free ends a vertical swing into or out of notches or recesses in the truck, the way being of greater width than the truck and having a double track, whereby the truck can receive or deliver upon either side of the same, substantially as described.

2. A car-transferring apparatus comprising a lowered way severing several railroad-tracks, a double track in said way, a truck to operate on the tracks in the way and provided with a transverse track to register with the severed tracks, said transverse track being shorter than the width of the cut, and a switch to throw the truck upon either track in the way, for the purpose set forth.

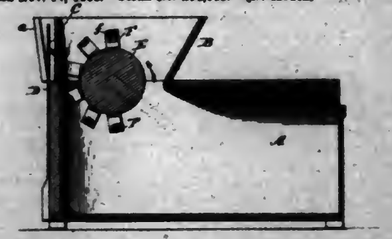
3. A car-switching apparatus comprising a cut transversely severing several lines of track, a double track in the bottom of said cut, consisting of rails of different heights, and a car-conveying truck operating on said tracks in the cut and provided with a section of track to register with the tracks severed by the cut, said truck being held in an inclined position by the track when delivering a car, for the purpose described.

4. A car-transferring apparatus comprising a truck operating in a lowered way severing several lines of track and carrying a track-section to register with the severed tracks and shorter than the width of the way, and grooved and notched rail-sections to removably bridge the space between the truck-rails and track-rails, as set forth.

5. The combination, with a car-conveying truck provided with a track-section to receive a car, of pivoted stops to hold the car upon said track, substantially as described.

6. The combination, with a car-conveying truck provided with a transverse track-section to receive a car, of pivoted stops to hold the car upon the rails and horizontally-movable levers to operate said stops, substantially as described.

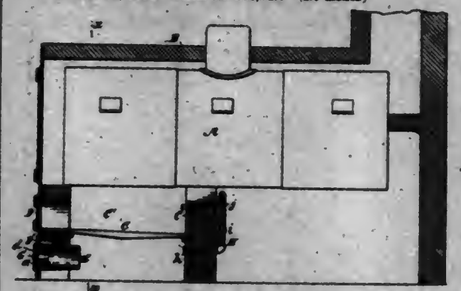
7. The combination of a lowered track severing several parallel tracks, a car-conveying truck provided with a transverse track-section to register with any one of said severed tracks, and removable independent frogs or rail-sections to bridge the breaks between the truck-rails and the track-rails, substantially as described.



8. A car-transferring apparatus comprising a lowered way severing several railroad-tracks, a double track in said way, each track having its rails on one side in a higher plane than the rails on the other side, and a switch in the way to close or open the passage to either track, as and for the purpose set forth.

9. A car-transferring apparatus comprising a lowered track in a way severing several railroad-tracks and having the rails on one side in a higher plane than those on the other side, a truck to operate on said track and having a track-section to register with said severed tracks, and pivoted stops carried by the truck to hold a car upon the track-section, substantially as set forth.

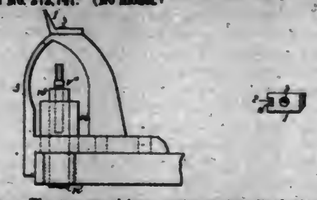
10. A car-transferring truck having a longitudinal passage extending therethrough and one or more rollers journaled in the same to support the cable operating the car and extending through the passage, as and for the purpose set forth.



11. A car-transferring apparatus comprising a truck operating on a track in a transverse lowered way severing several lines of tracks, a transverse track-section carried by the truck to register with the severed tracks, pulleys mounted at the ends of the severed way and also to one side of the same, and cables secured to the opposite ends of the truck and passing around said pulleys and adapted to be secured to opposite ends of a locomotive located upon one of the severed tracks, whereby the truck is moved by the movement of the locomotive, as set forth.

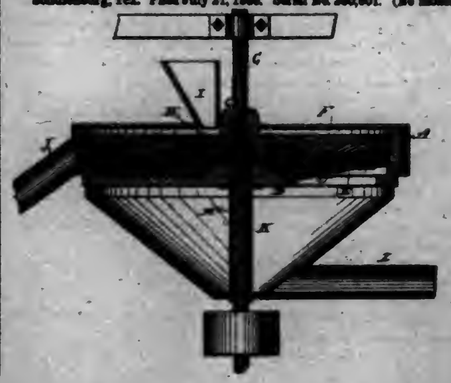
899,816. ROOT-CUTTER. WILLIAM H. ARNOTT, Martinsburg, Neb. Filed Nov. 17, 1888. Serial No. 291,063. (No model.)

Claim.—The combination, in a vegetable or root cutter, with a receptacle, A, having a hopper, B, and spring-board C, of a cylinder mounted between the hopper and receptacle, said cylinder being provided with semicircular cutters arranged spirally upon the cylinder, substantially as shown, and for the purpose set forth.



899,817. SMOKE-CONSUMER. ALCIDE C. BADAR, New York, N.Y. Filed Mar. 23, 1888. Serial No. 268,245. (No model.)

Claim.—1. The combination, with the furnace, of an injector comprising a perforated pipe, an open-ended tube beneath the furnace, through which air is forced by the injector, a bridge-wall, and an air-distributer consisting of a pipe having a perforated portion arranged at the rear of the bridge-wall, a vertically-extending portion, also at the rear of the bridge-wall, and a horizontally-extending portion extending through the bridge-wall and opening into the ash-pit, said pipe being otherwise independent of the bridge-wall, substantially as specified.



2. The combination, with a furnace, of an injector comprising a perforated pipe, an open-ended tube beneath the furnace, through which air is forced by the injector, a bridge-wall, and an air-distributer consisting of a pipe having a curved perforated portion arranged at the rear of the bridge-wall, vertically-extending portions, also at the rear of the bridge-wall, and horizontally-extending portions extending through the bridge-wall and opening into the ash-pit, said pipe being otherwise independent of the bridge-wall, substantially as specified.

899,818. SEWING-MACHINE. JONATHAN BARTLETT, Epping, and GEORGE B. WIGGIN, South New Market, N. H., assignors of one-half to John W. Heard, Providence, R. I. Original application filed July 26, 1887, Serial No. 245,561. Divided and this application filed May 3, 1888. Serial No. 272,747. (No model.)

Claim.—The improved horn and rest described, the rest being a pivoted angled piece, 3, having an opening at the rear of its base and the horn having a fixed pin projecting into such opening, which opening is larger than the body of the pin and serving to limit in both directions the swinging movements of such rest.

899,819. COTTON-SEED CLEANER. CHRISTIAN RAUSCHARTH, Schulenburg, Tex. Filed July 21, 1888. Serial No. 280,601. (No model.)

Claim.—A cotton-seed cleaning-machine consisting of the horizontal circular fixed table B, having alternating emery-slabs and perforated plates, a casing, A, inclosing the table and provided with hopper I on its top and the seed-outlet J on its side, the cone-shaped receptacle K, under the table and having the tubular central jacket, N, extending from its bottom upwardly through the center of the table, the outlet L at the bottom of the receptacle, the shaft G, extending through the casing and jacket K, and the circular brush on the shaft within the casing and having openings H, substantially as set forth.

899,820. FARE-BOX. TIMOTHY L. BRANAN, Knoxville, Tenn. Filed Apr. 18, 1888. Serial No. 271,048. (No model.)

Claim.—1. The combination, with a fare-box having a slot and opposite grooves in its walls registering therewith, and a glass or transparent plate slipped through said slot into the grooves, of a plug inserted in the slot outside the plate, and fastenings securing the plug at the inside of the box, substantially as described, whereby the glass cannot be removed through the slot without first disengaging the plug-fastenings inside the box, as and for the purposes set forth.

2. The combination, in a fare-box, of opposite side walls A A, grooved at *g g*, top, bottom, and front plates, *a a' a² a³ a⁴*, fixed to the side walls, and said top plate slotted at g^6, a glass, G, held in the grooves *g*, a strip, H, closing the slot g^6, and fastenings securing said strip at the inside of the box, substantially as herein set forth.

3. The combination, in a fare-box, of opposite side walls having grooves or ways and fixed top, bottom, and front plates, *a a' a² a³ a⁴*, and said top plate *a* slotted at g^6, a glass, G, held in the grooves *g*, fastenings above the glass at the inside of the box, a strip, H, closing the slot g^6, and fastenings securing said strip at the inside of the box, substantially as herein set forth.

4. In a fare-box, the door made to lock behind an upper plate of the box, combined with a fare-deposit drawer locking at the outside of the lower part of the door, substantially as herein set forth.

5. In a fare-box, the door made to lock behind an upper plate of the box and fitted at the sides into rabbets of the box-frame, combined with a fare-deposit drawer locking at the outside of the lower part of the door, substantially as herein set forth.

6. In a fare-box, the door made to lock behind an upper plate of the box, combined with a fare-deposit drawer locking at the outside of the lower part of the door, and said door provided with a bolt holding it up into place when the fare-drawer is removed, substantially as herein set forth.

7. In a fare-box, the door made to lock behind an upper plate of the box, combined with a fare-deposit drawer overlapping the outside of the lower part of the door, and lock-fastenings for said drawer, substantially as herein set forth

8. In a fare-box, the combination, with side wall A A and top, bottom, and front plates, *a a' a² a³ a⁴*, fixed thereto, and said top plate *a* slotted and provided in said slot with a removable strip, H, having fastenings inside the box, of a removable plate, B, giving access to the fastenings of said strip H, substantially as herein set forth.

9. In a fare-box made with side walls A A and top, bottom, and front plates, *a a' a² a³ a⁴*, fixed thereto, and said top *a*, slotted and fitted with a removable strip, H, having fastenings inside the box, substantially as specified, the combination, with said parts, of a removable plate, B, tongued and grooved into the parts A A *a*, and also having an outer lower tongue, b^4, a door, C, fitted to the side walls A A and provided with a rear upper tongue, *c*, locking behind the tongue b^4, and having a front rabbet, c^4, at its lower end, and a fare-deposit drawer at the bottom of the box, having a projection entering the rabbet c^4 and provided with a lock or locks, substantially as herein set forth.

10. In a fare-box, a fare-chute interposed between the pay chute or hole and the fare-rests, and having relatively-fixed outer side walls and provided between or within said outside walls with one or more yielding walls, substantially as herein set forth.

11. In a fare-box, a fare-chute having a discharge mouth or opening having no direct lateral or marginal communication with the side walls of the box, and formed with relatively-fixed outside walls and with one or more interior yielding walls normally allowing free passage of fares, and providing one or more robbing-implement pockets or traps within the chute and behind and below said yielding wall or walls, substantially as herein set forth.

12. In a fare-box, a fare-chute, F, interposed between the pay-chute and fare-rests and formed with side walls M M and front and rear walls N O, disposed to deflect and stop a robbing implement and to provide a discharge opening or mouth which has no communication with the side walls of the box, a wall or plate, P, next the wall O, and adapted to yield at its lower end, and a trap, R, arranged below and behind said yielding wall, substantially as herein set forth.

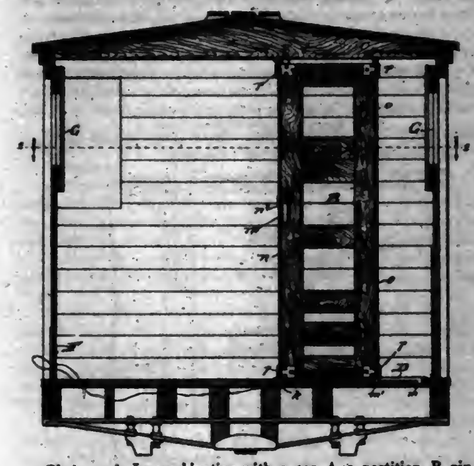
13. A fare-box fare-chute made as an independent structure, adapted for interposition between the pay-chute and fare-rests of the box and formed so as to separate the pay-chute and fare-rest or deposit-compartments of the box, and provided with a downwardly-ranging discharge-mouth having fixed outer side walls, and provided with one or more interior yielding walls normally allowing free passage of fares, and providing one or more robbing-implement pockets or traps within the chute and behind and below said yielding wall or walls, substantially as herein set forth.

14. The combination, in a fare-box and with a fare-chute therein having a mouth which has no direct lateral or marginal communication with the side walls of the box, of a valve fitted within the chute and closing its mouth should the fare-box be inverted, substantially as herein set forth.

15. In a fare-box, the fare-chute next the pay chute or hole, provided at its mouth with a guard plate or valve, combined with a weight which normally holds the plate open and closes it should the box be inverted, substantially as herein set forth.

16. In a fare-box, a fare-chute interposed between the pay chute or hole and the fare-rests and having a mouth which has no communication with the side walls of the box, and said fare-chute provided with a wall, N, a yielding wall, P, a trap, R, and an interior plate-valve, S, substantially as herein set forth.

17. In a fare-box, a lower fare-chute fitted at or above the final fare-deposit compartment of the box, and having a discharge opening or mouth which projects into the fare-deposit compartment and has no direct lateral or marginal communication with the side walls of this compartment or a drawer placed therein, substantially as herein set forth.



18. In a fare-box, a lower fare-chute fitted at or above the final fare-deposit compartment of the box, and having a discharge opening or mouth which projects into the fare-deposit compartment and has no direct lateral or marginal communication with the side walls of this compartment, combined with a hinged plate or valve fitted within the chute and closing it should the fare-box be inverted, substantially as herein set forth.

19. In a fare-box having fare-rests, as U' V', the combination, with said rests, of levers U V, adapted to tilt them, said lever U having an extension, U^3, cut away at v^6, at its lower forward corner or part, and said lever V having an extension, V^3, cut away at v^6, at its upper forward corner or part, said cut-away part v^6 normally facing the rounded portion of the plate U^3, and the cut-away part v^6 normally standing in front of the cut-away portion v^6, substantially as described, whereby the upper fare-rest, U', may be dumped independently of the next lower fare-rest, V', and the fare-rest V' cannot be dumped without first dumping the fare-rest U', as and for the purposes set forth.

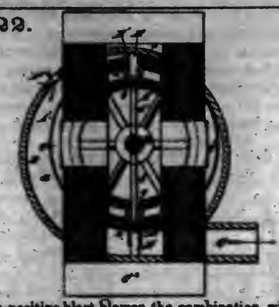
20. In a fare-box having upper, intermediate, and lower fare-rests, as U' V' W', and operating-levers U V W therefor, said levers U V having segmental extensions U^3 V^3 cut away at v^6 v^6, respectively, and said levers V W connected by a link, X, which is pivoted to the lever W, and has a slot, *x'*, at its upper end engaging a pin, *v'*, on the lever V, substantially as described, for the purposes set forth.

21. In a fare-box having fare-rests, as V' W', and operating-levers V W, adapted for tilting the rests, said levers connected by a link, X, pivoted to the lever W, and having a slot-and-pin connection, *x' v'*, with the lever V, substantially as herein set forth.

899,821. STOCK-CAR. ELIAS U. DEERINGS, Aurora, Ill. Filed Nov. 26, 1888. Serial No. 291,667. (No model.)

Claim.—1. In combination with a car, A, a partition, B, pivotally supported to stand vertically in the car and disconnected from the side of the car against which it is to be folded, and guides extending transversely of the car from near one side thereof for the upper and lower edges of the partition, whereby the partition may be turned on its pivotal support to extend parallel with and be thus folded against an inner side of the car, and be turned from its folded position to extend in the direction of the said guides, and be slid toward the opposite inner side of the car, and thus form a stall, E, open between the rear edge of the partition and the adjacent car-wall, substantially as described.

2. In combination with a car, A, an overhead guideway, C, a guideway, D, having end sockets, *m* and *m'*, and secured to the car-floor in line with the guideway C, a thimble, *l*, and a thimble, *k*, in the car-floor, respectively adjacent to the wall and in line with the guideway D transversely of the car, and a partition, B, having rods *o* and *n* at opposite edges, substantially as described.



3. A convertible stock-car comprising, in combination with a car, A, overhead transverse timbers *r*, guideways C, supported on the timbers, guideways D, having end sockets, *m* and *m'*, and countersunk into the car-floor, one directly below each guideway C, to extend transversely from near a wall of the car, partitions B, having rods *o* and *n* at their opposite lateral edges, each rod *o* extending at its opposite ends into coincident guideways C and D, thimbles *l*, countersunk into the car-floor adjacent to the said wall of the car and located each to receive the lower end of a rod, *n*, when the partition is folded against the side of the car, and thimbles *k*, countersunk into the car-floor, one in line with each guideway D, and each located to receive the lower end of a rod, *n*, when the partition is drawn out, to cause its rod *o* to enter a socket, *m'*, substantially as described.

4. A convertible stock-car comprising, in combination with a car, A, overhead transverse timbers *r*, equidistant apart, guideways C, secured to the timbers, guideways D, having end sockets, *m* and *m'*, and countersunk into the car-floor, one directly below each guideway C, to extend transversely from near a wall of the car, partitions B, having rods *o* and *n* at their opposite lateral edges, each rod *o* extending at its opposite ends into coincident guideways C and D, thimbles *l*, countersunk into the car-floor adjacent to the said wall of the car and located each to receive the lower end of a rod, *n*, when the partition is folded against the side of the car, thimbles *k*, countersunk into the car-floor, one in line with each guideway D, and each located to receive the lower end of a rod, *n*, when the partition is drawn out, to cause its rod *o* to enter a socket, *m'*, latches *n'* on the upper ends of the rods *n*, and catches *i*, supported on the timbers *r* in positions to be engaged by the said latches, substantially as described.

899,822. ELECTRIC BLAST-BLOWER. HARRY H. BLADES, Detroit, Mich. Filed July 23, 1887. Serial No. 245,106. (No model.)

Claim.—1. A positive blast-blower consisting of the combination, with an electric motor, of a fan-case embracing its armature, said armature located eccentrically within the case and provided with yielding wings or blades and means for maintaining them in contact with the periphery of the case, said case having an air-admission port at its periphery and an air-delivery port, substantially as described.

899,822.

2. In a positive blast-blower, the combination, with the armature of an electric motor, of wings or pistons supported upon and having a reciprocatory motion through said armature, and a fan-case embracing said armature, said apparatus adapted to draw in air and deliver the same air under pressure through the exit-pipe, substantially as described.

3. In a positive blast-blower, a blower-case, an armature of an electric motor eccentrically journaled within said case and having wings adapted to reciprocate through said armature, and mechanism for maintaining said wings in contact with the inner periphery of the blower-case, substantially as described.

4. In a positive blast-blower, the combination, with an electric-motor armature, of supporting-arms sleeved through the shaft of said armature and having a reciprocatory motion therein, and spring-actuated wings or pistons E and supports E', all constructed and adapted to operate substantially as described.

5. In a positive blast-blower, the combination, with a blower-case, D, of an electric-motor armature, A, field-magnets C, having pole-pieces C' and yokes C^3, having extensions *c* to form supports for the case D, wings E, springs *c*, and supports E', secured to arms *c'*, said arms having a reciprocatory motion through the shaft of said armature, substantially as described.

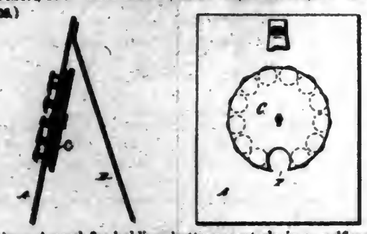
899,823. NUTMEG-GRATER. CHARLES O. BLOOD, Lynn, Mass., assignor to Arthur J. Blood and Lillebridge K. Blood, both of same place. Filed May 26, 1888. Serial No. 275,295. (No model.)

Claim.—1. In a nutmeg-grater, an inclosing-case, 6, the grater-plate within the same and held above the bottom thereof, having rows of perforations parallel to each other, a passage in the top of the inclosing-case formed diagonally to the rows of perforations in the grater-plate by bending the edges of the case inward, a nutmeg-holder having grooves in its sides adapted to the inwardly-turned edges of the inclosing-case, and a plunger within the holder, substantially as described.

2. In a nutmeg-grater, an inclosing-case, 6, having inwardly-turned edges forming a diagonal passage, a nutmeg-holder having grooves in its sides adapted to said edges, and the grater-plate having downwardly-turned edges adapted to rest on the bottom of the plate 6, and grooved to fit corresponding ridges in the sides thereof, substantially as described.

3. In a nutmeg-grater, an inclosing-case, 6, having inwardly-turned flanges forming a diagonal passage, a nutmeg-holder having grooves fitted to said flanges, a grater-plate supported above the bottom of the inclosing-case, and a handle, 4, closing the space beneath the grater-plate at one end, said handle having a groove to support one end of the grater-plate, said plate having downwardly-turning edges resting against the bottom of the plate 6, substantially as described.

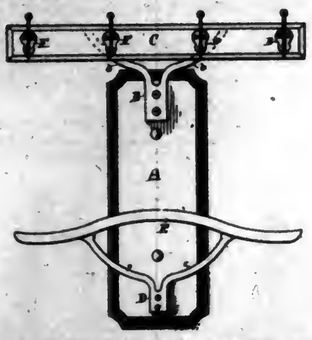
4. The combination of a grater-plate, 5, a holder, 7, movably supported on ways above the plate, and clearers 10, supported in the holder and movable therewith, and having downward projections extending into the corrugations of the grater-plate, substantially as described.



5. The combination of a grater-plate, 5, a holder, 7, supported movably above the same, and clearers 10, supported loosely in the holder and movable therewith, and provided with projections extending into the corrugations of the grater-plate, substantially as described.

6. The combination, with a grater-plate, 5, of the inclosing-case

6, the nutmeg-holder 7, and the guards or clearers, whereby the pieces are retained in the holder, substantially as described.



7. In combination, the inclosing-case 6, having inwardly-turned flanges, a grater-plate within the same, a holder having grooves to receive the inwardly-turned flanges, and means for limiting the movement of the holder and preventing its displacement, consisting of the bent ends 12 12 of the flanges, substantially as described.

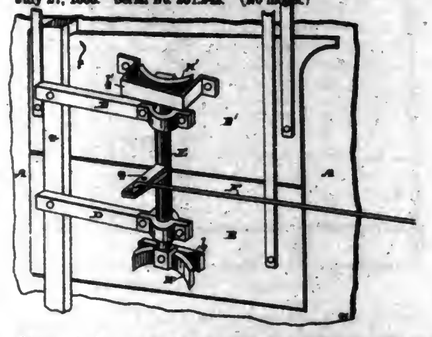
399,824. CARD FOR BUTTONS OR STUDS. CHARLES G. BLOOMER, Pawtuxet, R. I. Filed Dec. 31, 1888. Serial No. 294,967. (No specimens.)

Claim.—A card for holding buttons or studs in a uniform position, consisting of a back, A, having a series of button-holes, in combination with a rotary movable disk, C, pivoted thereto and having a slot, F, in the circumference thereof movable into position corresponding to each of the button-holes, the whole constructed and operating in the manner substantially as described.

399,825. HAT AND CLOTHES RACK. HENRY A. BERCHELL and FRASER H. REESE, Defiance, Ohio. Filed Sept. 20, 1888. Serial No. 286,730. (No model.)

Claim.—As an improved article of manufacture, the within-described rack, consisting of the broad base A, a bifurcated bracket, B, attached to the upper end thereof, having upwardly and outwardly diverging arms, and a horizontal bar, C, supported by said arms and carrying hooks F, and the bifurcated bracket D, attached to the lower part of said base and having upwardly and outwardly diverging arms, and the curved bar E, supported on said arms and lying nearer to base A than bar C, all substantially in the manner and for the purpose specified.

399,826. ELECTRIC CONDUCTOR. ALFRED A. BROOKS, Cambridge Mass. Filed Sept. 10, 1888. Serial No. 284,971. (No model.)

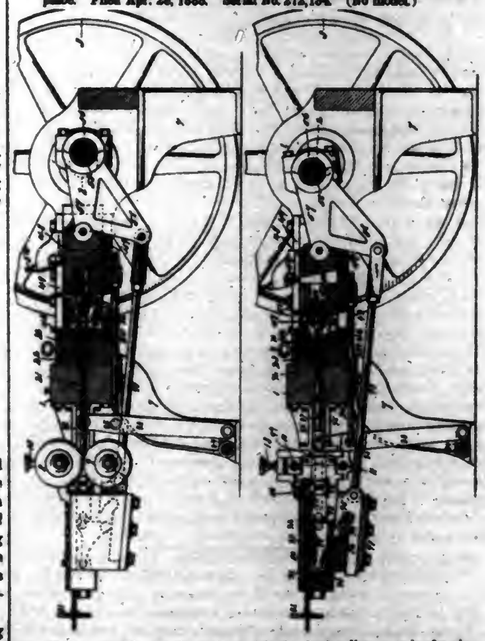


Claim.—1. An electric conductor consisting of a wire covered with a single-ply jacket composed of a single set of longitudinal yarns or warps, *b*, and two uniting woof or weft threads or yarns, *c c'*, which are both tightly wound around the said wire and interwoven with all of the said warps in parallel course or lines, said weft-threads being alternated with the said warp-threads, so that in the same course the thread *c* is beneath or inside of a warp-thread when a thread, *c'*, is above or outside of the same warp-thread, and vice versa, substantially as set forth.

2. An electric conductor consisting of a wire having an insulating layer or coating, *d*, and a single-ply tightly-woven jacket or covering composed of a single set of longitudinal yarns or warps, *b*, and two or more wefts interwoven with all the said warps and extending around the conductor in parallel course and passing alternately over and under the said warps, substantially as set forth.

3. An electric conductor consisting of a wire having a tightly-woven single-ply jacket composed of a single set of longitudinal warps, *b*, and two or more wefts, each of which is interwoven with all of the said warps and passing alternately over and under the same, said jacket having a water-proof coating, *e*, substantially as set forth.

4. An electric conductor consisting of a wire having an insulating layer or coating, *d*, and a single-ply tightly-woven jacket composed of a single set of warp-threads and two or more weft-threads, each of which is interwoven with all of the said warp-threads, and said jacket having a water-proof coating, *e*, substantially as set forth.



399,827. GRAIN-CLEANER. HENRY BRYAN, Modesto, Cal. Filed July 27, 1888. Serial No. 281,242. (No model.)

Claim.—1. In a grain-cleaner, the independently-vibrating shoes, one being provided with the bracket *b'*, in combination with the rock-shaft, the reversely-curved rockers on the shaft and working against the shoes, and the springs, substantially as herein described.

2. In a grain-cleaner, the shoes B B' and the springs for returning them, in combination with a stationary rock-shaft, a curved rocker on the lower end of the shaft bearing against the lower shoe, the oppositely-curved rocker on the upper end of the shaft bearing within a bracket upon the upper shoe, the rotary eccentric, the crank on the rock-shaft, and the connecting-link, all arranged substantially as herein described.

399,828. BOLT-HEADING MACHINE. ELLWOOD BURDSALL, Jr., Port Chester, N. Y., assignor of one-half to Richard H. Burdsall, same place. Filed Apr. 28, 1888. Serial No. 272,134. (No model.)

Claim.—1. The combination, with the feed-rollers, a tube for the wire, and cutter-tube 24, of receiver 59 and a sliding cutter acting between the receiver and tube 24 to sever the blank.

2. The combination, with the feed-rollers and a tube into which the wire passes, of receiver 59, having an adjustable stop whereby the length of the blank is determined.

3. The combination, with the receiver, the cutter-tube, and the sliding cutter, of the feed-rollers carried by shafts 10 and 11, a bracket to which shaft 10 is pivoted, and a set-screw whereby the pressure of the upper feed-roller is regulated.

4. The combination, with the cutter-tube, sliding cutter, and grippers, of cross-slide 27, to which the sliding cutter is adjustably secured, and slide 31, whereby the cross-slide is reciprocated.

5. Cross-slide 27, carrying the grippers, and slide 31, whereby said cross-slide is reciprocated, in combination with cross-head 36, connected to the cross-slide, rod 41, having a check-nut, lever 38, and spring 40, whereby the outward movement of the cross-slide and grippers is regulated.

6. The combination, with the cross-slide and the grippers, of cross-head 36, connected to the cross-slide, a lever pivoted to the cross-slide and to a link, 39, a spring acting to draw the cross-slide and cross-head outward, and a rod, 41, passing through the cross-head and having a nut at its outer end, whereby the outward movement of the cross-head and slide is limited, as and for the purpose set forth.

7. The combination, with tube 24, the cross-slide, and the grippers, of the cross-head connected to the cross-slide, lever 38, link 39, spring 40, and rod 41, passing through the cross-head and having a nut, 41ª, whereby the outward movement of the cross-slide and cross-head is adjusted, so that in the outward movement the grippers will stop at the exact position required to receive the wire from tube 24.

8. The combination with the cross-slide, block 26, having arms 26ª, and the grippers, of screws 28, engaging the cross-slide and having a collar engaged by said arms, whereby the grippers may be moved in or out relatively to the cross-slide, and a check-nut for locking the parts in position after adjustment.

9. The combination, with the heading-die, the cross-slide, and block 26, carrying the grippers, of screw 28, engaging the cross-slide and having a collar engaging said block, whereby the grippers may be adjusted relatively to the cross-slide, so that after forward movement the grippers will stop with the blank exactly before the recess in the heading-die.

10. The combination, with the header, heading-die, cross-slide, grippers, cutter 25, and tube 24, of screw 28, engaging the cross-slide and connected to the grippers, cross-head 36, acting to draw the cross-slide outward, and an adjustable stop to limit the outward movement of the cross-slide, whereby the grippers may be so adjusted as to receive the end of the wire in the outward movement and to leave the severed blank in front of the die in the inward movement.

11. The combination, with tube 24 and the receiver, of block 26, the grippers, and the cross-slide to which the block is adjustably secured.

12. The combination, with the heading-die and a receiver having an adjustable stop, of the cutter-tube and the cross-slide carrying cutter 25, and the grippers, whereby the length of the blank is determined and the severed blank is carried in front of the die.

13. The combination, with the cutter-tube and the cross-slide, of block 26, cutter 25, and the spring-grippers secured to the block and provided with steel dies 44.

14. The combination, with the heading-die and header, of tube 24, the cross-slide, block 26, carrying cutter 25 and spring-grippers, and means, substantially as described, for adjusting said block relatively to the cross-slide and for adjusting the outward movement of the cross-slide.

15. The combination, with the cutter-tube, sliding cutter, and the grippers, of receiver 59, into which the end of the wire passes, and an adjustable stop in said receiver which determines the length of the blank.

16. The combination, with the cutter-tube, sliding cutter, and grippers, of the receiver having a slot, 60, through which the severed blank is carried by the grippers.

17. The combination, with the cutter-tube, sliding cutter, and the grippers, of the receiver having slot 60, adjustable stop 61, and mechanism, substantially as described, whereby the stop may be adjusted and locked in position after adjustment.

18. The combination, with the receiver having a key, 59ª, and a threaded stop having a groove engaged by said key, of gear 62, which is socketed in the receiver and internally threaded to engage the stop, and means, substantially as described, for rotating said gear to adjust the stop.

19. The combination, with the receiver, threaded stop 61, and internally-threaded gear 62, engaging said stop, of shaft 64, having a bevel-gear, 65, and a gear engaging gear 62, a vertical shaft having a bevel-gear engaging gear 65, a tube inclosing the vertical shaft and slotted at its upper end, and a lock-nut which clamps the slotted end of the tube upon the vertical shaft to lock the parts in position after adjustment.

20. The combination, with the receiver, the cutter-tube, the sliding cutter, and the grippers, of heading-die 45 and the header.

21. The combination, with the heading-die and header, of the cutter-tube, the receiver, the sliding cutter, and the grippers, whereby the blank is severed and carried forward ready to be forced into the die by the header.

22. The combination, with the heading-die having a recess in which the bolt-head is formed and the header, of plunger 73, having a reduced and corresponding in diameter with the blank, a stop, 76, and a train of mechanism, substantially as described and shown, which permits said stop to yield in the formation of a bolt-head, so that in upsetting the metal it is forced into the forward portion of the recess in the heading-die.

23. The header, slide 48, and eccentric-rod 57, in combination with the plunger, stop 76, and a train of mechanism, substantially as described and shown, which permits said stop to yield in the formation of each bolt-head, as and for the purpose set forth.

24. The header, slide 48, and eccentric-rod 57, in combination with the plunger having a collar, 87, block 82, which slides on the plunger, and connecting mechanism, substantially as described, between said block and slide 48, whereby in the return movement said slide engages collar 87 and forces the plunger backward to expel the headed bolt.

25. The combination, with the slide, header, heading-die, and the plunger having collar 87, of block 82, sliding on the plunger, lever 83, pivoted to said block and to a link, 84, and rod 86, connecting said lever with the slide, as and for the purpose set forth.

26. In a bolt-heading machine, the combination, with slide 48, eccentric-rod 57, the header, heading-die, and plunger, of stop 76 and a train of mechanism, substantially as described and shown, which permits said stop to yield at predetermined times, as and for the purpose set forth.

27. The combination, with the header, heading-die, and plunger, of threaded top 76, slide 77, carrying said stop, and gearing, substantially as described, for adjusting the stop in the slide.

28. The combination, with the heading-die, the header, and plunger 73, of slide 77, having a key, 77ª, a threaded stop in said slide having a groove engaged by said key, gear 78, socketed in the slide and internally screw-threaded to engage the stop, and means, substantially as described, for rotating said gear to adjust the stop in or out.

29. The combination, with plunger 73, slide 77, and adjustable stop 76, of angle-block 89 and toggle 93.

30. The combination, with the header, heading-die, and plunger, of threaded stop 76, slide 77, internally-threaded gear 78, which is engaged by the stop and is socketed in the slide, and shaft 80, carrying a gear engaging gear 78, whereby the stop may be adjusted.

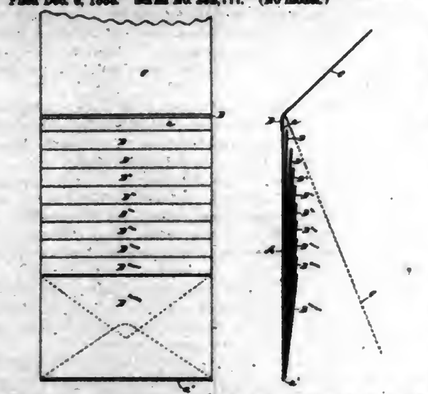
31. The combination, with the header, heading-die, plunger, and stop 76, of slide 77, by which the stop is carried, swinging angle-block 89, and toggle 93, engaging the slide and angle-block, whereby the slide is permitted to yield backward at a predetermined time.

32. The combination, with the eccentric-rod having downwardly-extending arm 58, the header, heading-die, plunger, and slide 77, carrying a stop, of angle-block 89, toggle 93, engaging the angle-block and slide 77, slide 96, having a cam-slot engaged by the angle-block, and a rod connecting slide 96 with arm 58.

33. The eccentric-rod having arm 58, the header, plunger, and slide 77, having a stop, in combination with angle-block 89, having a roller, 94, toggle 93, engaging slide 77 and the angle-block, slide 96, having a cam-groove engaged by said roller, and a rod connecting slide 96 with arm 58, whereby at a certain stage of the heading of a bolt slide 77, carrying the stop for the plunger, is allowed to yield, so that the blank is forced farther backward and a perfect head is formed without danger of binding in the die.

34. The combination, with the eccentric-rod having downwardly-extending arm 58, slide 48, the header, die, and plunger, of slide 77, carrying a stop, angle-block 89, toggle 93, slide 96, engaged by the angle-block, and an adjustable rod, 96, connecting slide 96 with arm 58.

35. The combination, with the plunger, of slide 77, carrying an adjustable stop, and mechanism—for example, an angle-block, toggle, and slide—which permits the stop to yield at a predetermined time.



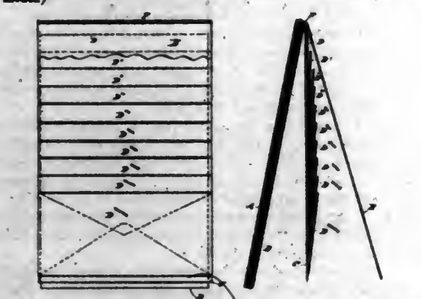
36. The combination, with the plunger, of slide 77, recessed in the frame-work, internally-threaded gear 78, recessed in said slide, threaded stop 76, engaging the gear, and a shaft carrying a gear engaging gear 78, whereby the stop may be adjusted.

37. In a bolt-heading machine, the combination, with slide 77, carrying stop 76, of angle-block 89, carrying roller 94, toggle 93, engaging the angle-block and the slide, and a slide, 96, having a cam-slot engaged by said roller.

38. The frame-work having recess 100, the stop 76, and slide 77, lying partly within said recess, in combination with the angle-block, toggle, and slide 96, whereby the slide and stop are held firmly during the first portion of the operation of heading and are then allowed to yield, as and for the purpose set forth.

39. The eccentric-rod, slide 48, the header, die, and the plunger having a collar, 87, in combination with blocks 82, through which the plunger slides, lever 83, pivoted to the block and to link 84, and an adjustable rod connecting lever 83 with slide 48, whereby the throw of the plunger in expelling the headed bolt may be regulated.

399,829. ENVELOPE-TABLET. ROBERT W. BURNS, Dayton, Ohio. Filed Dec. 6, 1888. Serial No. 292,777. (No model.)



Claim.—1. An envelope-tablet consisting of a suitable backing having attached thereto a series of envelopes overlapping and breaking joints with each other, substantially as described.

2. An envelope-tablet consisting of a suitable backing having detachably connected thereto a series of envelopes overlapping and breaking joints with each other, substantially as described.

3. An envelope-tablet consisting of a suitable backing having attached thereto a series of envelopes overlapping and breaking joints with each other and a top or cover connected to said backing by a a flexible connection, substantially as described.

4. The envelope-tablet herein described, consisting of a backing of paper-board or equivalent stiff material, a series of envelopes overlapping and breaking joints with each other, having one margin detachably connected by adhesive material or otherwise to said backing, and a blotter top or cover united to said backing by a flexible connection, substantially as described.

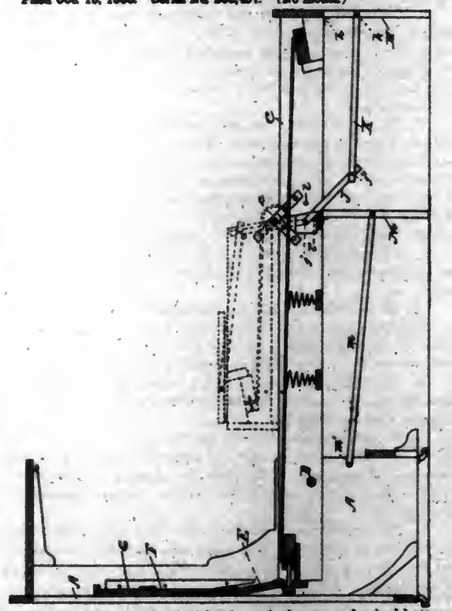
399,830. COMBINED PAPER AND ENVELOPE TABLET. ROBERT W. BURNS, Dayton, Ohio. Filed Dec. 6, 1888. Serial No. 292,778. (No model.)

Claim.—1. A combined paper and envelope tablet consisting, essentially, of a body of writing-paper secured to a suitable base-board or backing, a series of envelopes overlapping and breaking joints with each other, secured to a suitable base-board or backing, and a flexible connection uniting said base-boards, substantially as described.

2. A combined paper and envelope tablet consisting of a body of writing-paper secured to a base-board or backing, a series of envelopes overlapping and breaking joints with each other, secured on one margin to a base-board or backing, a top board or cover, and a flexible connection uniting said base-boards and cover at one of their corresponding edges.

3. The combination paper and envelope tablet herein described, consisting of the paper base-board, the body of writing-paper secured thereto, the envelope base-board of greater width than the paper base-board, the series of envelopes overlapping and breaking joints with each other detachably connected thereto on one margin, the blotter top, and the flexible connection uniting said base-boards and top at their inner ends, substantially as described.

399,831. CLIP FOR WHIFFLETREES. WILLIAM W. BURNS, Chicago, Ill. Filed May 9, 1888. Serial No. 273,366. (No model.)



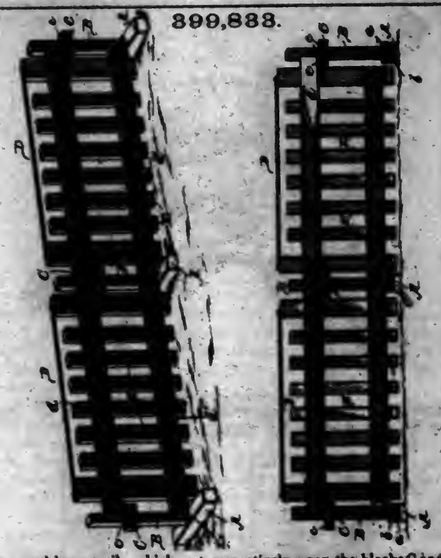
Claim.—1. A clip formed with two openings, the one which is to clasp the end of the wood having its inner end of less diameter than its outer, the other adapted to receive the draft-hook, having a connecting-bar between them adapted to clasp the end of the wood by the closing together of the sides of the clip at the union of the two openings, the connecting-bar being bent or upset in the operation, substantially as set forth.

2. A clip formed with two openings, the inner end being of less diameter than the outer end, provided with a connecting-bar and flanges or points on its inner end adapted to be closed upon the wood of the whiffletree by closing the sides of the clip between the two openings, substantially as set forth.

3. A clip having substantially a circular form to inclose the wood, except on one side, where the curve is re-entrant, provided with points or inwardly-projecting flanges on the inner end of the clip adapted to pierce and to clasp the wood by closing together the clip at the re-entrant curve, substantially as specified.

4. A clip having substantially a circular form to inclose the end of the whiffletree, except on one side, which is formed with a re-entrant curve adapted to clasp the wood by bringing the ends of the re-entrant curve nearer together, and a draft hook or ring connected therewith, substantially as set forth.

399,832. FOLDING BED. LEVI C. BUTTERFIELD, Somerville, Mass. Filed Oct. 18, 1888. Serial No. 288,467. (No model.)



Claim.—In a folding bed having a bed-case and a bed-bottom pivotally connected therewith and having its outer portion adapted to fold upon its inner portion, the combination of a pair of legs, H, hinged to the outer portion of the bed-body, the two-part levers hinged to the said legs, to the inner portion of the bed-bottom, and to each other, and stops located one upon the outer and the other upon the inner portion of the bed-bottom, whereby the radial motion of the levers may be checked to cause the legs to be opened or folded as the outer end of the bed-bottom is opened or folded, substantially as set forth.

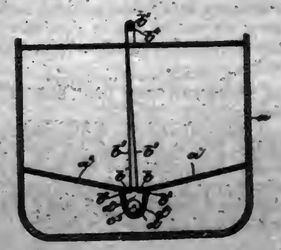
399,833. FENCE. WILLIAM W. CAMPBELL, Cambria, Ind. Filed Aug. 28, 1888. Serial No. 283,409. (No model.)

Claim.—In a portable fence, the combination of the sill placed on the ground transversely to the line of the fence and having sockets *a* and *a'*, the posts having reduced lower ends secured in the sockets *a*, and having blocks C attached to their front sides and provided with recesses *c*, and the panels composed of pickets connected by horizontal

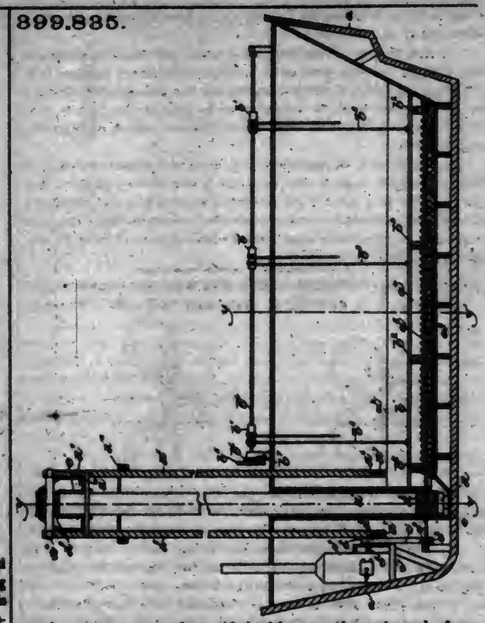
399,833.

upper and lower rails, which rest, respectively, upon the blocks C and the sills, and are provided with downwardly-extending pins entering the sockets *c c'*, said horizontal rails being of such length that the ends of the rails of adjoining panels shall abut against each other, substantially as set forth.

399,834. COVER-FASTENER FOR VESSELS. JACOB H. CASSELT, Leavenworth, Kans. Filed Nov. 7, 1888. Serial No. 290,227. (No model.)



Claim.—1. The combination, with a vessel provided with hinged bails having loops, of a cover provided with a staple for engagement of the loops, and a key to engage with the staple for holding the loops thereon, substantially as and for the purpose set forth.



2. The combination, with a vessel having hinged bails with loops, of a cover having a staple and a key for engagement therewith, consisting of a split ring, substantially as and for the purpose specified.

399,835. CONVEYER. JONATHAN CLARK, Boston, Mass. Filed Aug. 11, 1887. Renewed July 19, 1888. Serial No. 280,454. (No model.)

Claim.—1. A barge or vessel provided with a trough or channel, a^4, extended longitudinally the length of the said vessel and forming pockets a^5 and *c*, a metallic screw, a^6, located in the trough a^4, and having its shaft c^3 extended through the pocket *c*, an endless chain of buckets or scoops driven from the shaft c^3, a pivoted chute, d^3, having an opening through which the endless chain of buckets passes, and means, substantially as described, to rotate the shaft c^3, substantially as specified.

399,835.

2. A barge or vessel provided with a trough or channel, a^4, extending lengthwise thereof, and having a chamber or pocket, *c*, a metallic screw, a^6, located in the said trough, and having its shaft c^3 extended through the said chamber or pocket *c*, an endless chain of buckets driven from the said shaft, a chute to receive the material discharged from the said buckets, hinged doors or sections $\delta\ \delta'$ to cover or partly cover the top of the said trough, and connections for operating said doors from above, substantially as set forth.

399,836. CATARRH REMEDY. PEMBLEY S. CHANDLER, Rockster Springs, assignor of three-fourths to A. L. Chandler, C. T. Chandler, and D. A. Chandler, all of Trenton, Mo. Filed Oct. 10, 1887. Renewed Jan. 28, 1889. Serial No. 297,820. (No specimens.)

Claim.—A medical compound for the treatment of catarrh, consisting of rain-water, sulphate of zinc, nitrate potassa, and juice of elderberries, in substantially the proportions specified.

399,837. MANUFACTURE OF BOOTS AND SHOES. GEORGE H. CLARK, Boston, Mass., assignor to the Clark Relasting and Shoe-Treeing Company, Portland, Me. Filed Nov. 7, 1887. Serial No. 254,473. (No model.)

Claim.—1. An improved mode of manufacturing boots and shoes, which consists in forming them upon a last in the ordinary manner, then removing said last and introducing for the subsequent finishing

a last distorted relatively to the last used to form the said boot or shoe, substantially as described.

2. The process of manufacturing boots and shoes, consisting in first forming the boot or shoe on a last in an ordinary manner, then removing the said last and introducing for the subsequent finishing a last distorted relatively to the last used in forming the boot or shoe by lateral enlargements near the ball of the shoe or boot, substantially as described.

3. The process of manufacturing boots and shoes, consisting in first forming the boot or shoe on a last in an ordinary manner, then removing the said last and introducing for the subsequent finishing a fore-part last distorted relatively to the last used in forming the boot or shoe by lateral enlargements near the ball of the shoe or boot, substantially as described.

399,838. BOLSTER-SPRING FOR WAGONS. EDWARD CLIFF, Rochester, N. Y. Filed May 21, 1888. Serial No. 274,503. (No model.)

Claim.—1. In combination with the bolster B and bar C, two separate coil-springs disposed axially vertically at opposite sides of the bolster and formed individually with bearings at opposite ends.

2. In combination with the bolster B and bar C, the coils D D, disposed axially vertically at opposite sides of the bolster, separate from each other, and supported on the bolster, and formed individually at their upper ends with eyes *e e*, disposed with their planes horizontally, and the plate P, provided with bolt-holes at opposite sides of its longitudinal central line and formed with sockets *i i* for the eyes *e e* of the coils, substantially as described and shown.

399,839. PENCIL-SHARPENER. DONALD CODD, Winnipeg, Manitoba, Canada, assignor to Robert D. Richardson, same place. Filed June 22, 1888. Serial No. 277,396. (No model.)

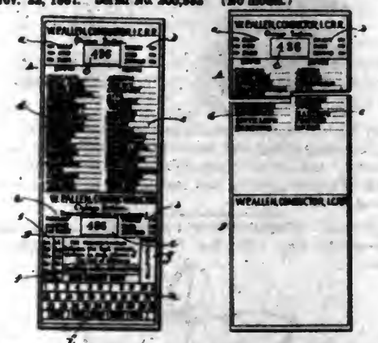
Claim.—1. A pencil-sharpener the cutting-edges of which consist of several separate and distinct series of saw-teeth, the lines of which teeth converge, substantially as described.

2. A pencil-sharpener which has, in combination, the frame and the saw-blades set in the frame, and the lines of the teeth on which saw-blades converge, substantially as described.

3. A pencil-sharpener and eraser which has, in combination, the frame and eraser attached to the frame, and the saw-blades set in the frame, substantially as described.

399,840. WATCH-CASE BOW. JONATHAN H. COOPER, Marshall, Tex. Filed Aug. 25, 1888. Serial No. 283,707. (No model.)

Claim.— The combination of a watch-pendant, a pair of radially-projecting annular bosses or flanges secured to or formed with the pendant and located diametrically opposite on the periphery of the same, a watch-bow having its ends provided with annular grooves and loosely fitting in said bosses, so that the grooves will also be located in the same, said bosses being provided with radial threaded openings, and set-screws extending from the periphery of the bosses through said openings removably into the annular grooves of the bow ends, for the purpose and in the manner substantially as described.



399,841. HORSE-COLLAR. WILLIAM COMER, San Francisco, Cal. Filed Aug. 1, 1888. Serial No. 281,667. (No model.)

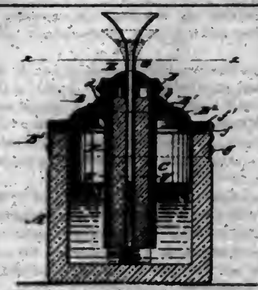
Claim.—In a horse-collar, the back extended to form the cap-piece for covering and protecting the joist at the top of the collar, and an independent or separate piece inserted under the cap-piece and covering the straw or stuffing up to the joint, substantially as herein described.

399,841.

399,842. RAILROAD-TICKET. JAMES CHILTON, Odin, Ill. Filed Nov. 22, 1887. Serial No. 255,993. (No model.)

Claim.—A railroad-ticket, A, having the lists of stations *d e* arranged in reverse order, and having the receipt portion B, said ticket and receipt portion having the corresponding numbers *e*, substantially as described.

399,843. TEA-KETTLE. GEORGE DAKIN and HARRY L. DRILLARD, Buffalo, N. Y. Filed Nov. 15, 1888. Serial No. 290,899. (No model.)



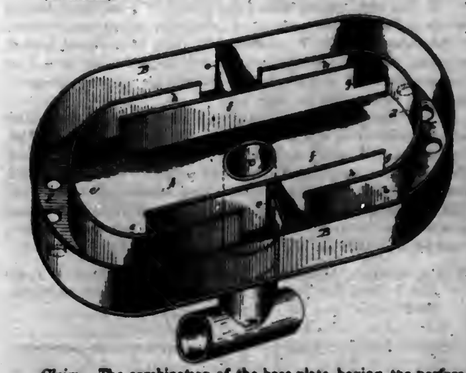
Claim.—1. The combination, with the ears *b*, provided with openings *b'*, of a bail or handle provided at its ends with hooks *c*, engaging in the openings *b'*, and lips *d*, formed on the bail and bearing against the upper edges of the ears, whereby the hooks of the bail are held in the openings of the ears, substantially as set forth.

2. The combination, with the ears *b*, provided with openings *b'*, of a bail or handle provided at opposite ends with hooks *c*, engaging in the openings *b'* of the ears, lips *d*, formed on the bail and bearing against the upper edges of the ears, and stops or projections formed on said ears and adapted to limit the swinging movement of the bail, substantially as set forth.

399,844. INKSTAND. BERT DAVIS, Kane, Pa. Filed Sept. 19, 1888. Serial No. 285,773. (No model.)

Claim.—1. The body or well A of the stand, having air-tight cover B, and tube C, fitted in said cover and reaching into the well and above the cover B, in combination with the float F, placed in the tube, the apertured cover E, closing the upper end of the tube C, and the tip funnel or tube G, held fast in the float F and projecting up through the said cover E, substantially as described.

399,844.



2. The outer annular cover, B^2, having screw-threaded flange B^3, adapted to be screwed upon the ink-well A, and the inner annular disk, B', of soft india-rubber, held at its outer edge air-tight between the well A and outer cover, B^2, in combination with the tube C, held air-tight in the disk B' and provided with the float F and dip-tube, substantially as described.

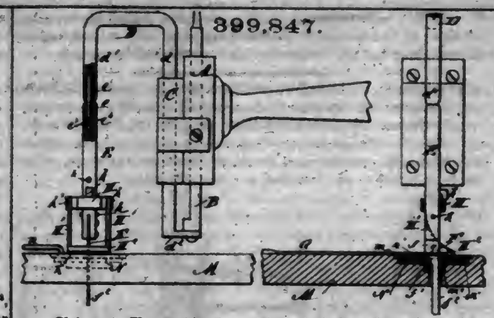
3. The outer annular cover, B^2, screwed upon the ink well or stand A, and the inner disk, B', of soft rubber, compressed between the outer cover, B^2, and the well A, in combination with the tube C, having flange *b*, held air-tight in the disk B', the upper ring, D, upon the upper end of the said tube, the float F, and the dip-tube, substantially as described.

4. The outer annular cover, B^2, screwed upon the ink-well, and the inner cover, B', of soft rubber, compressed between the cover B^2 and the upper edge of the ink-well, in combination with the tube C, having shoulder *b*, ring *d*, placed on said tube above the shoulder *b* and below the outer cover, B', and the ring D, screwed upon the upper end of the tube C, substantially as described.

399,845. FOUNTAIN ATTACHMENT FOR WASH-BOILERS. GEORGE W. DAY, Lansing, Kans. Filed Oct. 18, 1888. Serial No. 288,496. (No model.)

Claim.—The combination of the base-plate having the perforations therethrough near its ends, the flange secured to the edge of said plate, the curved partitions *c* and *d*, the short partitions *e*, the straight partitions *f*, having their ends reduced, the tube C, and the cross-tube telescoped on said tube C, substantially as described.

399,846. METHOD OF MAKING STRIPED PAPER BAGS. CHAS. A. DEAN and FREDERIC H. ROGUE, Boston, Mass. Filed July 21, 1888. Serial No. 280,660. (No model.)



Claim.—The method of making striped paper bags herein disclosed, which consists in striping and simultaneously drying one side of a web and subsequently and continuously conducting said web to and through bag-forming mechanism.

399,847. MACHINE FOR CUTTING PATTERNS. JAMES W. DEARING, Brooklyn, N. Y. Filed Dec. 14, 1887. Serial No. 257,883. (No model.)

Brief.—This device is intended to be attached to either a sewing-machine, fret-saw, or other similar machine having a reciprocating part.

399,847.

Claim.—1. The combination, with the bed-plate, the tool-carrying bar, and means for operating it, of a yielding feeder connected at its upper end to the bar and inclined or curved downward and rearward from its point of attachment, to bear down upon the work in the downward movement of the bar, and thereby force or feed the work toward the front side of the said tool-carrying bar, substantially as set forth.

2. The combination, with the bed-plate, the tool-carrying bar, and means for operating it, of a yielding feeder having a limited movement upon the said bar above its tool-receiving end and inclined or curved downwardly to the rear side of the said bar, to bear down upon the work and force or feed it toward the front side of the bar in the downward movement thereof, substantially as set forth.

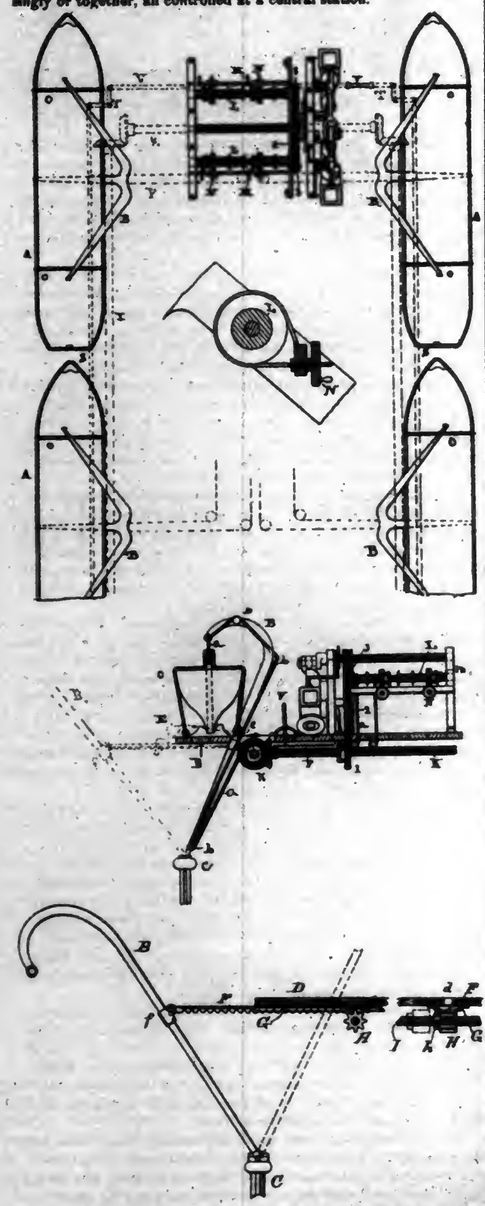
3. In a machine for cutting patterns, essentially as herein described, the combination, with a reciprocating arm, a vertical bar swiveled to said arm, and a knife carried by said bar above the top of the work-plate, of a block sliding upon the knife-bar and a spring-actuated feed-bar attached to said block at right angles to and in rear of the knife, all as and for the purposes herein set forth.

4. In a machine for cutting patterns, essentially as herein described, the combination, with a reciprocating arm, a vertical bar swiveled to said arm, and a knife carried by said bar, of a block sliding upon the knife-bar, provided with horizontal arms integral with the front face, rearwardly-extending curved springs attached to said arms, and a feed-bar carried horizontally by said springs, substantially as and for the purposes herein set forth.

5. In a machine for cutting patterns, essentially as herein described, the combination, with a reciprocating arm, a vertical bar swiveled to said arm, a knife carried by said bar, provided with an integral perpendicular guide, a block sliding upon the knife-bar, having horizontal arms integral with the front face, rearwardly-extending curved springs attached to said arms, and a feed-bar carried horizontally by said springs, of an apertured bed, a table rotating in said bed, provided with an aperture receiving the knife-guide, and means, substantially as described, for rotating the table, as and for the purposes herein set forth.

6. In a machine for cutting patterns, essentially as herein described, the combination, with a reciprocating arm, a vertical bar swiveled to said arm, a knife carried by said bar, provided with an integral perpendicular guide, a block sliding upon the knife-bar, having horizontal arms integral with the front face, rearwardly-extending curved springs attached to said arms, and a toothed or serrated feed-bar secured to said springs, of an apertured bed, a table rotating in said bed, provided with an aperture receiving the knife-guide, a presser-bar attached to the bed surrounding the knife and bearing upon the table, and means, substantially as described for rotating the table, as and for the purposes herein set forth.

7. The combination, with the machine-head, bar B, and vertically-grooved block C, secured to the head, of the V-shaped bar D, the arm *d* of which extends through the groove in block C, the arm d^3, connecting the arm *d* with the bar B, the knife-carrying bar E, swiveled to the lower end of the arm *d'*, the knife F on the lower end of said bar, and the vertically-slotted rotary table, down through which the knife extends, substantially as set forth.



8. The combination, with the rotary vertically-slotted table and the reciprocating knife extending down therethrough, of the presser-foot formed of a spring fixed at right angles to the knife, and having its free end bent around the knife just above or along the upper face of the table, substantially as set forth.

9. The combination, with a rotary vertically-slotted table and a horizontal spring presser-foot extending across the upper face thereof and bent around the said slot, of a vertically-reciprocating knife-bar, having a knife extending down through the presser-foot and slotted table, and a collar or block loose upon the knife-arm, and having a horizontal yielding feed-bar at right angles to the cutting-edge of the knife and in rear thereof, said feed-bar operating beyond the presser bar, substantially as set forth.

10. In a pattern-cutting machine, the feeder comprising the collar or block H, the springs H', secured to opposite sides thereof, and the serrated feed-bar H^3, connecting the lower ends of the springs.

399,848. LAUNCHING BOATS IN SERIES. CHARLES W. DELAP, Wiscasset, Me., assignor to the American Ship Windlass Company, Providence, R. I. Filed Oct. 8, 1888. Serial No. 287,458. (No model.)

Brief.—Mechanism by which a series of ship's davits may be simultaneously operated and the boats launched therefrom either singly or together, all controlled at a central station.

Claim.—1. The combination, with a vessel provided with two or more boats along the side, of a movable davit for each boat, a reciprocating rack joined to each davit, a shaft extending lengthwise of the vessel adjacent to all the davits and carrying pinions engaging with the racks, and mechanism, substantially as described, for rotating the shaft, and thereby actuating all the davits simultaneously.

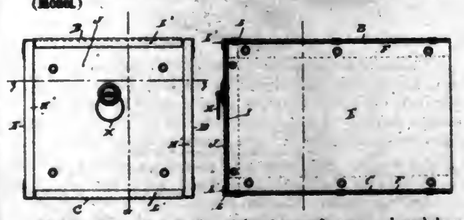
2. The combination, with a vessel, of two or more boats, suitable lashings for securing each boat, provided with detachable fastenings, and a rod connecting said fastenings, and extending to a central station for releasing said fastenings simultaneously, substantially as described.

3. The combination, with a vessel, of two or more davits movable in a vertical plane perpendicular to the side of the vessel and provided with suitable boat-falls leading to a central station, a rack and pinion for moving each davit, a connected series of shafts for rotating the pinions extending to the central station, and suitable mechanism located at the central station for operating both the falls and the shafts, substantially as described.

4. The combination, with a vessel, of two or more davits provided with suitable boat-falls leading to a central station, suitable lashings for the boats provided with detachable fastenings, a rod uniting said fastenings extending to and adapted to be actuated from the central station, and mechanism located at said station for operating the boat-falls, substantially as described.

5. The combination, with the movable davit B, of the rack F, attached to the davit, the pinion H, meshing with the rack, the shaft I, carrying the pinion, the shafts I and K, the bevel-gears *k*, uniting the shafts, and means for rotating the shaft K, substantially as described.

6. The combination, with the hinged davit B, of the slotted deck D, the rack F, having a sleeve, *f*, encircling the davit, the guide-bars G, located on each side of the slot and receiving the rack F, the pinion H, meshing with the rack and adjustably secured to the shaft I, and means for rotating the shaft, substantially as described.



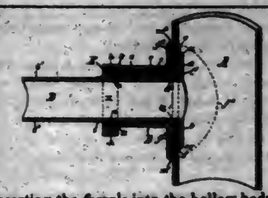
7. The combination, with a series of davits, B, provided with sheaves *b b'*, of the series of boat-falls *a*, running over said sheaves, and the winch located at a central station and provided with the loosely-mounted drums L, to each of which one boat's set of falls is attached, each drum being provided with a clutch, M, and a friction-band, N, substantially as described.

8. The combination, with two or more ship's boats, of lashings O, each secured at one end to the deck, and having at the other end an eye, *o*, forks P, receiving said eyes, hooks engaging the forks and the eyes, a rod uniting the hooks, and means for simultaneously actuating the rod, and thereby withdrawing all the hooks and releasing all the lashings, substantially as described.

9. The combination, with a ship's boat, of a lashing, O, secured at one end to the deck, and having at its other end an eye, *o*, a transversely-apertured fork, P, receiving said eye, a hook-shaped lever, R, engaging with said fork and eye, a rod, S, coupled to the lever R, an operating-lever, V, and connections between the rod and the operating-lever, substantially as described.

10. The combination, with a series of ship's boats, each suspended on a movable davit, of a rack and pinion for moving each davit, shafting carrying the pinions, a winch located at a central station, detachably connected with the shafting, and provided with several independently-actuated drums to receive and operate the several boat-falls, a series of lashings for securing the boats detachably connected to a series of hooks, an operating-lever near the winch, and connections between said hooks and said lever, substantially as described.

399,849. PAPER BOX. JOHN P. DEMEES, Elizabeth, N. J., and PAUL R. GOSON, New York, N. Y. Filed July 3, 1888. Serial No. 278,951. (Model.)



Claim.—As an improved article of manufacture, a knockdown paper box consisting in the sides E D, having angular metallic strips G riveted to it along its longitudinal edges and angular metallic strips H along its vertical edges or ends, the inwardly-extending flanges formed thereby being bent upon themselves, as at G' H', the front section, I J having inwardly-projecting flanges or folded edges interlocking with the parts H' of the sides, and the top and bottom B C, having metallic strips riveted thereto along the longitudinal edges F, bent back upon themselves and interlocking with the parts G', and having angle-strips L riveted to their front ends and overlapping the upper and lower edges of the front I J, substantially as set forth.

399,850. SADDLE-HUB AND FERRULE COMBINATION. MARTIN F. DOLAN, Brooklyn, N. Y. Filed Dec. 7, 1887. Serial No. 257,360. (No model.)

Claim.—1. In a detachable pipe-joint applicable from the outside to a hollow body, the combination, with a pipe or ferrule provided with a stationary leg and with a stationary clamp or lug removable

399,850.

for purposes of inserting the ferrule into the hollow body, and with a saddle arranged to encircle the ferrule and to travel forward on the ferrule and clamp without turning and to rest against the exterior of the hollow body, of suitable devices whereby the saddle and the ferrule-legs may be clamped together and the whole rigidly secured to the hollow body, as and for the uses and purpose set forth.

2. The combination, with the pipe or ferrule B, provided with a clamp, C, of the jam-nut E and saddle-hub D, provided with a groove, *e*, and adapted to work back and forth upon the clamp C of the ferrule or pipe B, substantially as described.

3. The combination, with the jam-nut E, saddle-hub D, and with the pipe or ferrule B, provided with a stationary lug, *b*, and with a pin, *c*, of the detachable clamp C, provided with an aperture, *c*, adapted to contain the pin *c*, substantially as set forth.

4. The combination, with the pipe or ferrule B, provided with a stationary lug, *b*, and with the pin *c*, and also with the detachable clamp C, provided with a lug, *d*, and with the aperture *c*, adapted to contain the pin *c*, and also with the saddle-hub D, provided with a groove, *e*, and adapted to work on the clamp C of the ferrule B, of the jam-nut E, adapted to engage both with the pipe or ferrule B and the saddle-hub D, and thereby rigidly secure the parts together, substantially as described.

399,851. CIGAR-VENDING APPARATUS. WILLIAM C. DOUGLASS, Lima, Ohio, assignor to Bertha C. Doubleday, same place. Filed Sept. 10, 1888. Serial No. 285,061. (No model.)

Claim.—1. In a vending apparatus, the combination of an endwise-movable delivery-slide and a horizontal carrier supported above said delivery-slide and connected thereto, whereby the carrier is caused to travel across the slide at right angles to the path of movement of the slide when the latter is moved endwise, substantially as and for the purpose described.

2. In a vending apparatus, the combination of an endwise-movable delivery-slide adapted to be withdrawn by hand from the shell or case of the apparatus, a receptacle having an open lower end arranged above said slide at one side thereof, a slotted movable carrier, also supported above said delivery-slide and arranged below said receptacle, and gearing intermediate of the delivery-slide and the carrier to move the latter at right angles to the path of the slide, whereby the carrier is caused to reciprocate between the receptacle and delivery-slide to deposit the article received in its slot from the receptacle upon the delivery-slide, substantially as and for the purpose described.

3. In a vending apparatus, the combination of a vertical fixed coin-tube having an open lower end, an inclined coinway terminating immediately above said coin-tube to deposit the coins directly therein, an endwise-movable delivery-slide operating transversely below and across said coin-tube and having a coin-slot into which the coins are received after they pass through said coin-tube, and a locking device for normally locking the slide against withdrawal from the case and adapted to be operated by the coin thereon, substantially as described.

4. In a vending apparatus, the combination of an inclined coinway, a coin-tube arranged below said way to receive the coins directly therefrom, an endwise-movable delivery-slide operating across the coin-tube and having a coin-receiving slot into which the coins are received from said coin-tube, a fixed stop on said slide in rear of the slot therein, and a gravity-locking device normally arranged in the path of said stop and adapted to be raised by the coin in the slot of said slide a sufficient distance to permit said fixed stop to clear the locking device, substantially as and for the purpose described.

5. In a vending apparatus, the combination of an inclined way, a coin-tube, a pivoted plate arranged in the path of the coins that pass therethrough and having an arm adapted to operate an audible alarm mechanism, and a delivery-slide operating across the coin-tube below the pivoted plate therein, substantially as and for the purpose described.

6. In a vending apparatus, the combination of an inclined coinway, a coin-tube immediately below the lower extremity of said way, an endwise-movable delivery-slide having a coin-receiving slot in its rear end and a fixed shoulder or stop in rear of the front extremity of said slot, and a gravity-locking arm pivoted at one side of the coin-tube and normally lying in a horizontal position transversely across said delivery-slide and in the path of the fixed shoulder or stop on said slide, substantially as and for the purpose described.

7. In a vending apparatus, the combination of an inclined coinway, a coin-tube, a platform having a guide-groove and a slot, *p*, intersecting said groove, and a delivery-slide operating across said coin-tube and having a coin-receiving slot adapted to convey the coins from said tube to the slot *p*, substantially as and for the purpose described.

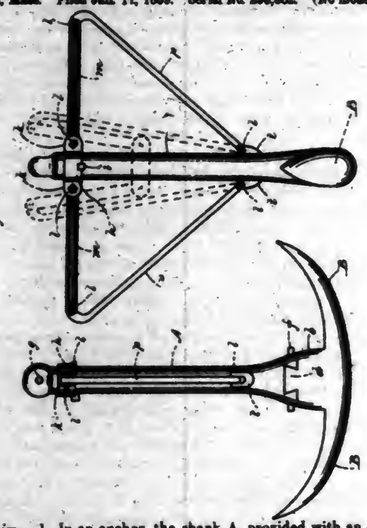
8. In a vending apparatus, the combination of a coinway, a coin-tube, an endwise-movable delivery-slide operating across said coin-tube, a carrier actuated by the delivery-slide, and a locking device for preventing the withdrawal of the slide and adapted to be released by the coin on the slide, substantially as and for the purpose described.

9. In a vending apparatus, the combination of a coinway, a coin-tube, a delivery-slide, a carrier operating above said slide, and gearing intermediate of said slide and the carrier for moving the latter at right angles to the path of the former, substantially as and for the purpose described.

10. In a vending apparatus, the combination of a delivery-slide, a support elevated above said slide and arranged at one side of the same, a carrier having a vertical opening and movable on a horizontal line between the support and the slide, and gear-connections intermediate of the slide and carrier for alternately moving the latter back and forth in a line at right angles to the path of the slide, substantially as and for the purpose described.

11. In a vending apparatus, the combination, with a delivery-slide and a bottomless support containing the articles to be delivered by said delivery-slide, of a carrier intermediate of said support and the delivery-slide and geared to the latter, said carrier having a corrugated surface and a transverse slot for receiving an article from the support when said slot aligns with the latter, substantially as described.

12. In a vending apparatus, the combination, with a case having a coin-slot and a horizontally-movable delivery-slide, of a horizontal lever, *d*, having its free end arranged above said delivery-slide and adapted to be depressed by the weight of the article resting on said slide, a coin-detaining rod arranged to slide transversely across said coin-slot when the free end of the lever is elevated, and connections intermediate of the lever and the coin-detaining rod, substantially as described.



399,852. ROAD-CART SPRING. FREDERICK DRIFFILL, Sterling, assignor to the Eureka Company, Rock Falls, Ill. Filed Sept. 12, 1888. Serial No. 285,260. (No model.)

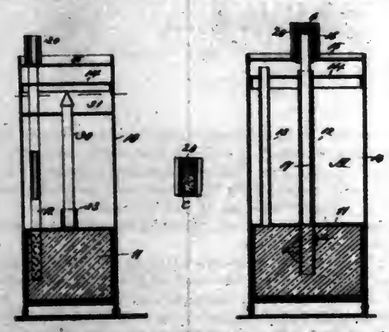
Claim.—1. In combination with the body and running-gears of a road-cart, the rods E E, relatively downwardly divergent, the loop F, the cross-plate G, provided with the enlarged opening H and flange N, the rod J, provided with loop J' and lower threaded exterior, the plate L, provided with boss M and threaded opening M', and the cushion P, provided with the opening R, substantially as shown, and for the purpose described.

2. In combination with the body and axle of a road-cart, the thills C, rods J, provided with the loop J', adapted to be attached to said thills, the rods E E, relatively downwardly divergent and provided with the loop F, adapted to be attached to the body of the vehicle, cross-plate G, provided with the enlarged opening H and flange N, the plate L, provided with boss M, and the cushion P, provided with the opening R, substantially as shown, and for the purpose described.

399,853. ANCHOR. CHARLES A. DUREE and EDWIN P. ELLIS, Boston, Mass. Filed Jan. 17, 1889. Serial No. 296,602. (No model.)

Claim.—1. In an anchor, the shank A, provided with an eye in one end and a dovetail groove in its opposite end, in combination with the blades B, provided with the dovetail *d*, and the pin *f*, for securing said blades to said shank, substantially as described.

2. In an anchor, the combination of a shank having a cable-eye at one end and a dovetail groove in its opposite end, smooth blades having their body portion dovetailed to enter said groove, and a pin for securing said shank thereto, substantially as described.



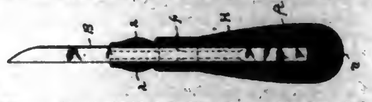
3. In an anchor, the combination of a shank provided with smooth blades, a sleeve fitted to slide on said shank, bars pivoted in lugs on said sleeve, rods pivoted to said bars and shank, and a pin for securing said sleeve in position on the shank, substantially as described.

4. In an anchor, the combination of a shank provided with a dovetail groove in its lower end, smooth blades having their body portion dovetailed to enter said groove, a pin for securing it therein, a sleeve fitted to slide on said shank and provided with slots, a pin passing through said shank and slots, a bar pivoted in ears on said sleeve at each side of the shank, and a rod pivoted to each bar and to said shank, substantially as described.

5. An anchor having its stock pivoted to the shank, and a rod pivoted to each end of the stock and to said shank, whereby the cable is prevented from fouling said anchor, substantially as described.

6. In an anchor, the combination of the shank A, having the eye *g* and a dovetail groove in its opposite end, the blades B B, having the dovetail *d*, the pin *f*, for securing said dovetail in said groove, the sleeve *h*, provided with lugs *k*, the bars *m*, pivoted in said lugs, the rods *p*, pivoted to said bars and shank, and the pin *i*, for securing said sleeve in position, all being arranged to operate substantially as set forth.

399,854. SIGNAL-BOMB. REGINALD H. EARLE, St. John, New foundland. Filed Oct. 17, 1888. Serial No. 288,312. (No model.)

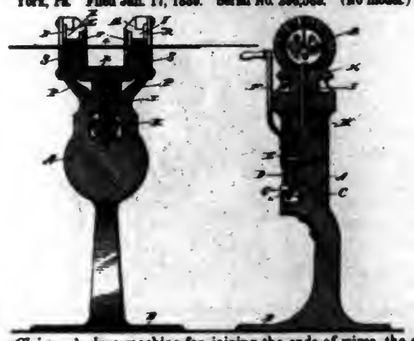


Claim.—1. A signal-bomb formed with an air-chamber, a chamber adapted to receive an explosive material and provided with a tube which leads from the explosive-receiving chamber through the air-chamber, said tube being adapted to receive a fuse, a disk arranged above the upper end of the tube, a nipple extending upward from the disk, and a cap formed with a roughened surface adapted to fit upon the nipple, substantially as described.

2. In a bomb, the combination, with a vessel, 10, of a vessel, 11, arranged therein, a disk, 14, also arranged within the vessel 10 and above the vessel 11, tubes 12 and 13, leading from the vessel 11 upward through the vessel 10 and through the disk 14, a disk, 15, arranged abve the disk 14, a nipple formed upon said disk, and a rough-ened-faced cap arranged in connection with the nipple, substantially as described.

3. In a bomb, the combination, with a vessel formed with an air-chamber and provided with a chamber adapted to receive an explosive below said air-chamber, of a rocket arranged within the air-chamber and a fuse-tube leading downward through the air-chamber to the explosive-chamber, substantially as described.

4. The combination, with a vessel provided with a nipple into which the fuse is adapted to project, of a cap fitting on the nipple and having a roughened surface, substantially as and for the purpose set forth.

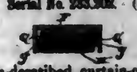


399,855. KNIFE-BLADE HOLDER. SHIRLEY V. ELLIS, Lynn, Mass. Filed Oct. 10, 1888. Serial No. 287,710. (No model.)

Claim.—1. In a knife-blade holder, the combination of the shell A, the holding-jaws *a*, fitting in slots in said shell and held from independent movement by their ends *e*, fitting recesses in the said shell, a handle or barrel, H, and means for changing the relative positions of the barrel and shell, substantially as described.

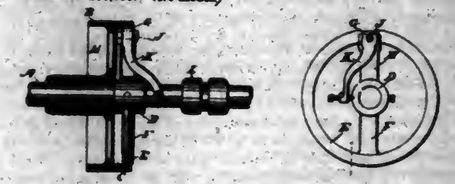
2. In a knife-blade holder, in combination with a handle or barrel, as H, the tubular shell A, recessed as described, the holding-jaws *a e*, ferrule *f*, and the nut *n*, substantially as described.

399,856. WIRE-TWISTING MACHINE. JOHN W. EISENHART, York, Pa. Filed Jan. 17, 1889. Serial No. 296,569. (No model.)



Claim.—1. In a machine for joining the ends of wires, the combination of two outer stationary twisting-plates radially slotted for the reception of the wires, two intermediate twisting-wheels carrying twisting-disks, and means for rotating the said intermediate twisting-wheels in opposite directions, as and for the purpose set forth.

2. In a machine for twisting the ends of wires and joining them together, the combination of two outer stationary twisting-plates, two intermediate twisting-wheels, and an intermediate bevel cog-wheel engaging the said twisting-wheels and adapted to rotate them in opposite directions, substantially as and for the purpose specified.



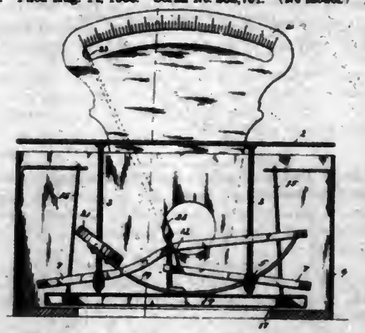
3. The combination of a frame, outer stationary slotted plates, S S, carried by the frame, intermediate twisting-wheels, L M, provided with bosses N, these wheels being journaled in the frame, rotating twisting slotted disks T upon the adjacent faces of the said twisting-wheels, a bevel cog-wheel, K, engaging the said twisting-wheels and adapted to rotate them in opposite directions, a bevel-pinion, H, secured upon the shaft of the said wheel K, and a driving bevel gear-wheel, D, engaging this latter wheel, all arranged substantially as described.

399,857. CURTAIN ATTACHMENT. JESSE EMBREE, Hardy, Nebr. Filed Aug. 20, 1888. Serial No. 283,202. (No model.)

Claim.—The herein-described curtain-cord holder, composed of the bracket having its ends bent at right angles and having pins projecting in from the bent ends of the bracket, and the coil-spring having its ends fitted on the said pins and extending between the same, substantially as specified.

399,858. FRICTION-CLUTCH. HERMAN ERDMAN, Cincinnati, Ohio, assignor to the G. A. Gray Company, same place. Filed Mar. 10, 1888. Serial No. 266,915. (No model.)

Claim.—In a friction-clutch, the combination, substantially as set forth, of pulley B, provided with a rim-bore, friction-ring E, fitting the rim-bore of the pulley and having gap G, spider-hub D, spider-arm F, rigidly uniting the hub and friction-ring, spider-arm H, projecting rigidly from the hub and having its outer end disposed behind the friction-ring at its gap, pivot J, projecting from the arm H forwardly through said gap, and cam-lever K, pivoted within the gap upon the pivot J.



399,859. PLUMB-LEVEL. ALVAN R. EWING, Lewisburg, Tenn. Filed July 11, 1888. Serial No. 279,654. (No model.)

Claim.—1. A level having one horizontal edge formed with bevels 16, and an intermediate arc, 17, a slot formed in said arc, a mortise, 2, leading from said slot, and a pointed pendulum, 8, suspended in said mortise, substantially as described.

2. A plumb and level consisting of the stock 1, having one horizontal edge formed with bevels 16, a slotted intermediate arc, 17, and a mortise, 2, and one end provided with a slot and a similar mortise, and a pointed pendulum pivoted in each mortise, substantially as shown and described.

399,860. WEIGHING-SCALE. LUTHER C. FARMER, Minneapolis, Minn. Filed Aug. 14, 1888. Serial No. 282,701. (No model.)

Claim.—The combination, in a scale, with the bar 14, of the links 15, supporting said bar, the curved bar 19, mounted upon said bar 14 and adapted to turn freely thereon, the weight 21, secured to said bar 19 at one side of its bearing, the lever 7, connected with said bar at the opposite side of its bearing, the scale-platform supported upon said levers, the indicating-scale, and the pointer secured upon said curved bar, substantially as described.

399,861. FASTENING FOR WATCH-BOWS. FRANK G. FAXON, Mount Morris, N. Y. Filed Aug. 15, 1888. Serial No. 282,790. (No model.)

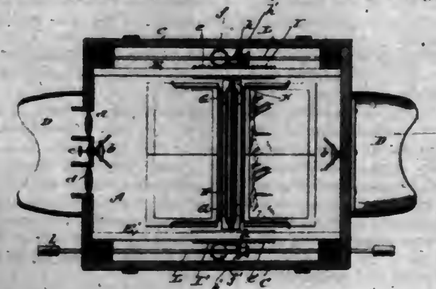
Claim.—1. The combination, with a watch-bow, of a divided pendant, between whose members the ends of the bow are clamped and which are relatively adjustable to bring them into closer relation, substantially as described.

2. The combination of the bow having headed ends, and the horizontally-divided pendant whose members are relatively adjustable to bring them in closer relation for taking up wear, substantially as described.

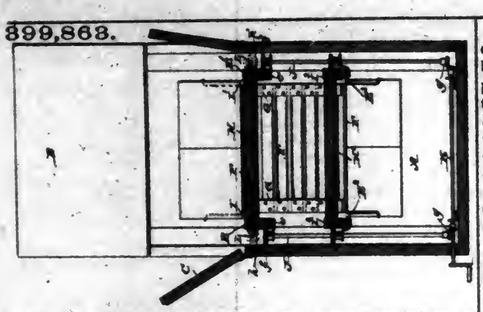
3. The combination of the part A, provided with the sleeve *g* and cavities *f*, the part B, fitted to the sleeve *g* and provided with the cavities *f*, the nut D, screwed on the end of the sleeve *g*, and the bow C, provided with the spheroidal ends *e*, substantially as described.

4. The combination of the part A, provided with the sleeve *g* and cavities *f*, and the rim *j*, the part B, fitted to the sleeve *g* and provided with the cavities *f*, the nut D, screwed on the end of the sleeve *g*, and the bow C, provided with the spheroidal ends *e*, substantially as described.

399,862. SIFTER. GEORGE H. FOUNTAIN, Plainfield, N. J. Filed July 31, 1888. Serial No. 281,518. (No model.)



Claim.—1. The combination, with a drum adapted to be rotated and a door pivoted in said drum opening inward, of a shield extending from the sides of the drum inward over the door-opening, substantially as described, whereby material within the drum is prevented from clogging the door, as set forth.

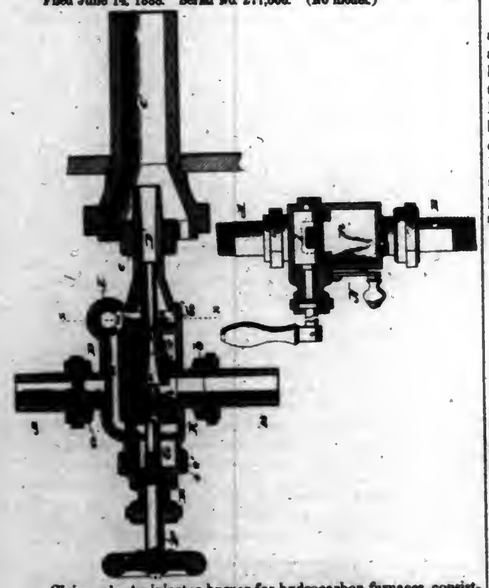


2. The combination, with the sifter-frame and a drum provided with a door pivoted in one side opening inward and closing by gravity, said door adapted to be held closed by the material when the drum is turned in one direction and to swing inward and open the feed-opening when turned in the opposite direction, of a door hinged near the lower front end of the sifter-frame, a similar door hinged near the upper rear end of the frame, and inclined blocks or stops attached to the inner wall of said frame, said doors adapted to swing inward and said front door adapted to engage the blocks and the rear door to engage the inner upper end of the front door when opened inward, thereby forming a chute or slide, substantially as and for the purposes specified.

399,863. STEREOSCOPE. ADELBERT E. FOUTCH, New Albany, Ind. Filed July 26, 1888. Serial No. 281,148. (No model.)

Claim.—1. The combination, in a stereoscope, of an endless series of view-holders distended upon rollers, a set of journal-plates arranged to slide horizontally in guides and carrying the said rollers, toothed gears for adjusting the plates horizontally, and a sliding bevel-gear

399,863.

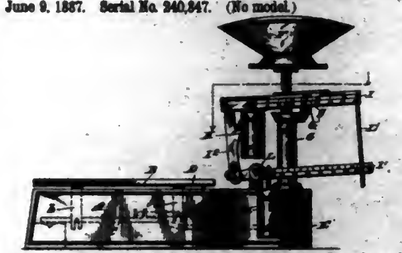


connection with the roller for rotating the series of view-holders, as described.

2. The combination, with the box or case, of the horizontally-slotted guide-bars E E' E² E³, the endless view-holder and rollers distending same, the plates I I' I² I³, carrying the journals of the rollers and provided with toothed rack-bars, the shaft J, with pinions *f f* and turning handle, the angular adjusting-shaft L, and a pair of bevel-gears connecting one of the rollers to the shaft J by a sliding connection, as described.

3. The combination, with a stereoscope having a series of rotary adjustable view-holders, of a case having a hinged top, and hinged side pieces, C C, for admitting light laterally to the views, substantially as described.

399,864. SPRAY-OIL BURNER. WILLIAM C. FISK, Toledo, Ohio. Filed June 14, 1888. Serial No. 277,066. (No model.)

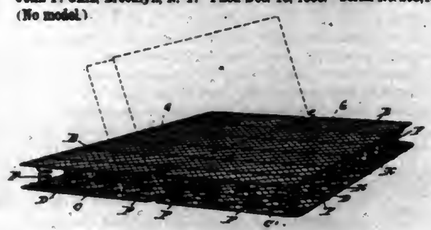


Claim.—1. An injector-burner for hydrocarbon furnaces, consisting of a casing communicating with oil and steam supply pipes, a steam-chamber and auxiliary steam-chamber arranged at opposite ends of the casing, a passage connecting the steam-chambers with the steam-supply, a valve to close communication between the auxiliary steam chamber and passage, an oil-chamber in direct communication with the oil-supply, a tubular jet-plug connecting the steam and oil chambers, an injector tube or nozzle leading from the auxiliary steam-chamber, a mixing-tube leading from the oil-chamber to the injector-tube, and a valve adapted to close the inlet end of the jet-plug, substantially as described.

2. An injector-burner for hydrocarbon-furnaces, consisting of a casing communicating with oil and steam supply pipes, a steam-chamber at one end of the casing, connected by a passage with the steam-supply, an oil-chamber communicating directly with the oil-supply, a tubular jet-plug connecting the steam and oil chambers, an air-chamber adjoining the oil-chamber, an injector-tube, a mixing-tube leading from the oil-chamber to the injector-tube and provided with lateral openings communicating with the air-chamber, a valved opening in the side of the air chamber, and a valve adapted to close the inlet end of the plug, substantially as described.

3. In a device of the character described, the combination of a casing communicating with oil and steam supply pipes, a steam-chamber and auxiliary steam-chamber at opposite ends of the casing, a passage connecting the steam-chamber with the steam-supply, a valve to close communication between the auxiliary steam-chamber and passage, an oil-chamber communicating directly with the oil-supply, an air-chamber between the oil and auxiliary steam-chambers having an opening in its outer wall, an open burner-tube flared at one end and projecting at its other end within a furnace, an injector-tube leading from the auxiliary steam-chamber and having its discharge end secured centrally within the flared end of the burner-tube, a mixing-tube extending from the oil-chamber to the injector-tube and provided with lateral openings communicating with the air-chamber, a valve or turn-button to close the opening in the wall of the air-chamber, and a valve adapted to close the inlet end of the jet-tube, substantially as described.

399,865. WEIGHING-SCALES. JOHN T. FRIEND, Irvine, Ky. Filed June 9, 1887. Serial No. 240,847. (No model.)



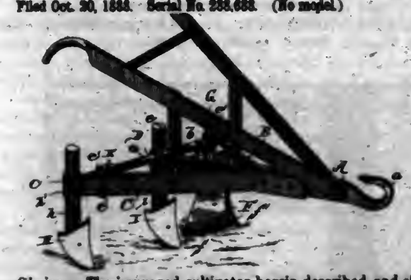
Claim.—In scales, the lower beam pivoted at L and graduated away from said pivot, and having a short arm on the side of the pivot away from said graduation, the upper beam connected with said lower beam by a bracket-arm, I², at the short arm of said lower beam, the standard G, to which said upper beam is pivoted, and the shaft E, pivotally attached to said upper beam, in combination with the lever C, resting at one end in the bearings *c'*, and attached at its other end to the bottom of said shaft E, and provided with pins *c²*, the lever D, resting in the bearings *d'*, pressing at its other end upon a point upon the lever C, and provided also with pins *c³*, and the platform B, provided with the legs *b*, bearing upon the pins *c³*, substantially as specified.

399,866. SINKER FOR FISH-LINES. JAMES R. GAGE, Concord, N. H. Filed Sept. 18, 1888. Serial No. 285,693. (No model.)

Claim.—A sinker or weight consisting of the body *a*, slitted longitudinally from end to end, having lips *c' c* at the ends thereof, and recesses *d d'*, opposite said lips, respectively adapted to receive the same when turned down upon them, substantially as and for the purpose described.

399,867. WOVEN-WIRE MATTRESS, &c. DANIEL H. GAIL and JOHN F. GAIL, Brooklyn, N. Y. Filed Dec. 10, 1888. Serial No. 293,158. (No model.)

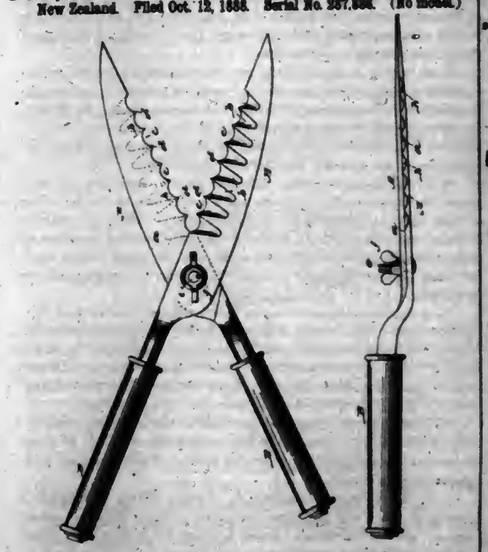
Claim.—1. The combination, in an elastic woven-wire mattress or bed-bottom, of the unbroken or continuous upper section, A, of interwoven wires, the two frames B B, supporting the same and having the inturned meeting ends entering and engaging coils of said upper section and forming a hinge, whereby the bed-bottom may be folded, the two separate lower sections, C C', of similar wires, the interposed spiral springs connecting said upper and lower sections, substantially as and for the purpose described.



2. The combination, in an elastic woven-wire mattress or seat, of the continuous or unbroken upper web of interwoven spiral wires, the two-part wire frame upon which the same is stretched, and the transverse re-enforcing spiral coils or tie-wires formed in two sections, each united at one end to the wire frame and extending through the coils of the woven-wire web and attached to the central cord or wire thereof, substantially as specified.

3. The combination, in an elastic woven-wire mattress or seat, of the woven-wire facing, the helical springs having loops H H projecting from their outer coil, and the tie-wires carried transversely through said loops and within the spiral coils of the woven-wire facing, whereby the springs are connected to said facing, substantially in the manner and for the purpose set forth.

4. The combination, in an elastic woven-wire mattress or seat, of the two outer facings severally formed of metallic frames and woven wires stretched upon said metallic frames, the interposed helical springs having loops H H projecting from their outer coils to pass in between the coils of the woven wires, the transverse straight tie-wires passing through the coils of one of said facings and engaging the loops at one end of the springs, and the spiral tie-wires passing centrally and transversely through the coils of the woven wires and the loops at the opposite ends of said springs, all substantially in the manner and for the purpose herein set forth.



5. The combination, in a woven-wire bed-bottom, of a frame, a continuous woven-wire fabric attached thereto, and re-enforcing wires, spiral coils, or rods separate therefrom, running transversely of said bed-bottom, secured at their ends to said frame, and connected to the fabric by engaging the coils thereof, substantially as described.

399,868. CULTIVATOR. JAMES G. GAITHER, Williston, Tenn. Filed Oct. 30, 1888. Serial No. 288,682. (No model.)

Claim.—The improved cultivator herein described and shown, comprising the main beam A, having an eye, *a*, at its rear end and a hook, *a'*, at its front end, the diverging beams B C, having their front ends secured to the beam A and their rear ends provided with eyes *b c*, the standards adjustably secured in the eyes *a b c*, the diagonal brace-bar extending over and resting upon the rear ends of the beams A B C, the bolts inserted through said brace-bar and having integral hooks on their lower ends engaging the lower edges of the beams A B C, and the nuts on the upper ends of the bolts turning against the brace-bar, as set forth.

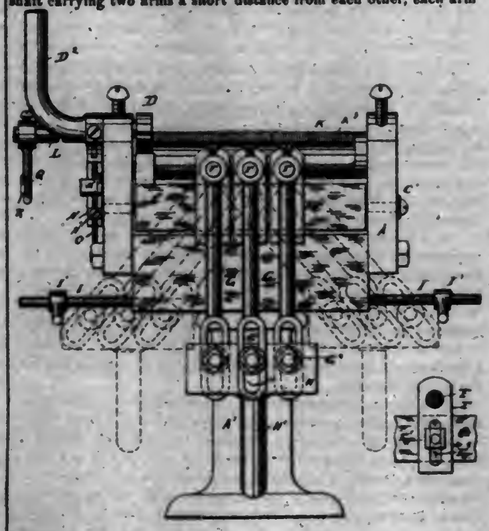
399,869. PRUNING-SHEARS. JAMES R. GASCOIGNE, Devonport New Zealand. Filed Oct. 12, 1888. Serial No. 287,886. (No model.)

Claim.—In hedge trimming or pruning shears, the combination of the pivoted blades A A, having flat meeting faces *a a*, and each constructed with a series of tapering flutes, *b*, in the back of the blade, of curvilinear form in transverse section and of increasing depth and width toward the cutting-edge of the blade, and leaving or forming sharp concave cutting-edges *c*, said flutes and concave cutting-edges of the two blades being arranged to lie opposite or in line with one another when the blades are closed, essentially as shown and described.

399,870. TUMBLER-HOLDER. JOSHUA W. GASKILL, Philadelphia, Pa., assignor to James Whitall, John M. Whitall, and John Whitall Nicholson, same place, John Mickle, Millville, N. J., C. Albert Tatum, New York, and Francis M. Underhill, Brooklyn, N. Y. Filed Dec. 31, 1888. Serial No. 295,009. (No model.)

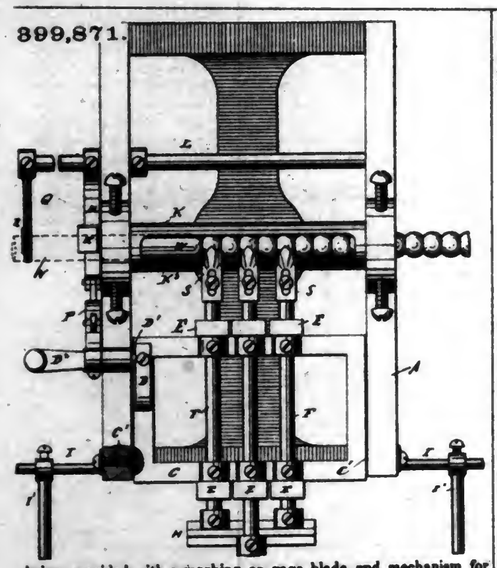
Claim.—1. A tumbler-holder comprising a frame with pivoted levers extending on opposite sides of their pivoting-points to bear against the tumbler above and below those points, substantially as and for the purpose set forth.

2. A tumbler-holder comprising a frame with pivoted legs which have bearing-points for the tumbler above and below their pivots, substantially as and for the purpose set forth.



399,871. MACHINE FOR TURNING MOLDINGS. JULIUS F. GERHARDT, Port Chester, N. Y. Filed Oct. 1, 1888. Serial No. 286,627. (No model.)

Claim.—1. In a lathe attachment for turning moldings, the combination, with a frame, of a swinging frame in the same, a series of rock-shafts in said swinging frame, cutters on the rock-shafts, and rods uniting the several rock-shafts with a common handle, substantially as set forth.



2. The combination, with a frame, of a swinging frame in the same, a spring for pressing said frame upward, a cam for pressing it downward, a series of rock-shafts in said frame and cutters on the rock-shafts, and rods uniting the several rock-shafts with a common handle, substantially as set forth.

3. The combination, with a frame, of a swinging frame in the same, vertically-adjustable independent bearing-pieces on the swinging frame, a rock-shaft in each pair of bearing-pieces, cutters on the rock-shafts, and rods uniting the several rock-shafts with a common handle, substantially as set forth.

4. The combination, with a frame, of a series of cutters, a rock-shaft carrying two arms a short distance from each other, each arm

399,871.

being provided with a marking or gage blade, and mechanism for manipulating said arms, substantially as set forth.

5. The combination, with a frame, of a swinging frame in the same, rocking shafts having cutters mounted in said swinging frame, a cam-lever acting on the swinging frame, a shaft provided with two arms a short distance from each other, marking-blades on said arms, one of said arms being connected with the cam-shaft, substantially as set forth.

6. The combination, with a frame, of a slotted guide-sleeve in the same, a swinging frame mounted in the above-mentioned frame, rocking shafts in the swinging frame, and cutters on said rocking shafts, substantially as set forth.

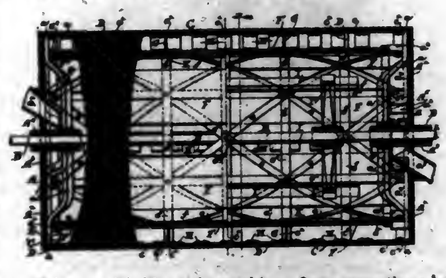
7. The combination, with a frame, of a swinging frame in the same, rocking shafts in said swinging frame, cutters on the rocking shafts, a rod on each shaft, the free ends of said rods being slotted, and a common handle-piece connected with the slotted ends of said bars, substantially as set forth.

399,872. **TENSION DEVICE FOR GRAIN-BINDERS.** JACOB S. GIBB, Norristown, Pa., assignor to the Bridgeport Twine Binder Company. Filed Apr. 20, 1887. Serial No. 235,511. (No model.)

Claim.—1. A tension device consisting of a fixed base-plate, an annular rim on said plate forming a chamber, a top plate mounted rotatably on the base-plate, a circumferential rim mounted on the top plate formed with openings to allow the passage of the cord, a band or ring fixed on the upper edge of the rim to close the openings thereof and prevent displacement of the cord, and a spring arranged in the chamber of the base-plate, having one end connected to said base-plate and the other end to the top plate, said parts operating substantially in the manner and for the purpose described.

2. A tension device consisting of a base-plate, an annular rim on said plate forming a chamber, a top plate mounted rotatably on the base-plate, a rim on the top plate having opposite openings therein, a surmounting band or ring on the rim closing said openings, shoulders or bearing-blocks on alternate sides of said openings, and a spring located in the chamber of the base-plate, having one end connected to said base-plate and the other end thereof connected to the rotatable plate, said parts operating substantially in the manner and for the purpose described.

3. A tension device consisting of the base-plate having attaching-ears, a rim forming a chamber, and central pivot-post formed with a recess, a top plate resting on the rim of the base-plate, having a depending flange fitting in the recess of the pivot-post of said base-plate, and a depending lug adapted to contact with one of the attaching-ears of the base-plate, a rim on the top plate having openings therein, shoulders or bearing-blocks at alternate sides of said openings, a surmounting band or ring on the said rim, and a spring arranged in the chamber of the base-plate, having one end connected to the said plate and the other end connected to the top plate, said parts being combined and operating substantially in the manner and for the purpose described.



399,873. **GUIDING ATTACHMENT FOR SEWING-MACHINES.** HARRY C. GOODRICH, Chicago, Ill. Filed Apr. 26, 1887. Serial No. 236,239. (Model.)

Claim.—1. The combination, with the separator-blade B, of the plate C, adjustable with relation to said separator-blade and carrying guides E and F, having backwardly-turned tongues *e* and *f*, respectively, said guides being provided with openings *e'* *e''* and *f'* *f''*, respectively, and the plate C being provided with straight edges *g* and *h* opposite said guide-openings, substantially as described.

2. The combination, with the plate A and the separator-plate B, of the adjustable plate C, carrying guides E, F, and *i*, and the lever D, pivoted to the plate A and connected with the plate C, for the purpose of adjusting said plate C to bring the material acted upon into proper relation with the line of stitching, substantially as described.

399,874. **BOLTING-REEL.** WILLIAM R. GORTON, Moline, Ill. Filed Oct. 27, 1887. Serial No. 253,490. (No model.)

Claim.—1. A bolting-reel comprising a frame supporting a bolting-cloth, and a series of separate short deflectors located within the reel and side by side longitudinally of the latter, with their outer edges adjacent to the bolting-cloth and inclined inwardly and rearwardly with reference to the direction of motion of the reel, substantially as described.

2. A bolting-reel comprising an exterior frame covered with bolting-cloth, a wall supported upon the frame within the bolting-cloth, and a series of separate deflectors located side by side longitudinally of the reel between the bolting-cloth and inner wall and inclined inwardly and rearwardly with reference to the direction of motion of the reel, substantially as described.

3. A bolting-reel comprising an exterior frame provided with a covering of bolting-cloth, an interior apertured concentric wall or cylinder attached to said exterior frame, and a series of separate deflectors mounted side by side longitudinally of the reel between the bolting-cloth and inner wall, said deflectors being arranged opposite the apertures of the cylinder, substantially as described.

4. A reel comprising two connected parts or members—namely, an exterior cloth-supporting frame and an inner wall or cylinder—one of said parts or members being provided with oblique or spirally-directed ribs arranged to cross each other and secured together at their intersections to form a unitary truss, and the other part or member being supported from the said trussed member, substantially as described.

5. A bolting-reel comprising an exterior frame covered with bolting-cloth, one or more rings or annular partitions extending inwardly from the exterior frame at points between the ends of the reel, and a series of deflectors attached to the exterior frame between the said rings or partitions and acting to throw inwardly from the bolting-cloth the material resting thereon, substantially as described.

6. A bolting-reel comprising an exterior frame, bolting-cloth applied thereto, an inner concentric apertured wall, and rings or annular partitions located between the said exterior frame and inner wall, substantially as described.

7. A bolting-reel comprising an exterior frame, bolting-cloth thereon, an inner wall arranged concentric with the exterior frame, rings or annular partitions located between the said exterior frame and inner wall, and a series of deflectors located adjacent to the bolting-cloth between said bolting-cloth and the inner wall and between the said partitions, said deflectors acting to throw inwardly away from the cloth the material resting thereon, substantially as described.

8. A bolting-reel comprising a trussed frame formed by spirally-directed ribs arranged to cross each other and secured together at their intersected points, an exterior cloth-supporting frame, and annular partitions or rings located between the said trussed reel-frame and the exterior cloth-supporting frame, said partitions serving to support the said exterior frame from the interior trussed frame, substantially as described.

9. The combination, with a reel comprising an exterior frame covered with bolting-cloth and an interior concentric longitudinally-slotted wall attached to and moving with said exterior frame, of a series of revolving beaters located within said reel, substantially as described.

10. The combination, with a reel comprising an exterior frame covered with bolting-cloth, of an inner concentric longitudinally-slotted wall attached to and moving with said exterior frame, a series of separate inclined deflectors located between the exterior frame and interior wall, and a series of revolving beaters located within the reel, substantially as described.

11. The combination, with a reel comprising an exterior frame covered with bolting-cloth and an interior concentric apertured wall, of annular partitions or rings located between the said exterior frame and inner wall and a series of revolving beaters located within the reel, substantially as described.

12. The combination, with a reel comprising an exterior frame covered with bolting-cloth, annular partitions or rings, and inclined deflectors attached to the exterior frame between the said annular partitions, of a series of revolving beaters located within the said reel, substantially as described.

13. The combination, with a reel comprising an exterior frame covered with bolting-cloth, an interior apertured wall, annular partitions or rings located between the said inner wall and exterior frame, and inclined deflectors attached to the exterior frame between the said annular partitions, of a series of revolving beaters located within the said reel, substantially as described.

14. A bolting-reel comprising two heads, a trussed frame connecting said heads, and an exterior cloth-supporting frame arranged concentric with the trussed frame and attached to and supported by the same, said reel being provided with an exterior covering or bolting-cloth attached to the cloth-supporting frame, and with an interior concentric longitudinally-slotted wall or cylinder formed by strips of cloth or other flexible material attached to said trussed frame, substantially as described.

15. A bolting-reel comprising an exterior frame covered with bolting-cloth, an interior apertured wall arranged concentric with the exterior frame, and a series of separate deflectors attached to the said interior wall and extending inwardly from the latter, substantially as described.

16. A reel comprising an exterior frame covered with bolting-cloth, an interior apertured concentric wall provided with slots, annular partitions or rings located between the said inner wall and outer frame, and a series of short deflectors secured to the outer frame side by side, with spaces between them, substantially as described.

17. The combination, with a bolting-reel provided with an exterior cloth-supporting frame and with an inner apertured wall attached to said frame, of spirally-arranged deflectors attached to said inner wall and extending inwardly therefrom, substantially as described.

399,875. **WATER-FILTER.** JOTT GRANT, Boston, Mass. Filed July 6, 1888. Serial No. 279,195. (No model.)

Claim.—In a filter having shoulders for the diaphragms to rest against, the combination of two freely-moving diaphragms, D D', placed at the ends of the interior chamber and having between them loosely-packed filtering material H, with the spring S, adapted to hold the two diaphragms D and D' against the said shoulders and to yield under the sudden shock of the incoming water and then react automatically, so as to loosen the filtering material, all constructed substantially as described, and for the purpose set forth.

399,876. **CIRCUIT-CLOSING DEVICE FOR ELECTRICAL TORPEDO-FUSES.** JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Oct. 9, 1888. Serial No. 287,622. (No model.)

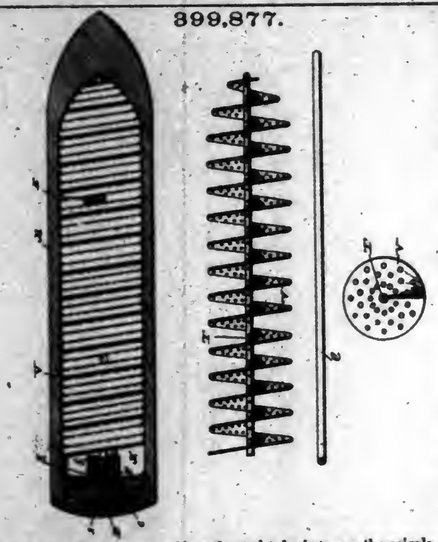
Claim.—1. The combination, with a torpedo-shell provided on the inside with an electric battery, the current from which is normally broken, of a spring-pressed circuit-closing plug seated in the shell and adapted to be moved forward to close the circuit by the pressure of the water when the torpedo has reached a predetermined depth in the water.

2. The combination, with a torpedo-shell provided on the inside with an electric battery, the current from which is normally broken, of a screw-threaded tube inserted in an opening in the shell, and a spring-pressed circuit-closing plug seated within said tube, the tube being provided with means for confining the spring, the tension of which is so regulated as to be overcome by the pressure of the water when the torpedo has reached a predetermined depth, and thus allow the plug to be moved forward to close the circuit, substantially as described.

3. The combination, with a torpedo-shell provided on the inside with an electric battery, the current from which is normally broken, of a tube inserted in an opening in the shell, the bore of the tube being larger at the inner end than at the outer end, a circuit-closing plug provided with a disk at its outer end seated in the larger bore of the tube, and a spring coiled around the plug, and bearing at one end against the disk and at the other end against a stop at the inner end of the tube, the tension of the spring being so regulated that it will be overcome by the pressure of the water when the torpedo has reached a predetermined depth, and thus allow the circuit-closing plug to be moved forward to close the circuit, substantially as described.

399,876.

399,877. **HIGH-EXPLOSIVE SHELL.** JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Oct. 9, 1888. Serial No. 287,629. (No model.)



Claim.—1. In a high-explosive projectile for air-guns, the combination, with a shell, of a flexible tube containing the bursting-charge coiled within the shell, and devices for detonating said charge on the discharge of the gun, substantially as described.

2. In a high-explosive projectile for air-guns, the combination, with a shell, of a rigid perforated tube containing the detonating-charge extending longitudinally of the charge-chamber, a flexible tube containing the bursting-charge coiled around said perforated tube, and a device for firing the detonating-charge on the discharge of the gun, substantially as described.

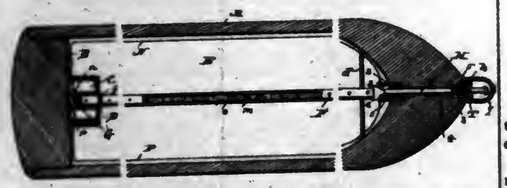
3. In a high-explosive projectile for air-guns, the combination, with a shell, of a rigid perforated tube containing the detonating-charge extending longitudinally of the charge-chamber and provided with a spiral flange, a flexible tube containing the bursting-charge coiled around said perforated tube between the spirals of the flange, and a device for firing the detonating-charge, substantially as described.

4. In a high-explosive projectile for air-guns, the combination, with a shell, of a rigid perforated tube containing the detonating-charge extending longitudinally of the charge-chamber and provided with a perforated spiral flange, a flexible tube containing the burst-

399,877.

ing-charge coiled around said perforated tube between the spirals of the flange, and a device for firing the detonating-charge, substantially as described.

399,878. HIGH-EXPLOSIVE CHARGE. JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Oct. 9, 1888. Serial No. 287,630. (No specimens.)



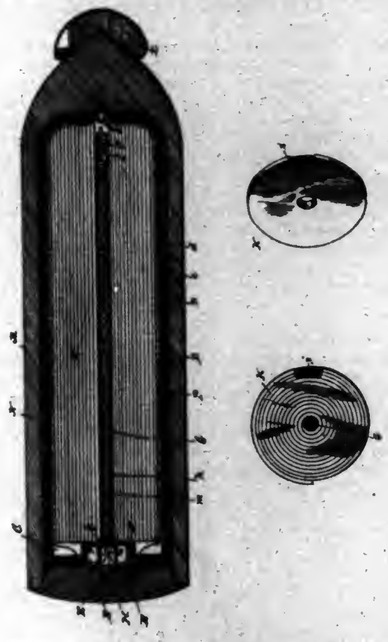
Claim.—1. A high-explosive charge for torpedo or artillery use, consisting of a quantity of high-explosive material inclosed in a flexible tube which is itself an explosive, the tube being laid in coils, substantially as described.

2. A high-explosive charge for torpedo or artillery use, consisting of a quantity of dynamite or other high explosive inclosed in a flexible tube rendered explosive by the application thereto of an active gas-producing material, the tube being laid in coils, substantially as described.

3. A high-explosive charge for torpedo or artillery use, consisting of a quantity of dynamite or other high explosive inclosed in a flexible absorbent tube saturated with nitro-glycerine and laid in coils, substantially as described.

399,879. ELECTRICAL FUSE FOR ORDNANCE-SHELLS. JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Oct. 9, 1888. Serial No. 287,631. (No model.)

Claim.—1. An electrical fuse for shells, consisting of a battery, a perforated fuse-tube containing the fuse material, said tube provided with a platinum disk and extending longitudinally of the charge-chamber in the shell, battery-wires normally out of circuit, and a movable plunger in one of the walls of the shell, adapted to be forced longitudinally between the ends of said wires to close the circuit, all combined substantially as described.



2. An electrical fuse for shells, consisting of a battery located at the rear end of the charge-chamber of the shell, a perforated fuse-tube containing the fuse material, said tube provided at its rear end with a platinum disk and extending longitudinally of the charge-chamber, binding-posts provided with contact-plates at the front end of the charge-chamber, battery-wires normally out of circuit leading to and connected with said binding-posts, and a movable plunger in the front wall of the shell, adapted to be forced longitudinally between said contact-plates to close the electric circuit, all combined substantially as set forth.

399,880. TAIL-GUIDE FOR PROJECTILES. JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Oct. 9, 1888. Serial No. 287,632. (No model.)

Claim.—The combination, with an elongated projectile for a pneumatic gun, of a flexible tail-guide secured at one end to the screw-plug of the projectile, and a telescopic rigid guide secured in the screw-plug and surrounding a portion of the flexible guide, substantially as described, and for the purposes stated.

399,881. SHELL. JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Nov. 8, 1888. Serial No. 290,283. (No model.)

Claim.—1. In a shell having a high-explosive bursting-charge, the combination, with the shell-casing, of a niter lining for the charge-chamber, for the purposes set forth.

2. In a shell having a high-explosive bursting-charge, the combination, with the shell-casing, of a pulverized-niter lining for the charge-chamber, for the purposes set forth.

3. In a shell having a high-explosive bursting-charge, the combination, with the shell-casing, of a lining for the charge-chamber composed of pulverized niter enveloped in a material which will not absorb moisture, for the purposes set forth.

4. In a shell having a high-explosive bursting-charge, the combination, with the shell-casing, of a lining for the charge-chamber composed of pulverized niter enveloped in a suitable fabric covered with paraffined paper, for the purposes set forth.

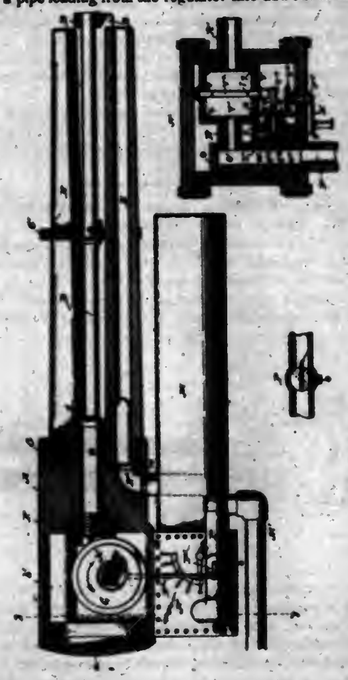
5. The combination, with a shell-casing, of a flexible porous sack containing oil secured to the point of the shell, for the purpose set forth.

6. In a shell, the combination, with the shell-casing, a fuse, and a device for igniting the fuse, of a high-explosive bursting-charge consisting of a cloth fabric saturated with nitro-glycerine, substantially as described.

7. In a shell, the combination, with a shell-casing, a fuse, and a device for igniting the fuse, of a high-explosive bursting-charge consisting of a cloth fabric saturated with nitro-glycerine and covered by a non-porous substance, substantially as described.

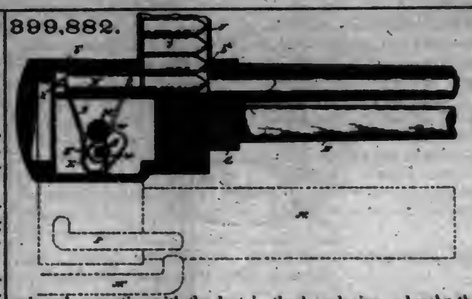
8. In a shell, the combination, with the shell-casing, a fuse extending longitudinally of the charge-chamber, and a device for firing the fuse, of a high-explosive cloth fabric surrounding the fuse, substantially as described.

9. In a shell, the combination, with a shell-casing, a fuse extending longitudinally of the charge-chamber, and an electrical device for firing the fuse, of a high-explosive cloth fabric wrapped around the fuse, substantially as described.



10. A shell comprising a shell-casing having a charge-chamber, a heat-resisting and gas-producing lining for said chamber, a perforated fuse-tube filled with fuse material extending longitudinally of the chamber, an electrical device for firing the fuse material, and a high-explosive cloth fabric surrounding the fuse-tube, all as described, and for the purposes set forth.

11. A shell comprising a shell-casing having a charge-chamber, a perforated fuse-tube filled with fuse material extending longitudinally of the chamber, an electrical device for firing the fuse material, a high-explosive cloth fabric surrounding the fuse-tube, and a flexible porous sack containing oil secured to the point of the shell, all as described, and for the purposes set forth.



399,882. REVOLVING PNEUMATIC GUN. JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Nov. 8, 1888. Serial No. 290,229. (No model.)

Claim.—1. The combination, with the series of revoluble barrels, the breech-piece having a duct in register with one of said barrels when the latter is in position for discharge, and mechanism for revolving the barrels, of an air-reservoir, an automatic air-pressure regulator, a pipe provided with a shut-off cock, connecting the reservoir and regulator, and a pipe leading from the regulator to the duct in the breech-piece, whereby one of the barrels is discharged when the air exerts a predetermined degree of pressure in the regulator.

2. The combination, with the series of revoluble barrels, the breech-piece having a duct in register with the lower barrel when the latter is in position for discharge, and mechanism for revolving the barrels, of an air-reservoir, an automatic air-pressure regulator, a pipe provided with a shut-off cock, connecting the reservoir and regulator, and a pipe leading from the regulator into and out of the reservoir and connecting with the duct in the breech-piece, whereby the lower barrel is discharged when the air exerts a predetermined degree of pressure in the regulator.

399,882.

3. In a revolving air-gun constructed substantially as described, the combination, with the worm-wheel shaft, the reservoir, the automatic air-pressure regulator, and the pipe connecting the reservoir and regulator, of a shut-off cock in said pipe, and an eccentric-rod journaled on the worm-wheel shaft and connected to said cock, whereby air is admitted to the regulator from the reservoir in proper relation to the loading and revolving operations.

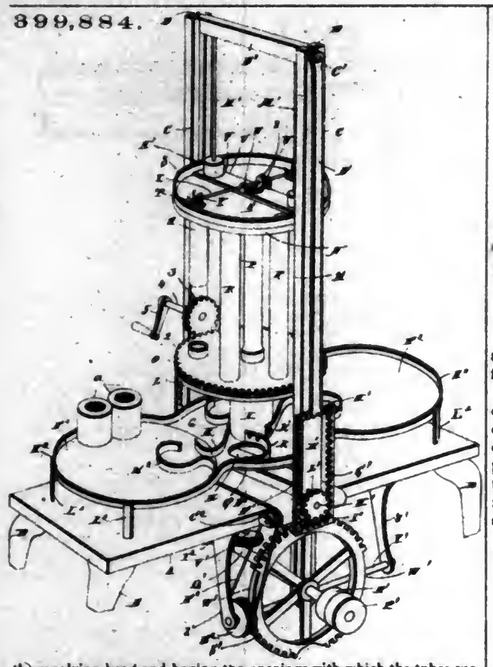
4. The combination, with the breech-piece provided with a guide-way in its upper portion, and a loading-piston in said guideway, of a link pivoted to the lower portion of the breech-piece and provided with an arm which engages with the loading-piston, a cam within the link, and mechanism for revolving the cam to rock the link, whereby the loading-piston is reciprocated in the guideway, for the purpose set forth.

5. The combination, with the breech-piece provided with a partially-open guideway in its upper portion, a magazine above the open part of the guideway, and a loading-piston in said guideway, of a link pivoted to the lower portion of the breech-piece and provided with an arm which engages with the loading-piston, a cam within the link, and mechanism for revolving the cam to rock the link, whereby the loading-piston is reciprocated in the guideway, for the purpose set forth.

6. The combination, with the breech-piece provided with a guide-way in its upper portion, and a loading-piston in the guideway, of the worm-wheel shaft journaled in the breech-piece and provided on its inner end with a gear-wheel, a link pivoted in the lower portion of the breech-piece and having an arm in engagement with the loading-piston, a short shaft journaled in the breech-piece and carrying a gear-wheel in mesh with the one on the worm-wheel shaft, and a cam within the link secured on said short shaft, substantially as described, and for the purposes stated.

399,883. HIGH-EXPLOSIVE CHARGE. JAMES W. GRAYDON, Washington, D. C., assignor to Robert Southworth Lawrence, London, England. Filed Nov. 8, 1888. Serial No. 290,293. (No specimens.)

Claim.—1. An explosive charge made of a sheet of suitable fabric saturated with nitro-glycerine and having a coating or covering capable of preventing the exudation of the nitro-glycerine.



2. An explosive charge made of a sheet of suitable fabric saturated with nitro-glycerine and covered with paraffined paper, as described.

3. An explosive charge made of a sheet of suitable fabric saturated with nitro-glycerine covered with paraffined paper and formed into a roll, as described.

399,884. APPARATUS FOR FILLING AND PACKING CANS. SOLOMON L. GREGG, Greene, Pa. Filed Apr. 19, 1888. Serial No. 271,142. (No model.)

Claim.—1. The combination of the platform L, having the openings, the revoluble head, comprising the upper and lower circular plates and the tubes extending vertically between the same and adapted to align successively with said openings, and the hopper arranged above

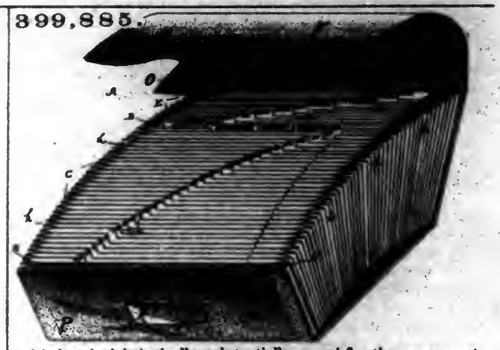
399,884.

the revolving head and having the openings with which the tubes successively register, substantially as described.

2. The combination of the stationary platform G, having the openings H, the revoluble hub having the arms K, and the revoluble tables F^3, having the guides adapted to direct cans placed on said tables into the path of the arms K, substantially as described.

3. The combination of the revoluble head, comprising the plates N and O and the vertical tubes R, the hopper at the upper end of the head having the openings T and V, with which said tubes successively register, the platform L under the revoluble head, having the openings with which the tubes successively register, and the vertically-movable plungers adapted to pass through the tubes when the latter register with the openings V, substantially as described.

4. The combination of the revoluble shaft F, the revoluble head comprising the upper and lower circular plates and the tubes extending vertically between said plates, the wheel A' at the upper end of said shaft, the hopper at the upper end of the revoluble head, having the openings T, with which the tubes successively register, and the shaft X, journaled in the hopper, having the wheel Z, engaging wheel A', and provided with the stirrers Y, arranged over the openings T, substantially as described.



5. The combination of the revoluble head, comprising the plates N O and the tubes R, the stationary platform under said head having the openings with which the tubes successively register, the hopper at the upper end of the revoluble head, having the openings T and V, with which the tubes successively register, and the vertically-movable cross-heads having the plungers adapted to pass through the tubes which register with openings V, substantially as described.

6. The combination of the driving-shaft O', the revoluble measuring-head comprising the plates N O and the tubes R, the platform L under said head having the openings for the purpose set forth, the hopper at the upper end of the revoluble head having the openings T V, the vertically-movable cross-head having the plungers guided in the openings V, the oscillating depending arms D', connected to the cross-head and having the frames at their lower ends provided with the racks F', G', H', and I', and the pinions L', adapted to engage said racks and geared to the shaft O', substantially as described.

399,885. BANKER'S AND MERCHANT'S NOTE-CASE. J. B. THRASHER HALL, St. Louis, Mo. Filed Sept. 1, 1888. Serial No. 284,343. (No model.)

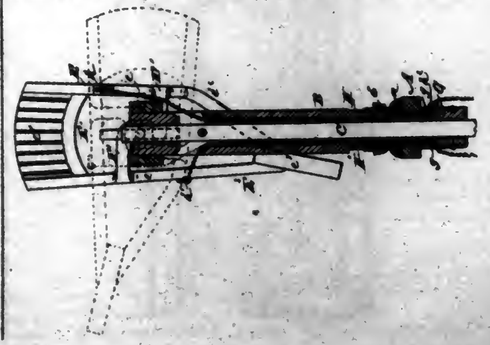
Claim.—1. A case for use in filing notes, &c., comprising, first, a series of thirty-one pockets connected at the ends and having their upper edges cut away, as described, and indexed by the succeeding days of the month, and twelve additional pockets which are similarly constructed and indexed by the months of the year, in combination with an inclosing-cover and an index-book having its leaves bound

399,885.

and indexed alphabetically, substantially as and for the purpose set forth.

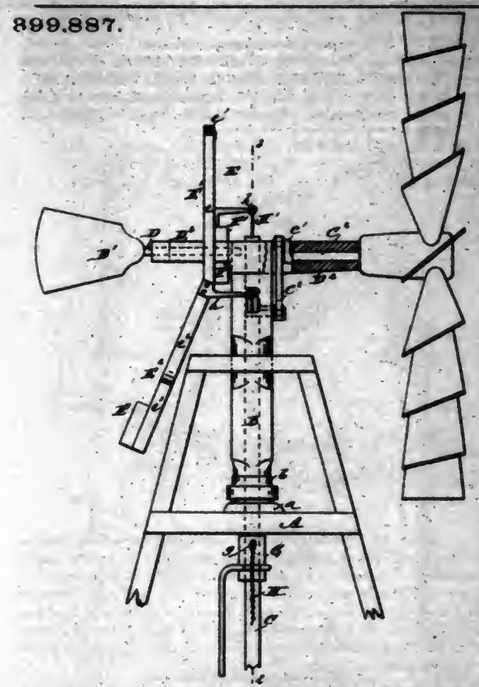
2. A case for use in filing notes, &c., comprising the combination of, first, a series of thirty-one connected pockets indexed by the days of the month; second, twelve additional pockets indexed by months of the year, and, third, a removable and co-operative index-book composed of bound leaves indexed alphabetically and having opposite facing pages correspondingly numbered and provided with a list of months and corresponding rectangular blank spaces, substantially as set forth.

399,886. SHOEING-STAND. JOHN J. HALSTEAD, Kesler's Cross Lanes, W. Va. Filed Mar. 30, 1888. Serial No. 268,996. (No model.)



Claim.—1. A shoeing-stand having a box-like seat or rest, the walls of which are provided with grooves or ways C^2, combined with the keeper having portions fitted to said grooves C^2, whereby the keeper may be adjusted in said grooves within the seat or rest, and a lock for securing said keeper, substantially as set forth.

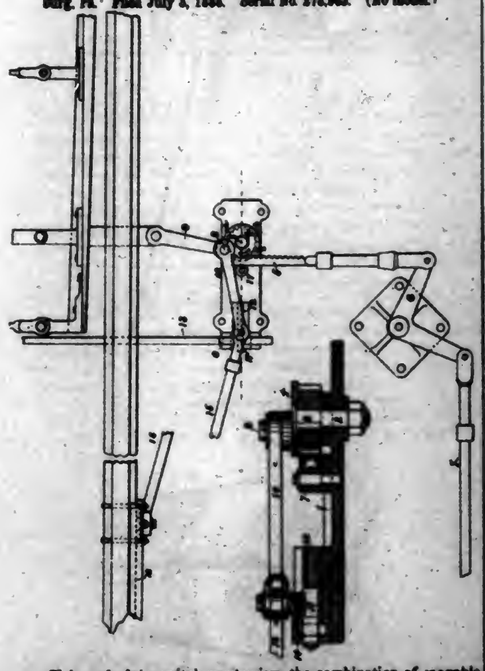
2. In a shoeing-stand, a seat or rest having its walls slotted at C' C^2, the keeper having portions fitted to said slots, and a lock for securing said keeper, substantially as set forth.



3. In a shoeing-stand, the rest or seat having its walls provided with a slot for the entrance of the keeper, and with a groove, C^2, intersecting said slot, and the keeper having portions fitted to the slot and groove, substantially as set forth.

399,887. WINDMILL. GEORGE W. HAINES, Adin, Cal. Filed Aug. 19, 1887. Serial No. 247,267. (No model.)

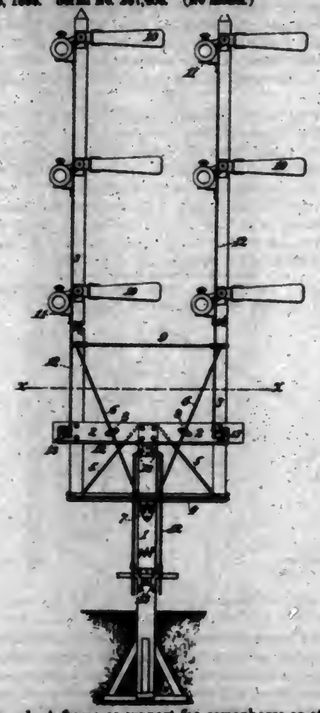
Claim.—In a windmill, the combination, with the turn-post B, the pump-rod C, the rudder-shaft D, and the governor E, secured to the rudder-shaft and provided with the arms A, of the swivel G, provided with the apertures *g* and mounted on the pump-rod, and the ropes or chains H H', secured to the arms *A* of the governor and passing down



399.887.

through the turn-post and out through the apertures of the swivel, the chain H being provided with the button A^3, substantially as herein shown and described.

399,888. SWITCH MECHANISM. JAMES T. HAMBAY, Wilkinsburg, Pa. Filed July 3, 1888. Serial No. 278,963. (No model.)



Claim.—1. In a switch mechanism, the combination of movable switch-rails, a locking-bar connected thereto, a locking-pin, and a rotating wheel, the locking-pin and switch-rails having independent connections to the wheel at the same or diametrically-opposite points, whereby a full movement of the pin preceding and succeeding a full movement of the switch-rails is secured, substantially as set forth.

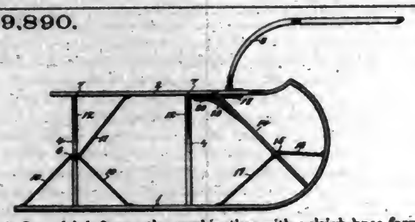
2. In a switch mechanism, the combination of movable switch-rails, a locking-bar connected thereto, a locking-pin, and a rotating wheel, the locking-pin and switch-rails having connections to the same or diametrically-opposite points of the wheel, said connections being arranged at right angles to each other, substantially as set forth.

3. In a switch mechanism, the combination of movable switch-rails, a locking-bar connected thereto, a locking-pin, a detector-rail, and a rotating wheel, the locking-pin, detector-rail, and switch-rails having connections to the same or diametrically-opposite points of the wheel, the connections for the detector-rail and locking-pin being arranged at right angles to the connection of the switch-rail, substantially as set forth.

399,889. SIGNAL-POST. JAMES T. HAMBAY, Swissvale, Pa. Filed Oct. 6, 1888. Serial No. 287,402. (No model.)

Claim.—1. A frame or support for semaphores or other signals, having in combination a main post, cross-beams secured to said post, signal-posts supported by the cross-beams on opposite sides of the main post, the ends of the signal-posts extending below the cross-beams, and tie-beams connecting the lower ends of the signal-posts to each other and to the main posts, substantially as set forth.

2. A frame or support for semaphores or other signals, having in combination a main post, cross-beams secured to said post, signal-posts supported by the cross-beams and having their lower ends extending below the cross-beams, tie-beams connecting the lower ends of the signal-posts to each other and to the main post, and a strap connected to the lower ends of the signal-post and passing over the main post, substantially as set forth.



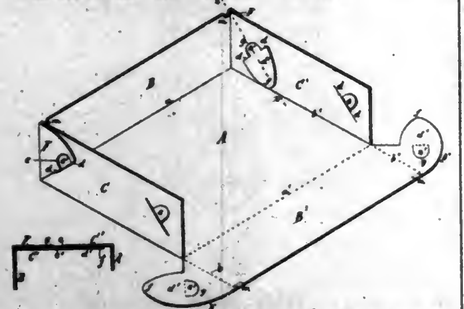
3. A frame or support for semaphores or other signals, having in combination a main post, cross-beams secured to said post, signal-posts supported by the cross-beams on opposite sides of the main posts, straining or queen posts secured to the cross-beams, and truss-rods having their ends connected to the main post and to the signal-posts at points above the cross-beams and passing over the straining-posts, substantially as set forth.

399,890. SLEIGH. WILLIAM J. HAMILL, St. Catharines, Ontario, Canada. Filed Dec. 15, 1888. Serial No. 293,703. (No model.)

Claim.—1. A sleigh-knee formed in arch shape and provided with a brace consisting of a curved truss formed on a center eccentric with that of the knee, the curve of the truss being greater than that of the knee, substantially as specified.

2. A sleigh-knee and bench formed in arch shape and provided with a curved truss, the curve of the truss being greater than that of the knee and the center thereof being eccentric with that of the knee, and devices for binding the knee and truss in relative position, substantially as specified.

399,890.



3. In a sleigh-frame, the combination, with a sleigh-knee formed on substantially a half-circle and provided with a truss formed on a half-circle, the radius of which is greater than that on which the knee is formed and the center thereof being eccentric with that of the knee, of a cross-piece secured to the knee, and bolts passing through the cross-piece, knee, and truss, substantially as specified.

4. The combination, with the runners 1, of the knees 4, the curved truss-braces 5, connected, as at 6, to the knees, substantially as specified.

5. The combination, with the runners 1, fenders 2, and front curved brace, 18, of the diagonal brace 14, secured to the fenders, and provided with the branch brace 19, secured to the curved brace, and the clip 15, having the braces 16 and 17, substantially as specified.

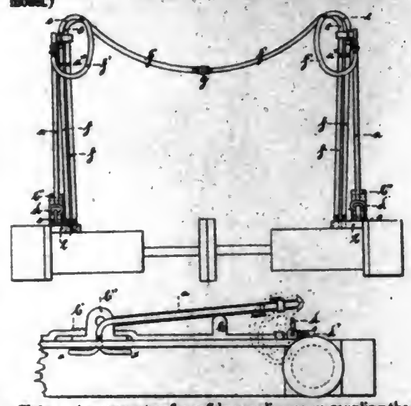
6. The combination, with the runners 1, having the knees 4, and trusses 5, secured thereto, as at 6, of the cross-pieces 7, secured to the knees and trusses, as at 8 and 19, and the interposed side braces, 12, secured to the cross-pieces at their upper ends and to the knees at their lower ends, as at 13, substantially as specified.

399,891. PAPER BOX. GEORGE W. T. HARLEY, Frederick, Md. Filed Jan. 10, 1889. Serial No. 296,926. (No model.)

Claim.—A paper box which comprises in its construction one or more walls having end flaps, F, provided with locking parts *e'*, in combination with one or more walls provided with a slit, *d*, and an opening, *e*, substantially as and for the purpose described.

399,892. EYE-SHADE. THOMAS H. HARRISON, London, England, assignor of one-half to Levy, Dreyfus & Co., New York, N. Y. Filed Dec. 19, 1888. Serial No. 294,094. (No model.)

Claim.—An eye shade or protector consisting of a main part or body formed of larger eye parts, and a connecting bridge-piece having a rearwardly-bent nose-rest, and of a retaining device for attaching the protector to the head, substantially as set forth.



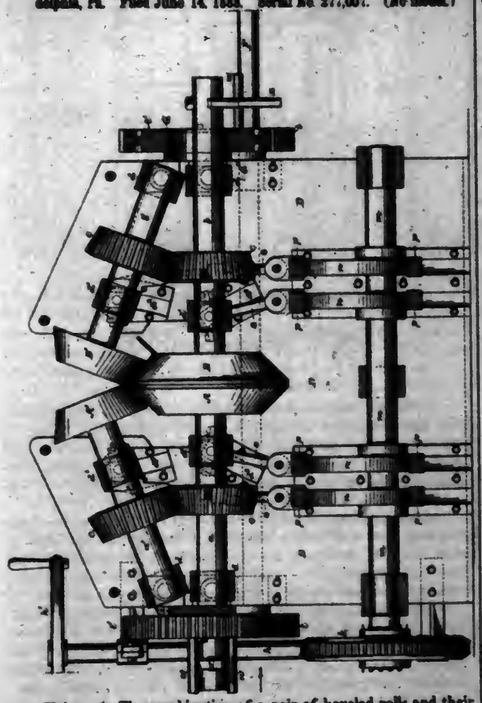
399,893. LEATHER-DRESSING. JAMES J. HAYWARD, Ballston, N. Y. Filed Nov. 1, 1888. Serial No. 289,735. (Specimens.)

Claim.—1. The herein-described composition of matter to be used for rendering substances impervious to water, consisting of paraffine, camphor, rosin, and naphtha, in proportions substantially as specified.

2. The herein-described composition of matter to be used for rendering substances impervious to water, consisting of paraffine, asphaltum, camphor, rosin, neat's-foot oil, and naphtha, in proportions substantially as specified.

3. The herein-described composition of matter to be used for rendering substances impervious to water, consisting of paraffine, asphaltum, camphor, rosin, and naphtha, in the proportions substantially as specified.

399,894. MEANS FOR SAFELY COUPLING OR UNCOUPLING THE PIPES OF PNEUMATIC BRAKES OR STEAM-HEATING APPARATUS ON RAILWAY-TRAINS. BARTHOLOMÄUS HEINRICHS, Cöblentz, Prussia, Germany. Filed Jan. 10, 1888. Serial No. 260,372. (No model.)

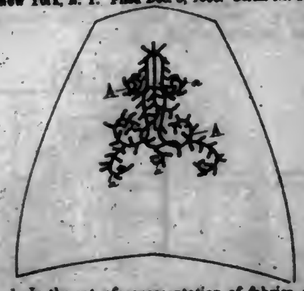


Claim.—An apparatus for safely coupling or uncoupling the pipes of pneumatic brakes or steam-heating apparatus on railway-trains, consisting of radius-rods *a* between the buffers of each carriage, the upper ends of said rods being in connection with each other by means of branch pipes *c*, toothed gears *a'*, secured to radius-rods *a*, sliding bars *b*, with racks *b'*, for turning the toothed gears *a'*, spring-catches *i i* in the sliding bars *b*, and projections *k'*, for catching spring-catches *i i*, substantially as set forth.

399,895. SNOW-PLOW. ERIC M. HEMELSON, Rockford, Minn. Filed Mar. 29, 1888. Serial No. 268,738. (No model.)

Claim.—In a snow-plow, the combination, with an inclined bottom, of a central vertical knife held on the said bottom, wings extending rearwardly from the rear end of the said central knife, extension-wings hinged to the top edges of the said wings, side knives secured to the sides of the said bottom near its front end, the said side knives extending upward and outward, a brace secured to the top edges of the said side knives and central knife, and wedge-shaped sides extending rearward from the said side knives and along the sides of the said bottom, substantially as shown and described.

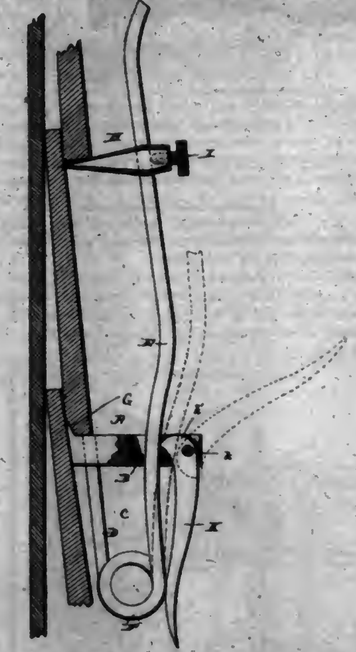
399,896. MACHINE FOR CHANGING THE ANGLE OF THE FLANGES OF Z AND ANGLE BARS. WILLIAM R. HIGHFIELD, Philadelphia, Pa. Filed June 14, 1888. Serial No. 277,057. (No model.)



Claim.—1. The combination of a pair of beveled rolls and their shafts adapted to pivoted boxes, with an arm projecting laterally from the shaft of one roll, and a driving-wheel having longitudinally-projecting fingers for engaging with said arm, and a central opening of larger diameter than the shaft, whereby the swinging of the latter on its pivots is permitted, all substantially as specified.

2. The combination of a pair of bevel-wheels having shafts adapted to pivoted boxes, an arm projecting from the shaft of one roll, a driving-wheel having projecting fingers engaging with said arm, and a sleeve serving as a bearing for said wheel and having a vertical slot for the passage of the shaft, all substantially as specified.

3. The combination of the two pairs of beveled rolls and the pivoted shafts carrying the same, a shaft having cams, and connecting-rods whereby said cams are caused to act on the roll-shafts, a counter-shaft, worm-gearing whereby the counter-shaft is caused to operate the cam-shaft, and a hand-wheel whereby said counter-shaft may be directly operated, all substantially as specified.



399,897. METHOD OF ORNAMENTING FABRICS. MICHAEL L. HILLER, New York, N. Y. Filed Dec. 5, 1888. Serial No. 292,726. (No model.)

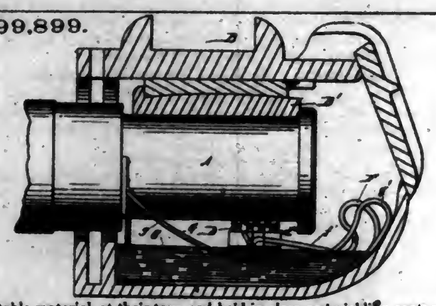
Claim.—1. In the art of ornamentation of fabrics, an embroidered surface, the leaders of the design being composed of one or more lengths of cord sewed flatly in place, and having extending from said cord lengths of smaller members of the general design composed of a series of beaded work, substantially as described.

2. The within-described means for ornamenting surfaces of fabrics, which consists in the combination of leaders A, formed of lengths of cord sewed in place upon such surfaces, with extensions branched out therefrom composed of series of bead-work, as and for the purpose indicated, substantially as described.

399,898. SIDING-GAGE. SAMUEL G. HORACK, Ann Arbor, Mich. Filed June 21, 1888. Serial No. 277,736. (No model.)

Claim.—1. In a siding-gage, the combination of the slotted bar A, having an inclined or beveled inner end and provided with the spur flush with the said inner end, the spring-actuated arm passing upward through the slot in the said bar and provided with a pointed finger, and the cam-lever mounted in the slot and adapted to bear against the said arm, substantially as specified.

2. In a siding-gage, the combination, with the transverse bar A, having a slot, B, therein, and provided with a spur, G, of the movable arm E, passing through the slot B and provided at its lower end with a spring-coil, F, connected to the under side of the transverse bar, the adjustable finger arranged on the said arm, and the cam-lever mounted in the slot B and bearing against the arm, substantially as specified.



3. The herein-described siding-gage, comprising the transverse slotted bar A, having an inclined or beveled inner end and provided with the flat spur G, flush with the said end, the spring-rod C, provided with the short depending arm D, affixed at its upper end to the inner end of the bar A, the movable arm E, passing upward through the slot in the bar A, and the spring-coil F, connecting the lower ends of the arms D E and serving to press the movable arm outward, the adjustable finger H, mounted on the movable arm and provided with a thumb-screw to clamp it in the desired position, the inner end of the said finger being pointed to engage the siding, and the cam-lever mounted on a transverse pivot in the outer end of the slot in the bar A and adapted to bear against the movable arm E to force it inward against the strength of the spring-coil and engage the inner end of the finger in the siding, substantially as specified.

399,899. CAR-AXLE LUBRICATOR. CHARLES A. HOWARD, Pontiac, assignor to Henry G. Hodges and Charles G. Hodges, Detroit, Mich. Filed Nov. 6, 1888. Serial No. 290,094. (No model.)
